Disclaimer Notice

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgment when deciding the most appropriate care to enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

Background

The drug Clinical Review Prior-Authorization (CRPA) process is designed to ensure that newly approved (FDA) drugs are used appropriately in cases where a drug poses potential efficacy, quality, toxicity, or utilization concerns for the members and the Health Plan. In addition, this policy may be used for medications that have significant concerns about safety or inappropriate use, but do not warrant a stand-alone policy. The Pharmacy Management clinical team reviews the drugs found in this policy. A Letter of Medical Necessity (LOMN), Exception Form, or Prior Authorization Form completion is required for consideration of drug coverage under this policy.

Summary

Effective Date of Policy:	8/13/26
HCPCS	J0491, J1306, J1440, J2724
Duration	Per product

Required Criteria for Approval

Ceprotin (Protein C Concentrate, Human) - Medical

1. Must be followed by a hematologist
2. Have a diagnosis of severe congenital protein C deficiency confirmed by antigenic and functional plasma coagulation assays
3. Approval is for 2 years

HCPCS: J2724

Leqvio (inclisiran) - Medical

1. The medication must be prescribed by or in consultation with a cardiologist, endocrinologist, lipidologist, nephrologist AND
2. The patient must have one of the following diagnoses (a, b, c OR d):
    a. Clinical atherosclerotic cardiovascular disease (ASCVD)
        i. Patient must be 18 years of age or older AND
        ii. Must have a history of acute coronary syndrome, myocardial infarction (MI), stable or unstable angina, coronary/other arterial revascularization, stroke, TIA, peripheral arterial disease, or other documented atherosclerotic disease (such as coronary atherosclerosis, renal atherosclerosis, aortic aneurysm secondary to atherosclerosis, or Carotid plaque with ≥ 50% stenosis)
    b. Heterozygous Familial Hypercholesterolemia (HeFH)
        i. Patient must be 12 years of age or older AND
        ii. Molecular genetic testing must demonstrate evidence of an LDL-R mutation, LDLRAP1 mutation, familial defective apo B100, or a PCSK9 mutation OR
        iii. Diagnosis must be confirmed as "definite" according to the World Health Organization Criteria (Dutch Lipid Network) OR Simon-Broome Register Diagnostic Criteria [Refer to table 1 and table 2 in the appendix]. Documentation of the following must be provided to calculate an accurate score:
            A. Patient's first-degree relatives with ANY of the following:
                a. Tendon xanthoma
                b. Corneal arcus c
                c. Known LDL-C >95th percentile by age and gender for country
                d. Known premature (< 55 years, men < 60 years, women) coronary heart disease (CHD)
            B. Patient's child(ren) < 18 years with LDL-C / 95th percentile by age and gender for country
            C. Patient's baseline LDL-C level prior to use of ALL-cholesterol lowering medications
            D. Patient's history of CHD

E. Patient's history of cerebral or peripheral vascular disease
F. Physical exam finding of tendon xanthoma
G. Physical exam finding of corneal arcus

c. Primary hypercholesterolemia without ASCVD or HeFH
   i. Patient must be 18 years of age or older AND
   ii. Patient is at high risk for ASCVD as evidenced by one of the following (documentation must be submitted):
      A. Severe hypercholesterolemia with an untreated LDL-C ≥ 190 mg/dL and poorly controlled risk factors (i.e., age > 35, male sex, obesity, smoking, hypertension, low HDL-C < 35 mg/DL) OR
      B. American Heart Association Predicting Risk of cardiovascular Disease EVENTs (PREVENT-ASCVD) 10-year risk equation ≥ 5% OR
      C. American College of Cardiology/American Heart Association (ACC/AHA) pooled cohort risk assessment score ≥ 7.5% OR
      D. Framingham Risk Score ≥ 20% OR
      E. Coronary artery calcium (CAC) score ≥ 300 OR
      F. Lp(a) ≥ 125 nmol/L (≥ 50 mg/dL)

d. Homozygous familial hypercholesterolemia (HoFH)
   i. Patient is 12 to < 18 years of age AND
   ii. Patient must meet one of the following (A or B):
      A. Molecular genetic testing must demonstrate two mutant allelles on different chromosomes at the LDLR, LDLRAP1, APOB, or PSCK9 genes or show at least 2 such pathogenic variants at different loci
         a. Coverage will not be provided for patients with evidence of two LDLR negative alleles (null homozygous) as these genotypes have little to no response to medications that inhibit proprotein convertase subtilisin kexin type 9 (PCSK9)
      B. Patient has a history of untreated LDL-C > 400 mg/dL with either (a or b)
         a. Xanthoma before the age of 10 years OR
         b. Evidence of heterozygous familial hypercholesterolemia in at least one parent

3. The provider must attest that a discussion with the patient has taken place regarding lifestyle modifications (i.e., a heart healthy diet, the importance of exercise, and smoking cessation [if applicable])
4. Documentation of baseline LDL-C level must be provided- measurement must occur within 60 days prior to treatment
5. The patient must have failed to reach target LDL-C while receiving treatment with high-intensity statin therapy (i.e., atorvastatin 80 mg/day or rosuvastatin 40 mg/day), or maximally tolerated statin therapy, for at least 8 weeks
   a. Target LDL-C for:
      i. ASCVD: < 55 mg/dL
      ii. HeFH for adults 18 and older: < 70 mg/dL
      iii. HeFH or HoFH for adolescents 12 to < 18: < 100 mg/dL
      iv. Primary Hyperlipidemia:
         A. Severe hypercholesterolemia: < 100 mg/dL
         B. PREVENT-ASCVD 10-year risk equation 5% to < 100 mg/dL
         C. PREVENT-ASCVD 10-year risk equation ≥ 10%: < 70 mg/dL
         D. ACC/AHA pooled cohort risk assessment score ≥ 7.5% to < 20%: < 100 mg/dL
         E. ACC/AHA pooled cohort risk assessment score ≥ 20%: < 70 mg/dL
         F. Framingham Risk Score ≥ 20% : < 70 mg/dL
         G. CAC ≥ 300: < 70 mg/dL
         H. Lp(a) ≥ 125 nmol/L (≥ 50 mg/dL): < 70 mg/dL
   b. If patient is unable to tolerate statin therapy, documentation in progress notes must include:
      i. A contraindication to statin therapy according to FDA labeling OR
      ii. History of statin-related rhabdomyolysis:
         A. Must have symptoms consistent with rhabdomyolysis (i.e., muscle pain, swelling, and weakness, dark urine) AND
         B. Must have creatine kinase (CK) level > 10 times upper limit of normal, myoglobinuria, or acute renal failure (increase in serum creatinine > 0.5 mg/dL) AND

C. Patient was receiving a statin at the time of the event and symptoms resolved upon discontinuation of the statin OR

iii. History of statin intolerance. Documentation must include the following:

A. Inability to tolerate at least 2 different statins

a. At least 1 statin must be hydrophilic (such as pravastatin, fluvastatin, or rosuvastatin) starting at the lowest starting average daily dose AND

b. Intolerance associated with confirmed, intolerable statin-related adverse effects (i.e., muscle related symptoms) or significant biomarker abnormalities (i.e., ALT/AST > 3 times the upper limit of normal accompanied by increase in total bilirubin > 2 times the upper limit of normal) AND

c. Non-statin causes of muscle symptoms or biomarker abnormalities have been ruled out (for example, hypothyroidism, reduced renal function, reduced hepatic function, rheumatologic disorders such as polymyalgia rheumatic, steroid myopathy, vitamin D deficiency, or primary muscle disease)

6. The patient must have serious side effects or drug failure to Repatha
7. If patient can tolerate statins, Leqvio must be prescribed in combination with the maximum tolerated dose of a statin
8. Leqvio will not be approved in combination with Praluent, Repatha, Lerochol, Nexletol, or Nexlizet as current medical literature does not support this
9. Approval timeframes: 6 months for initial, 12 months for all recertifications
   a. Initial recertification requires:
      i. Documentation of adequate reduction in LDL cholesterol defined as:
         A. ≥ 40% reduction in LDL as compared to baseline LDL level or reduction to LDL goal for patients with a diagnosis of ASCVD OR
         B. Reduction in LDL level as compared to baseline LDL level for patients with a diagnosis of HeFH, HoFH, or primary hypercholesterolemia without ASCVD or HeFH AND
      ii. Continued adherence to a high intensity statin at maximum tolerated dose (if patient is able to tolerate) AND
      iii. Continued adherence to lifestyle modifications (non-smoker, diet, and exercise)
   b. Subsequent recertification requires:
      i. Documentation that confirms the patient has maintained an adequate reduction in LDL cholesterol compared to baseline
      ii. Continued adherence to a high intensity statin at maximum tolerated dose (if patient is able to tolerate) AND
      iii. Continued adherence to lifestyle modifications (non-smoker, diet, and exercise)
10. Approved dosing: 284 mg administered as a single subcutaneous injection initially, again at 3 months, and then every 6 months thereafter

HCPCS: J1306

Rebyota (fecal microbiota,live-jslm) - Medical

1. The patient must be at least 18 years of age AND
2. Must be prescribed by, or in consultation with, an Infectious Disease or GI specialist AND
3. Rebyota must be used to prevent the recurrence of Clostridioides difficile infection (CDI) AND
4. The patient must have a recurrent episode of Clostridioides difficile infection (CDI) AND
5. The patient must have had a positive stool test for the presence of Clostridioides difficile toxin within the past 30 days AND
6. Current CDI must be controlled following completion of at least 10 days of standard of care antibiotic therapy (e.g., vancomycin, fidaxomicin) AND
7. Administration must take place within 24-72 hours following the completion of an antibiotic course used for CDI treatment AND
8. Patient must not be immune compromised
9. Retreatment with Rebyota for the same CDI will not be covered
10. Rebyota will not be covered for the treatment of Clostridioides difficile infection (CDI) or any other non-FDA approved indications
11. Approval will be granted for 1 month to allow for administration of a single dose a. All approvals are valid only when it is confirmed that Rebyota will be administered within the required timeframe relative to the CDI antibiotic course (i.e., therapeutic window of administration). As such, providers must confirm, prior to approval (on initial or appeal), that the member will receive the therapy within the therapeutic window of administration. If the therapeutic window of administration has expired, the request will not be approved.

12. Approved dosing: 150 mL single dose

HCPCS: J1440

Saphnelo (anifrolumab-fnia) - Medical

1. Must be 18 years of age or older
2. Must be prescribed by or in consultation with a rheumatologist
3. Must have a confirmed diagnosis of active Systemic Lupus Erythematosus (SLE)
    a. A diagnosis of SLE is confirmed by the presence of autoantibodies (such as antinuclear antibodies [ANA], anti-double-stranded DNA [anti-dsDNA] antibodies, anti-Smith [anti-Sm] antibodies)
        i. Due to lab variability in standards for positive values, values reported as "positive" from that lab are acceptable
4. Must be used in combination with standard-of-care therapy (i.e., prednisone, hydroxychloroquine, azathioprine, mycophenolate mofetil, methotrexate)
5. Must not have severe active lupus nephritis or severe active central nervous system (CNS) lupus
6. For new starts only: All requests for Saphnelo will require clinical justification why Benlysta SQ cannot be used (i.e., inability to self-inject)
    a. The use of Saphnelo in combination with Benlysta will not be approved as these medications have not been studied for use together
7. Initial approval will be for 6 months. Continuations for 1 year will require documentation of a decrease in disease signs and symptoms (including reduction in disease flares) from baseline
8. Subsequent reauthorizations for 1 year at a time require documentation of maintenance of improvement in disease signs and symptoms (including reduction in disease flares) from baseline.
9. The approved dose is 300 mg IV (intravenous) once every 4 weeks

HCPCS: J0491

Considerations

- Prior authorization is obtained through the CDPHP pharmacy department.
- Clinical documentation must be submitted for each request (initial and recertification) unless otherwise specified (e.g., provider attestation required). Supporting documentation includes, but is not limited to, progress notes documenting previous treatments/treatment history, diagnostic testing, laboratory test results, genetic testing/biomarker results, imaging and other objective or subjective measures of benefit which support continued use of the requested product is medically necessary. Also, ongoing use of the requested product must continue to reflect the current policy's preferred formulary. Recertification reviews may result in the requirement to try more cost-effective treatment alternatives as they become available (i.e., generics, biosimilars, or other guideline supported treatment options). Requested dosing must continue to be consistent with FDA-approved or off-label/guideline-supported dosing recommendations.
    - Continued approval at time of recertification will require documentation that the drug is providing ongoing benefit to the patient in terms of improvement or stability in disease state or condition.
- Supportive documentation of previous drug use must be submitted for any criteria that require a trial of a preferred agent if the preferred drug is not found in claims history.

Appendix

Table 1: Diagnostic Criteria for the Clinical Diagnosis of HeFH (WHO)

	Criteria	Score
Family history	First-degree relative known with premature CAD[a] and/or first-degree relative with LDL-C >95th percentile	1
	First-degree relative with tendon xanthomata and/or children <18 y with LDL-C >95th percentile	2
Clinical history	Patient has premature CAD[a]	2
	Patient has premature cerebral/peripheral vascular disease	1
Physical examination	Tendon xanthomata	6
	Arcus cornealis age <45 y	4
LDL-C	>8.5 mmol/L (> ≈330 mg/dL)	8
	6.5-8.4 mmol/L (≈250-329 mg/dL)	5
	5.0-6.4 mmol/L (≈190-249 mg/dL)	3
	4.0-4.9 mmol/L (≈155-189 mg/dL)	1
Definite FH		Score >8
Probable FH		Score 6-8
Possible FH		Score 3-5
No diagnosis		Score <3

CAD: coronary artery disease; FH: familial hypercholesterolemia; HeFH: heterozygous familial hypercholesterolemia; LDL-C: low-density lipoprotein cholesterol; WHO: World Health Organization.
[a] Premature CAD: male before age 55, women before age 60.

Table 2: Simone-Broome Criteria for Diagnosis of FH

FH	Criteria
Definite	• TC >6.7 mmol/L or LDL-C >4.0 mmol/L in a child aged <16 y OR • TC >7.5 mmol/L or LDL-C >4.9 mmol/L in an adult (levels either pretreatment or highest on-treatment) PLUS Tendon xanthomas in patient, or in first-degree relative (parent, sibling or child), or in second-degree relative (grandparent, uncle, or aunt) OR • DNA-based evidence of an LDL-R mutation, familial defective apo B_{100}, or a PCSK9 mutation.
Possible	• TC >6.7 mmol/L or LDL-C >4.0 mmol/L in a child aged <16 y OR • TC >7.5 mmol/L or LDL-C >4.9 mmol/L in an adult (levels either pretreatment or highest on-treatment) AND AT LEAST ONE OF THE FOLLOWING • Family history of myocardial infarction: <50 y of age in second-degree relative or <60 y of age in first-degree relative • Family history of raised TC: >7.5 mmol/L in adult first- or second-degree relative or >6.7 mmol/L in child or sibling aged <16 y.

apo: apolipoprotein; FH: familial hypercholesterolemia; LDL-C: low-density lipoprotein cholesterol; LDL-R: low-density lipoprotein receptor; PCSK9: proprotein convertase subtilisin/kexin type 9; TC: total cholesterol.

MEDICAL POLICY

Medical Policy Title	**Cochlear Implants and Auditory Brainstem Implants**
Policy Number	**7.01.26**
Current Effective Date	**June 1, 2026**
Next Review Date	**March 2027**

Our medical policies are guides to evaluate technologies or services for medical necessity. Criteria are established through the assessment of evidence based, peer-reviewed scientific literature, and national professional guidelines. Federal and state law(s), regulatory mandates and the member's subscriber contract language are considered first in the determination of a covered service. (Link to Product Disclaimer)

This policy addresses cochlear implants and auditory brainstem implants only. Therefore, bone conduction, semi-implantable and fully implantable hearing aids (e.g., Branemark bone-anchored hearing aid or BAHA System, Esteem Implanted Hearing System, Vibrant Soundbridge System, and RetroX Hearing System) are not addressed in this policy.

POLICY STATEMENT(S)

Cochlear Implants (Unilateral and Bilateral) for Bilateral Sensorineural Hearing Loss (SNHL)

I. Unilateral and bilateral* cochlear implants are considered **medically appropriate** as a prosthetic for hearing loss when **ALL** of the following criteria are met:

   A. The prosthetic is approved by the U.S. Food and Drug Administration (FDA) (Refer to Regulatory section) for the individual's age;

   B. Individual has bilateral severe-to-profound SNHL defined as a pure-tone average (PTA) of >70 decibels (dB HL) at 500 hertz (Hz), 1000 Hz, and 2000 Hz;

   C. There has been limited or no benefit from appropriately fit hearing aids;

   D. Physician attestation of the willingness of the individual or family to undergo an extended program of auditory rehabilitation;

   E. None of the following contraindications for cochlear implants are present:

      1. Cochlear aplasia (absence of cochlear development);

      2. Deafness due to lesions of the eighth cranial (acoustic) nerve or central auditory pathway;

      3. Infection of the external or middle ear (e.g., otitis media) or other active aural disease processes.

*Bilateral cochlear implantation should be considered only when it has been determined that the alternative of unilateral cochlear implant plus hearing aid in the contralateral ear will not result in a binaural benefit (e.g., in those individuals with hearing loss of a magnitude where a hearing aid will not produce the required amplification).

Unilateral Cochlear Implants for Single-Sided Deafness (SSD) or Asymmetric Hearing Loss (AHL)

II. Unilateralc ochlear implants are considered **medically appropriate** as a prosthetic for SSD or AHL when **ALL** of the following criteria are met:

A. Individual is five (5) years of age or older (Refer to Regulatory section);

B. There has been limited or no benefit from appropriately fit hearing aids;

C. Individual has **EITHER** of the following:

1. Profound SNHL (defined as a PTA of >90 dB HL at 500 Hz, 1000 Hz, 2000 Hz, and 4000 Hz) in one ear and normal hearing or mild SNHL in the other ear (defined as a PTA up to 30 dB HL at 500 Hz, 1000 Hz, 2000 Hz, 4000 Hz); **or**

2. Profound SNHL (defined as a PTA of >90 dB HL at 500 Hz, 1000 Hz, 2000 Hz, and 4000 Hz) in one ear and mild to moderately severe SNHL (ranging from 31 dB HL up to 55 dB HL at 500 Hz, 1000 Hz, 2000 Hz and 4000 Hz) in the other ear, with a difference of at least 15 dB HL in PTA between ears;

D. Individual has had a one (1) month trial wearing a Contra Lateral Routing of Signal (CROS) hearing aid and has not shown any benefit;

E. Physician attestation of the willingness of the individual or family to undergo an extended program of auditory rehabilitation;

F. None of the following contraindications for cochlear implants are present:

1. Cochlear aplasia (absence of cochlear development);

2. Deafness due to lesions of the eighth cranial (acoustic) nerve or central auditory pathway;

3. Infection of the external or middle ear (e.g., otitis media) or other active aural disease processes.

Hybrid Cochlear Implants

III. Unilateral cochlear implantation with a device that includes the hearing aid integrated into the external sound processor (e.g., the Nucleus Hybrid L24 Cochlear Implant System) is considered **medically appropriate** when **ALL** of the following criteria are met:

A. Individual is five (5) years of age or older (Refer to Regulatory section);

B. Individual meets **BOTH** of the of the following criteria:

1. One ear has severe to profound SNHL (defined as a PTA of > 80 dB HL at 500 Hz, 1000 Hz, 2000 Hz and 4000 Hz); **and**

2. In the contralateral ear, normal or near normal hearing (defined as a PTA of ≤ 30 dB HL at 500 Hz, 1000 Hz, 2000 Hz and 4000 Hz).

C. There has been limited benefit from an appropriately fit unilateral hearing aid (defined as a score of less than or equal to 5% on a Consonant Nucleus Consonant [CNC] word test);

D. For individuals between five (5) years and 18 years of age, insufficient functional access to sound in the ear to be implanted must be determined by aided speech perception test scores of 5% or less on developmentally appropriate monosyllabic word lists when tested in the ear to be implanted alone;

E. Physician attestation of the willingness of the individual or family to undergo an extended program of auditory rehabilitation;

F. None of the following contraindications for cochlear implants are present:

1. Cochlear aplasia (absence of cochlear development);
2. Deafness due to lesions of the eighth cranial (acoustic) nerve or central auditory pathway;
3. Infection of the external or middle ear (e.g., otitis media) or other active aural disease processes.

Auditory Brainstem Implants

IV. Auditory brainstem implants are **medically appropriate** when **ALL** of the following criteria are met:

A. The implant is approved by the U.S. Food and Drug Administration (FDA) (Refer to Regulatory section) for the individual's age;

B. Individual has neurofibromatosis type 2;

C. Individual is rendered deaf due to bilateral resection or treatment of neurofibromas of the auditory nerve.

Device Repair

V. Repair of a medically necessary Cochlear Implant or Auditory Brainstem Implant or components not under warranty will be considered **medically appropriate** when the following criteria are met:

A. Physician documentation includes **ALL** of the following:

1. date of device implantation/initiation;
2. manufacturer warranty information, if applicable;
3. attestation that the individual has been compliant with the use of device and will continue to benefit from the use of device;

B. The device is no longer functioning adequately; and **BOTH** of the following criteria are met:

1. inadequate function interferes with activities of daily living; **and**
2. repair is expected to make the equipment fully functional (as defined by manufacturer).

VI. Repair of equipment damaged due to individuals neglect, theft, abuse, or when another available coverage source is an option (e.g., homeowners, rental, auto, liability insurance, etc.) is **ineligible for coverage**.

Device Replacement

VII. Replacement of a medically necessary Cochlear Implant or Auditory Brainstem Implant or components not under warranty will be considered **medically appropriate** when **EITHER** of the following criteria are met:

A. The device is no longer functioning adequately and has been determined to be non-repairable or the cost of the repair is in excess of the replacement cost;

B. There is documentation that a change in the individual's condition makes the present unit non-functional and improvement is expected with a replacement unit.

VIII. The replacement of a properly functioning Cochlear Implant or Auditory Brainstem Implant, its components or accessories is considered **not medically necessary**. This includes, but is not limited to, replacement desired due to advanced technology or in order to make the device more aesthetically pleasing.

IX. The replacement of equipment damaged or lost due to individual's neglect, theft, abuse, or when another available coverage source is an option (e.g., homeowners, rental, auto, liability insurance, etc.) is **ineligible for coverage**.

X. Accessories or components for a Cochlear Implant or Auditory Brainstem Implant that are considered not medically necessary or investigational by peer-reviewed literature will also be considered as **not medically necessary or investigational** by the Health Plan.

POLICY GUIDELINE(S)

I. Cochlear implants and auditory brainstem implants are prosthetic devices. Coverage for prosthetic devices is contract dependent.

II. A post cochlear implant rehabilitation program is essential to achieve benefit from the cochlear implant. The rehabilitation program includes development of skills in understanding running speech, recognition of consonants and vowels, and tests of speech perception ability.

DESCRIPTION

The American Speech-Language-Hearing Association (ASHA, n.d.) defines hearing loss (HL) within its practice portal. Available from: Hearing Loss in Adults [Accessed 2026 Jan 09].

HL refers to an audiologic diagnosis of hearing thresholds outside the range of typical hearing, and can be described by variation in type, degree, and configuration.

The three basic types of HL are:

- Sensorineural hearing loss (SNHL): cochlear (sensory) or vestibulocochlear nerve/CN VIII (neural) auditory dysfunction.
- Conductive hearing loss: a problem conducting sound waves through the outer ear canal, tympanic membrane, or middle ear (ossicles).
- Mixed hearing loss: the result of damage to conductive pathways of the outer or middle ear and to the nerves or sensory hair cells of the inner ear.

HL can be bilateral or unilateral, symmetrical (degree and configuration of HL are the same in each ear) or asymmetrical, progressive or sudden in onset, fluctuating or stable, and present at birth or acquired. The degree of HL refers to level of severity, and is measured in decibels in hearing level, or dB HL. The degree of HL can have significant implications for an individual (e.g., limiting the ability to understand speech in background noise, decreasing the enjoyment of music, impacting overall quality of life).

The most widely accepted degree of hearing loss system utilized in the audiology field (ASHA, n.d.) is as follows:

- Normal: -10 to 15 dB HL
- Slight: 16 to 25 dB HL
- Mild: 26 to 40 dB HL
- Moderate: 41 to 55 dB HL
- Moderately severe: 56 to 70 dB HL
- Severe: 71 to 90 dB HL
- Profound: ≥ 91 dB HL

The World Health Organization (2024) identifies several causes of HL that span across the lifespan, and often occur during critical periods of life, including the following:

<u>Prenatal Period</u>

- genetic factors including hereditary and non-hereditary HL
- intrauterine infections, such as rubella and cytomegalovirus infection

<u>Perinatal Period</u>

- birth asphyxia
- hyperbilirubinemia
- low-birth weight
- other perinatal morbidities and their management

<u>Childhood and Adolescence</u>

- chronic suppurative otitis media

- chronic nonsuppurative otitis media
- meningitis and other infections

Adulthood and Older Age

- chronic diseases
- smoking
- otosclerosis
- age-related sensorineural degeneration
- sudden SNHL

Factors Across the Life Span

- cerumen impaction
- trauma to the ear or head
- loud noise/loud sounds
- ototoxic medicines
- work related ototoxic chemicals
- nutritional deficiencies
- viral infections and other ear conditions
- delayed onset or progressive genetic HL

The Minimum Speech Test Battery (MSTB) for adults has been utilized to guide clinicians for cochlear implant candidacy and document post-operative speech recognition performance. The MSTB was recently revised (MSTB-Version 3) (Dunn 2024) to include the minimum battery of tests that could be utilized to provide a comprehensive assessment, which include unaided audiometric testing, hearing aid verification, functional outcomes using The Cochlear Implant Quality of Life tool (CIQOL 10), the Speech, Spatial and Qualities of Hearing Scale (SSQ-12), a Tinnitus handicap inventory when significant tinnitus is reported, and an aided speech test battery. The aided speech test battery includes the following:

- CNC Monosyllabic word test evaluating each ear separately in the best-aided condition using a list of 50-words given at different decibels to determine the better versus poorer ear to assist in the determination of which ear should be implanted.
- AzBio Sentence Test: reviews a list of words at different decibels with differing signal to noise ratios of the ear to be implanted to represent the best-aided condition.

Post-operatively, audiologic rehabilitation is recommended to help individuals understand their HL type and regain skills that they may have lost.

Technologies for the treatment of HL are dependent on the cause and severity and can include assistive listening and alerting devices, hearing aids, cochlear implants, and middle ear implants.

Hearing aids amplify sound to allow detection by damaged ears. Cochlear implants differ in that they don't amplify, rather, they directly stimulate the auditory nerve, bypassing the damaged portions of the ear altogether. The auditory nerve recognizes the signals as sound. Hearing through a cochlear implant is different from normal hearing and takes time to learn or relearn. However, it allows many people to recognize warning signals, understand other sounds in the environment, and understand speech in person or over the telephone. (National Institute on Deafness and Other Communication Disorders 2024)

Cochlear Implants (Unilateral and Bilateral) for Bilateral Sensorineural Hearing Loss (SNHL)

The basic structure of a cochlear implant includes both external and internal components. The external components include a microphone, an external sound processor, and an external transmitter. The internal components are implanted surgically and include an internal receiver implanted within the temporal bone and an electrode array that extends from the receiver into the cochlea through a surgically created opening in the round window of the middle ear. Sounds picked up by the microphone are carried to the external sound processor, which transforms sound into coded signals that are then transmitted transcutaneously to the implanted internal receiver. The receiver converts the incoming signals into electrical impulses that are then conveyed to the electrode array, ultimately resulting in stimulation of the auditory nerve. Cochlear implants can worsen low-frequency hearing sensitivity (the ability to still hear low-pitched sounds) because although the inner ear is being stimulated to restore higher frequency hearing, it results in a reduced ability to perceive low-frequency sound when compared to natural hearing.

Bilateral cochlear implants are utilized for patients who meet the criteria for unilateral cochlear implant, when it has been determined that a unilateral cochlear implant plus a hearing aid in the contralateral ear will not result in a binaural benefit (e.g., patients with HL of such magnitude that a hearing aid will not produce the required amplification). The benefits of bilateral cochlear implants are to improve understanding of speech in noise, localization of sounds, and speech intelligibility. Bilateral implantation may be performed independently with separate implants and speech processors in each ear, or with a single processor. Bilateral cochlear implantation may be done sequentially or simultaneously.

Unilateral Cochlear Implants for Single-Sided Deafness (SSD) and Asymmetric Hearing Loss (AHL)

AHL is when an individual has profound HL in one ear and mild to moderately severe HL in the hearing ear. The ear with the profound loss can be completely ineffective or not usable for hearing, making it unlikely the individual will benefit from an appropriately fit bilateral hearing aid. HL that only affects one ear is known as SSD, or unilateral hearing loss (UHL). The degree of impairment in the contralateral ear can range from mild to profound.

SSD occurs in both adults and children. Those with SSD experience poorer spatial hearing abilities and diminished speech understanding in the presence of competing noise when compared to listeners with normal hearing bilaterally. Historically, clinical recommendations for adults with SSD were to remain in an unaided condition or listen with a hearing technology that reroutes the acoustic signal from the impaired ear to the normal hearing ear (e.g., bone conduction device or contralateral routing of the signal [CROS] hearing aid). Given the limitations of these options, cochlear implant of the impaired ear for stimulation of both auditory pathways aims to improve performance on spatial

hearing tasks, including sound source localization and speech understanding in spatially separated noise (Dillon 2022).

Hybrid Cochlear Implant

Hybrid devices incorporate both a hearing aid and the external sound processor of a cochlear implant. They are indicated for individuals who have high-frequency SNHL with preserved low-frequency hearing sensitivity (the ability to still hear low-pitched sounds even when experiencing significant hearing loss in higher frequencies). Candidates for a hybrid device have too much residual hearing to receive a traditional cochlear implant, yet not enough hearing to benefit from using a hearing aid.

Hybrid cochlear implant electrodes are shorter and are inserted to a depth that are proposed to preserve residual low-frequency hearing that is generally lost through the use of traditional cochlear implants. The developer of the Nuclear 24 Hybrid Implant System, Cochlear (Lone Tree, Colorado), describes the hybrid mechanism of action as the following: 1) Sound processor microphones pick up the sound and convert it into digital information, 2) The acoustic component amplifies low frequency sound and sends it down the ear canal through the normal hearing pathway, 3)The high frequency information is transferred via the coil to the implant under the skin, 4)The implant sends electrical signals down the electrode into the cochlea where the hearing nerve fibers pick up the electrical signals and are combined with the amplified sounds, 5)The electrical signals are then sent to the brain to interpret the sound.

Auditory Brainstem Implant

Auditory brainstem implants are devices designed to restore some hearing in patients with neurofibromatosis type II. Neurofibromatosis type II is a genetic disorder that causes a growth of tumors. Individuals with this condition can have complete hearing loss due to the bilateral removal of the characteristic neurofibromas involving the auditory nerve. The device consists of an externally worn speech processor that provides auditory information to an electrical signal, which is transferred to a receiver/stimulator that is implanted in the temporal bone. The receiver stimulator is attached to an electrode array that is implanted on the surface of the cochlear nerve in the brainstem, thus bypassing the inner ear and auditory nerve. The electrode stimulates multiple sites on the cochlear nucleus, which is then processed normally by the brain.

SUPPORTIVE LITERATURE

Cochlear Implants (Unilateral and Bilateral) for Bilateral Sensorineural Hearing Loss (SNHL)

Cochlear implants, unilateral and bilateral, for adults and children with bilateral SNHL are a well-established intervention. Published studies show consistent improvement in speech reception, especially in noise, and in sound localization with bilateral devices (Baron 2018; McRacken 2018; Gaylor 2013; Crathorne 2012; Bond 2009).

Unilateral Cochlear implants for Single-Sided Deafness (SSD) or Asymmetric Hearing Loss (AHL)

For individuals who have SSD who receive a cochlear implant(s), the evidence includes small open-label RCTs, a feasibility study, prospective and retrospective studies reporting within-subjects comparisons, and systematic reviews of observational studies. Individuals with SSD have the inability

to process input from both ears, and this inability to provide a complete auditory picture negatively impacts the localization of sound, speech perception, and quality of life. Studies have been limited by population size, and heterogeneity, but several of the studies report positive outcomes for improved sound localization, speech perception in both quiet and noise, tinnitus suppression, and improved quality of life when compared to the use of Contralateral Routing of Signal and bone anchored hearing aids in specific individuals. Because of this, the use of cochlear implants for the treatment of SSD is supported by national professional society guidelines (Refer to Professional Societies Section).

In 2017, Sladen and colleagues retrospectively reviewed prospectively collected data of short-term (six-month) follow-up for 23 adults and children with single-sided deafness from a variety of mechanisms who received a cochlear implant. In the implanted ear, consonant-nucleus-consonant (CNC) word recognition improved significantly from preimplantation to three months post activation (p=0.001). However, for AzBio sentence understanding in noise (+5 dB signal-to-noise), there was no significant improvement from preimplantation to six months post activation.

Marx and colleagues aimed to assess the outcomes of cochlear implants (CI) and other treatment options in SSD or AHL on quality of life in a prospective study published in 2021. Performances for speech-in-noise recognition and localization were measured as secondary outcomes. The study included both an observational cohort of SSD/AHL who were treated using contralateral routing of the signal hearing aids (CROS) or bone-anchored systems (BAHS) or individuals who declined all treatments, and a randomized controlled trial was performed on subjects treated by cochlear implantation after failed CROS or BAHS trials. Those individuals were treated with two trials of CROS and BAHSs on headband and were then allowed to choose from the four treatment options (abstention, CROS, BAHS, or CI). Those that selected CI were then randomized into two arms, CI versus initial observation (n=51). Follow up was conducted at six months and demonstrated quality-of-life outcomes as significantly better in the CI arm versus observation, particularly in patients with associated severe tinnitus. No significant effect of the CI was found on binaural hearing results. The study was limited by the small sample size included within the RCT, and a short follow up timeframe to capture the longer-term effects of the CI on binaural hearing.

Peters et al (2021) randomized 120 adults with single-sided deafness (median duration, 1.8 years) into three treatment groups for the "Cochlear Implantation for siNGLE-sided deafness" (CINGLE) trial: cochlear implant (n=29); first bone-conduction devices, then CROS (n=45); and first CROS, then bone-conduction devices (n=46). Patients with a maximum 30 dB HL in the best ear and a minimum 70 dB HL in the poor ear with duration of single-sided deafness between three months and 10 years were eligible for inclusion. After the initial cross-over period, 25 patients were allocated to bone-conduction devices, 34 patients were allocated to CROS, and 26 patients preferred no treatment. Seven patients did not receive their allocated treatment. For the primary outcome, speech perception in noise from the front, a statistically significant improvement was noted for the cochlear implant group at three and six months compared to baseline. At three months follow-up, the cochlear implant group performed significantly better than all other groups. At six months, the cochlear implant group performed significantly better than the bone-conduction devices and no treatment groups, but no significant difference was observed between the cochlear implant group and the CROS group. Sound localization improved in the cochlear implant group only. All treatment groups improved on disease-specific quality of life compared to baseline. The study was limited by small sample size, device

heterogeneity, loss to follow-up, and lack of allocation concealment. Study follow-up through five years is ongoing.

Dillon et al (2022) conducted a systematic review of the published literature on outcomes of cochlear implant use for auditory abilities, tinnitus perception, and quality of life. The review included 42 articles published between January 2008 and September 2021. Studies were screened by two independent reviewers based on title and abstracts. Each article was assessed for the level of evidence and categorized based on the reported outcome data. Of nine studies that were included in the assessment for speech recognition in quiet (n= 307), 100% of adults implanted with a CI had an improvement. Of the studies that evaluated outcomes for speech recognition in noise (n=256), 96% experienced improvements when the target speech was presented from the CI ear, with masking configuration presented from the normal hearing ear (13 studies noted with significant improvements).

Park et al (2022) conducted a review of the literature and subsequently developed guidelines for the clinical assessment and management of cochlear implants in children with SSD, endorsed by the American Cochlear Implant Alliance Task Force (Refer to Professional Society Section). The guidelines recommend:

- Assurance of an accurate diagnosis of nerve deficiency through 3D-MRI of the internal auditory canals;
- Cochlear implants should be considered a priority for children who are at risk of HL progression in the better hearing ear, as well as children with SSD due to bacterial meningitis;
- Children with longer lengths of deafness may experience fewer benefits and should be appropriately counseled;
- Cochlear implant evaluation is recommended for children with a unilateral three frequency PTA of > 60 dB HL or an aided speech intelligibility score <0.65 as these children are not likely to receive adequate benefit from traditional amplification;
- Trials with rerouting devices are not recommended for children seeking binaural hearing as these devices are not able to provide the brain with bilateral input and the trial could delay a time-sensitive procedure;
- Counseling for families considering cochlear implants should include information about developmental disadvantages of SSD, the advantage of implantation at a younger age, the importance of post implant listening therapy, and reasonable expectations;
- The most appropriate post-activation test batteries and timeframes;
- Technique to utilize for evaluating audibility in the sound field;
- Device programming considerations.

The authors emphasized that this is a rapidly evolving field and readers should keep abreast of the literature and current research outcomes.

Oh et al (2023) published a systematic review and meta-analysis of 50 studies, including prospective and retrospective observational studies and case series, evaluating cochlear implantation in adults

(n=674) with SSD. Pooled outcomes indicated improved scores in speech perception, localization, tinnitus, and quality of life. Study interpretation was limited by small sample sizes and heterogeneity in reported outcomes and follow-up durations.

Piva de Freitas et al (2025) published a systematic review and meta-analysis to evaluate how children with single-sided deafness (SSD) feel about their quality of life (QoL) after receiving a cochlear implant (CI). The study compares the experiences based on when the hearing loss began, and the feedback received (child vs. parent). The study also assesses the ease of use of the device as related to the when the hearing loss started. There were 187 children included in the study all under the age of 18 with unilateral severe to profound hearing loss and normal contralateral hearing. The results showed that children with congenital SSD who received a CI demonstrated a statistically significant improvement in QoL, as reported by the patient and their parents. This analysis is limited by its smaller sample size and lack of generalizability. Additionally, each included study of the meta-analysis utilized different QoL assessment tools which made direct comparisons difficult. Overall, significant improvements in QoL were reported by both children with SSD and their parents, after having a CI implanted. Larger study populations and extended follow-up are needed to validate the study findings.

Hybrid Cochlear Implant

Lenarz et al (2013) reported on results of a prospective multicenter European study evaluating the Nucleus Hybrid L24 system. The study enrolled 66 adults with bilateral severe-to-profound high-frequency HL to investigate the preservation of residual hearing the performance benefits (e.g., speech recognition, sound quality, and quality of life) up to one-year post-implantation. The group median increase in air-conduction thresholds in the implanted ear for test frequencies 125-1000 Hz was less than 15 dB across the population, both immediately and one year post-operatively. At one year postoperatively, 89% of the patients were still using the Hybrid processor, 65% of subjects had significant gains in speech recognition in quiet, and 73% had significant gains in noisy environments. Compared with the cochlear implant hearing alone, residual hearing significantly increased speech recognition scores. The authors concluded that useful residual hearing was conserved in 88% of subjects, and speech perception was significantly improved over pre-operative hearing aids, as was sound quality and quality of life. Study limitations include short-term follow-up, small patient population, and fewer number of subjects still using the hybrid processor at the one-year mark.

The pivotal trial results for the Cochlear Nucleus Hybrid L24 were published by Roland et al in January 2016. A prospective, single-arm, repeated measures, single-arm, multicenter, nonrandomized study undertaken to evaluate the safety and efficacy of acoustic and electric sound processing for individuals with significant residual low-frequency hearing and severe-to-profound high-frequency SNHL. Fifty (50) individuals aged 18 years and older, with low-frequency hearing and severe high-frequency loss were implanted with the Cochlear Nucleus Hybrid L24 implant at 10 investigational sites. Significant mean improvements were observed for co-primary endpoints: consonant-nucleus-consonant words and AzBio sentences in noise 96% of subjects performed equal or better on speech in quiet and 90% in noise. 82% of subjects showed improved performance on speech in quiet and 74% in noise. Self-assessments were positive, corroborating speech perception results. 65 adverse events involving 34 of the 50 subjects were reported. The type and frequency of events were consistent with those reported in cochlear implantation (e.g., electrode open or short

circuits, postoperative dizziness, changes in tinnitus) or other mastoid operations; no unanticipated adverse events were reported. The authors concluded the Nucleus Hybrid System provides significant improvements in speech intelligibility in quiet and noise for individuals with severe high-frequency loss and some low-frequency hearing and expands indications to hearing-impaired individuals who perform poorly with amplification due to bilateral high-frequency HL and who previously were not implant candidates. However, they also noted additional longer-term follow-up for safety and study of the device in larger and diverse subgroups is important.

Five-year outcomes for the pivotal trial were reported by Roland et al (2018). The results of three related clinical studies compiled to provide outcome data after one, three and five years of implant use in a group of subjects who presented with preoperative high-frequency HL and were implanted with a Nucleus Hybrid L24 (Cochlear Ltd., Sydney, Australia) cochlear implant. The authors concluded the results demonstrate long-term success and benefits significantly better than those in the preoperative best-aided condition. The level of evidence given to these studies was 2b.

A final outcomes study by the same authors was reported by Gantz et al in April 2016. A total of 87 subjects received a Nucleus Hybrid S8 Cochlear Implant in their poorer ear. Speech perception in quiet (CNC words) and in noise (Bamford-Kowal-Bench Sentences-In-Noise [BKB-SIN]) were collected pre- and postoperatively at three, six, and 12 months. Subjective questionnaire data using the Abbreviated Profile for Hearing Aid Benefit (APHAB) were also collected. Some level of hearing preservation was accomplished in 98% subjects, with 90% maintaining a functional low-frequency pure-tone average (LFPTA) at initial activation. By 12 months, five subjects had total HL, and 80% of the subjects maintained functional hearing. CNC words demonstrated that 82.5% and 87.5% of subjects had significant improvements in the hybrid and combined conditions, respectively. Results also indicated that, as long as subjects maintained at least a severe LFPTA, there was significant improvement in speech understanding. Furthermore, all subjects reported positive improvements in hearing in three of the four subscales of the APHAB. Most experienced a progressive loss of acoustic hearing in the implant ear. The authors concluded that the concept of hybrid speech processing has significant advantages for subjects with residual low-frequency hearing. The Nucleus Hybrid S8 provided improved word understanding in quiet and noise, and there appeared to be stability of the residual hearing after initial activation of the device. They also stated that the reasons for loss of hearing after activation of the implant and acoustic amplification required more research.

In 2024, Reinhart and colleagues conducted a prospective multi-center clinical trial (NCT02379819) to assess the safety and effectiveness of a hybrid cochlear implant for delivering electric-acoustic stimulation (EAS) in patients with low- frequency acoustic hearing and severe-to-profound high-frequency HL. The study enrolled 52 adults, who were newly implanted with the hybrid cochlear implant. Post implant, testing included unaided and aided audiometric thresholds, speech perception (CNC words in Quiet and AzBio sentences +5 dB SNR), as well as patient reported outcomes using the Speech, Spatial and Qualities of Hearing Scale with a follow up timeframe of up to five years. Functionally aidable hearing, defined as low-frequency PTA (125–500 Hz) <80 dB HL, was maintained for 77% of patients through one year, with 66.7% maintaining through five years. Speech perception was significantly improved at all postoperative timepoints compared with preoperative performance with hearing aid(s), and patient-reported outcomes indicated significantly improved subjective speech understanding, spatial hearing, and sound quality. Participants with preserved acoustic hearing using

EAS reported significantly higher subjective spatial hearing and sound quality than participants with electric-only hearing in the implanted ear. The results replicated the outcomes reported in the pivotal trial (Roland 2016).

Auditory Brainstem Implant

Studies have shown that, while the use of an auditory brainstem implant is associated with a very modest improvement in hearing, this level of improvement is considered significant in this group of patients who have no other treatment options (Otto et al 2008; Ontario Health 2020).

The evidence on auditory brainstem implants in nontumor patients includes case series and systematic reviews. A 2014 systematic review (Merkus et al) suggested that auditory brainstem implants might improve outcomes in bilateral complete cochlear and inner ear aplasia. Recent research includes studies of children who are deaf but would not benefit from a cochlear implant. Hearing in this age group is critical for language development, and the auditory brainstem implants have potential to substantially improve health outcomes. However, studies of early (now obsolete) auditory brainstem implants found a high rate of failure in children and high rates of adverse events in adults. Evidence from ongoing studies assessing newer device models is needed to evaluate efficacy and durability in patients with nontumor indications.

PROFESSIONAL GUIDELINE(S)

Cochlear Implants for Bilateral SNHL

In April 2021, the American Academy of Otolaryngology–Head and Neck Surgery (AAO-HNS) revised the position statement on cochlear implants to endorse unilateral and bilateral cochlear implantation as appropriate treatment for adults and children over nine months of age with moderate to profound HL who have failed a trial with appropriately fit hearing aids.

In July 2021 (revised September 2021), AAO-HNS issued a new position statement specifically addressing cochlear implant candidacy for children with bilateral SNHL. The position reconfirms that cochlear implantation should be considered for children with bilateral sensorineural HL who are not making expected progress despite appropriately fit amplification.

Unilateral Cochlear Implants for Single-sided Deafness (SSD)/Unilateral Hearing Loss (SSD/UHL)

In 2022, the American Cochlear Implant Alliance Task Force published guidelines on the assessment and management of adult cochlear implantation for SSD (Dillon 2022). The guidance recommendations were based on expert consensus and systematic review of the current literature. The task force concluded that although further research investigating the patient and device variables that may influence the performance of adult cochlear implant users with SSD, cochlear implantation is an effective treatment option for adults with SSD. Noted potential contraindications include advanced cochlear ossification, severe labyrinthine dysplasia, and cochlear nerve aplasia; however, advanced age is not a contraindication. Prolonged duration of deafness combined with congenital SSD onset may result in limited cochlear implantation outcomes.

In April 2023, the AAO-HNS issued two new position statements endorsing cochlear implantation for

cases of single sided deafness (asymmetric or unilateral sensory HL) for adult patients and children. Adults with asymmetric or unilateral sensory HL struggle with speech perception in noise and sound source localization due to loss of binaural cues. They also experience disabling tinnitus and reduced quality of life and quality of hearing, stating that cochlear implants restore binaural hearing and markedly improve sound localization, speech perception in noise, reduces or eliminates tinnitus, and improves quality of life and hearing.

The AAO-HNS recommends that select children with unilateral SNHL, as early as nine months of age, should undergo cochlear implantation as soon as HL and appropriate anatomy is verified to avoid missing a developmental window that permits integration of binaural cues. Specifically indicating that children with unilateral SNHL also experience problems with sound localization, speech perception in noise, and increased auditory effort due to loss of binaural cues. Restoration of true binaural hearing can only be accomplished with a cochlear implant, and use of a cochlear implant has demonstrated marked improvements in localization, speech perception in noise and auditory effort.

The American Speech-Language Hearing Association (ASHA) publishes Evidence Maps to summarize published Clinical Practice Guidelines. Strong recommendations were made based upon guidelines published by the Brazilian Society of Otology Task Force for individuals with SSD (Tsuji 2025) and include the following:

- CIs are the most effective treatment to restore useful hearing in profound deafness in individuals with SSD. CIs are the only option to restore binaural hearing for this population. (Strong Recommendation; Low-Quality Evidence)
- CIs can restore binaural hearing and produce significant improvements in speech perception, spatial localization of sound, tinnitus control, and overall quality of life. (Strong Recommendation; Moderate-Quality Evidence)
- "In children with SSD due to congenital cytomegalovirus, CI is more appropriate due to the increased risk of contralateral hearing deterioration over time." (Strong Recommendation; Low-Quality Evidence)
- Family counseling should be conducted prior to the use of CI in cases of SSD in order to adjust expectations and conduct therapy. (Strong Recommendation; Moderate-Quality Evidence)
- "Adult patients with SSD undergoing ipsilateral CI have statistically significant improvements in speech perception, tinnitus reduction, sound localization, and quality of life." (Strong Recommendation; Moderate-Quality Evidence)
- In cases of sporadic vestibular schwannoma (VS), CI is a treatment option for SSD. This is especially true in the presence of disabling tinnitus and preserved cochlear nerve function. (Strong Recommendation; Low-Quality Evidence)

REGULATORY STATUS

The U.S. Food and Drug Administration (FDA) has approved several cochlear implants for commercial use in the United States. Cochlear implants are Class III devices, and therefore, FDA approval is device specific to ensure they are safe and effective for human use. Refer to the FDA Medical Device website. Available from: https://www.fda.gov/medical-devices. [accessed 2026 Jan 09]

The FDA lists the most serious type of medical device recalls as well as early alert communications about corrective actions being taken by companies that the FDA believes are likely to be the most serious type of recalls. Available from: Medical Device Recalls | FDA [accessed 2026 Jan 09]

In 2002, the FDA issued an alert stating that children with cochlear implants were at greater risk of developing bacterial meningitis caused by streptococcus pneumoniae than children in the general population. Their investigation showed that cochlear implants with electrode positioners were associated with greater risk of developing meningitis than implants without positioners. The only model with a positioner was withdrawn from the market in July 2002. In 2006, an alert was issued discussing results of a two-year follow-up of the children identified in the earlier investigation. To decrease the risk of meningitis, the FDA recommends: adherence to the CDC vaccination guidelines, early recognition of the signs of meningitis, prompt diagnosis and treatment of middle ear infections, and consideration of the use of prophylactic antibiotics perioperatively.

In October 2007, the FDA issued a Public Health Notification: Importance of Vaccination in Cochlear Implant Recipients, and Advice for Patients with Cochlear Implants: New Information on Meningitis Risk. Both reminded of the increased, life-threatening risk of bacterial meningitis in cochlear implant recipients, especially those with a positioner, and the importance of full vaccination of those recipients, as two patients had recently died from infection, and neither one was fully vaccinated.

Hybrid Cochlear Implant

The Nucleus Hybrid L24 Cochlear Implant System (Cochlear Americas) received FDA approval on March 20, 2014, through the premarket approval (PMA) process (P130016). The implant was intended for unilateral use in patients aged 18 years and older who have residual low-frequency hearing sensitivity and severe-to-profound high-frequency SNHL, and who obtain limited benefit from an appropriately fitted bilateral hearing aid.

In 2022, the Nucleus Hybrid L24 received expanded approval for single-sided deafness or unilateral HL in adults and children aged five or older (P970051/S205). According to the FDA's summary of safety and effectiveness data, approval was based on unpublished data in 42 adults from a feasibility study (n=10) and real-world data from two cochlear implantation centers (n=32). Study interpretation is limited by small sample size in adult subjects only, unclear rationale for the efficacy threshold, and missing data. The FDA has required Cochlear Americas to conduct a post marketing study to continue to assess the safety and efficacy of the implant in a new enrollment cohort of adults and children.

The MED-EL Cochlear Implant System combined with electrical stimulation and acoustic amplification (EAS) received FDA approval in September 2016 (P000025/S084) and was indicated for partially deaf individuals aged 18 years and older who have residual hearing sensitivity in the low frequencies sloping to a severe/profound SNHL in the mid to high frequencies, and who obtain minimal benefit from conventional acoustic amplification. The FDA expanded the indication for the MED-EL Cochlear Implant System in July 2019 (P000025/S104) to include individuals aged five years and older with SSD or AHL who have profound sensorineural hearing loss in one ear and normal hearing or mild SNHL in the other ear.

Auditory Brainstem Implant

The Nucleus 24 Auditory Brainstem Implant System (Cochlear Corporation) is the only device that has received approval by the FDA (2016) for auditory brainstem implantation. The device is indicated for individuals 12 years of age and older who have been diagnosed with neurofibromatosis type II.

CODE(S)

- Codes may not be covered under all circumstances.
- Code list may not be all inclusive (AMA and CMS code updates may occur more frequently than policy updates).
- (E/I)=Experimental/Investigational
- (NMN)=Not medically necessary/appropriate

CPT Codes

Code	Description
69930	Cochlear device implantation, with or without mastoidectomy
92601	Diagnostic analysis of cochlear implant, patient younger than 7 years of age; with programming
92602	subsequent reprogramming
92603	Diagnostic analysis of cochlear implant, age 7 years or older; with programming
92604	subsequent reprogramming
92605	Evaluation for prescription of non-speech-generating augmentative and alternative communication device, face-to-face with the patient; first hour
92618	each additional 30 minutes (List separately in addition to code for primary procedure)
92640	Diagnostic analysis with programming of auditory brain stem implant, per hour

Copyright © 2026 American Medical Association, Chicago, IL

HCPCS Codes

Code	Description
L8614	Cochlear device, includes all internal and external components
L8615 - L8619	Replacement components of cochlear implant device/system (code range)

Code	Description
L8621 - L8624	Replacement batteries used with cochlear implant device/system (code range)
L8625	External recharging system for battery for use with cochlear implant or auditory osseointegrated device, replacement only, each
L8627	Cochlear implant, external speech processor, component, replacement
L8628	Cochlear implant, external controller component, replacement
L8629	Transmitting coil and cable, integrated, for use with cochlear implant device, replacement
S2235	Implantation of auditory brainstem implant

ICD10 Codes

Code	Description
H90.3 - H90.8	Conductive and sensorineural hearing loss (code range)
H90.A2-H90.A32	Mixed conductive and sensorineural hearing loss (code range)
H91.3	Deaf nonspeaking, not elsewhere classified
H93.3x1-H93.3x9	Disorders of acoustic nerve (code range)
Q85.02	Neurofibromatosis, type 2
Z96.21	Cochlear implant status

PRODUCT DISCLAIMER

- Services are contract dependent; if a product does not cover a service, medical policy criteria do not apply.
- If a commercial product (including an Essential Plan or Child Health Plus product) covers a specific service, medical policy criteria apply to the benefit.
- If a Medicaid product covers a specific service, and there are no New York State Medicaid guidelines (eMedNY) criteria, medical policy criteria apply to the benefit.
- If a Medicare product covers a specific service, and there is no national or local Medicare coverage decision for the service, medical policy criteria apply to the benefit.

POLICY HISTORY/REVISION	
Committee Approval Dates	
New:09/07 **Revised**:07/08, 07/09, 01/10, 07/10, 07/11, 07/13, 07/14, 07/15, 07/16, 07/17, 01/18, 11/19, 07/20, 7/21, 11/22, 11/25 **Reviewed**:07/12, 07/18, 07/19, 7/22, 7/23, 7/24, 1/25, 5/26	
Date	**Summary of Changes**
6/1/2026	Annual update, policy intent unchanged.
1/1/2026	Transitioned Cochlear Implant policy, 1370/20.000446 to Lifetime HealthCare Companies policy template.
9/26/2022	Revised criteria for hearing test scores from 40% correct to 60% correct. Added exception in Policy Considerations that members may be approved for coverage if not meeting policy criteria but enrolled in an FDA-approved category B investigational device exemption clinical trial.
8/1/2021	Under exclusion section: removed hybrid cochlear implant/hearing. Under Position Statement: added criteria for a hybrid cochlear implant/hearing aid.
11/1/2020	Removed coverage information for small group/individual plans in its entirety from Product Variations section as coverage is no different than commercial coverage addressed in application section of policy.
1/1/2020	Moved all coverage criteria from Medicare section to the Application section. Added coverage criteria for Small Group Individual Plans to CDPHP Product Variations section.

POLICY NAME: CONCURRENT REVIEW

POLICY EFFECTIVE DATE:	8/1/2023
Policy Control #:	1370/20.000174
Next Annual Review:	July, 2027

DISCLAIMER

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgement when deciding the most appropriate care to enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

DESCRIPTION

Inpatient concurrent review is an ongoing assessment to determine medical necessity of the care provided and appropriateness of the clinical setting during an enrollee's confinement in a hospital, skilled nursing, or rehabilitation facility.

CDPHP utilizes state and nationally published guidelines to assist with all determinations regarding admission and appropriateness of continued stay to facilitate the coordination of discharge planning and to research alternate levels of care.

Coverage determinations for inpatient behavioral health services are made in a manner consistent with accepted medical practices and Federal and State behavioral health parity laws.

The concurrent review process for behavioral health services includes application of criteria that are no more stringent than criteria used in the review of medical services and the review process itself is comparable to and no more stringent than the process for reviewing medical services.

POLICY NAME: CONCURRENT REVIEW

- CDPHP Concurrent Review Guideline, 1370/20.000497

POSITION STATEMENT

The CDPHP concurrent review process includes the following elements:

- The utilization of InterQual guidelines and a set of well-defined resource coordination medical policies.
- The utilization of LOCADTR-3 patient placement tool for substance use disorder treatment
- The utilization of InterQual medical necessity criteria for mental health services, along with case review in accordance with the NYS Office of Mental Health Guiding Principles.
- Obtaining necessary information from facility staff (designated UM department), physicians, and other members of the health care team regarding the clinical status, progress, and care being provided to enrollees.
- Identifying continuing care needs early in the inpatient stay to facilitate discharge to the appropriate setting.
- Assessing the ongoing provision of medical services and treatment to determine benefit coverage.
- Notifying practitioners, providers, and the enrollee or designee of coverage determinations in the appropriate manner and timeframe.
- Identifying enrollees for referral to covered specialty programs, including CDPHP Care Management Program, Chronic Condition Management, Behavioral Health Care Management, Enhanced Primary Care (EPC) Program, and Readmission Avoidance Program (RAD).

Concurrent review may be conducted daily, as deemed appropriate, on all CDPHP enrollees who are identified as inpatient to include, but not limited to the following:

- Planned admissions to hospitals
- Emergent/urgent admissions to hospitals
- Admission to skilled nursing facilities
- Admission to rehabilitation facilities
- Out-of-area admissions

Admission to a Participating OASAS-Licensed Facility

Coverage for inpatient admission for substance use disorder treatment at an OASAS-licensed facility that participates in the CDPHP network is not subject to preauthorization. Coverage will be subject to concurrent review on day 29 of the inpatient admission if the OASAS-licensed facility notifies CDPHP of both the admission and the initial treatment plan within two business days of admission. The entire stay may be reviewed, including the initial 28-day period, to determine whether the admission and treatment is medically necessary. Care for members discharged prior to day 29 will be reviewed retrospectively. Facilities are required to notify CDPHP of discharge within 24 hours of the discharge date and retrospective review may begin

when CDPHP is notified of the discharge. The facilities must hold members harmless for any denial of stay based upon retrospective review. Applies to member contracts issued or renewed on or after 1/1/17. Most self-insured and Medicare Advantage products are excluded from this consideration and will follow standard prior authorization requirements.

Inpatient Mental Health Admissions for Children under age 18

Coverage for inpatient admission to a participating facility within New York State, for the treatment of a mental health condition, for children under age is not subject to preauthorization. Coverage determinations are rendered when a member meets one or more predefined clinical or quality triggers, in accordance with the New York State Office of Mental Health's Guiding Principles for the utilization review process for mental health treatment. If a trigger is met, coverage will be subject to concurrent review on day 15 of the inpatient admission if the facility notifies CDPHP of both the admission and the initial treatment plan within two business days of admission. The entire stay may be reviewed, including the initial 14-day period, to determine whether the admission and treatment is medically necessary. In the event that a trigger is met, care for members discharged prior to day 15 will be reviewed retrospectively. Facilities are required to notify CDPHP of discharge within 24 hours of the discharge date and retrospective review may begin when CDPHP is notified of the discharge. Most self-insured- and Medicare Advantage products are excluded from this consideration and will follow standard prior authorization requirements. Applies to members under age 18 at the time of their hospitalization. When no trigger for utilization review it met, concurrent review does not occur. The member's care is assigned to a clinician for care coordination purposes.

Inpatient Mental Health Admissions

Prior authorization is not required for emergent admissions to inpatient mental health levels of care and concurrent review, using the InterQual guidelines, and is completed only when one or more specific clinical or quality triggers are met.

POLICY CONSIDERATIONS

Concurrent review is conducted by the resource coordination staff via telephonic review.

The utilization reviewer or behavioral health inpatient care manager facilitates appropriate use of medical and community resources to improve quality of care and maintain cost effectiveness.

When the utilization reviewer or behavioral health inpatient care manager has any question of medical necessity or inappropriate resource utilization, the case is reviewed with a CDPHP medical director.

After careful review, including contact with the attending physician as necessary, denial determinations may be rendered by a medical director.

POLICY NAME: CONCURRENT REVIEW

In those cases of denial of continued stay, the denial process is instituted.

- The attending physician, enrollee or designee, and the inpatient facility are notified and correspondence signed by the medical director is sent directly by fax and/or mail to the enrollee or designee, physician, and facility.
- If the enrollee is to be liable, the enrollee or designee is notified verbally as well as with written notification.
- All correspondence includes appeal rights.

Assessment of medical necessity for all substance use disorder treatment that is provided within New York state at facilities licensed by the Office of Alcoholism and Substance Abuse Services ("OASAS") is done in compliance with Chapter 41 of the Laws of 2014; New York Insurance Law Article 49; New York Public Health Law Article 49, using the Level of Care for Alcohol and Drug Treatment Referral ("LOCADTR") tool, which has been approved for such use by the Commissioner of OASAS in consultation with the Commissioner of Health and the Superintendent of Financial Services.

Assessment of medical necessity for all inpatient mental health treatment that is provided within New York State is done in compliance with Chapter 57 of the Laws of 2019, Insurance Law § 4902 and Public Health Law § 4902.

CDPHP PRODUCT VARIATIONS

CHILD HEALTH PLUS	Subject to all terms and conditions noted above in the policy.
MEDICARE ADVANTAGE	Subject to all terms and conditions noted above in the policy except admission to OASAS-licensed facility. However, in the event of a denial for continued stay, the physician who is responsible for the enrollee's hospital care must concur.
SELECT PLAN/HARP	Subject to all terms and conditions noted above in the policy, in addition to the following: • LOCADTR 3 is utilized exclusively for all substance use disorder level of care decisions. • Decisions related to authorization of continued stay for behavioral health diagnosis will be made by licensed behavioral health professionals with at least three (3) years of clinical experience in behavioral health. • All behavioral health decision makers have clinical expertise in treating enrollee's condition, stratified by age. • Behavioral health denials are conducted by a peer with credentials at least equal to that of the recommending clinician.

	• For all inpatient behavioral health treatment denials, review will be completed by: ➢ A physician board certified in general psychiatry for inpatient psychiatric treatment. ➢ A physician board certified in child and adolescent psychiatry for inpatient psychiatric treatment for enrollees aged 18 and under. ➢ A physician certified in addiction treatment for inpatient substance use disorder treatment.

POLICY NAME: CONCURRENT REVIEW GUIDELINE

POLICY EFFECTIVE DATE:	5/1/2022
Policy Control #:	1370/20.000497
Next Annual Review:	May, 2027

The following guideline outlines those services that require concurrent review. All services outlined in this guideline are subject to medical necessity and benefit availability as defined in the enrollee's contract and/or employer-sponsored Summary Plan Description (SPD) and Benefit Design Document (BDD). Coverage of a service is subject to the member's eligibility, specific contract benefits, and CDPHP® medical/behavioral health policy. Requests for a service that do not meet criteria outlined in a CDPHP policy, or for an extension of services beyond what has been approved by CDPHP, should be directed to the resource coordination (RC) department at (518) 641-4100/1-800-274-2332. Inquiries regarding behavioral health services should be directed to the behavioral health (BH) department at (518) 641-3600/1-888-320-9584.

The **provider** is responsible for seeking prior authorization for services indicated within this guideline for the following CDPHP products: HMO, Medicare Choices HMO, Select Plan/HARP, and Child Health Plus. The **member** is responsible for seeking authorization for such services for the following CDPHP UBI products: PPO and HDPPO (in- and out-of-network), and EPO and HDEPO.

MEDICAL POLICY

Medical Policy Title	**Continuous Glucose Monitoring Systems/External Insulin Pump Therapy for Diabetes**
Policy Number	**1.01.30**
Current Effective Date	**September 1, 2026**
Next Review Date	**December 2026**

Our medical policies are based on the assessment of evidence based, peer-reviewed literature, and professional guidelines. Eligibility for reimbursement is based upon the benefits set forth in the member's subscriber contract. (Link to Product Disclaimer)

POLICY STATEMENT(S)

I. Initial Request for External Insulin Pump Therapy (HCPCS: E0784)*

A. External insulin pumps are **medically appropriate** for individuals with diabetes requiring insulin when **ALL** the following criteria are met:

1. On a program of multiple daily injections of insulin (at least three (3) per day);
2. Require frequent self-adjustments of insulin dose for at least three (3) months prior to initiation of the insulin pump;
3. Performs self-testing of glucose an average of at least three (3) times per day one (1) month prior to initiation of the insulin pump or has been using a continuous glucose monitor (CGM);
4. Completed a comprehensive diabetes education program;
5. Diabetes is poorly controlled despite best practices (please refer to Policy Guideline II).

B. External insulin pumps are **medically appropriate** for women with gestational diabetes when **BOTH** of the following criteria are met:

1. Require three (3) or more insulin injections per day;
2. Diabetes cannot be controlled by intermittent dosing.

*Disposable external insulin infusion pumps (e.g., OmniPod Insulin Management System/Omnipod Dash, V-Go transdermal insulin delivery device) are considered acceptable alternatives to standard insulin infusion pumps.

II. Replacement External Insulin Pump

A. Replacement of an external insulin pump is **medically appropriate** when the following criteria are met:

1. The external insulin pump has been previously approved by the Health Plan, or the external insulin pump was in use prior to the effective date of the member's coverage with the Health Plan; **and**
2. The pump has exceeded its warranty (warranty period for insulin pumps: four (4) years)

Proprietary Information of Capital District Physicians' Health Plan, Inc. | CDPHP Universal Benefits,® Inc. | Capital District Physicians' Healthcare Network, Inc.

and the pump is malfunctioning; **or**

3. The request is for a child in need of a larger insulin reservoir.

B. Replacement of an external insulin pump is **not medically necessary** for the following indications including, but not limited to:

1. Slight damage to the pump (e.g., scratched screen);
2. Damage does not cause the pump to malfunction; **or**
3. Replacement request is driven by an advancement in technology.

III. Initial Request for Continuous Glucose Monitoring System (CGMS) (HCPCS: A9276, A9277, A9278, E2102, E2103, A4238, A4239)

A. Continuous glucose monitoring (CGM) devices are **medically appropriate** for individuals with a diagnosis of diabetes mellitus (i.e., Type 1, Type 2, other specific types of diabetes, gestational diabetes) whose age is consistent with U.S. Food and Drug Administration (FDA) indications for the specific CGM device.

B. Implantable sensors (e.g., Eversense, Senseonics) are **medically appropriate** for individuals with diabetes who meet the following criteria:

1. Age is consistent with U.S. Food and Drug Administration (FDA) indications for the specific CGM device; and have **ANY** of the following:
   a. Physical disability, such as an impairment in vision, hearing, or dexterity;
   b. A severe sensitivity to adhesives or plastics used in transcutaneous CGM components; **or**
   c. Any significant condition or situation requiring vibration alerts (e.g., individual lives alone and requires additional alarms to increase awareness of highs or lows).

IV. Professional Glucose Monitoring (three (3) to seven (7) days) (CPT: 95249, 95250, 95251)

A. Professional Glucose Monitoring is **medically appropriate** for **EITHER** of the following indications:

1. Diabetes is poorly controlled despite current evidence of best practices; **and**
   a. Has demonstrated compliance with recommended medical regimens; **or**
2. For individuals with a diagnosis of diabetes mellitus (i.e., Type 1, Type 2, other specific types of diabetes, gestational diabetes) who
   a. Are pregnant or about to become pregnant; **and**
   b. Who cannot meet recommended targets for control of diabetes in pregnancy.

V. Replacement of a CGM Device Transmitter (HCPCS: A9277, E2102)

A. Replacement of a CGM transmitter is **medically appropriate** when the following criteria

are met:

1. The transmitter or receiver is out of warranty (Warranty Period for CGM: One Year); **and**
2. The CGM device has been previously approved by the Health Plan; **or**
3. The CGM device was in use prior to the effective date of the member's coverage with the Health Plan.

VI. Replacement of a CGM Sensor (HCPCS: A4238, A4239 A9276, E2103)

A. Replacement of a CGM sensor is **medically appropriate** when **EITHER** of the following criteria are met:

1. CGM device has been previously approved by the Health Plan; **or**
2. CGM device was in use prior to the effective date of the member's coverage with the Health Plan.

VII. Initial Request for a Combined External Insulin Pump and CGM Device (Artificial Pancreas) (HCPCS: E0784 and A9276, A9277, A9278)

A. External insulin pumps and CGM devices consisting of sensor-augmented insulin pump therapy with a low glucose threshold suspend feature and a continuous glucose monitor, are considered **medically appropriate** when criteria for an external insulin pump **AND** a CGM device have been met.

VIII. Replacement of a Combined External Insulin Pump and CGM~~S~~ Device (Artificial Pancreas):

A. Replacement of an external insulin pump and CGM device is **medically appropriate** when **BOTH** of the following criteria are met:

1. The combined external insulin pump and CGM device has been previously approved by the Health Plan or the combined external insulin pump and CGM device was in use prior to the effective date of the member's coverage with the Health Plan; **and**
2. The combined external insulin pump and CGM device's transmitter or receiver are out of warranty and the insulin pump is malfunctioning.

POLICY GUIDELINE(S)

I. Evidence of poorly controlled diabetes may include, but are not limited to, the following:

A. Hemoglobin A1c (HbA1c) greater than 7% within the last four (4) months;

B. History of recurring hypoglycemia (blood glucose levels low enough to put the individual or

others at risk;

C. Wide fluctuations in blood glucose before mealtime;

D. Dawn phenomenon with fasting blood sugars frequently exceeding 200 mg/dL; or

E. History of severe glycemic excursions.

II. Improvement in control of the disease may be evidenced by, among other indications, **ANY** of the following:

A. HbA1c within therapeutic range;

B. Fewer episodes of hyperglycemia or hypoglycemia; or

C. More time spent in range (avoidance of either high or low glucose values).

III. The individual is liable for any non-medical accessories or add-ons of basic external insulin pump models.

IV. Replacement of purchased equipment that is damaged due to individual neglect, theft, or abuse; or replacement when another available coverage source is an option (e.g., homeowners, rental, auto, or liability insurance, etc.) is **ineligible for coverage**.

DESCRIPTION

Continuous Glucose Monitoring (CGM) Devices

CGM devices are used by diabetic individuals to supplement, not replace, blood glucose information obtained using standard fingerstick glucose meters and test strips. These devices are placed subcutaneously and automatically measure and track interstitial glucose and produce trends in glucose measurements throughout the day which may allow for tighter glucose control and a subsequent decrease in complications from diabetes. Most of today's CGM systems are built with active alarms to alert the user of hypoglycemia, which they may not have been aware of otherwise. Additionally, as an added safety mechanism, many CGM systems have the capability to share data between the individual, clinicians, and caregivers.

The CGM device consists of a sensor, transmitter, and receiver. The sensor is usually changed every three to fourteen days. The warranties for the transmitters range from three months to one year, depending on the type of device.

There are two forms of CGM systems available for personal use. Real-time CGM (rtCGM) devices automatically transmit data to a receiver and/or smartphone of a person with diabetes, and isCGM, also historically known as "flash" CGM, which requires a person to "swipe" the receiver and/or smartphone close to the sensor to obtain current and historical glucose data.

External Insulin Pumps/Continuous Subcutaneous Insulin Infusion (CSII) Systems

CSIIs are the traditional insulin pumps, using tubing to deliver insulin from the machine through a cannula. They can be used by Type 1 (T1) and Type 2 (T2) patients who require precise dosing

through flexible basal-bolus therapy. Injection sites are rotated every 24-72 hours. The primary benefit of the CSII is reduced injection burden, but additionally, they are discreet and are compatible with CGMs.

Sensor Augmented Pumps (SAPs)

Sensor-augmented pumps (SAPs), also known as hybrid closed-loop systems, include an insulin pump, a continuous glucose monitor (CGM), and an algorithm that automatically pauses insulin delivery when the user's glucose level is low or predicted to drop within the next 30 minutes. These devices have been shown to significantly reduce hypoglycemia, particularly overnight. SAPs have been replaced by automated insulin delivery (AID) systems, which demonstrate even better outcomes. However, AID systems can still operate in low-glucose or predictive low-glucose suspension modes, similar to SAPs.

Automated Insulin Delivery (AID) Systems

Like SAPs, AID systems consist of an insulin pump, a CGM, and an algorithm. These devices are now preferred over non-automated pumps and multi-dose injections for T1 diabetics. Examples include the iLet Bionic Pancreas System, the MiniMed 780G System, and the Omnipod 5, which was recently approved for use in T2 diabetes who are 18 years of age and older (SmartAdjust AID software, with the Omnipod 5 tubeless pump and Dexcom CGM).The algorithm uses CGM data to adjust insulin dosing by modifying preprogrammed basal rates or delivering microdoses of insulin every five minutes based on CGM readings. These systems require manual entry of carbohydrate amounts to assist with prandial dose calculations but also allow adjustments for physical activity.

Patch Pumps

Newer to the market, these are tubeless CSII, with automation, meant for T1 and T2 diabetics that can be treated with bolus only dosing because they are non-programmable. They reduce the injection burden in that they can be worn up to 3 days, and are simple to operate, but they do not have compatibility with CGMs.

The V-Go (Zealand Pharma) and Omnipod DASH (Insulet) are both disposable, tubeless insulin delivery systems that are indicated for T1 or T2 diabetics who require insulin. These systems deliver a pre-set basal rate and on demand boluses via a mechanical button or touchscreen controller (that is not disposable). Each is worn for 24 -72 hours, after which, is removed and a new device is needed to be attached. It does not work with a CGM.

SUPPORTIVE LITERATURE

Wada et al (2020) conducted a 24-week, multicenter, open-label, randomized (1:1) parallel-group study to evaluate the effects of flash glucose monitoring (FGM) versus conventional self-monitoring of blood glucose (SMBG) on glycemic control in patients with non–insulin-treated T2 diabetes. Participants (FGM: n = 49; SMBG: n = 51) used their assigned device for 12 weeks (FGM group received a FreeStyle Libre from Abbott Diabetes Care; SMBG group received a FreeStyle Precision Neo, also from Abbott Diabetes Care). The primary outcome was the change in HbA1c between

groups, analyzed using an analysis of covariance model that included baseline values and group as covariates. All participants and investigators were blinded to sensor glucose measurements during the baseline period. Additionally, the SMBG group was blinded again for the final two weeks of the 12-week intervention. At baseline, mean HbA1c levels were 7.83% in the FGM group and 7.84% in the SMBG group. At 12 weeks, both groups showed reductions (FGM: –0.43%; SMBG: –0.30%; $P \leq 0.001$). However, at 24 weeks, a significant decrease from baseline persisted in the FGM group but not in the SMBG group (FGM: –0.46%, $P < 0.001$; SMBG: –0.17%, $P = 0.124$). HbA1c reductions were significant using both ANCOVA and linear mixed model methods. The authors concluded that FGM use in non–insulin-treated patients may help maintain good glycemic control even after discontinuation of glucose measurement.

Isganaitis et al (2021) assessed the effectiveness and safety of closed loop control (CLC) insulin delivery systems in adolescents and young adults with type 1 diabetes. A sub analysis was conducted on data from a six-month multi center randomized trial. Participants aged 14 through 24 with type 1 diabetes were randomly assigned (2:1) to CLC (tandem control-IQ) or sensor augmented pump (SAP). The mean age of the 63 participants was 17 years, with a mean baseline HbA1c of 8.1%. All 63 participants completed the trial. CLC significantly increased the time in range (TIR) compared to SAP (13% increase with CLC versus 1% decrease with SAP). CLC reduced time > 180mg/dl and time < 70 mg/dl. There were no significant differences in HbA1c levels between the groups. The closed-loop system was active 89% of the time. There was one case of diabetic ketoacidosis that occurred in the CLC group. Researchers concluded that CLC used for six months was substantial and improve TIR and reduce hypoglycemia in adolescents and young adults with type 1 diabetes.

Grace and Salyer (2022) investigated the relevance of commonly used criteria for rtCGM in patients with T2 diabetes who were receiving less intensive therapy, specifically, fewer than three insulin injections per day and a history of blood glucose testing four times daily. This prospective, interventional, single-arm study included 38 patients and analyzed changes in HbA1c, average glucose, glycemic variability (percent coefficient of variation), and the percentage of TIR (70–180 mg/dL), below range (TBR; < 70 mg/dL, < 54 mg/dL), and above range (TAR; >180 mg/dL). Secondary outcomes included changes in body weight and body mass index (BMI). Participants included in the analysis had T2 diabetes, HbA1c > 7.5%, and were treated with basal insulin, non-insulin injectable antidiabetic medications, oral antidiabetic medications, and/or diet and exercise. Screening occurred at baseline, with follow-up clinic visits at three and six months. A significant reduction in mean HbA1c was observed from baseline to three months (10.1% ± 1.8% to 7.3% ± 1.3%, $P < 0.001$) and at six months (10.1% ± 1.8% to 7.1% ± 1.2%, $P < 0.001$). Increases in TIR and reductions in TAR were noted across all groups, although no significant changes in glycemic variability were identified. All participants maintained TBR targets throughout the study period. Additional reductions were observed in weight (103.5 ± 18.2 kg to 100.3 ± 18.6 kg, $P = 0.002$) and BMI (35.6 ± 7.4 to 34.5 ± 6.3, $P = 0.002$). The authors concluded that, despite the study's single-arm design and short duration, intensive insulin therapy requirements and frequent monitoring criteria for CGM coverage are not relevant. They recommend expanding access to CGM for patients with type 2 diabetes who are treated with less intensive therapies.

Beck et al (2023) conducted a meta-analysis of randomized controlled trial (RCT) outcomes on the effects of the hybrid closed loop Control-IQ technology (Control-IQ) in subgroups based on baseline characteristics such as race and ethnicity, social economic status (SES), pre-study insulin delivery modalities (pump or multiple daily injections) and baseline glycemic control. Data were pooled and analyzed from three RCTs comparing Control-IQ to a Control group using CGM in 369 participants with T1 diabetes from age 2 to 72 years old. TIR 70–180 mg/dL in the Control-IQ group (n = 256) increased from 57% – 17% at baseline to 70% – 11% during follow-up, and in the Control group (n = 113) was 56% – 15% and 57% – 14%, respectively (adjusted treatment group difference = 11.5%, 95% confidence interval +9.7% to +13.2%, P < 0.001), an increase of 2.8 h/day on average. Significant reductions in mean glucose, hyperglycemia metrics, hypoglycemic metrics, and HbA1c were also observed. A statistically similar beneficial treatment effect on time in range 70–180 mg/dL was observed across the full age range regardless of race-ethnicity, household income, pre-study continuous glucose monitor use, or pre-study insulin delivery method. Participants with the highest baseline HbA1c levels showed the greatest improvements in TIR and HbA1c. The pooled analysis of Control-IQ RCTs demonstrated the beneficial effect of Control-IQ in T1 diabetes across a broad spectrum of participant characteristics (e.g., racial-ethnic minority, lower SES, lack of pre-study insulin pump experience, and high HbA1c levels). The most benefit was observed in participants with the worst baseline glycemic control in whom the auto-bolus feature of the Control-IQ algorithm has substantial impact. No subgroups were identified that did not benefit from Control-IQ, hybrid-closed loop technology. The investigators strongly suggested its use for all youth and adults with T1 diabetes.

Uhl et al (2024) conducted a systematic review and meta-analysis of RCTs on CGM for the management of T2 diabetes in adults ≥ 18 years older. Objective measures consisted of HbA1c, TIR, hyperglycemia, and hypoglycemia. Findings included 14 randomized trials with 825 individuals using real time CGMs (rtCGM) and 822 using flash CGM. The use of CGM showed modest but statistically significant HbA1c reduction levels of about 0.32%. Separate analysis for each device showed similar HbA1c reductions. Both rtCGM and flash CGMs led to a modest but significant decline in HbA1c for T2 individuals.

Gupta et al (2024) investigated the effect of short-term application of rt and isCGMS in individuals with T1D. They measured HbA1c levels over a period of 3 months. T1 diabetic individuals were randomized into three groups in a ratio of 1:1:2, Group A (rtCGMS for 2 weeks initially, followed by isCGMS for 2 weeks at 3 months), Group B (isCGMS for 2 weeks initially followed by rtCGMS for 2 weeks at 3 months) and Group C (only self-monitoring of blood glucose), respectively. The HbA1c was measured at baseline, 3, and 6 months. Out of a total 68 T1 diabetic individuals, HbA1c decreased significantly in groups A and B at 6 months compared to the baseline, but not in group C. HbA1c was significantly lower in Group A compared to Group C at 3 and 6 months. Fructosamine levels significantly decreased in Group B before and after cross-over. Switching from isCGMS to rtCGMS led to significant improvement in glycemic variability indices. Authors concluded that intermittent application of CGMS for 2 weeks improves short- and long-term blood glucose control in T1 diabetes.

PROFESSIONAL GUIDELINE(S)

The American Diabetes Association (ADA) Professional Practice Committee published an updated Standards in Medical Care in Diabetes 2025, with a chapter dedicated to diabetes in technology, acknowledging the rapid evolution and complexity of new devices that can improve the lives and health of people with diabetes, but can be barriers to implementation for not just people with diabetes, but for their care partners and their dedicated health care team.

The ADA published 32 recommendations in the report, which consistently stated throughout that device selection should be made based on the individual's circumstances, preferences, skill level, and needs. The recommendations include, but are not limited to the following:

1. "Diabetes devices should be offered to people with diabetes (A);
2. Initiation of continuous glucose monitoring (CGM) should be offered to people with type 1 diabetes early in the disease, even at time of diagnosis (A);
3. When prescribing a device, ensure that people with diabetes and caregivers receive initial and ongoing education and training, either in person, or remotely, and ongoing evaluation of technique, results, and the ability to utilize data, including uploading or sharing data (if applicable) to monitor and adjust therapy (C);
4. People with diabetes who have been using CGM, continuous subcutaneous insulin infusion and/or automated insulin delivery (AID) for diabetes management should have continued access across third-party payors regardless of age or A1C levels (E);
5. Recommend early initiation, including at diagnosis, of CGM, CSII, and AID depending on a person's or caregiver's preferences (C);
6. People who are taking insulin and using BGM should be encouraged to check their blood glucose levels when appropriate based on their insulin therapy. This may include checking when fasting, prior to meals and snacks, after meals, at bedtime, in the middle of the night, prior to, during, and after exercise when hypoglycemia is suspected, after treating low blood glucose levels until they are normoglycemic, when hyperglycemia is suspected, and prior to and while performing critical tasks such as driving (B);
7. Although BGM in people on noninsulin therapies has not consistently shown clinically significant reductions in A1C levels, it may be helpful when modifying meal plans, physical activity plans, and/or medications (particularly medications that can cause hypoglycemia) in conjunction with a treatment adjustment program (E);
8. Recommend real-time CGM (rtCGM) (A) or intermittently scanned CGM (isCGM) (B) for diabetes management to youth (C) and adults (B) with diabetes on any type of insulin therapy.
9. Consider using rtCGM or isCGM in adults with type 2 diabetes treated with glucose-lowering medications other than insulin to achieve and maintain individualized glycemic

goals (B).

10. CGM can help achieve glycemic goals (e.g., time in range and time above range) (A) and A1C goal (B) in type 1 diabetes and pregnancy and may be beneficial for other types of diabetes in pregnancy;
11. In circumstances when consistent use of CGM is not feasible, consider periodic use of personal or professional CGM to adjust medication and/or lifestyle (C);
12. Skin reactions, either due to irritation or allergy, should be assessed and addressed to aid in successful use of devices (E);
13. AID systems should be the preferred insulin delivery method to improve glycemic outcomes and reduce hypoglycemia and disparities in youth and adults with type 1 diabetes and other types of insulin-deficient diabetes who are capable of using the device (either by themselves or with a caregiver) (A);
14. Insulin pump therapy, preferably with CGM, should be offered for diabetes management to youth and adults on multi-dose insulin with type 2 diabetes who can use the device safely (either by themselves or with a caregiver) (A)."

The ADA addresses insulin delivery systems in Chapter 9. Pharmacologic Approaches to Glycemic Treatment: Standards of Care in Diabetes- 2025, and includes insulin patches as a proper administration technique, stating that selection of method of administration will depend on a variety of individual-specific factors and needs, cost and coverage, and individual preferences.

In 2025, the Endocrine Society and European Society of Endocrinology published a joint clinical practice guideline regarding preexisting diabetes and pregnancy, which includes, but is not limited to the following:

- Despite being limited direct evidence of superiority of CGM use, it may offer a potential advantage over SBMG in certain subgroups of preexisting T2 diabetes, and therefore pregnant individuals with T2 diabetes should be considered for either CGM or SMBG.
- The standard of care pregnancy glucose targets of fasting < 95mg/dl (5.3mmol/L), one-hour post prandial < 140mg/dl (7.8 mmol/L), two-hour post prandial < 120 md/dl (6.7mmoL) should be used rather than a single CGM target in individuals with pre-existing diabetes mellitus.

The Management of Individuals with Diabetes at High Risk for Hypoglycemia Endocrine Society Clinical Practice Guideline was published by McCall and colleagues in 2022. The recommendations include:

- CGM is preferred over SMBG for patients with T1 diabetes receiving multiple daily injections;
- rtCGM and algorithm-driven insulin pumps should be utilized for adults and children with T1 diabetes, instead of multiple daily injections and SMBG;
- rtCGM is suggested for outpatients with T2 diabetes who take insulin and/or sulfonylureas and

are at risk for hypoglycemia.

The American Association of Clinical Endocrinology (AACE) Clinical Practice Guideline: The Use of Advanced Technology in the Management of Persons with Diabetes Mellitus was published by Grunberger G et al in 2021. AACE addresses the following:

- The glucose metrics to be utilized in clinical practice to assess glycemic status;
- Identification of those who would benefit from diabetes technologies, including but not limited to CGM use for all individuals with problematic hypoglycemia, CGM may be recommended for women with gestational diabetes mellitus who are not on insulin therapy and also that CGM may be recommended for individuals with T2 diabetes who are treated with less intensive insulin therapy (Grade B);
- The most efficient approach to interpreting continuous glucose monitoring data;
- Diagnostic/professional CGM considerations;
- Insulin delivery techniques;
- Safety considerations for the use of diabetes technology including CGMs, insulin delivery devices, integrated devices, open-source automatic insulin-dosing systems not approved by the U.S. Food and Drug Administration;
- The implementation of diabetes technologies to clinical practice.

The National Institute for Health and Care Excellence (NICE) guidelines on diagnosis and management of type 1 diabetes in adults (2022) made the following recommendation:

- "Offer adults with type I diabetes a choice of real-time continuous glucose monitoring (rtCGM) or intermittently scanned continuous glucose monitoring (isCGM, commonly referred to as "flash"), based on their individual preferences, needs, characteristics, and the functionality of the devices available."

A 2017 steering committee made up of representatives from the American Association of Clinical Endocrinologists, the American Association of Diabetes Educators, the American Diabetes Association, the Endocrine Society, JDRF International, The Leona M. and Harry B. Helmsley Charitable Trust, the Pediatric Endocrine Society, and the T1D Exchange formed a decision-making group for the Type 1 Diabetes Outcomes Program (Agiostratidou et al). Their goal was to develop a consensus on definitions for hypoglycemia, hyperglycemia, time in range, diabetic ketoacidosis, and patient-reported outcomes. While their decisions were informed via input from researchers, industry, and people with diabetes, they relied on published evidence, their own clinical expertise, and advisory committee feedback.

The above identified steering committee defined three levels of hypoglycemia:

- Level 1 hypoglycemia was defined as a measurable glucose concentration of less than 70 mg/dL (3.9 mmol/L) but greater than or equal to 54 mg/dL (3.0 mmol/L), which "can alert a person to take action," In those without diabetes, a blood sugar of 70 mg/dL (3.9 mmol/L) is

known as low blood sugar. Blood glucose levels at less than 70 mg/dL (3.9 mmol/L) are relevant and "clinically important," despite a lack of severe symptoms.

- Level 2 hypoglycemia was defined as a measurable glucose concentration of less than 54 mg/dL (3.0 mmol/L), which requires immediate action. At this stage, "neurogenic and neuroglycopenic hypoglycemic symptoms begin to occur, ultimately leading to brain dysfunction at levels less than 50 mg/dL (2.8 mmol/L)." At this level, symptoms like behavioral changes, visual changes, seizure, and loss of consciousness occur due to "central nervous system neuronal glucose deprivation."
- Level 3 hypoglycemia was defined as "a severe event characterized by altered mental and/or physical status requiring assistance." At this level, a person's symptoms are such that they require help from others. For some, this level may occur during the a forementioned level 1 or 2 for hypoglycemia.

REGULATORY STATUS

The New York State Insurance Laws require a medical expense indemnity corporation or a health service corporation which provides medical coverage that includes coverage for physician services in a physician's office and every policy which provides major medical or similar comprehensive type coverage to include coverage of certain equipment and supplies for the treatment of diabetes when recommended or prescribed by a physician or other licensed health care provider. Additionally, coverage must include diabetes self-management education, limited to visits medically necessary upon the diagnosis of diabetes, where a physician diagnoses a significant change in the patient's symptoms or conditions which necessitate changes in a patient's self-management, or where reeducation or refresher education is necessary.

The U.S. Food and Drug Administration (FDA) regulates CGMS and external insulin pumps as medical devices. All CGMS and external insulin pumps including related components require FDA approval before marketing and use in the United States to ensure they are safe and effective for human use. Refer to the FDA Medical Device website. Available from: https://www.fda.gov/medical-devices [accessed 2025 Nov 11]

The FDA lists the most serious type of medical device recalls as well as early alert communications about corrective actions being taken by companies that the FDA believes are likely to be the most serious type of recalls. Available from: Medical Device Recalls | FDA [accessed 2025 Nov 11]

I. Examples of FDA approved external insulin pumps include, but are not limited to the following:

Brand Name	Manufacturer
MiniMed 770G with SmartGuard technology	Medtronic
MiniMed 780G System	Medtronic

Omnipod	Insulet Corp.
CeQur Simplicity	CeQur
iLet Bionic Pancreas System	Beta Bionics
Omnipod 5	Insulet Corp.
Omnipod Dash	Insulet Corp.
t:slim X2 Insulin Pump with Control-IQ	Tandem Diabetes Care
twist	Sequel
V-Go	Zealand Pharma

II. Examples of FDA approved CGM devices include, but are not limited to:

Brand Name	Manufacturer	Approved for:	Sensor	Transmitter	Receiver
DexCom G6	DexCom, Inc.	Individuals ≥ two (2) years (not for use in pregnant women, people on dialysis, or critically ill patients)	Three per 30 days	Four per 360 days	One per year
DexCom G7	DexCom, Inc.	Individuals ≥ two (2) years (can be worn during pregnancy for all types of diabetes)	Combined Sensor and transmitter Three per 30 days	N/A	One per year (Optional)
Guardian Connect System	Medtronic Diabetes	Individuals ≥ 14 years	Four per 30 days	One per year	NA
Guardian Sensor 3 with Guardian Link 3 transmitter	Medtronic Diabetes	Individuals > 2 with Medtronic 770G system, 7+ with Medtronic	7 days	Rechargeable	N/A

		670G system			
FreeStyle Libre 2 system	Abbott Diabetes Care	Individuals ≥ four (4) years	Two per 28 days	N/A	One per one year
FreeStyle Libre 14 Day System	Abbott Diabetes Care	Individuals ≥ 18 years (not for use in pregnant women)	Two per 28 days	N/A	One per one year
FreeStyle Libre 3	Abbott Diabetes Care	Children, adolescents, and adults ≥ two (2) years	Two per 28 days	N/A	One per year
FreeStyle Libre 3 Plus	Abbott Diabetes Care	Individuals ≥ 4 years	Two per 28 days	N/A	One per year
Eversense	Senseonics Holdings, Inc.	Individuals ≥ 18 years	One per 90 days	One per year	NA
Eversense E3	Senseonics Holdings, Inc.	Individuals ≥ 18 years	One per 180 days	One per year	NA

III. Examples of FDA approved external insulin pump/continuous glucose monitoring systems include, but are not limited to:

Brand Name	Manufacturer	Approved for:
Minimed 630G System	Medtronic	Individuals ≥ seven (7) years
Minimed 770G System	Medtronic	Individuals ≥ two (2) years
Minimed 780G System	Medtronic	Children and adults with type 1 diabetes Type 2 insulin treated diabetics ≥ 18 years
T-slim with Control-IQ technology/Dexcom G6	Tandem Diabetes Care, Inc.	Individuals ≥ six (6) years
iLet Bionic Pancreas	Beta Bionics	Individuals ≥ 6 years of age

		with type 1 diabetes

CODE(S)

HCPCS Codes

Code	Description
A4226	Supplies for maintenance of insulin infusion pump with dosage rate adjustment using therapeutic continuous glucose sensing, per week
A4230	Infusion set for external insulin pump, non-needle cannula type
A4231	Infusion set for external insulin pump, needle type
A4232	Syringe with needle for external insulin pump, sterile, 3 cc
A4238	Supply allowance for adjunctive continuous glucose monitor (cgm), includes all supplies and accessories, 1 month supply = 1 unit of service
A4239	Supply allowance for non-adjunctive, non-implanted continuous glucose monitor (cgm), includes all supplies and accessories, 1 month supply = 1 unit of service
A9274	External ambulatory insulin delivery system, disposable, each, includes all supplies and accessories
A9276	Sensor; invasive (e.g., subcutaneous), disposable, for use with interstitial continuous glucose monitoring system, 1 unit = 1 day supply
A9277	Transmitter; external, for use with interstitial continuous glucose monitoring system (CGM)
A9278	Receiver (monitor); external, for use with interstitial continuous glucose monitoring system (CGM)
E0784	External ambulatory infusion pump, insulin
E0787	External ambulatory infusion pump, insulin, dosage rate adjustment using therapeutic continuous glucose sensing (e.g., Dexcom Continuous Glucose Monitoring System and the Tandem T:Slim)
E2102	Adjunctive, nonimplanted continuous glucose monitor (CGM) or receiver
E2103	Non-adjunctive, non-implanted continuous glucose monitor or receiver (CGM)
S1030	Continuous noninvasive glucose monitoring device, purchase (for physician interpretation of data, use cpt code)
S1031	Continuous noninvasive glucose monitoring device, rental, including sensor, sensor replacement, and download to monitor (for physician interpretation of data, use cpt code)

Code	Description
S1034	Artificial pancreas device system (e.g., low glucose suspend [LGS] feature) including continuous glucose monitor, blood glucose device, insulin pump and computer algorithm that communicates with all of the devices
S1035	Sensor; invasive (e.g., subcutaneous), disposable, for use with artificial pancreas device system
S1036	Transmitter; external, for use with artificial pancreas device system
S1037	Receiver (monitor); external, for use with artificial pancreas device system
S9145	Insulin pump initiation, instruction in initial use of pump (pump not included)

ICD10 Codes

Code	Description
E10.10-E10.9	Type 1 diabetes mellitus (code range)
E11.00-E11.9	Type 2 diabetes mellitus (code range)
E13.00-E13.9	Other specified diabetes mellitus (code range)
E79.0	Hyperuricemia without signs of inflammatory arthritis and tophaceous disease
O24.011-O24.019	Pre-existing diabetes mellitus, type 1, in pregnancy (code range)
O24.03	Pre-existing diabetes mellitus, type 1, in the puerperium
O24.111-O24.119	Pre-existing diabetes mellitus, type 2, in pregnancy (code range)
O24.13	Pre-existing diabetes mellitus, type 2, in the puerperium
O24.311-O24.33	Unspecified pre-existing diabetes mellitus in pregnancy, childbirth and the puerperium (code range)
O24.410-O24.439	Gestational diabetes mellitus in pregnancy (code range)
O24.811-O24.819	Other pre-existing diabetes mellitus in pregnancy (code range)
O24.83	Other pre-existing diabetes mellitus in the puerperium

Code	Description
O24.911-O24.93	Unspecified diabetes mellitus in pregnancy, childbirth and the puerperium (code range)
O99.810-O99.815	Abnormal glucose complicating pregnancy, childbirth and the puerperium (code range)
P70.2	Neonatal diabetes mellitus
R73.01-R73.9	Elevated blood glucose level (code range)

PRODUCT DISCLAIMER

- Services are contract dependent; if a product does not cover a service, medical policy criteria do not apply.
- If a commercial product (including an Essential Plan or Child Health Plus product) covers a specific service, medical policy criteria apply to the benefit.
- If a Medicaid product covers a specific service, and there are no New York State Medicaid guidelines (eMedNY) criteria, medical policy criteria apply to the benefit.
- If a Medicare product covers a specific service, and there is no national or local Medicare coverage decision for the service, medical policy criteria apply to the benefit.

POLICY HISTORY/REVISION

Committee Approval Dates

New: 05/09

Revised: 01/11, 05/11, 09/11, 03/12, 05/12, 01/14, 07/14, 01/15, 05/15, 05/16, 05/17, 11/17, 01/18, 03/18, 07/18, 09/18, 11/18, 05/19, 11/19, 03/20, 01/21, 03/21, 7/21, 5/22, 5/23, 5/24, 5/26

Reviewed: 05/10, 05/13, 05/14, 05/15, 05/20, 5/25

Date	Summary of Changes
9/1/2026	• Transitioned External Ambulatory Insulin Infusion Pump policy, 1370/20.000457 to Lifetime HealthCare Companies policy template and also added CGM criteria from Diabetic Services Policy 1370/20.000047.

6/1/2024	• Removed V-Go from the exclusions section and added as an acceptable alternative to a standard insulin infusion pump. • Under Medicaid, added V-Go as an allowance to the disposable insulin pump verbiage.
6/1/2023	• Under the position statement: removed the values for "hypoglycemia" and "wide fluctuations in blood glucose before mealtime" criteria. • Under Medicaid: removed value for "hypoglycemia" criteria.
6/1/2022	• Changed required visit timeframe for patients with an external insulin infusion pump from every three months to every six months.
7/1/2021	• Per DOH guidelines, updated criteria for insulin infusion pumps for Select Plan/HARP.
5/01/2021* *No change to effective date	• Under Policy Considerations: removed 2 statements: 1. Combined/integrated insulin pump/continuous glucose monitoring systems (S1034, S1035, S1036, S1037) are considered nonstandard equipment and will be considered for coverage only for individuals meeting the medical-necessity criteria for a personal glucose monitoring system (these codes are addressed in the Diabetic Services policy) 2. The interpretation and reporting (95251) of data from a patient-owned continuous glucose monitor may be reported once every 30 days (statement is being moved to the Diabetic Services policy under Continuous Glucose Monitors. • Under Medicare: removed reference to Continuous Glucose Monitors as they are addressed in the Diabetic Services policy.
5/1/2021	• Updated paragraph in the Policy Considerations section in regards to coverage of personal CGM's as coverage is now available for Diabetes type I and type II.

11/13/2019	• Added Omnipod Dash to the list of covered programmable disposable external insulin infusion pumps to the Policy Considerations section as covered for all LOB. • Removed exclusion for non-coverage of Omnipod from the Select Plan section as it is now covered for all LOB. • Added compliance with usage of a therapeutic continuous glucose monitor as an alternative to the requirement for glucose self-testing.
11/13/2019 Effective date of policy remains the same	• Added statement to Select Plan section to address coverage of Omnipod/Omnipod Dash as an acceptable alternative to an external ambulatory insulin infusion pump.

MEDICAL POLICY

Medical Policy Title	**Continuous Positive Airway Pressure (CPAP) and Auto-Adjusting Positive Airway Pressure (APAP) Devices**
Policy Number	**1.01.06**
Current Effective Date	**January 1, 2027**
Next Review Date	**June 2027**

Our medical policies are guides to evaluate technologies or services for medical necessity. Criteria are established through the assessment of evidence based, peer-reviewed scientific literature, and national professional guidelines. Federal and state law(s), regulatory mandates and the member's subscriber contract language are considered first in the determination of a covered service. (Link to Product Disclaimer)

POLICY STATEMENT(S)

Initial 90-day Trial

Continuous Positive Airway Pressure and Auto-Adjusting Devices

I. Continuous positive airway pressure (CPAP) and auto-adjusting positive airway pressure (APAP) devices are considered **medically appropriate** for **ANY** of the following indications:

   A. Adults with obstructive sleep apnea (OSA) who meet **ONE** of the following indications:

      1. Polysomnography (PSG) or home sleep testing (HST) results documenting an apnea-hypopnea index (AHI) or respiratory disturbance index (RDI) of > 5 (five), and < 15 respiratory events per hour and **ONE** of the following associated symptoms:

         a. Symptoms of OSA (e.g., excessive daytime sleepiness, impaired cognition, insomnia); **or**

         b. Documented cardiovascular diseases, including hypertension, ischemic heart disease, or history of stroke; **or**

      2. PSG or HST results document an AHI or RDI of ≥ 15 respiratory events per hour.

   B. Children < 18 years with OSA who meet **ONE** of the following indications: (Please note that a 90-day continuation review is not required for pediatric members.)

      1. Failure of adenotonsillectomy to relieve OSA symptoms;

      2. A contraindication to surgical intervention; **or**

      3. For whom a nonsurgical approach is strongly preferred; **and**

      4. **Either** of the following criteria:

         a. PSG results documenting an AHI or RDI of ≥ 5 and exhibits OSA symptoms; **or**

         b. PSG results demonstrated an AHI or RDI within normal ranges and the individual exhibits OSA symptoms (e.g., excessive daytime sleepiness, impaired cognition, insomnia) **and ONE** of the following:

i. The child exhibits episodes of hypercarbia based on end-tidal CO_2 measurements > 53 mm Hg; **or**

ii. The end-tidal CO_2 is > 50 mmHg for 10 to 24% of the sleep time.

Continuation of Use (Past 90-day Trial)

II. Continuation of coverage after the 90-day trial is **medically appropriate** when **BOTH** of the following have been demonstrated.

A. Improved AHI and symptom resolution during trial; **and**

B. Compliance has been demonstrated (e.g., defined by using the device for 70% of the nights, for four (4) or more hours per 24-hour period, during a consecutive 30-day period).

III. CPAP is **not medically necessary** for the treatment of snoring without accompanying OSA.

Durable Medical Equipment (DME) Repair

IV. Repair of a medically necessary CPAP or components not under warranty will be considered **medically appropriate** when the following criteria are met:

A. Physician documentation includes **ALL** the following:

1. Date of DME initiation;
2. Manufacturer warranty information, if applicable;
3. Attestation that the patient has been compliant with the use of the DME and will continue to benefit from the use of the DME;

B. The DME is no longer functioning adequately; and **BOTH** of the following criteria are met:

1. Inadequate function interferes with activities of daily living; and
2. Repair is expected to make the equipment fully functional (as defined by manufacturer).

V. Repair of equipment damaged due to patient neglect, theft, abuse, or when another available coverage source is an option (e.g., homeowners, rental, auto, liability insurance, etc.) is **ineligible for coverage**.

DME Replacement

VI. Replacement of a medically necessary CPAP or components not under warranty will be considered **medically appropriate** when **ALL** of the following criteria are met:

A. For positive pressure devices proof of compliance needs to be documented (refer to continuation of coverage after 90-day trial).

B. **Either** of the Following:

1. The DME is no longer functioning adequately and has been determined to be non-repairable, or the cost of the repair is in excess of the replacement cost;
2. There is documentation that a change in the patient's condition makes the present unit

non-functional and improvement is expected with a replacement unit.

VII. The replacement of a properly functioning CPAP, its components or accessories is considered **not medically necessary**. This includes, but is not limited to, replacement desired due to advanced technology or to make the DME more aesthetically pleasing;

VIII. The replacement of equipment damaged or lost due to patient neglect, theft, abuse, or when another available coverage source is an option (e.g., homeowners, rental, auto, liability insurance, etc.) is **ineligible for coverage**.

IX. Accessories or components for CPAP that are considered not medically necessary or investigational by peer-reviewed literature will also be considered as **not medically necessary or investigational** by the Health Plan.

RELATED POLICIES

Corporate Medical Policy

1.01.57 Home Non-Invasive Positive Pressure Ventilation (NIPPV) devices for Respiratory Insufficiency and Failure

2.01.28 Sleep Studies

7.01.41 Surgical Management of Sleep Disorders

11.01.03 Experimental or Investigational Services

POLICY GUIDELINE(S)

I. Individuals who do not meet the criteria for continuation of coverage during the initial 90 day trial are eligible to re-qualify for a CPAP device, but must have a clinical re-evaluation by the treating physician to determine the etiology of the failure to respond to CPAP therapy (e.g., documentation of failure of symptoms to resolve or improper fit of device, and re-education of the individuals regarding proper use of the equipment or re-fitting of masks).

II. CPAP with expiratory relief or APAP are options for patients who cannot tolerate the high constant air pressure associated with CPAP but wish to continue treatment for OSA.

III. Supplemental oxygen or humidification can be added to positive pressure devices to increase oxygen saturation and decrease vasomotor rhinitis.

IV. Coverage is allowed for a one-month rental when the CPAP device is malfunctioning and out of warranty, (and not associated with a manufacturer recall) while the device is being repaired.

V. The monitoring feature/device, stand-alone or integrated, any type, including all accessories, components, and electronics, not otherwise classified (HCPCS: A9279) is considered inclusive to the positive airway pressure device.

VI. Devices used to clean or sanitize CPAP devices are considered a convenience item and are **ineligible for coverage** (e.g., SoClean, SoClean 2 Go).

DESCRIPTION

Sleep Apnea

Sleep apnea is a common sleep disorder characterized by repeated interruptions in breathing during sleep. These interruptions called apnea can occur hundreds of times per night which can lead to fragmented sleep and decreased oxygen levels resulting in daytime fatigue, cardiovascular problems, and other health issues.

Obstructive Sleep Apnea (OSA)

Obstructive sleep apnea (OSA) is a sleep-related breathing disorder caused by upper-airway obstruction, most often from relaxed throat muscles during sleep. In adults, OSA involves recurrent episodes of complete or partial upper airway blockage lasting more than 10 seconds and is commonly linked to obesity, male sex, aging, and anatomical factors. Symptoms include loud snoring, witnessed apneas, gasping, excessive daytime sleepiness, and hypertension, and diagnosis requires polysomnography or home sleep testing with evidence of clinical impairment. Untreated adult OSA increases the risk of hypertension, heart failure, atrial fibrillation, other arrhythmias, and nonalcoholic fatty liver disease.

Pediatric OSA, typically caused by enlarged tonsils and adenoids, is defined by prolonged partial obstruction or intermittent complete obstruction lasting at least two respiratory cycles and may present with snoring, breathing pauses, restless sleep, behavioral issues, or poor growth. If left untreated, children may experience growth abnormalities, neurologic problems, or cor pulmonale. Polysomnography (PSG) is the preferred diagnostic tool, although normative AHI/RDI values for children are not well established. Adenotonsillectomy is first-line therapy for pediatric OSA, while persistent cases or those with contraindications may require CPAP, observation, medications, or additional airway surgery. Obstructive hypoventilation (OH), a related condition in children, may present with normal AHI but episodes of hypercarbia indicated by elevated end-tidal CO_2.

Central Apneas

Central sleep apnea is defined as the cessation of airflow through the nose and mouth for at least 10 seconds with no respiratory effort noted. The cessation in breathing can be caused by problems involving brain mechanisms, or an obstructive component. Approximately 4% of individuals undergoing PSG in a sleep laboratory are diagnosed with central sleep apnea, making this an uncommon condition.

Mixed Apneas

Mixed sleep apnea is a combination of obstructive and central sleep apnea. Not only does the patient have an obstruction in the airway, but the patient may have a neurological dysfunction or cardiopulmonary as well that contributes to the central apnea component.

Continuous Positive Airway Pressure (CPAP)

CPAP is the gold standard treatment option for adults with documented OSA. The symptoms associated with OSA, such as excessive daytime sleepiness, impaired cognition, and mood disorders

are reduced or eliminated with the consistent use of CPAP. CPAP is not indicated in individuals with simple snoring that is not associated with pauses in respirations. Treatment recommendations for OSA are based primarily on the RDI or the AHI, the severity of the presenting symptoms, and the existence and severity of co-morbid conditions.

CPAP provides constant pressure throughout the respiratory cycle by raising the intraluminal upper airway pressure above the positive critical transmural pressure of the pharynx or hypopharynx. The pressure is delivered by a flow generator through either nasal mask or modified nasal prongs to keep the upper airway patent resulting in adequate ventilation and arterial oxygenation. The pressure used is determined individually, with a range of 3 to 20 cm water.

Auto- or Self-Titrating Positive Airway Pressure (APAP)

Auto- or self-titrating positive airway pressure, or APAP, systems utilize an algorithm that uses a pressure transducer and microprocessor to monitor the airway for vibration patterns and then makes air pressure adjustments based on the incidence of apnea or absence of vibration. APAP devices are also referred to as demand positive airway pressure devices (DPAP).

CPAP with expiratory relief (e.g., C- Flex technology Respironics, Inc., Murrysville, PA) is designed to provide pressure relief during expiration, while maintaining optimal pneumatic splinting for effective therapy. CPAP with expiratory relief technology monitors the patient's airflow during expiration and reduces expiratory pressure proportional to expiratory flow. CPAP with C-Flex technology can increase compliance in those patients who find it difficult or uncomfortable to breathe out against the continuous positive pressure. This technology can be applied to CPAP, BPAP and APAP devices.

Most PAP machines now contain a data card that can record and transmit daily use rates of the device. In addition, most PAP machines can also be equipped with a modem (either wired or wireless) that is capable of transmitting data daily to a manufacturer-owned database. The ability to detect disturbances in a variety of measures, including air flow, amount of time used, and mask leak, is also included in most commercially available PAP machines.

SUPPORTIVE LITERATURE

Sanchez-de la-Torre et al (2023) conducted a systematic review and meta-analysis of individual participant data (IPD) from three randomized controlled trials (RCT, Sleep Apnea Cardiovascular Endpoints (SAVE), Impact of Sleep Apnea Syndrome in Acute Coronary Syndrome (ISAACC) and Randomized Intervention with CPAP in Coronary Artery Disease and Sleep Apnea (RICCADSAO) to assess whether adherence to CPAP therapy reduces the risk of major adverse cardiac and cerebrovascular events (MACCEs) in individuals with OSA and established cardiovascular disease. The study included 4186 adults with cardiovascular disease and OSA. The primary outcome was the first MACCEs. Statistical analysis included one stage and two stage IPD meta-analysis as well as on treatment analysis using marginal structural models to assess the effects of CPAP adherence. A total of 691 MACCEs (16.5%) were observed, the CPAP group had 349 and the no CPAP group 342. The main outcome intention- to-treat analysis did not show a significant difference in MACCEs between the CPAP and the no CPAP group. The on-treatment analysis revealed good adherence to CPAP (≥ 4 hours per day) was associated with a reduced risk of MAACEs reoccurrence. Adherence to CPAP was

associated with reduced MACCE recurrent risks suggesting that treatment adherence is a key factor in secondary cardiovascular prevention in individuals with OSA.

Patil et al (2019) conducted a systematic review and meta-analysis of 184 studies to evaluate the effectiveness of PAP therapy for adults with OSA. CPAP significantly reduced AHI by 23 events/hour versus no treatment—an 86% reduction from 32.7 to 4.1 events/hour. CPAP also improved daytime sleepiness by 2.4 points in symptomatic patients and showed clinically meaningful benefits for sleep-related quality of life, blood pressure, and motor vehicle crash risk. Observational evidence suggested reductions in cardiovascular events and mortality, though RCTs did not confirm these outcomes. No major differences were found among CPAP, APAP, and BiPAP for individual clinical outcomes, supporting CPAP as first-line therapy unless not tolerated. Home-based versus in-lab APAP initiation showed comparable results. Education, behavioral interventions, and telemonitoring improved adherence. Nasal masks enhanced adherence and reduced AHI more effectively than oronasal masks. Humidification reduced side effects without improving adherence or outcomes. Overall, CPAP reliably reduces OSA severity, improves sleepiness, and lowers blood pressure, particularly in symptomatic or hypertensive adults. Benefits for asymptomatic individuals and long-term cardiovascular outcomes remain uncertain.

Wang et al (2019) conducted a systematic review to assess the effectiveness of home noninvasive NIPPV (home mechanical ventilation (HMV), BiPAP, or CPAP devices) in adults with chronic respiratory failure. Sixty-eight (68) studies evaluating 53,733 patients were included. In patients with COPD, home BiPAP (compared to no device) was associated with lower mortality, decreased need for intubations and hospital admissions, but no change in quality of life. In patients with COPD, HMV (compared individually with BiPAP, CPAP, or no device) was associated with fewer hospital admissions. In patients with thoracic restrictive diseases, HMV (compared to no device) was associated with lower mortality. In patients with neuromuscular diseases, home BiPAP (compared to no device) was associated with lower mortality and better quality of life. In patients with obesity hypoventilation syndrome, home HMV/BiPAP (compared to no device) was associated with lower mortality. Current evidence was not available to assess the comparative effectiveness of many device capabilities on patient outcomes. Criteria to initiate home NIPPV and home respiratory services varied and were not validated in comparative studies.

PROFESSIONAL GUIDELINE(S)

The 2021 National Institute for Health and Care Excellence (NICE) Clinical Guidelines for Diagnosis and Management of Obstructive Sleep Apnea/Hypopnea Syndrome (OASAHS), Obesity Hypoventilation Syndrome (OHS) and Chronic Obstructive Pulmonary Disease with OSAHS (COPD-OSAHS overlap syndrome) in people over 16 years of age.

- Offering fixed-level CPAP in those with mild OSA when symptoms affect quality of life (QOL) and usual daytime activities if lifestyle changes alone have been unsuccessful or are considered inappropriate.
- APAP as an alternative to fixed-level CPAP in those unable to tolerate CPAP.

- In individuals who cannot tolerate or refuse CPAP, they recommend offering a customized mandibular advancement device.
- In individuals with moderate to severe OSA, CPAP is recommended as a treatment option, with APAP offered as an alternative in those unable to tolerate CPAP.
- A customized mandibular advancement device may be used if an individual refuses PAP or is unable to tolerate PAP.
- A positional modifier may be considered for those with mild to moderate positional OSA if other treatments are unsuitable or not tolerated, but this should not be a first-line treatment option.
- The European Respiratory Society (ERS) and the American Thoracic Society (ATS) Clinical Recommendation for non-invasive ventilation (NIV) in Adults with Acute Respiratory Failure (ARF) (Rochwerg 2017). Bilevel NIV for individuals with ARF leading to acute or acute-on-chronic respiratory acidosis (pH <7.35) due to COPD exacerbation. (Strong recommendation, high certainty of evidence.)
- Either bilevel NIV or CPAP for individuals with ARF due to cardiogenic pulmonary oedema. (Strong recommendation, moderate certainty of evidence.
- Early NIV for immunocompromised individuals ARF. (Conditional recommendation, moderate certainty of evidence.)
- Due to the uncertainty of evidence ERS/ATS is unable to offer a recommendation on the use of NIV for de novo ARF.
- NIV for individuals with post-operative ARF. (Conditional recommendation, moderate certainty of evidence.)
- NIV to dyspneic individuals for palliation in the setting of terminal cancer or other terminal conditions. (Conditional recommendation, moderate certainty of evidence.)
- NIV should not be used in the treatment of patients with established post-extubation respiratory failure. (Conditional recommendation, low certainty of evidence.

The American Academy of Pediatrics Clinical Guidelines for the Diagnosis and Management of Childhood Obstructive Sleep Apnea Syndrome (OSAS) (2012).

- All children/adolescents should be screened for snoring.
- Polysomnography should be performed in children/adolescents with snoring and symptoms/signs of OSAS; if polysomnography is not available, then alternative diagnostic tests or referral to a specialist for more extensive evaluation may be considered.
- Adenotonsillectomy is recommended as the first-line treatment of patients with adenotonsillar hypertrophy.
    - High-risk patients should be monitored as inpatients postoperatively.
    - Patients should be reevaluated postoperatively to determine whether further treatment is

required. Objective testing should be performed in patients who are high risk or have persistent symptoms/signs of OSAS after therapy.

- Continuous positive airway pressure is recommended as treatment if adenotonsillectomy is not performed or if OSAS persists postoperatively.

- Weight loss is recommended in addition to other therapy in patients who are overweight or obese.
- Intranasal corticosteroids are an option for children with mild OSAS in whom adenotonsillectomy is contraindicated or for mild postoperative OSAS.

American Academy of Sleep Medicine (ASSM 2008) Clinical Guidelines for the Manual Titration of Positive Airway Pressure in Patient with OSA.

- Pre-Titration Preparation: All candidates should receive PAP education, hands-on demonstration, careful mask fitting, and acclimatization. (Standard)
- Transition to BiPAP: If a patient is uncomfortable or intolerant of high CPAP pressures, or obstructive respiratory events continue at 15 cm H2O, switch the patient to BiPAP. (Consensus)
- Repeat Titration Study: Consider repeating a titration if the initial titration was not optimal/good and, for split-night studies, fails to meet AASM criteria. (Consensus)

REGULATORY STATUS

The United States Food and Drug Administration (FDA) regulates PAP devices as medical devices. All PAP devices including related components require FDA approval before marketing and use in the United States to ensure they are safe and effective for human use. Refer to the FDA Medical Device website. Available from: https://www.fda.gov/medical-devices [accessed 2026 Feb 13]

The FDA lists the most serious type of medical device recalls as well as early alert communications about corrective actions being taken by companies that the FDA believes are likely to be the most serious type of recalls on our website by the date that the FDA posts the information on our website. Available from: Medical Device Recalls | FDA [accessed 2026 Feb 13]

E0562	Humidifier, heated, used with positive airway pressure device
E0601	Continuous airway pressure (CPAP) device

ICD10 Codes

Code	Description
E66.2	Morbid (severe) obesity with alveolar hypoventilation
G47.00	Insomnia, unspecified
G47.10	Hypersomnia, unspecified
G47.20	Circadian rhythm sleep disorder, unspecified type
G47.8	Other sleep disorders
G47.9	Sleep disorder, unspecified
I50.9	Heart failure, unspecified
J39.8	Other specified diseases of upper respiratory tract
J44.1	Chronic obstructive pulmonary disease with (acute) exacerbation
J44.9	Chronic obstructive pulmonary disease, unspecified

Code	Description
J95.2	Acute pulmonary insufficiency following nonthoracic surgery
J96.00-J96.02	Acute respiratory failure (code range)
J96.10-J96.12	Chronic respiratory failure (code range)
J96.20-J96.22	Acute and chronic respiratory failure (code range)
J96.90-J96.92	Respiratory failure, unspecified, unspecified whether with hypoxia or hypercapnia (code range)
J98.4	Other disorders of lung
J98.8	Other specified respiratory disorders

RESOURCE COORDINATION POLICY

Capital District Physicians' Health Plan, Inc.
CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: CORONARY FRACTIONAL FLOW RESERVE USING COMPUTED TOMOGRAPHY (FFR-ct)

POLICY EFFECTIVE DATE:	11/1/2024
Policy Control #:	1370/20.000511
Next Annual Review:	November, 2026

DISCLAIMER

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgement when deciding the most appropriate care to enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

PROCEDURE CODES

75580, 0523T

DESCRIPTIONS

Fractional flow reserve (FFR) measurement involves determining the ratio between the maximum achievable blood flow in a diseased coronary artery and the theoretical maximum flow in a normal coronary artery. An FFR of 1.0 is widely accepted as normal. An FFR lower than 0.75-0.80 is generally considered to be associated with myocardial ischemia (MI).

FFR is easily measured during routine coronary angiography by using a pressure wire to calculate the ratio between coronary pressure distal to a coronary artery stenosis and aortic pressure under conditions of maximum myocardial hyperemia. This ratio represents the potential decrease in coronary flow distal to the coronary stenosis.

Coronary computed tomography angiography (CCTA) is a noninvasive imaging modality designed to be an alternative to invasive cardiac angiography (cardiac catheterization) for diagnosing coronary artery disease (CAD) by visualizing the blood flow in arterial and venous vessels.

Computed tomography (CT)-based Fractional flow reserve (FFR-ct) computations are used to evaluate the functional severity of coronary artery stenoses, with FFRs derived from outflow

boundary conditions based on conventional morphology generally agreeing with those based on positron-emission tomography (PET) conditions. FFR-ct uses simulated pressure, velocity and blood flow information generated from static CCTA images to determine the fraction of maximal coronary blood flow that can be achieved in a restricted artery.

RELATED POLICIES/DOCUMENTS

Resource Coordination:

Artificial Intelligence Enabled CT Based Quantitative Coronary Topography (AI-QCT) Coronary Plaque Analysis (AI-CPA), 1370/20.000523

POSITION STATEMENT

CDPHP will cover Computed Tomography-based Fractional Flow Reserve Technology (FFR-ct) that is FDA-approved for patients who meet **one** of the following criteria:

- Intermediate risk* patients with acute or stable chest pain and no known coronary artery disease, with coronary artery stenosis of 40-90% in proximal or middle coronary artery on Coronary Computed Tomography Angiography (CCTA);

OR

- Intermediate risk with acute chest pain and known non-obstructive (< 50%) coronary artery stenosis of 40-90% in a proximal or middle segment on CCTA;

OR

- Stable nonobstructive coronary artery (< 50%) disease with persistent ischemia related symptoms despite maximally tolerated medical therapy requiring further testing, and ≥ 40-90% stenosis on CCTA

Fractional flow reserve technology will not be covered in conjunction with stress testing unless FFR-ct was not high quality, and an alternative study is needed.

*Intermediate and high-risk is as defined in the 2021 AHA/ACC/ASE/CHEST/SAEM/SCCT/SCMR Guideline for the Evaluation and Diagnosis of Chest Pain

The patient's medical record must include **all** the following information:

- The clinical findings that led to the initial performance of the CCTA, and the CCTA must be fully reviewed before the performance of FFR-ct. (as evidenced by the submission of the Coronary Computed Tomographic Angiography Report)
- Description of symptoms consistent with stable ischemic heart disease.
- Body mass index

POLICY NAME: CORONARY FRACTIONAL FLOW RESERVE USING COMPUTED TOMOGRAPHY (FFR-ct)

- Fractional Flow Reserve analysis report

POLICY CONSIDERATIONS

This service should be performed in patients with stable coronary symptoms. It should not be performed until after the base study (CCTA) has been completed and interpreted.

If higher grade stenoses (i.e., greater than 90%) are present, this study is not medically necessary, as the patient should proceed to catheterization. Similarly, low-grade stenoses (less than 30%) do not require additional confirmatory data.

This should be performed as an alternative to stress testing. If extensive plaque is present, a high quality CCTA is unlikely and stress testing is preferred.

EXCLUSIONS

Intraprocedural coronary fractional flow reserve (FFR) with 3D functional mapping of color-coded FFR values for the coronary tree, derived from coronary angiogram data, for real-time review and interpretation of possible atherosclerotic stenosis(es) intervention (0523T).

FFR-ct will not be covered for the following clinical circumstances:

- Prior placement of prosthetic valves
- Prior placement of grafts in coronary bypass surgery
- Suspicion of acute coronary syndrome (where MI or unstable angina have not been ruled out)
- Intracoronary metallic stent
- Status post-heart transplantation
- Recent MI (30 days or less)
- Prior pacemaker or defibrillator lead placement
- Newly diagnosed systolic heart failure, with no prior left heart catheterization
- Left main coronary artery disease with Intermediated Coronary Stenosis (lumen reduction less than or equal to 40%)
- Non-obstructing stenosis (< 50% of all major epicardial vessels) on CTA or catheterization in the past twelve months, in the absence of a new symptom complex.
- If turnaround times may impact prompt clinical care decisions

MEDICAL POLICY

Medical Policy Title	**Cosmetic and Reconstructive Procedures**
Policy Number	**7.01.11**
Current Effective Date	**January 1, 2027**
Next Review Date	**September 2027**

Our medical policies are based on the assessment of evidence based, peer-reviewed literature, and professional guidelines. Eligibility for reimbursement is based upon the benefits set forth in the member's subscriber contract. (Link to Product Disclaimer)

POLICY STATEMENT(S)

This policy does not address criteria related to gender affirming surgeries/procedures. Refer to the Related Policies section below for policy reference.

Reconstructive Procedures

I. A procedure is considered reconstructive and **medically appropriate** when **ALL** of the following are met:

   A. **ONE** (1) of the following definitions of functional deficit is documented:

      1. Pain or other physical deficit that interferes with activities of daily living; **or**
      2. Impaired physical activity;

   B. **ONE** (1) of the following definitions of reconstruction is documented:

      1. The procedure is performed to correct structures of the body affected by congenital defects, developmental abnormalities, trauma, infection, tumors, or disease that have resulted in the functional deficit;
      2. Reconstructive procedures incidental to or following surgery to treat an accidental injury, infection, or other disease of the part of the body involved, that correct the functional deficit; **or**
      3. The procedure is intended to correct a congenital disease or anomaly of a child that has resulted in the functional deficit; **and**

   C. Indication specific criteria are met below:

      1. Acne procedures (10040, 11900, 11901)

         a. Intralesional injection of painful acne cysts

         b. Surgical drainage of painful acne lesions (acne surgery)

         For comedone extraction or chemical exfoliation, refer to Policy Statement II

         For cryotherapy (e.g., carbon dioxide [CO2] slush, liquid nitrogen), refer to Policy Statement III

         Related CMP #8.01.21 Light and Laser Therapies for Dermatologic Conditions

2. Actinic keratoses
    a. The use of surgical or medical treatment methods, including, but not limited to cryosurgery, curettage, and excision

    Related CMP #8.01.21 Light and Laser Therapies for Dermatologic Conditions

3. Benign skin lesions, including skin tag removal (11200-11201, 11300-11313, 1140-11474, 17110-17111):
    a. Treatment is required due to bleeding, pain, recent changes in physical appearance (e.g., color, size), obstruction of an orifice, clinically restricts eye function, or exposure to frequent irritation.

    For any other indication, refer to Policy Statement II.

4. Breast procedures: augmentation with implant (19325), correction of asymmetry, grafting of autologous fat or tissue (15769, 15771-15772), mastopexy/breast lift (19316), nipple tattooing (11920, 11921, 11922) when **EITHER** of the following criteria are met:
    a. A significant functional deficit is documented; **or**
    b. When performed during or after surgical mastectomy, including partial mastectomy (e.g., lumpectomy, segmentectomy, quadrantectomy) for benign or malignant disease as required under applicable law.

    For any other indication, refer to Policy Statement II.

    Related CMP #10.01.01 Breast Reconstruction Surgery and Prophylactic Breast Cancer Risk-Reducing Mastectomy

    Related CMP #7.01.39 Reduction Mammaplasty (Mammoplasty) for female breast reduction.

    Related criteria InterQual, Reduction Mammaplasty, Male for male mastectomy for gynecomastia.

5. Congenital chest wall deformity surgical correction (21740, 21742, 21743):
    a. Pectus excavatum:
        i. Haller index is 3.25 or greater;
        ii. **ONE** (1) of the following criteria documenting functional impairment are met:
            a) Cardiac impairment including but not limited to conduction abnormalities, cardiac displacement, reduced cardiac output;
            b) Pulmonary impairment as evidenced by paradoxical respirations or pulmonary function tests (PFTs) demonstrating restrictive or obstructive lung capacity; **or**

c) Exercise intolerance as demonstrated by cardiopulmonary exercise testing (CPET) results that are below the predicted values; (See Policy Guidelines).

b. Pectus carinatum or Poland syndrome:

i. **ONE** (1) of the following criteria documenting functional impairment are met:

a) Cardiac impairment including but not limited to conduction abnormalities, cardiac displacement, reduced cardiac output;

b) Pulmonary impairment as evidenced by paradoxical respirations or pulmonary function tests (PFTs) demonstrating restrictive or obstructive lung capacity; **or**

c) Exercise intolerance as demonstrated by cardiopulmonary exercise testing (CPET) results that are below the predicted values; (See Policy Guidelines).

6. Dermabrasion (15780, 15781, 15782, 15783)

a. When the documented functional deficit results from a traumatic injury, previous surgery, or burn.

For any other indication, refer to Policy Statement II.

7. Ear or body piercing repair (12001, 12011, 12051)

a. Repair, immediately post-injury, of traumatic laceration

For any other indication, refer to Policy Statement II.

8. Hemangioma treatment (17106, 17107, 17108)

a. Treatment of hemangioma(s), including laser therapy, when a functional deficit (e.g., bleeding, ulceration, affecting a vital structure [e.g., nose, eyes, lips]) is documented.

9. Hyperhidrosis

a. Surgical treatments including endoscopic transthoracic sympathicotomy/ sympathectomy (ETS), sympathectomy (radial artery, ulnar artery, superficial palmar arch), video assisted thoracic sympathectomy (VATS), and surgical excision of axillary sweat glands (32664, 64821, 64822, 64823, 97033) when **BOTH** of the following criteria are met:

i. Documentation of **ONE** of the following:

a) a medical complication such as skin breakdown with secondary infections (e.g., folliculitis or cellulitis requiring treatment with systemic antibiotics, or fissuring or cracking); **or**

b) documented significant biopsychosocial functional impairments (e.g., agoraphobia requiring mental health intervention); **and**

ii. Documentation supporting inability to tolerate or failure of **ALL** the following conservative therapies:

a) Topical aluminum chloride or other extra-strength antiperspirants are ineffective or result in a severe rash;

b) Patient is unresponsive or unable to tolerate pharmacotherapy prescribed for excessive sweating; **and**

c) For treatment of primary focal axillary hyperhidrosis only: Patient has failed to adequately respond to treatment with botulinum toxin A (Botox A).

For other treatments, refer to Policy Statement III.

10. Hypertrophic scar revision (e.g., burn laceration, surgical incision, and keloid) (0479T, 0480T, 11400 - 11446, 11900, 11901, 17110, 17111, 17999) when **ALL** of the following criteria are met:

a. The treatment is expected to improve the significant functional deficit (e.g., contracture, limited range of motion; **and**

b. Treatment includes **ONE** (1) of the following:

i. intralesional injection of corticosteroid or 5-fluorouracil;

ii. fractional ablative laser; **or**

iii. surgical excision.

This policy does not address adjunct radiation treatment for keloids.

Related CMP #10.01.01 Breast Reconstruction Surgery and Prophylactic Breast Cancer Risk-Reducing Mastectomy

11. Otoplasty / Pinnaplasty (69300)

a. For the treatment of congenital protruding or prominent ears when **BOTH** of the following are met:

i. a functional deficit is documented; **and**

ii. when the distance from helical rim to mastoid is greater than or equal to 2.1 centimeters (cm) (normal distance is 1.5-2.0 cm).

12. Rhytidectomy (face lift) (15824 - 15829)

a. The functional deficit is a result of facial nerve palsy

For any other indication, including glabella (frown line correction), refer to Policy Statement II.

13. Rosacea, including erythematotelangiectatic rosacea (visible dilated blood vessels [telangiectasia]) (17106-17108)

a. When **ONE** of the following treatment methods is used to treat the functional deficit (e.g., bleeding, ulceration, affecting a vital structure [e.g., nose, eyes, lips]):

i. Photoablation

ii. Laser treatment; **or**

iii. Ultraviolet light therapy.

14. Vulvectomy (56620, 56625)

a. Vulvectomy as part of surgery to treat cancer or pre-cancerous lesions (dysplasia) is considered **medically appropriate**.

For vaginal rejuvenation procedures, refer to Policy Statement II.

Cosmetic Procedures

II. Cosmetic procedures are performed to reshape structures of the body to improve a patient's appearance or self-esteem in the absence of a functional deficit.

Unless the criteria outlined in Policy Statement I are met, the following non-inclusive list of procedures are typically considered cosmetic and **not medically necessary** for **ALL** indications. A medical exception may be considered when clinical records document a significant functional deficit that cannot be adequately addressed through conservative treatments.

A. Benign skin lesions (11300-11313; 11400-11471; 17110-17111);

B. Body sculpting, non-surgical (e.g., cryolipolysis [also known as fat freezing; e.g., CoolSculpting], deoxycholic acid injection [e.g., Kybella, CPT J0591]);

C. Breast augmentation with implants (19325);

D. Breast lift (mastopexy) (19316);

E. Chemical exfoliation or peel (15788 - 15793, 17360);

F. Comedone extraction, including when combined with light/laser technology (e.g., TheraClearX);

G. Dermabrasion (15780 - 15783);

H. Grafting of autologous fat or tissue (15769 - 15772);

I. Hairplasty (hair transplant) (15775, 15776);

J. Hair removal, including for treatment of hirsutism or hypertrichosis (17380, 17999);

K. Ear or body piercing (69090);

L. Ear lobe or body piercing repair (12001, 12011, 12051);

M. Rhytidectomy, including for glabella (frown line) correction (15824 - 15829);

N. Tattooing (CPT 11920, 11921, 11922);

O. Tattoo removal (CPT 11920, 11921, 11922, 15783);

P. Vaginal rejuvenation (e.g., labiaplasty, vulvectomy) (56620, 56625);

Q. Voice lifting procedures.

III. The following procedures are considered **investigational**:

A. Cryotherapy (carbon dioxide [CO2] slush, liquid nitrogen) in the treatment of acne (17340);

B. The following treatments for hyperhidrosis: acupuncture, axillary liposuction, homeopathy, hypnosis, massage, and phytotherapy (use of extracts from natural origin as medicines);

C. Autologous epidermal cell (cultured and noncultured melanocytic) transplantation for skin repigmentation as a treatment for vitiligo (15011 – 15018, C1832).

POLICY GUIDELINE(S)

I. Requests for procedures or services will be considered in accordance with State and Federal Law.

II. When procedures are intended to improve impaired function/functional deficit, coverage will be

considered based on adequate documentation submitted for clinical review. Documentation must be provided upon request and prior to performing the procedure. This may include objective documentation of any impairment(s), study/test results, description and duration of conservative treatments, photographs, copies of consultations, and any other pertinent information.

III. If a medical condition results from a cosmetic procedure, medically necessary services required to treat the medical condition will be eligible for coverage. Common, anticipated, side effects (e.g., nausea and vomiting that results in a prolonged hospital stay) are considered part of the cosmetic procedure and are ineligible for coverage.

IV. Normal cardiopulmonary exercise testing (CPET) results: peak oxygen content (PVO_2) > 84% predicted; ventilatory anaerobic threshold (VAT) > 40% PVO2 (40–80%); maximum heart rate (HRmax) > 90% age predicted; heart rate reserve (HRR) < 15 beats per minute; blood pressure (BP) < 220/90; O2 pulse (VO2/HR) > 80%; Ventilatory reserve (VR) MVV2VEmax > 11 liters or VEmax/MVV x 100 < 85%, respiratory rate (RR) < 60 breaths per minute; minute ventilation/carbon dioxide output ratio (VE/VCO2) at VAT < 34 (Albouaini 2007).

DESCRIPTION

Acne vulgaris is a chronic, inflammatory skin disease that primarily presents with open or closed comedones, papules, pustules, or nodules on the face or trunk and may result in pain, erythema, hyperpigmentation, or scars. Acne inversa (hidradenitis suppurativa) is a chronic follicular occlusive disease primarily affecting the axilla, waist, groin, perianal, perineal, and inframammary areas.

Actinic keratosis (AKs), also known as solar keratoses, are common, sun-induced skin lesions that are confined to the epidermis and have the potential to become a skin cancer. Various options exist for treating AKs, including cryosurgery with liquid nitrogen, topical drug therapy, and curettage. Less commonly performed treatments for AK include dermabrasion, excision, chemical peels, laser therapy, and photodynamic therapy.

Hyperhidrosis is defined as excessive sweating beyond a level required to maintain normal body temperature, in response to heat exposure or exercise. It can be classified as primary or secondary. Primary focal hyperhidrosis is idiopathic, typically involving the hands (palmar), feet (plantar), or axillae (underarms). Secondary hyperhidrosis can result from a variety of drugs (e.g., tricyclic antidepressants, selective serotonin reuptake inhibitors) or underlying diseases/conditions (e.g., febrile diseases, diabetes, menopause). Secondary hyperhidrosis is usually generalized or craniofacial sweating. Secondary gustatory hyperhidrosis is excessive sweating on ingesting highly spiced foods. Frey syndrome is an uncommon type of secondary gustatory hyperhidrosis that arises from injury to surgery near the parotid gland resulting in damage to the secretory parasympathetic fibers of the facial nerve. A variety of therapies have been investigated for primary hyperhidrosis, including topical therapy with aluminum chloride, topical anticholinergic medications, oral anticholinergic medications, iontophoresis, intradermal injections of botulinum toxin, endoscopic transthoracic sympathectomy, and surgical excision of axillary sweat glands. Treatment of secondary hyperhidrosis focuses on treatment of the underlying cause, such as discontinuing certain drugs or hormone replacement therapy as a treatment for menopausal symptoms.

Keloids and hypertrophic scars are fibroproliferative disorders that result from aberrant wound healing in predisposed individuals following trauma, inflammation, surgery, or burns. While hypertrophic scars do not exceed the margins of the original wound, keloids are characterized by continuous growth and invasion into the adjacent, healthy skin beyond the original wound boundary. Keloids are often associated with pain and itch, can be disfiguring, and impair function and quality of life. Keloids also have a marked tendency to recur when surgically excised. Although hypertrophic scars and, especially, keloids are widely perceived as difficult to treat and at high risk of recurrence, advances in the understanding of the pathophysiology of abnormal scars has led to improved therapeutic approaches and outcomes (Ogawa 2024). Numerous treatment options exist (e.g., intra-lesional corticosteroid injections, pressure therapy, cryotherapy, surgical excision followed by immediate adjunctive postoperative low dose radiation therapy. Radiation is typically indicated for recurrent keloids or those at high risk of recurrence.

Otoplasty is a surgical procedure performed to correct protruding or prominent ears, a congenital deformity that can result in social and psychological problems. Assessment of the ear includes measurement of the distance from the scalp to the helix at three points. In the normal ear, the upper third of the helix is 10-12 millimeters (mm) from the skull, the middle third is 16-18 mm from the skull, and the lobule is 20-22 mm from the mastoid and should not project beyond the upper two thirds of the ear. The ideal age for otoplasty surgery is 4 or 5, which is when the ears have become firmer and mostly stopped growing.

Pectus defects are a group of congenital conditions where the sternum is depressed back towards the spine (excavatum), protrudes forwards (carinatum) or more rarely is a mixture of both. For the majority of patients, it is well tolerated, but some patients are affected psychologically, physiologically, or both. A small number of patients have more extreme depression of their sternum that impedes their physiological reserve, which can occur when engaging in strenuous exercise (e.g., running) but can also limit moderate activity such as walking and climbing stairs. The effects can be so extreme that symptoms occur at rest or cause life-threatening compression of the major blood vessels and organs (Dunning 2024). When investigating a patient with pectus excavatum with suspected cardiac compression, cross-sectional imaging of the thorax to determine the Haller index. A Haller index of 3.25 is consistently used to determine the severe category.

Poland syndrome is a rare congenital condition that is classically characterized by absence (aplasia) of chest wall muscles on one side of the body (unilateral) and abnormally short, webbed fingers (symbrachydactyly) of the hand on the same side (ipsilateral) (National Organization for Rare Disorders 2015). Affected individuals may have variable associated features, such as underdevelopment or absence of one nipple (including the darkened area around the nipple [areola]) and/or patchy absence of hair under the arm. In females, there may be underdevelopment or absence of one breast and subcutaneous tissues. In some cases, associated skeletal abnormalities may also be present, such as underdevelopment or absence of upper ribs; elevation of the shoulder blade (Sprengel deformity); and/or shortening of the arm, with underdevelopment of the forearm bones (i.e., ulna and radius). Surgical intervention, although rarely necessary, can be indicated for reasons including paradoxical movement of the chest wall, severe rib hypoplasia and aplasia, hypoplasia or aplasia of the female breast, and cosmetic indication for men and women with chest

wall asymmetry (Tafti 2023).

Rosacea is characterized by episodic erythema, edema, papules, pustules, and telangiectasia that occur primarily on the face but also present on the scalp, ears, neck, chest, back, and occasionally rosacea may affect the eyes. Rosacea is not life-threatening, but if not treated, it may lead to persistent erythema, telangiectasias, and rhinophyma (hyperplasia and nodular swelling and congestion of the skin of the nose). While the clinical manifestations of rosacea do not usually impact the physical health status of the patient, psychological consequences from the most visually apparent symptoms (i.e., erythema, papules, pustules, telangiectasias) may impact quality of life. Rhinophyma, an end-stage form of chronic acne, has been associated with obstruction of nasal passages and basal cell carcinoma in rare, severe cases. The probability of developing nasal obstruction or basal or squamous cell carcinoma with rosacea is not sufficient to warrant the preventive removal of rhinophymatous tissue. Treatment may include pharmacologic therapy or nonpharmacologic therapies such as dermabrasion, chemical peels, surgical debulking, and electrosurgery.

Vitiligo is a disease that causes areas of skin to lose color, resulting in spots and patches of lighter skin that can develop anywhere on a person's skin (American Academy of Dermatology 2022). Vitiligo can affect eyes, mucous membranes, hair color, and melanocytes in the inner ear leading to hearing loss. When vitiligo is actively destroying cells that give a person's skin its color, the patches can itch and can be pink or tricolor (causing a zone of tan skin between a person's natural skin color and the white vitiligo). Once vitiligo is no longer active, the patches turn completely white. There is no one best treatment for vitiligo. Personal preference, the type of vitiligo, where it appears on the body, and how it's progressing also play important roles. Treatment options include cover up (makeup or self-tanner), medication (e.g., corticosteroids, tacrolimus ointment, JAK inhibitor), and light therapy. The transplantation of cultured and noncultured melanocytic cells has emerged as one of the most novel treatment alternatives and consists of obtaining melanocytic and keratinocyte cells from a donor site and then transplanting them to the diseased site. This treatment can be performed autologously using different graft harvesting methods, as well as cell preparation (Souroujon 2023).

SUPPORTIVE LITERATURE

Acne Treatment Procedures

Cryotherapy (cryoslush) treatment has insufficient published evidence to determine the safety and efficacy for the treatment of acne. A pilot clinical trial investigated the feasibility and efficacy of precision cryotherapy for acne vulgaris on a small sample of volunteers (n=20) using the TargetCool (RecensMedical Inc.) carbon dioxide-based device (Hong 2024). The authors reported a significant reduction (90.25%) in the acne lesion count by week 4, with clinical improvement indicated by the Investigator Global Assessment (IGA) scale score reduction ($p<0.001$). The erythema index (EI) showed notable improvements at weeks 1, 2, and 4. Study limitations (e.g., small size and short-term follow-up) are noted to impact the generalizability of the results.

Actinic Keratosis (AK)

There is significant evidence from prospective studies and comparative trials to support the use of cryosurgery as a readily available, rapid, and effective lesion-directed treatment for AKs. Clinically,

cryosurgery has been reported to cure between 57% and 98.8% of AKs followed up over 3 months to 8.5 years (Eisen 2021).

Steeb et al (2020) conducted a systematic review and meta-analysis assessing the efficacy and safety of chemical peels for the treatment of actinic keratosis. A total of eight (8) trials were included in the systematic review (4 RCTs, 2 non-randomized controlled trials, and 2 single-arm studies). Data analysis and interpretation of results were challenged by the presence of multiple study designs and the investigation of multiple distinct comparisons. The studies included in the review were at a high risk for selection bias because only one study clearly described the generation of a random sequence and performed allocation concealment. None of the patients in the studies were blinded; blinding of the outcome assessor was described in one study. Additionally, the chosen efficacy outcomes refer to short-term clearance rates but may not reflect long-term results. Overall, the authors concluded that additional high-quality studies and a standardization of peeling protocols were warranted in order to appropriately determine the value of chemical peeling as a treatment for actinic keratoses.

Congenital Chest Wall Deformity Correction

Zens et al (2022) acknowledge that repair of pectus excavatum has cosmetic benefits, but the physiological impacts remain controversial. A single-center analysis was conducted to characterize the relationship between the degree of pectus excavatum and cardiopulmonary dysfunction seen on cardiac magnetic resonance (CMR; n=345) imaging, cardiopulmonary exercise testing (CPET; n=261), and pulmonary function testing (PFT; n=281). The right ventricular ejection fraction (RVEF) was < 0.50 in 16% of patients, left ventricular ejection fraction (LVEF) was < 0.55 in 22%, RVEF Z-score was < -2 in 32%, and the LVEF Z-score was < -2 in 18%. CPET revealed 33% of patients had reduced aerobic fitness. PFT results were abnormal in 23.1% of patients. Adjusted analyses revealed the Haller index had significant (P<.05) inverse associations with RVEF and LVEF. The authors concluded the severity of pectus excavatum is associated with ventricular systolic dysfunction. Pectus excavatum impacts right and left ventricular systolic function and can also impact exercise tolerance. The Haller index and correction index may be the most useful predictors of impairment.

Rosacea

No randomized controlled trials (RCTs) evaluating dermabrasion, chemical peels, surgical debulking, or electrosurgery for treating rosacea were identified.

Scar Revision, Including Burn and Keloid

Walsh et al (2023) conducted an evidence-based systematic review of recent advances in keloid treatments up to November 2020. The search was limited to prospective studies (n=108) that were peer-reviewed and reported on clinical outcomes of keloid therapies. The authors concluded that current literature supports silicone gel or sheeting with corticosteroid injections as first-line therapy for keloids. Adjuvant intralesional 5-fluorouracil (5-FU), bleomycin, or verapamil can be considered, although mixed results have been reported with each. Laser therapy can be used as independent therapy for keloids or in combination with intralesional corticosteroids or topical steroids with occlusion to improve drug penetration. Excision of keloids with immediate post-excision radiation therapy is an effective option for recalcitrant lesions. There is sparse but emerging evidence on the

utilization of photodynamic therapy (PDT) in treating keloids and hypertrophic scars. Extracorporeal shockwave therapy (ESWT) as a monotherapy for keloids showed a reduction in volume, height, and appearance that was not significantly different compared to intralesional triamcinolone. Further long-term studies of the effect of ESWT would be interesting as an additional treatment modality prior to excision. Intralesional cryotherapy is recommended for smaller lesions. Laser-assisted delivery of corticosteroids and combination of different lasers for treatment of keloids are emerging treatments.

Vitiligo – Transplantation

The evidence is insufficient to determine that the procedure results in an improvement in the net health outcome.

Souroujon and colleagues (2023) aimed to address the gap in knowledge and literature on autologous cell transplant as a therapeutic approach for stable segmental vitiligo. Stating that autologous cell transplant has emerged as a promising modality for managing vitiligo, with cultured and non-cultured transplants being considered when determining the patient's treatment approach, the authors conducted a systematic review of the literature to assess the efficacy of the melanocyte and keratinocyte transplantation. Six studies were assessed (2 case reports, 3 pilot studies, 1 case series), for a total of 23 patients. Although the studies were limited by factors such as sample size, lack of data (e.g., age), and use of different technique for cell preparation, the authors concluded that autologous cell transplantation in stable segmental vitiligo holds tremendous promise as a viable alternative. Final recommendation is to further explore and thoroughly investigate the potential of cell transplantation and its associated techniques to establish comprehensive guidelines for standardizing transplantation procedures.

Lou and colleagues (2024) conducted a systematic review and meta-analysis of randomized trials to assess the efficacy and safety of autologous epidermal cell suspensions for re-epithelialization of skin lesions. The primary output measure was the healing time, and the secondary outputs were effective rate, size of donor site for treatment, size of study treatment area, operation time, pain scores, repigmentation, complications, scar scale scores and satisfaction scores. A total of 32 RCTs met inclusion criteria, for a total of 1552 patients grouped into the autologous epidermal cell suspensions group, control group, and within-subject controlled. Of these trials, stable vitiligo was studied in 12 trials (n=417 patients), with a follow-up range of 3- to 24-months. The pooled data from all included studies demonstrated that the treatment group has significantly reduced healing time ($p=0.02$), size of donor site for treatment ($p<0.001$) operation time ($p<0.001$), pain scores ($p=0.0002$), and complications ($p=0.03$). There were no significant differences in the size of study treatment area, depigmentation, scar scale scores and satisfaction scores between the two groups. Identified study limitations include a small number of studies, study bias, and varying methodological quality. Specific to stable vitiligo, the authors concluded that autologous epidermal cell suspensions present a safe and effective treatment and is potentially useful in early-stage interventions. Overall, the authors conclude that this systematic review support the potential role of autologous epidermal cell suspensions as a novel approach to the management of acute or chronic wounds, and vitiligo; however, the authors found that this intervention has minimal impact on size of treatment area, repigmentation, scar scale scores and satisfaction scores.

PROFESSIONAL GUIDELINE(S)

Acne Vulgaris

The American Academy of Dermatology (AAD) issued guidelines for the care management of acne vulgaris with 18 evidenced-based recommendations and five (5) good practice statements (Reynolds 2024). The AAD made a good practice recommendation supporting the use of intralesional corticosteroid injections as an adjuvant therapy treatment option in patients with larger acne papules or nodules. The AAD found that the available evidence is insufficient to develop a recommendation on the use of acne lesion/comedo extraction, chemical peels (including glycolic acid, trichloroacetic acid, salicylic acid, Jessner's solution, or mandelic acid), or photodynamic therapy with aminolevulinic acid for the treatment of acne.

In 2023 the National Institute for Health and Care Excellence (NICE) published updated guidelines on the management of acne vulgaris and recommends the use of intralesional corticosteroids in treating severe inflammatory cysts.

Actinic Keratosis

The American Academy of Dermatology (AAD) issued guidelines for the care management of actinic keratosis with 18 recommendations based on the best available evidence (Eisen 2021). Strong recommendations are made for using ultraviolet protection, topical imiquimod, topical 5-fluorouracil, and cryosurgery. A conditional recommendation, based on moderate evidence, was made for treatment with cryosurgery over CO2 laser ablation and for treatment with aminolevulinic acid (ALA)-red light photodynamic therapy (PDT) over 35% trichloroacetic acid (TCA) peel.

Hirsutism

In 2018, the Endocrine Society issued clinical practice guidelines for the evaluation and treatment of Hirsutism (Martin et al., 2018). The goal in assessing hirsutism is to determine the specific etiology and to provide a baseline for the patient. There are two main approaches to the management of hirsutism that may be used either individually or in combination: pharmacologic therapies that target androgen production and action, and direct hair removal methods. The Endocrine Society suggests pharmacotherapy as initial therapy. Cosmetic measures to manage hirsutism include methods that remove hair shafts from the skin surface (depilation) and those that extract hairs to above the bulb (epilation). Shaving is a popular depilation method that removes hair down to just below the surface of the skin. Chemical depilatory agents are also commonly used to dissolve the hair. Epilation methods (e.g., plucking or waxing) can cause some discomfort but are relatively safe and inexpensive. These methods do not cause an increase in hair diameter.

Hyperhidrosis

This International Hyperhidrosis Society developed five separate clinical guidelines and algorithms for treatment of hyperhidrosis (generalized as well as focal) to help guide clinicians as they determine the optimal therapeutic course. The general recommendation is to attempt more conservative therapy before resorting to invasive treatment.

The National Institute for Health and Care Excellence (NICE) issued two interventional procedures guidance recommendations for hyperhidrosis. In 2014, endoscopic thoracic sympathectomy (ETS) was recommended for primary hyperhidrosis of the upper limb only for patients suffering from severe and debilitation primary hyperhidrosis that has been refractory to other treatments. In 2017, NICE determined that the evidence on the safety and efficacy of transcutaneous microwave ablation for severe primary axillary hyperhidrosis is inadequate in quantity and quality.

Hypertrophic Scar Revision, Including Burn and Keloid

In 2019, in the absence of guidelines on the use of superficial radiation therapy (SRT) for treatment of keloids a group of qualified dermatologists issued consensus guidelines with recommendations for treatment based on published evidence (Nestor 2019). The authors reported that an enormous body of literature has demonstrated the effectiveness of SRT as an adjunctive therapy for the treatment of keloid scars that are resistant to other therapies, postsurgical treatment of keloid excision suture lines with several fractions of SRT significantly reduces keloid recurrence rates, and with three (3) post-surgical fractions. Although effective outcomes can be achieved with single doses of SRT, long-term sequelae are improved with three doses.

In 2020, an international consensus recommendation for laser treatment of traumatic scars and contractures was published (Seago 2020). The panel members are unanimous in their view that lasers are a first-line therapy in the management of traumatic scars and contractures. The lasers that target all major chromophores in the skin have demonstrated utility in the management of traumatic scars including hemoglobin (e.g., 595-nm pulsed dye laser [PDL]), pigment (e.g., 532-, 694-, 755-, and 1064-nm lasers), and tissue water (e.g., 1,540- and 1,565-nm non-ablative fractional lasers [NAFL]), 2940- and 10,600-nm ablative fractional lasers (AFL), and full- field ablative lasers. The fractional lasers, especially AFL, have the most potential to treat the entire range of clinical issues as a single modality.

- For larger traumatic injuries such as burns, over 90% of panelists would begin laser treatment within 4 months or less, and 76% within 2 months or less. Early intervention to minimize pathological scar formation and related disability is an important paradigm shift in traumatic scar treatment, and an essential potential benefit of minimally invasive laser procedures.

Ogawa et al (2022) published an updated algorithms for the treatment and prevention of hypertrophic scars and keloids. Treatment of hypertrophic scars depends on scar contracture severity: if severe, surgery is the first choice. If not, conservative therapies are indicated. Conservative therapies (e.g., gel sheets, tape fixation, topical and injected external agents, should be administered on a case-by-case basis. Keloid treatment depends on whether they are small and single or large and multiple. Small and single keloids can be treated radically by surgery with adjuvant therapy (e.g., radiotherapy) or multimodal conservative therapy. For large and multiple keloids, volume- and number-reducing surgery is a choice. Regardless of the treatment(s), patients should be followed up over the long term.

Otoplasty

According to the American Society of Plastic Surgeons (ASPS), otoplasty is a medically necessary and

reconstructive surgery when it is performed to approximate a normal appearance, even if it does not improve function (ASPA 2015).

Pectus Excavatum and Pectus Carinatum

In 2012, the American Pediatric Surgical Association (APSA) issued clinical practice guidelines with recommendation to assist pediatric surgeons and pediatricians in the evaluation and management of children with pectus carinatum.

- Without strong evidence for ideal timing of treatment, expert opinion suggests that the age for operative therapy must be individualized but is typically deferred until pubertal growth in nearly complete.
- For the compliant pectus deformity, nonoperative compressive orthotic bracing is usually an appropriate first line therapy as it does not preclude the operative option.
- Expert opinion suggests that the noncompliant chest wall deformity or significant asymmetry of the pectus carinatum deformity caused by a concomitant excavatum-type deformity may not respond to orthotic bracing.
- Open surgical reconstructive techniques are acceptable surgical options in the hands of experienced pediatric surgeons.
- Unless there is some overwhelming indication for repair, operative repair of pectus chest wall deformities is to be discouraged in children ages 5 years and younger due to the risk of disruption of normal chest wall growth with resultant chest wall restriction.

In 2024, joint specialist societies issued best practice consensus guidelines on the treatment of patients with pectus abnormalities (Dunning et al 2024), including the following recommendations:

- Patients with severe pectus excavatum with a Haller index above 3.25 and objective evidence of cardiac compression benefit physiologically from surgical intervention. (Class I, Level of Evidence B)
- Some patients who experience shortness of breath and exercise intolerance but do not fit the preceding criteria may also benefit from surgery, but other objective parameters should be used to determine the likelihood of improvement in cardiovascular performance. (Class IIb, Level of Evidence C)
- For patients with very severe pectus excavatum and evidence of symptomatic malignant arrhythmias with no other cause identified, surgical treatment is indicated to mitigate the risk of death from that arrhythmia. (Class I, Level of Evidence C)
- Surgery is indicated in patients with syncope or presyncope due to severe pectus excavatum. (Class I, Level of evidence C)
- Patients with very severe pectus excavatum and dysphagia (not otherwise explained by esophageal pathology) should benefit from surgery to relieve these symptoms. (Class IIa, Level of Evidence C)

- Bracing is a highly effective and safe conservative treatment for patients with significant pectus carinatum and must be available to all suitable patients who wish to be treated for their condition. It has fewer risks and is cheaper than an operation and still provides good outcomes. (Class I, Level of Evidence B)

Poland Syndrome (PS)

In 2020, the Italian Association of Poland Syndrome (AISP) issued consensus-based recommendation for diagnosis and medical management of Poland syndrome (Baldelli 2020). AISP reports that there are no strict guidelines or indications regarding thoracic surgery in the current literature. The mandatory feature of PS is the agenesis or hypoplasia of the pectoralis major muscle (the sterno-costal head is always affected). In most cases, PS is unilateral. Presumed bilateral PS needs a more extensive differential diagnosis. Additional diagnostic criteria are hypo/aplasia of the homolateral mammary gland and nipples, and malformations of the homolateral upper limb (limited to or more severely affecting the central rays).

- The indication for thoracic surgery is usually related to severe rib cage anomalies, either regarding anterior chest wall (pectus excavatum, carinatum or combination of both) or ribs (rib agenesis).
- Respiratory symptoms are not common in PS patients. Lack of protection of lungs and other thoracic organs due to the rib cage defect (rib agenesis) does not indicate per se thoracoplasty during childhood.

Rosacea

The National Rosacea Society's standard management options for rosacea (Thiboutot 2019) and the American Acne & Rosacea Society's update on the management of rosacea (Del Rosso 2019) do not address chemical peels or dermabrasion as treatment options for rosacea.

Vitiligo – Cellular Transplant

The international Vitiligo Task Force issued a consensus position statement, part 2, for specific treatment recommendations (Senschal 2023). Surgery should be reserved for patients with stable vitiligo and other localized and stabilized forms of vitiligo (non-segmental) after the documented failure of medical interventions. Several techniques exist, including punch grafting, suction blister grafting, non-cultured epidermal cellular grafting, and cultured epidermal cellular grafting. Each method has its pros and cons.

REGULATORY STATUS

Not Applicable

CODE(S)

- Codes may not be covered under all circumstances.
- Code list may not be all inclusive (AMA and CMS code updates may occur more frequently than policy updates).

- (E/I)=Experimental/Investigational
- (NMN)=Not medically necessary/appropriate

CPT Codes

Code	Description
0479T	Fractional ablative laser fenestration of burn and traumatic scars for functional improvement; first 100 cm^2 or part thereof, or 1% of body surface area of infants and children
0480T	each additional 100 cm^2, or each additional 1% of body surface area of infants and children, or part thereof (List separately in addition to code for primary procedure)
10040	Acne surgery (e.g., marsupialization, opening or removal of multiple milia, comedones, cysts, pustules)
11200	Removal of skin tags, multiple fibrocutaneous tags, any area; up to and including 15 lesions
11201	each additional 10 lesions, or part thereof (List separately in addition to code for primary procedure)
11300	Shaving of epidermal or dermal lesion, single lesion, trunk, arms, or legs; lesion diameter 0.5 cm or less
11301	lesion diameter 0.6 to 1.0 cm
11302	lesion diameter 1.1 to 2.0 cm
11303	lesion diameter over 2.0 cm
11305	Shaving of epidermal or dermal lesion, single lesion, scalp, neck, hands, feet, genitalia; lesion diameter 0.5 cm or less
11306	lesion diameter 0.6 to 1.0 cm
11307	lesion diameter 1.1 to 2.0 cm
11308	lesion diameter over 2.0 cm
11310	Shaving of epidermal or dermal lesion, single lesion, face, ears, eyelids, nose, lips, mucous membrane
11311	lesion diameter 0.6 to 1.0 cm
11312	lesion diameter 1.1 to 2.0 cm
11313	lesion diameter over 2.0 cm
11401 - 11406	Excision, benign lesion including margins, except skin tag (unless listed

Code	Description
	elsewhere), trunk, arms, or legs (code range)
11420 - 11426	Excision, benign lesion including margins, except skin tag (unless listed elsewhere), scalp, neck, hands, feet, genitalia (code range)
11440 - 11446	Excision, other benign lesion including margins, except skin tag (unless listed elsewhere), face, ears, eyelids, nose, lips, mucous membrane; (code range)
11900	Injection, intralesional; up to and including 7 lesions
11901	more than 7 lesions
11920	Tattooing, intradermal introduction of insoluble opaque pigments to correct color defects of skin, including micropigmentation; 6.0 sq cm or less
11921	6.1 to 20.0 sq cm
11922	each additional 20.0 sq cm, or part thereof (List separately in addition to code for primary procedure)
12001	Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 2.5 cm or less
12011	Simple repair of superficial wounds of face, ears, eyelids, nose, lips and/or mucous membranes; 2.5 cm or less
12051	Repair, intermediate, wounds of face, ears, eyelids, nose, lips and/or mucous membranes; 2.5 cm or less
15011 (*E/I)	Harvest of skin for skin cell suspension autograft; first 25 sq cm or less (*E/I for diagnosis codes L80 Vitiligo; H02.73-H02.739; N90.8-N90.89)
15012 (*E/I)	each additional 25 sq cm or part thereof (List separately in addition to code for primary procedure) (*E/I for diagnosis codes L80 Vitiligo; H02.73-H02.739; N90.8-N90.89)
15013 (*E/I)	Preparation of skin cell suspension autograft, requiring enzymatic processing, manual mechanical disaggregation of skin cells, and filtration; first 25 sq cm or less of harvested skin (*E/I for diagnosis codes L80 Vitiligo; H02.73-H02.739; N90.8-N90.89)
15014 (*E/I)	each additional 25 sq cm of harvested skin or part thereof (List separately in addition to code for primary procedure) (*E/I for diagnosis codes L80 Vitiligo; H02.73-H02.739; N90.8-N90.89)
15015 (*E/I)	Application of skin cell suspension autograft to wound and donor sites, including application of primary dressing, trunk, arms, legs; first 480 sq cm or less (*E/I for diagnosis codes L80 Vitiligo; H02.73-H02.739; N90.8-N90.89)

Code	Description
15016 (*E/I)	each additional 480 sq cm or part thereof (List separately in addition to code for primary procedure) (*E/I for diagnosis codes L80 Vitiligo; H02.73-H02.739; N90.8-N90.89)
15017 (*E/I)	Application of skin cell suspension autograft to wound and donor sites, including application of primary dressing, face, scalp, eyelids, mouth, neck, ears, orbits, genitalia, hands, feet, and/or multiple digits; first 480 sq cm or less (*E/I for diagnosis codes L80 Vitiligo; H02.73-H02.739; N90.8-N90.89)
15018 (*E/I)	each additional 480 sq cm or part thereof (List separately in addition to code for primary procedure) (*E/I for diagnosis codes L80 Vitiligo; H02.73-H02.739; N90.8-N90.89)
15769 (NMN)	Grafting of autologous soft tissue, other, harvested by direct excision (e.g., fat, dermis, fascia)
15771 (NMN)	Grafting of autologous fat harvested by liposuction technique to trunk, breasts, scalp, arms, and/or legs; 50 cc or less injectate
15772 (NMN)	each additional 50 cc injectate, or part thereof (List separately in addition to code for primary procedure)
15775 (NMN)	Punch graft for hair transplant; 1 to 15 punch grafts
15776 (NMN)	more than 15 punch grafts
15780	Dermabrasion; total face (e.g., for acne scarring, fine wrinkling, rhytids, general keratosis)
15781	segmental, face
15782	other than face
15783	superficial, any site (e.g., tattoo removal)
15788 (NMN)	Chemical peel, facial; epidermal
15789 (NMN)	dermal
15792 (NMN)	Chemical peel, nonfacial; epidermal
15793 (NMN)	dermal
15824	Rhytidectomy; forehead
15825	neck with platysmal tightening (platysmal flap, P-flap)
15826 (NMN)	glabellar frown lines
15828	cheek, chin, and neck

Code	Description
15829	superficial musculoaponeurotic system (SMAS) flap
17106	Destruction of cutaneous vascular proliferative lesions (e.g., laser technique); less than 10 sq cm
17107	10.0 to 50.0 sq cm
17108	over 50.0 sq cm
17110	Destruction (e.g., laser surgery, electrosurgery, cryosurgery, chemosurgery, surgical curettement), of benign lesions other than skin tags or cutaneous vascular proliferative lesions; up to 14 lesions
17111	15 or more lesions
17340 (E/I)	Cryotherapy (CO2 slush, liquid N2) for acne
17360 (NMN)	Chemical exfoliation for acne (e.g., acne paste, acid)
17380 (NMN)*	Electrolysis epilation, each 30 minutes (*Unless related to gender affirming procedure requests. Refer to Related Policies section for criteria.)
17999 (*NMN)	Unlisted procedure, skin, mucous membrane, and subcutaneous tissue (*NMN when used for laser hair removal, unless related to gender affirming procedure requests. Refer to Related Policies section for criteria.)
19316	Mastopexy
19325	Breast augmentation with implant
21740	Reconstructive repair of pectus excavatum or carinatum; open
21742	minimally invasive approach (Nuss procedure), without thoracoscopy
21743	minimally invasive approach (Nuss procedure), with thoracoscopy
32664	Thoracoscopy, surgical; with thoracic sympathectomy
56620	Vulvectomy simple; partial
56625	complete
64821	Sympathectomy; radial artery
64822	ulnar artery
64823	superficial palmar arch
69090 (NMN)	Ear piercing
69300	Otoplasty, protruding ear, with or without size reduction

PRODUCT DISCLAIMER

- Services are contract dependent; if a product does not cover a service, medical policy criteria do not apply.
- If a commercial product (including an Essential Plan or Child Health Plus product) covers a specific service, medical policy criteria apply to the benefit.
- If a Medicaid product covers a specific service, and there are no New York State Medicaid guidelines (eMedNY) criteria, medical policy criteria apply to the benefit.
- If a Medicare product covers a specific service, and there is no national or local Medicare

coverage decision for the service, medical policy criteria apply to the benefit.

RESOURCE COORDINATION POLICY

Capital District Physicians' Health Plan, Inc.
CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: COSMETIC AND RECONSTRUCTIVE SURGERY

POLICY EFFECTIVE DATE:	4/1/2026
Policy Control #:	1370/20.000071
Next Annual Review:	May, 2026

DISCLAIMER

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgement when deciding the most appropriate care to enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

PROCEDURE CODES

See Exclusions and Attachment A: Covered & Non-Covered Procedures.

See Attachment B for breast reconstruction services.

DESCRIPTIONS

Cosmetic surgery is defined as surgery performed to reshape normal structures of the body in order to improve the patient's appearance and self-esteem, or as an elective treatment for aesthetic improvement of non-disabling physical defects or problems.

Reconstructive surgery is defined as medically necessary surgery performed on an abnormal structure of the body, caused by congenital defects, developmental abnormalities, trauma, infection, tumors, or disease. It is generally performed to improve function.

A surgical procedure is not considered cosmetic when such service is incidental to or follows surgery resulting from trauma, infection, or other diseases of the involved part, or to correct a congenital disease or anomaly of a covered dependent child that has resulted in a functional impairment.

- Orthognathic Surgery, 1370/20.000274.
- Reduction Mammaplasty (Mammoplasty), 7.01.39

POSITION STATEMENT

CDPHP considers a reconstructive procedure medically necessary when performed for one or more of the following indications:

- The procedure is to correct an abnormality that is incidental to or following surgery, trauma, infection, or other diseases of the involved part that has resulted in a functional impairment.
- The procedure is intended to correct a congenital anomaly of a covered dependent child that has resulted in a functional impairment.
- The procedure is performed to correct other abnormalities or anomalies, other than those stated above, that cause significant functional impairment that have not been relieved by application of all available physician-directed conservative measures.
- As required by applicable laws and mandates.

Submission of medical record documentation, from the primary care physician or treating physician, is required and must demonstrate the requested procedure meets one of the criteria stated above. In addition, documentation should include the following information:

- Documentation of the etiology of the abnormality in question.
- Any conservative treatments provided.
- Objective documentation of any functional impairment.
- Studies or tests to confirm the presence of the abnormality and the degree to which it is causing functional impairment.
- Photographs when applicable and/or upon request.
- Consultations and/or operative reports.
- Any other pertinent information to support the medical necessity of the procedure being requested.

Medical Photographs

CDPHP requires original medical photographs to be sent for review to determine the medical necessity of services. Faxed or photo-copied images will not be accepted. The CDPHP preferred method of sending original photos is through our secure provider portal at cdphp.com or by US mail. If sending through US mail, please use the following address:

Capital District Physicians' Health Plan, Inc.
CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: COSMETIC AND RECONSTRUCTIVE SURGERY

CDPHP Utilization Review Department
6 Wellness Way
Latham, NY 12110

The submission of photographs through the portal or US Mail must include the following information:

- Patient Name (Required)
- CDPHP ID# (Required)
- Date of Birth (Required if CDPHP ID# is not available)
- A sentence stating what is attached (i.e., medical photos attached for review)

POLICY CONSIDERATIONS

Services in attachment "A" that have covered indications (not considered cosmetic) may not be inclusive of all indications for the specific service. Some indications could be considered not medically necessary or experimental/investigational and should be submitted for review prior to service being rendered to determine coverage status.

Initial evaluations for establishment of a diagnosis will be allowed.

CDPHP administers benefits for medically necessary removal of skin lesions by all acceptable methods.

- All lesion removals will be reimbursed at CDPHP fee schedule regardless of method of removal.
- All lesion removal services are subject to retrospective review.

CDPHP allows removal of benign skin lesions when symptoms or signs warrant medical intervention such as:

- Bleeding
- Intense itching
- Pain
- Change in physical appearance (i.e., reddening, pigmentary change, enlargement)
- Physical evidence of inflammation or infection (i.e., purulence, edema, oozing, erythema)
- Lesion obstructs an orifice
- Lesion clinically restricts eye function
    - Lesion restricts eyelid function
    - Lesion causes misdirection of eyelashes or eyelid
    - Lesion restricts lacrimal puncta and interferes with tear flow
    - Lesion touches globe
- Clinical uncertainty as to the likely diagnosis, particularly where malignancy is a realistic consideration based on lesion appearance

POLICY NAME: COSMETIC AND RECONSTRUCTIVE SURGERY

- Wart removals is not considered cosmetic when guidelines above are met or if any of the following clinical circumstances are present:
    - Periocular warts associated with chronic recurrent conjunctivitis thought secondary to lesion virus shedding
    - Warts showing evidence of spread from one body area to another, particularly in immunosuppressed patients or warts of recent origin in an immunocompromised patients
    - Lesions are condyloma acuminata or molluscum contagiosum
    - Cervical dysplasia that is associated with genital warts
    - Pregnancy that is associated with genital warts

Pursuant to the applicable participating provider agreement, providers ordering, or performing a non-covered cosmetic service must inform the enrollee of the non-covered status before rendering the service. CDPHP requires a written waiver specific to the service being performed; a generic waiver is not considered to be an acceptable form of enrollee consent.

- If a provider informs the enrollee prior to performing a specific service that the service is not covered, and the enrollee consents to accept liabilities for the services by signing a waiver specific to that service, the provider ***may bill*** the enrollee.
- If a provider performs a specific service without notifying the enrollee the service is not covered, or the enrollee does not consent to accept liability for the specific service, the provider ***may not bill*** the enrollee.

Services performed by aestheticians and billed by a medical provider are not considered medically necessary and are not covered.

Cosmetic procedures do not become eligible for coverage because of psychiatric and/or emotional distress. (For exceptions to this, please refer to the Gender Dysphoria Therapies policy, 1370/20.000447).

Cosmetic and reconstructive services are subject to retrospective review.

EXCLUSIONS

Non-medically necessary cosmetic services, including surgery and elective treatment for aesthetic improvement of non-disabling physical defects or problems.

Surgery for scar repair or revision only, where no functional defect is present.

Procedures performed at the time of the initial visit for cosmetic purposes will not be allowed.

The following list is not all inclusive but contains examples of procedures that are generally considered cosmetic. As such, they are not covered except when a case specific review justifies a medical exception due to documented functional impairment that cannot be addressed through conservative treatment.

- Chemical peel for treatment of skin wrinkles or uneven pigmentation (15788, 15789, 15792, 15793)
- Cryotherapy or chemical exfoliation for treatment of skin wrinkles, uneven pigmentation, or post acne scarring (17340, 17360)
- Correction of diastasis recti abdominis
- Dermabrasion for treatment of skin wrinkles, uneven skin pigmentation, acne, post-acne scarring, removal, or treatment of decorative tattoo (15780, 15781, 15782, 15783)
- Ear or body piercing (69090)
- Ear lobe repair in the absence of accidental injury
- Electrolysis for hirsutism (17380) or laser hair removal (For exceptions to this, please refer to the Gender Dysphoria Therapies policy, 1370/20.000447)
- Excision of excessive skin and subcutaneous tissue of the abdomen, thigh, leg, hip, buttock, arm, forearm or hand, submental fat pad, or other area (15832, 15833, 15834, 15835, 15836, 15837, 15838, 15839)
- Labiaplasty or labia reduction for asymmetrical, enlarged, or hypertrophic labia minora and/or labia majora except when performed as part of initial gender reassignment surgery (15839, 56620)
- Liposuction – suction assisted lipectomy (15876, 15877, 15878, 15879)
- Lipectomy (15832, 15833, 15834, 15835, 15836, 15837, 15838, 15839,)
- Subcutaneous injection of filling material, e.g., collagen (11950, 11951, 11952, 11954)
- Treatment of melasma (L81.0-L81.9)
- Treatment for vitiligo (L80, H02.731-H02.736, H02.739, A67.2, N90.89)
- Treatment/surgery for xanthomas or xanthelasma (H02.60-H02.66)

POLICY NAME: COSMETIC AND RECONSTRUCTIVE SURGERY

ATTACHMENT A

The following table is not all-inclusive but contains examples of covered and non-covered procedures.

CPT Code	Non-covered Indication (cosmetic)	Covered Procedure (Indications to be supported by medical documentation)	Prior Authorization Requirement
15830, 15847	Abdominoplasty, panniculectomy and lipectomy performed solely for purpose of enhancing appearance.	Refer to Resource Coordination Policy: ***Abdominoplasty, Panniculectomy, and Lipectomy Services***, **1370/20.000443.**	Yes
15786, 15787	Abrasion, lesions (e.g., keratosis, scar) repair performed solely for the purpose of enhancing appearance.	Performed due to a congenital disease or anomaly resulting in a functional impairment.	Yes
15820, 15821 15822, 15823 67900, 67901 67902, 67903 67904, 67906 67908, 67909, 67911	Blepharoplasty performed solely for purpose of enhancing appearance.	Refer to Resource Coordination Policy: ***Blepharoplasty, 1370/20.000225.***	Yes
21280, 21282	Canthopexy (revision of upper eyelid) performed solely for purpose of enhancing appearance.	Refer to Resource Coordination Policy*:* **Blepharoplasty, 1370/20.000225.**	Yes
15819	Cervicoplasty (surgery of the neck) performed solely for purpose of enhancing appearance.	Cervicoplasty when performed incidental to or following surgery, trauma, infection, or other diseases of the involved part, or to correct a congenital disease or anomaly of a covered dependent child that has resulted in a functional impairment.	Yes
54150, 54161	Circumcision performed post-newborn period without medical indication.	Circumcision performed beyond the newborn period (four weeks) for the following indications: • Circumcision delayed due to infant being premature or ill; **or** • Symptomatic urinary tract infection or evidence of reflux upon workup in infants up to one year of age; **or**	No

POLICY NAME: COSMETIC AND RECONSTRUCTIVE SURGERY

CPT Code	Non-covered Indication (cosmetic)	Covered Procedure (Indications to be supported by medical documentation)	Prior Authorization Requirement
		• Significant adhesions, infection, or inflammation (balanitis). Surgical intervention for such conditions may be considered appropriate at any age; **or** • Phimosis that is non-responsive to more conservative measures (i.e., steroid creams). Surgical intervention for phimosis is considered appropriate for age groups six years of age and older. Surgery performed on age groups < 6 years may not be medically necessary as phimosis is considered physiologic in nature.	
21137, 21138 21139, 21172 21175, 21179 21180	Forehead reduction or reconstruction performed solely for purpose of enhancing appearance.	Forehead reduction and/or reconstruction when performed incidental to or following surgery, trauma, infection, or other diseases of the involved part, or to correct a congenital disease or anomaly of a covered dependent child that has resulted in a functional impairment.	Yes
21120, 21121 21122, 21123	Genioplasty (chin augmentation) performed solely for purpose of enhancing appearance.	Genioplasty when performed incidental to or following surgery, trauma, infection, or other diseases of the involved part, or to correct a congenital disease or anomaly of a covered dependent child that has resulted in a functional impairment.	Yes
19300	Gynecomastia surgery performed solely for purpose of enhancing appearance or for any indication other than presence of existing breast mass suspicious for malignancy.	Surgical treatment for the removal of an existing breast mass suspicious for malignancy or have confirmed genetic condition of Klinefelter Syndrome.	Yes
15775, 15776 15220, 15221	Hair transplant for alopecia, male pattern baldness or age-related hair thinning in women.	Hair transplant when performed incidental to or following surgery, trauma, infection, or other diseases of the involved part, or to correct a congenital disease or anomaly of a covered dependent child that has resulted in a functional impairment.	Yes
21083, 21087	Impression and custom preparation of palatal lift or nasal prosthesis for purpose of enhancing appearance.	Insertion or injection of prosthetic material for significant deformity when performed incidental to or following surgery, trauma, infection, or other diseases of the involved part, or to correct a congenital disease or anomaly of a covered dependent child that has resulted in a functional impairment.	Yes

POLICY NAME: COSMETIC AND RECONSTRUCTIVE SURGERY

CPT Code	Non-covered Indication (cosmetic)	Covered Procedure (Indications to be supported by medical documentation)	Prior Authorization Requirement
10040, 17110, 17111	Acne (L70.0-L70.9) treatment that does not meet criteria in next column.	Acne extractions/10040 as an initial treatment for severe acne will be considered medically necessary for treatment of painful inflamed cysts or pustules or when one of the below is met: • Documentation supports failure of initial medication treatments (e.g., oral contraceptive hormone therapy, antibiotics, retinoids); • Documentation supports development of side effects of initial medication treatments Comedone extractions are considered not medically necessary. For continued treatments following the initial surgery, procedure notes that identify the treatment technique being utilized and documentation of medical necessity for continued treatment will be required. Only one surgical treatment for acne will be authorized at a time. ** Severe acne treatment with laser, pulsed dye laser, PUVA, etc. (e.g., ClearLight Acne Photoclearing System, AviClear Laser System, TheraClear Acne Therapy) are considered experimental/investigational (refer to Non-Covered Technologies policy).	Yes
21270	Malar augmentation (cheek bone) performed solely for purpose of enhancing appearance.	Malar augmentation when performed incidental to or following surgery, trauma, infection, or other diseases of the involved part, or to correct a congenital disease or anomaly of a covered dependent child that has resulted in a functional impairment.	Yes
21125, 21127 21193, 21194, 21195, 21198, 21245, 21246, 21247, 21249	Mandibular augmentation or mandible or maxilla reconstruction performed solely for purpose of enhancing appearance.	Augmentation or reconstruction of the mandible or maxilla when performed incidental to or following surgery, trauma, infection, or other diseases of the involved part, or to correct a congenital disease or anomaly of a covered dependent child that has resulted in a functional impairment.	Yes

POLICY NAME: COSMETIC AND RECONSTRUCTIVE SURGERY

CPT Code	Non-covered Indication (cosmetic)	Covered Procedure (Indications to be supported by medical documentation)	Prior Authorization Requirement
69300	Otoplasty to correct lop ears, bat ears, or prominent or protruding ears without functional deficiencies.	Otoplasty when performed incidental to or following surgery, trauma, infection, or other diseases of the involved part, or to correct a congenital disease or anomaly of a covered dependent child that has resulted in a functional impairment.	Yes
21740, 21742 21743	Reconstructive repair of pectus excavatum or carinatum without functional impairment.	Surgical repair of pectus excavatum when both of the following criteria are met: Imaging studies (i.e., CT scan) confirm Haller index greater than 3.25 **and** documentation of functional impairment evidenced by one or more conditions below: • Cardiac impairment evidenced by cardiac test results (e.g., echocardiograph, cardiac MRI) that are consistent with external compression (e.g., murmurs, mitral valve prolapse, cardiac displacement or conduction abnormalities). • Pulmonary impairment evidenced by pulmonary function tests results that are consistent with moderate to severe restrictive or obstructive lung disease. • Objective evidence of exercise intolerance as demonstrated by cardiopulmonary exercise testing and exercise pulmonary function testing that are below the predicted values. Requests for coverage of repair for pectus carinatum will be reviewed on an individual case basis as it is extremely uncommon for this deformity to cause a functional and/or physiological deficit.	Yes
21181, 21182 21183, 21184	Reconstruction by contouring or following intra- and extracranial excision of a benign tumor of the cranial bones (e.g., fibrous dysplasia).	Reconstruction repair of a bony defect when performed incidental to or following surgery, trauma, infection, or other diseases of the involved part, or to correct a congenital disease or anomaly of a covered dependent child that has resulted in a functional impairment.	Yes
17106, 17107 17108	Treatment of cutaneous vascular lesions (e.g., hemangiomas, port wine stains) from which no significant improved physiologic function is achieved.	Pulse-dye laser for cutaneous vascular lesions when the lesion meets one of the following: • affecting a vital structure (e.g., nose, eyes, lips) • bleeding	Yes

POLICY NAME: COSMETIC AND RECONSTRUCTIVE SURGERY

CPT Code	Non-covered Indication (cosmetic)	Covered Procedure (Indications to be supported by medical documentation)	Prior Authorization Requirement
		• painful • ulcerating	
ICD-10: L91.0	Keloid or hypertrophic scar that is asymptomatic.	Steroid injection of symptomatic keloids or hypertrophic scars or excision when there is functional impairment and failure of steroid injections, if appropriate. **If intralesional steroid injections do not improve symptoms after completion of 3-4 injections, 3-4 weeks apart, excision is considered medically necessary. If there has been no treatment for 1 year after the last intralesional injection(s), a new course of injections should be trialed before excision is performed. For adults only, who have excision of a keloid(s), radiation as an adjunctive therapy if initiated immediately following or within 72 hours following surgery. Up to a maximum of three fractionated doses are allowed. Radiation treatment as a stand-alone treatment without prior keloid excision may also be used for patients deemed not to be surgical candidates to improve subjective symptoms (e.g., pain, itching). Radiation therapy used for these indications as a monotherapy is only recommended for keloid scars and not hypertrophic scars.	No No
31570, 31571, 31574, L8607, C1878	Radiesse or Prolaryn™ used as a dermal filler (e.g., filling of vertical lip lines, corners of the mouth, and nasolabial folds; performed solely for purpose of enhancing appearance.	1. For the treatment for vocal cord insufficiency as follows: • Vocal fold paralysis resulting from: • Prior neck or chest surgery that damaged the vagus or recurrent laryngeal nerve • Complications from endotracheal intubation • Tumor invasion causing nerve damage • Blunt trauma to the neck or chest • Viral/inflammatory processes or • Degenerative neural disorders • Vocal cord paresis • Vocal cord scarring	Yes

POLICY NAME: COSMETIC AND RECONSTRUCTIVE SURGERY

CPT Code	Non-covered Indication (cosmetic)	Covered Procedure (Indications to be supported by medical documentation)	Prior Authorization Requirement
		• Presblaryngitis (age related loosening of the vocal cords aka vocal cord atrophy) • Parkinson's disease 2. For management of Type 1 Laryngeal cleft when there has been a failed 3-month trial of conservative measures (i.e., thickening the consistency and viscosity of feed, feeding strategies and positioning).	
30400, 30410 30420, 30430 30435, 30450	Rhinoplasty for external nasal deformity not due to trauma or disease without functional impairment.	Rhinoplasty for external nasal deformity, in which there is a functional impairment, when incidental to or following surgery, trauma, infection, or disease, or congenital anomaly or disease of a covered dependent child. Medical documentation must include clinical to support all the following: • Relevant history of accidental or surgical trauma, congenital defect, or disease. • Prolonged obstructed nasal breathing. • Results of nasal endoscopy, CT, or other appropriate imaging that documents the degree of nasal obstruction. • Symptoms related to the nasal airway obstruction (e.g., chronic rhinosinusitis). • Obstructive symptoms that persist despite conservative treatment for 4 weeks or greater (e.g., nasal steroids, antihistamines, immunotherapy). • Photographs (frontal, lateral, and worms eye) that demonstrate an external nasal deformity. • Indication as to why septoplasty and turbinectomy alone will not resolve obstructive symptoms.	Yes
15824, 15825 15826, 15828 15829	Rhytidectomy (facelift) to diminish the aging process	Reconstructive rhytidectomy for burns.	Yes

POLICY NAME: COSMETIC AND RECONSTRUCTIVE SURGERY

CPT Code	Non-covered Indication (cosmetic)	Covered Procedure (Indications to be supported by medical documentation)	Prior Authorization Requirement
36468, 36470, 36471	Sclerotherapy for telangiectasia (spider veins) as these are not associated with any physical symptoms and do not cause a functional deficit.	• Sclerotherapy as a medically necessary adjunctive treatment of symptomatic varicose and tributary veins, 3.0 mm or greater in diameter for individuals with a CEAP score of 2 or greater who are being treated or have previously been treated (ligation and stripping, radiofrequency ablation, endovenous laser ablation) for incompetence (i.e., reflux) of the greater or small saphenous veins who meet the following criteria: • Perforator veins located under an open or healed venous ulceration, • **or** • Significant or recurrent bleeding from a ruptured varicosity or venulectasia, • **or** ○ • Meets either (a) or (b and c) below: • Severe and persistent pain resulting in a significant functional impairment (e.g., impaired mobility, inability to perform household chores, or interferes with essential job functions • **or** • Significant recurrent attacks of superficial phlebitis • **and** • These have been unresponsive to non-surgical medical management for at least three months (analgesics, elevation of legs, avoidance of prolonged immobility, and use of prescription gradient support	Yes

POLICY NAME: COSMETIC AND RECONSTRUCTIVE SURGERY

CPT Code	Non-covered Indication (cosmetic)	Covered Procedure (Indications to be supported by medical documentation)	Prior Authorization Requirement
		compression stockings, unless contraindicated). For additional treatments, three months' time must elapse after prior treatment to document continued symptoms and/or functional impairment despite conservative treatments. **Exception**: For Medicare Advantage: The treatments of the varicose and tributary veins will be considered medically necessary if saphenous reflux is not present or already successfully eliminated, the veins are > than 4 mm in diameter and if the patient remains symptomatic after a six-week trial of conservative therapy. The patient is considered symptomatic if any of the following signs and symptoms of significantly diseased vessels of the lower extremities are documented in the medical record: • Stasis ulcer of the lower leg, • Significant pain and significant edema that interferes with activities of daily living, • Bleeding associated with the diseased vessels of the lower extremities, • Recurrent episodes of superficial phlebitis, • Stasis dermatitis, or • Refractory dependent edema.	
ICD-10: L82.1	Seborrheic keratosis that is asymptomatic.	Destruction of seborrheic keratosis only when repeatedly irritated, inflamed, or bleeding.	No
11200, 11201	Skin tags that are asymptomatic.	Skin tag removal only when repeatedly irritated or bleeding.	No
54660	Testicular prosthesis for purpose of enhancing appearance.	Testicular prosthesis for replacement of congenitally-absent testes or testes lost due to trauma, infection, or disease, or congenital anomaly with functional impairment.	Yes

ATTACHMENT B

Below CPT codes for breast reconstruction services are allowed without a Prior Authorization following a mastectomy or partial mastectomy when billed with one of the following diagnosis codes:

- Z42.1 (Encounter for breast reconstruction following mastectomy)
- Z90.1 (Acquired absence of breast and nipple)
- Z90.10 (Acquired absence of unspecified breast and nipple)
- Z90.11 (Acquired absence of right breast and nipple)
- Z90.12 (Acquired absence of left breast and nipple)
- Z90.13 (Acquired absence of bilateral breasts and nipples)

CPT Code	Non-covered Indication (cosmetic)	Covered Procedure (Indications to be supported by medical documentation)
19340 19342	Breast prosthesis (implant) For cosmetic enhancement of the breast in the absence of mastectomy, or to correct congenital asymmetry without functional impairment.	
19325, 15771-15772	Augmentation of small but otherwise normal breasts.	
19350 19355 19361 19364 19367 19368 19369 19380 19396 S2066 S2067 S2068	Breast reconstruction surgery solely for enhancement of appearance.	
19316	Mastopexy (breast lift) to treat sagging of the breasts.	

POLICY NAME: COSMETIC AND RECONSTRUCTIVE SURGERY

CPT Code	Non-covered Indication (cosmetic)	Covered Procedure (Indications to be supported by medical documentation)
11920 11921 11922	Tattooing (flesh color) of the areola or for the treatment of port wine stains, hemangiomas, or birth marks.	
11960 11970 11971 19357	Tissue expander; insertion and/or replacement for purpose of enhancing appearance.	
19328 19330	Breast prosthesis (explantation). Explantation of a breast implant in an asymptomatic patient simply desiring removal. Explantation of ruptured saline implant(s) in patients who had originally undergone breast implantation for cosmetic purposes.	Explantation of a silicone or saline breast implant due to rupture*, infection, extrusion, Baker class IV contracture • *Note: Explantation of a ruptured saline breast implant is covered only for those patients who had originally undergone breast implantation for reconstructive purposes following a mastectomy or other approved reconstructive surgery. Replacement of an implant is covered only when: 1. It was originally placed following a covered mastectomy/partial mastectomy; or 2. The reason for the original implantation surgery was determined medically necessary.
19370 19371	Explantation of breast implant and capsulectomy/capsolotomy performed on an asymptomatic patient.	Explantation of breast implant with capsulectomy/capsulotomy for symptomatic capsular contracture when the following criteria are met: • Baker Class IV contracture associated with severe pain; or • Baker Class IV contracture with limited movement leading to inability to perform tasks that involve reaching or abduction.

POLICY HISTORY

This section is intended to provide only highlights of the policy changes. The policy should always be reviewed in its entirety to ensure a comprehensive understanding of coverage.

POLICY NAME: COSMETIC AND RECONSTRUCTIVE SURGERY

Effective Date	Update
4/1/2026	Updated verbiage under acne treatment section.
1/1/2026	Under acne treatment, added comedone extractions as not medically necessary.
9/1/2025	Added additional criteria and coverage information for hypertrophic scars to keloids section.
5/1/2025 *No change to effective date for this policy	Added additional coverage criteria for Medicare Advantage for sclerotherapy.
5/1/2025* *No change to effective date for this policy	Updated requirements for submitting medical photographs.
5/1/2025	Clarified criteria for acne surgery.
9/1/2024	Added criteria for acne surgery (10040) and non-covered indications for acne treatment.
7/1/2024	Updated criteria for sclerotherapy.
3/1/2024	Added additional indication for Radiesse/Prolaryn. Added time frames for radiation treatment following keloid excision.
2/1/2024	Updated criteria for pulse dye laser (17106, 17107 17108) treatment. Removed codes 15830 and 15847 as these are addressed in policy 1370/20.000443.
1/1/2024 *No change to effective date of policy	Added "Attachment B" for breast reconstruction services and codes that will allow reconstruction without a PA. Updated keloid section to include radiation treatment.
1/1/2024	Added codes 31574, L8607 and the product Prolaryn to the Radiesse section.
11/1/2023 *No change to effective date of policy	For clarification, added the below statement to the Policy Considerations section:

	• Services in attachment "A" that have covered indications (not considered cosmetic) may not be inclusive of all indications for the specific service. Some indications could be considered not medically necessary or experimental/investigational and should be submitted for review prior to service being rendered to determine coverage status. Removed codes 21141, 21142 21143, 21145 21146, 21147, 21150, 21151 21154, 21155 21159, 21160, 21188, 21196, & 21248 from policy and PA requirement.
11/1/2023	Added criteria for benign lesion removal
12/1/22 *No change to effective date of policy	Added language to require original photographs when required
6/1/2022	No content changes. Removed Refractive Surgery/Keratoplasty, 1370/20.000257 under the related policies section. Added to refer to Gender Dysphoria Therapies policy regarding cosmetic procedures related to psychiatric and/or emotional distress.
3/1/22	Added criteria for rhinoplasty and updated verbiage to clarify that sclerotherapy for telangiectasia (spider veins) is considered cosmetic.
12/1/2021	Added the condition of Klinefelter Syndrome to the coverage allowance for gynecomastia surgery.
9/1/2021	Removed deleted CPT codes: 19324, 19366, 36469. Added replacement codes 15771 and 15772 for code 19324. Removed codes 30460 and 30462 from requiring a PA as these are related to congenital anomaly cleft palate repair, which is not cosmetic in nature. Removed from exclusions: Surgical procedures to correct refractive errors (65760, 65765, 65767, 65770, 65771, 65772, 65775, S0800, S0810)

Next Annual Review:	May, 2027

DISCLAIMER

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgement when deciding the most appropriate care to enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

PROCEDURE CODES

See Exclusions and Attachment A: Covered & Non-Covered Procedures.

DESCRIPTIONS

Cosmetic surgery is defined as surgery performed to reshape normal structures of the body in order to improve the patient's appearance and self-esteem, or as an elective treatment for aesthetic improvement of non-disabling physical defects or problems.

Reconstructive surgery is defined as medically necessary surgery performed on an abnormal structure of the body, caused by congenital defects, developmental abnormalities, trauma, infection, tumors, or disease. It is generally performed to improve function.

A surgical procedure is not considered cosmetic when such service is incidental to or follows surgery resulting from trauma, infection, or other diseases of the involved part, or to correct a congenital disease or anomaly of a covered dependent child that has resulted in a functional impairment.

RELATED POLICIES/DOCUMENTS

Resource Coordination Policies:

Capital District Physicians' Health Plan, Inc.
CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: COSMETIC AND RECONSTRUCTIVE SURGERY

- Abdominoplasty, Panniculectomy, & Lipectomy Services, 1370/20.000443.
- Blepharoplasty, 1370/20.000225.
- Gender Dysphoria Services, 1370/20.000447.
- Non-Covered Technologies, 1370/20.000444.
- Clinical Review Preauthorization List
- Reduction Mammaplasty (Mammoplasty), 7.01.39

POSITION STATEMENT

CDPHP considers a reconstructive procedure medically necessary when performed for one or more of the following indications:

- The procedure is to correct an abnormality that is incidental to or following surgery, trauma, infection, or other diseases of the involved part that has resulted in a functional impairment.
- The procedure is intended to correct a congenital anomaly of a covered dependent child that has resulted in a functional impairment.
- The procedure is performed to correct other abnormalities or anomalies, other than those stated above, that cause significant functional impairment that have not been relieved by application of all available physician-directed conservative measures.
- As required by applicable laws and mandates.

Submission of medical record documentation, from the primary care physician or treating physician, is required and must demonstrate the requested procedure meets one of the criteria stated above. In addition, documentation should include the following information:

- Documentation of the etiology of the abnormality in question.
- Any conservative treatments provided.
- Objective documentation of any functional impairment.
- Studies or tests to confirm the presence of the abnormality and the degree to which it is causing functional impairment.
- Photographs when applicable and/or upon request.
- Consultations and/or operative reports.
- Any other pertinent information to support the medical necessity of the procedure being requested.

Medical Photographs

CDPHP requires original medical photographs to be sent for review to determine the medical necessity of services. Faxed or photo-copied images will not be accepted. The CDPHP preferred method of sending original photos is through our secure provider portal at cdphp.com or by US mail. If sending through US mail, please use the following address:

CDPHP Utilization Review Department
6 Wellness Way

POLICY NAME: COSMETIC AND RECONSTRUCTIVE SURGERY

Latham, NY 12110

The submission of photographs through the portal or US Mail must include the following information:

- Patient Name (Required)
- CDPHP ID# (Required)
- Date of Birth (Required if CDPHP ID# is not available)
- A sentence stating what is attached (i.e., medical photos attached for review)

POLICY CONSIDERATIONS

Services in attachment "A" that have covered indications (not considered cosmetic) may not be inclusive of all indications for the specific service. Some indications could be considered not medically necessary or experimental/investigational and should be submitted for review prior to service being rendered to determine coverage status.

Initial evaluations for establishment of a diagnosis will be allowed.

CDPHP administers benefits for medically necessary removal of skin lesions by all acceptable methods.

- All lesion removals will be reimbursed at CDPHP fee schedule regardless of method of removal.
- All lesion removal services are subject to retrospective review.

CDPHP allows removal of benign skin lesions when symptoms or signs warrant medical intervention such as:

- Bleeding
- Intense itching
- Pain
- Change in physical appearance (i.e., reddening, pigmentary change, enlargement)
- Physical evidence of inflammation or infection (i.e., purulence, edema, oozing, erythema)
- Lesion obstructs an orifice
- Lesion clinically restricts eye function
    - Lesion restricts eyelid function
    - Lesion causes misdirection of eyelashes or eyelid
    - Lesion restricts lacrimal puncta and interferes with tear flow
    - Lesion touches globe
- Clinical uncertainty as to the likely diagnosis, particularly where malignancy is a realistic consideration based on lesion appearance
- Wart removals is not considered cosmetic when guidelines above are met or if any of the following clinical circumstances are present:

POLICY NAME: COSMETIC AND RECONSTRUCTIVE SURGERY

- Periocular warts associated with chronic recurrent conjunctivitis thought secondary to lesion virus shedding
- Warts showing evidence of spread from one body area to another, particularly in immunosuppressed patients or warts of recent origin in an immunocompromised patients
- Lesions are condyloma acuminata or molluscum contagiosum
- Cervical dysplasia that is associated with genital warts
- Pregnancy that is associated with genital warts

Pursuant to the applicable participating provider agreement, providers ordering, or performing a non-covered cosmetic service must inform the enrollee of the non-covered status before rendering the service. CDPHP requires a written waiver specific to the service being performed; a generic waiver is not considered to be an acceptable form of enrollee consent.

- If a provider informs the enrollee prior to performing a specific service that the service is not covered, and the enrollee consents to accept liabilities for the services by signing a waiver specific to that service, the provider ***may bill*** the enrollee.
- If a provider performs a specific service without notifying the enrollee the service is not covered, or the enrollee does not consent to accept liability for the specific service, the provider ***may not bill*** the enrollee.

Services performed by aestheticians and billed by a medical provider are not considered medically necessary and are not covered.

Cosmetic procedures do not become eligible for coverage because of psychiatric and/or emotional distress. (For exceptions to this, please refer to the Gender Dysphoria Therapies policy, 1370/20.000447).

Cosmetic and reconstructive services are subject to retrospective review.

EXCLUSIONS

Non-medically necessary cosmetic services, including surgery and elective treatment for aesthetic improvement of non-disabling physical defects or problems.

Surgery for scar repair or revision only, where no functional defect is present.

Procedures performed at the time of the initial visit for cosmetic purposes will not be allowed.

The following list is not all inclusive but contains examples of procedures that are generally considered cosmetic. As such, they are not covered except when a case specific review justifies a medical exception due to documented functional impairment that cannot be addressed through conservative treatment.

- Chemical peel for treatment of skin wrinkles or uneven pigmentation (15788, 15789,

15792, 15793)
- Cryotherapy or chemical exfoliation for treatment of skin wrinkles, uneven pigmentation, or post acne scarring (17340, 17360)
- Correction of diastasis recti abdominis
- Dermabrasion for treatment of skin wrinkles, uneven skin pigmentation, acne, post-acne scarring, removal, or treatment of decorative tattoo (15780, 15781, 15782, 15783)
- Ear or body piercing (69090)
- Ear lobe repair in the absence of accidental injury
- Electrolysis for hirsutism (17380) or laser hair removal (For exceptions to this, please refer to the Gender Dysphoria Therapies policy, 1370/20.000447)
- Excision of excessive skin and subcutaneous tissue of the abdomen, thigh, leg, hip, buttock, arm, forearm or hand, submental fat pad, or other area (15832, 15833, 15834, 15835, 15836, 15837, 15838, 15839)
- Labiaplasty or labia reduction for asymmetrical, enlarged, or hypertrophic labia minora and/or labia majora except when performed as part of initial gender reassignment surgery (15839, 56620)
- Liposuction – suction assisted lipectomy (15876, 15877, 15878, 15879)
- Lipectomy (15832, 15833, 15834, 15835, 15836, 15837, 15838, 15839,)
- Subcutaneous injection of filling material, e.g., collagen (11950, 11951, 11952, 11954)
- Treatment of melasma (L81.0-L81.9)
- Treatment for vitiligo (L80, H02.731-H02.736, H02.739, A67.2, N90.89)
- Treatment/surgery for xanthomas or xanthelasma (H02.60-H02.66)

CDPHP PRODUCT VARIATIONS

POLICY NAME: COSMETIC AND RECONSTRUCTIVE SURGERY

ATTACHMENT A

The following table is not all-inclusive but contains examples of covered and non-covered procedures.

CPT Code	Non-covered Indication (cosmetic)	Covered Procedure (Indications to be supported by medical documentation)	Prior Authorization Requirement
15830, 15847	Abdominoplasty, panniculectomy and lipectomy performed solely for purpose of enhancing appearance.	Refer to Resource Coordination Policy: ***Abdominoplasty, Panniculectomy, and Lipectomy Services***, **1370/20.000443.**	Yes
15786, 15787	Abrasion, lesions (e.g., keratosis, scar) repair performed solely for the purpose of enhancing appearance.	Performed due to a congenital disease or anomaly resulting in a functional impairment.	Yes
15820, 15821 15822, 15823 67900, 67901 67902, 67903 67904, 67906 67908, 67909, 67911	Blepharoplasty performed solely for purpose of enhancing appearance.	Refer to Resource Coordination Policy: ***Blepharoplasty, 1370/20.000225.***	Yes
21280, 21282	Canthopexy (revision of upper eyelid) performed solely for purpose of enhancing appearance.	Refer to Resource Coordination Policy*:* **Blepharoplasty, 1370/20.000225.**	Yes
	Cervicoplasty (surgery of the neck) performed solely for purpose of enhancing appearance.	Cervicoplasty when performed incidental to or following surgery, trauma, infection, or other diseases of the involved part, or to correct a congenital disease or anomaly of a covered dependent child that has resulted in a functional impairment.	Yes
54150, 54161	Circumcision performed post-newborn period without medical indication.	Circumcision performed beyond the newborn period (four weeks) for the following indications: • Circumcision delayed due to infant being premature or ill; **or** • Symptomatic urinary tract infection or evidence of reflux upon workup in infants up to one year of age; **or** • Significant adhesions, infection, or inflammation (balanitis). Surgical	No

POLICY NAME: COSMETIC AND RECONSTRUCTIVE SURGERY

CPT Code	Non-covered Indication (cosmetic)	Covered Procedure (Indications to be supported by medical documentation)	Prior Authorization Requirement
		intervention for such conditions may be considered appropriate at any age; **or** • Phimosis that is non-responsive to more conservative measures (i.e., steroid creams). Surgical intervention for phimosis is considered appropriate for age groups six years of age and older. Surgery performed on age groups < 6 years may not be medically necessary as phimosis is considered physiologic in nature.	
21137, 21138 21139, 21172 21175, 21179 21180	Forehead reduction or reconstruction performed solely for purpose of enhancing appearance.	Forehead reduction and/or reconstruction when performed incidental to or following surgery, trauma, infection, or other diseases of the involved part, or to correct a congenital disease or anomaly of a covered dependent child that has resulted in a functional impairment.	Yes
21120, 21121 21122, 21123	Genioplasty (chin augmentation) performed solely for purpose of enhancing appearance.	Genioplasty when performed incidental to or following surgery, trauma, infection, or other diseases of the involved part, or to correct a congenital disease or anomaly of a covered dependent child that has resulted in a functional impairment.	Yes
19300	Gynecomastia surgery performed solely for purpose of enhancing appearance or for any indication other than presence of existing breast mass suspicious for malignancy.	Surgical treatment for the removal of an existing breast mass suspicious for malignancy or have confirmed genetic condition of Klinefelter Syndrome.	Yes
15775, 15776 15220, 15221	Hair transplant for alopecia, male pattern baldness or age-related hair thinning in women.	Hair transplant when performed incidental to or following surgery, trauma, infection, or other diseases of the involved part, or to correct a congenital disease or anomaly of a covered dependent child that has resulted in a functional impairment.	Yes
21083, 21087	Impression and custom preparation of palatal lift or nasal prosthesis for purpose of enhancing appearance.	Insertion or injection of prosthetic material for significant deformity when performed incidental to or following surgery, trauma, infection, or other diseases of the involved part, or to correct a congenital disease or anomaly of a covered dependent child that has resulted in a functional impairment.	Yes

POLICY NAME: COSMETIC AND RECONSTRUCTIVE SURGERY

CPT Code	Non-covered Indication (cosmetic)	Covered Procedure (Indications to be supported by medical documentation)	Prior Authorization Requirement
10040, 17110, 17111	Acne (L70.0-L70.9) treatment that does not meet criteria in next column.	Acne extractions/10040 as an initial treatment for severe acne will be considered medically necessary for treatment of painful inflamed cysts or pustules or when one of the below is met: • Documentation supports failure of initial medication treatments (e.g., oral contraceptive hormone therapy, antibiotics, retinoids); • Documentation supports development of side effects of initial medication treatments Comedone extractions are considered not medically necessary. For continued treatments following the initial surgery, procedure notes that identify the treatment technique being utilized and documentation of medical necessity for continued treatment will be required. Only one surgical treatment for acne will be authorized at a time.	Yes
21270	Malar augmentation (cheek bone) performed solely for purpose of enhancing appearance.	Malar augmentation when performed incidental to or following surgery, trauma, infection, or other diseases of the involved part, or to correct a congenital disease or anomaly of a covered dependent child that has resulted in a functional impairment.	Yes
21125, 21127 21193, 21194, 21195, 21198, 21245, 21246, 21247, 21249	Mandibular augmentation or mandible or maxilla reconstruction performed solely for purpose of enhancing appearance.	Augmentation or reconstruction of the mandible or maxilla when performed incidental to or following surgery, trauma, infection, or other diseases of the involved part, or to correct a congenital disease or anomaly of a covered dependent child that has resulted in a functional impairment.	Yes
69300	Otoplasty to correct lop ears, bat ears, or prominent or protruding ears without functional deficiencies.	Otoplasty when performed incidental to or following surgery, trauma, infection, or other diseases of the involved part, or to correct a congenital disease or anomaly of a covered dependent child that has resulted in a functional impairment.	Yes

POLICY NAME: COSMETIC AND RECONSTRUCTIVE SURGERY

CPT Code	Non-covered Indication (cosmetic)	Covered Procedure (Indications to be supported by medical documentation)	Prior Authorization Requirement
21740, 21742 21743	Reconstructive repair of pectus excavatum or carinatum without functional impairment.	Surgical repair of pectus excavatum when both of the following criteria are met: Imaging studies (i.e., CT scan) confirm Haller index greater than 3.25 **and** documentation of functional impairment evidenced by one or more conditions below: • Cardiac impairment evidenced by cardiac test results (e.g., echocardiograph, cardiac MRI) that are consistent with external compression (e.g., murmurs, mitral valve prolapse, cardiac displacement or conduction abnormalities). • Pulmonary impairment evidenced by pulmonary function tests results that are consistent with moderate to severe restrictive or obstructive lung disease. • Objective evidence of exercise intolerance as demonstrated by cardiopulmonary exercise testing and exercise pulmonary function testing that are below the predicted values. Requests for coverage of repair for pectus carinatum will be reviewed on an individual case basis as it is extremely uncommon for this deformity to cause a functional and/or physiological deficit.	Yes
21181, 21182 21183, 21184	Reconstruction by contouring or following intra- and extracranial excision of a benign tumor of the cranial bones (e.g., fibrous dysplasia).	Reconstruction repair of a bony defect when performed incidental to or following surgery, trauma, infection, or other diseases of the involved part, or to correct a congenital disease or anomaly of a covered dependent child that has resulted in a functional impairment.	Yes
17106, 17107 17108	Treatment of cutaneous vascular lesions (e.g., hemangiomas, port wine stains) from which no significant improved physiologic function is achieved.	Pulse-dye laser for cutaneous vascular lesions when the lesion meets one of the following: • affecting a vital structure (e.g., nose, eyes, lips) • bleeding • painful • ulcerating	Yes
ICD-10: L91.0	Keloid or hypertrophic scar that is asymptomatic.	Steroid injection of symptomatic keloids or hypertrophic scars or excision when there is functional impairment and failure of steroid injections, if appropriate. **If intralesional steroid injections do	No No

POLICY NAME: COSMETIC AND RECONSTRUCTIVE SURGERY

CPT Code	Non-covered Indication (cosmetic)	Covered Procedure (Indications to be supported by medical documentation)	Prior Authorization Requirement
		not improve symptoms after completion of 3-4 injections, 3-4 weeks apart, excision is considered medically necessary. If there has been no treatment for 1 year after the last intralesional injection(s), a new course of injections should be trialed before excision is performed. For adults only, who have excision of a keloid(s), radiation as an adjunctive therapy if initiated immediately following or within 72 hours following surgery. Up to a maximum of three fractionated doses are allowed. Radiation treatment as a stand-alone treatment without prior keloid excision may also be used for patients deemed not to be surgical candidates to improve subjective symptoms (e.g., pain, itching). Radiation therapy used for these indications as a monotherapy is only recommended for keloid scars and not hypertrophic scars.	
31570, 31571, 31574, L8607, C1878	Radiesse or Prolaryn™ used as a dermal filler (e.g., filling of vertical lip lines, corners of the mouth, and nasolabial folds; performed solely for purpose of enhancing appearance.	1. For the treatment for vocal cord insufficiency as follows: • Vocal fold paralysis resulting from: • Prior neck or chest surgery that damaged the vagus or recurrent laryngeal nerve • Complications from endotracheal intubation • Tumor invasion causing nerve damage • Blunt trauma to the neck or chest • Viral/inflammatory processes or • Degenerative neural disorders • Vocal cord paresis • Vocal cord scarring • Presblaryngitis (age related loosening of the vocal cords aka vocal cord atrophy) • Parkinson's disease 2. For management of Type 1 Laryngeal cleft when there has been a failed 3-month trial of conservative measures (i.e., thickening the	Yes

POLICY NAME: COSMETIC AND RECONSTRUCTIVE SURGERY

CPT Code	Non-covered Indication (cosmetic)	Covered Procedure (Indications to be supported by medical documentation)	Prior Authorization Requirement
		consistency and viscosity of feed, feeding strategies and positioning).	
30400, 30410 30420, 30430 30435, 30450	Rhinoplasty for external nasal deformity not due to trauma or disease without functional impairment.	Rhinoplasty for external nasal deformity, in which there is a functional impairment, when incidental to or following surgery, trauma, infection, or disease, or congenital anomaly or disease of a covered dependent child. Medical documentation must include clinical to support all the following: • Relevant history of accidental or surgical trauma, congenital defect, or disease. • Prolonged obstructed nasal breathing. • Results of nasal endoscopy, CT, or other appropriate imaging that documents the degree of nasal obstruction. • Symptoms related to the nasal airway obstruction (e.g., chronic rhinosinusitis). • Obstructive symptoms that persist despite conservative treatment for 4 weeks or greater (e.g., nasal steroids, antihistamines, immunotherapy). • Photographs (frontal, lateral, and worms eye) that demonstrate an external nasal deformity. • Indication as to why septoplasty and turbinectomy alone will not resolve obstructive symptoms.	Yes
15824, 15825 15826, 15828 15829	Rhytidectomy (facelift) to diminish the aging process	Reconstructive rhytidectomy for burns.	Yes
36468, 36470, 36471	Sclerotherapy for telangiectasia (spider veins) as these are not associated with any physical symptoms and do not cause a functional deficit.	• Sclerotherapy as a medically necessary adjunctive treatment of symptomatic varicose and tributary veins, 3.0 mm or greater in diameter for individuals with a CEAP score of 2 or greater who are being treated or have previously been treated (ligation and stripping, radiofrequency ablation, endovenous laser ablation) for incompetence (i.e.,	Yes

CPT Code	Non-covered Indication (cosmetic)	Covered Procedure (Indications to be supported by medical documentation)	Prior Authorization Requirement
		reflux) of the greater or small saphenous veins who meet the following criteria: • Perforator veins located under an open or healed venous ulceration, • **or** • Significant or recurrent bleeding from a ruptured varicosity or venulectasia, • **or** ○ • Meets either (a) or (b and c) below: • Severe and persistent pain resulting in a significant functional impairment (e.g., impaired mobility, inability to perform household chores, or interferes with essential job functions • **or** • Significant recurrent attacks of superficial phlebitis • **and** • These have been unresponsive to non-surgical medical management for at least three months (analgesics, elevation of legs, avoidance of prolonged immobility, and use of prescription gradient support compression stockings, unless contraindicated). For additional treatments, three months' time must elapse after prior treatment to document continued symptoms and/or functional impairment despite conservative treatments. **Exception**: For Medicare Advantage: The	

CPT Code	Non-covered Indication (cosmetic)	Covered Procedure (Indications to be supported by medical documentation)	Prior Authorization Requirement
		treatments of the varicose and tributary veins will be considered medically necessary if saphenous reflux is not present or already successfully eliminated, the veins are > than 4 mm in diameter and if the patient remains symptomatic after a six-week trial of conservative therapy. The patient is considered symptomatic if any of the following signs and symptoms of significantly diseased vessels of the lower extremities are documented in the medical record: • Stasis ulcer of the lower leg, • Significant pain and significant edema that interferes with activities of daily living, • Bleeding associated with the diseased vessels of the lower extremities, • Recurrent episodes of superficial phlebitis, • Stasis dermatitis, or • Refractory dependent edema.	
ICD-10: L82.1	Seborrheic keratosis that is asymptomatic.	Destruction of seborrheic keratosis only when repeatedly irritated, inflamed, or bleeding.	No
11200, 11201	Skin tags that are asymptomatic.	Skin tag removal only when repeatedly irritated or bleeding.	No
54660	Testicular prosthesis for purpose of enhancing appearance.	Testicular prosthesis for replacement of congenitally-absent testes or testes lost due to trauma, infection, or disease, or congenital anomaly with functional impairment.	Yes

POLICY HISTORY

This section is intended to provide only highlights of the policy changes. The policy should always be reviewed in its entirety to ensure a comprehensive understanding of coverage.

POLICY NAME: COSMETIC AND RECONSTRUCTIVE SURGERY

Effective Date	Update
9/1/2026	Removed information on acne treatment with laser as this info is now housed in the Light and Laser Therapies for Dermatologic Conditions policy, 8.01.21. Removed information related to mastectomy as this is now in the Breast Reconstruction Surgery and Prophylactic Breast Cancer Risk-Reducing Mastectomy policy, 10.01.01. Removed termed code 15819
4/1/2026	Updated verbiage under acne treatment section.
1/1/2026	Under acne treatment, added comedone extractions as not medically necessary.
9/1/2025	Added additional criteria and coverage information for hypertrophic scars to keloids section.
5/1/2025 *No change to effective date for this policy	Added additional coverage criteria for Medicare Advantage for sclerotherapy.
5/1/2025* *No change to effective date for this policy	Updated requirements for submitting medical photographs.
5/1/2025	Clarified criteria for acne surgery.
9/1/2024	Added criteria for acne surgery (10040) and non-covered indications for acne treatment.
7/1/2024	Updated criteria for sclerotherapy.
3/1/2024	Added additional indication for Radiesse/Prolaryn. Added time frames for radiation treatment following keloid excision.
2/1/2024	Updated criteria for pulse dye laser (17106, 17107 17108) treatment. Removed codes 15830 and 15847 as these are addressed in policy 1370/20.000443.

POLICY NAME: COSMETIC AND RECONSTRUCTIVE SURGERY

1/1/2024 *No change to effective date of policy	Added "Attachment B" for breast reconstruction services and codes that will allow reconstruction without a PA. Updated keloid section to include radiation treatment.
1/1/2024	Added codes 31574, L8607 and the product Prolaryn to the Radiesse section.
11/1/2023 *No change to effective date of policy	For clarification, added the below statement to the Policy Considerations section: • Services in attachment "A" that have covered indications (not considered cosmetic) may not be inclusive of all indications for the specific service. Some indications could be considered not medically necessary or experimental/investigational and should be submitted for review prior to service being rendered to determine coverage status. Removed codes 21141, 21142 21143, 21145 21146, 21147, 21150, 21151 21154, 21155 21159, 21160, 21188, 21196, & 21248 from policy and PA requirement.
11/1/2023	Added criteria for benign lesion removal
12/1/22 *No change to effective date of policy	Added language to require original photographs when required
6/1/2022	No content changes. Removed Refractive Surgery/Keratoplasty, 1370/20.000257 under the related policies section. Added to refer to Gender Dysphoria Therapies policy regarding cosmetic procedures related to psychiatric and/or emotional distress.
3/1/22	Added criteria for rhinoplasty and updated verbiage to clarify that sclerotherapy for telangiectasia (spider veins) is considered cosmetic.
12/1/2021	Added the condition of Klinefelter Syndrome to the coverage allowance for gynecomastia surgery.
9/1/2021	Removed deleted CPT codes: 19324, 19366, 36469. Added replacement codes 15771 and 15772 for code 19324. Removed codes 30460 and 30462 from requiring a PA as these are related to congenital anomaly cleft palate repair, which is not

	cosmetic in nature. Removed from exclusions: Surgical procedures to correct refractive errors (65760, 65765, 65767, 65770, 65771, 65772, 65775, S0800, S0810)

This policy is subject to contractual limitations and/or parameters established in any Employer sponsored Summary Plan Description (SPD) and/or Benefit Design Document (BDD).

MEDICAL POLICY

Medical Policy Title	**Coverage for Ambulatory Surgery Unit (ASU)/Outpatient Facility and Anesthesia for Dental Services**
Policy Number	**7.03.01**
Current Effective Date	**January 1, 2027**
Next Review Date	**May 2027**

Our medical policies are guides to evaluate technologies or services for medical necessity. Criteria are established through the assessment of evidence based, peer-reviewed scientific literature, and national professional guidelines. Federal and state law(s), regulatory mandates and the member's subscriber contract language are considered first in the determination of a covered service. (Link to Product Disclaimer)

This policy addresses medical coverage for ambulatory surgery unit (ASU)/outpatient facility and anesthesia for dental services. It does not address coverage for dental benefits.

POLICY STATEMENT(S)

I. Services at an outpatient facility or ambulatory surgery unit, including anesthesia by an anesthesiologist, for dental services are considered **medically appropriate** for members with **ANY** of the following indications:

   A. Age seven years or younger;

   B. Developmental disability, when treatment has been unsuccessful in the traditional dental setting;

   C. Concurrent hazardous medical condition(s) with medical documentation and justification, subject to review by a Health Plan Medical Director, that this service must be rendered in an ambulatory surgery unit (ASU) setting and not in the traditional setting;

   D. Behavioral management issues with documentation of an unsuccessful attempt to treat in the dental office, after the use of a sedation modality (e.g., oral sedation, nitrous oxide).

For situations described in Policy Statement I.B. and I.D listed above, if in the judgment of the Health Plan, it is inappropriate to treat the patient in the dental office due to the developmental disability, the severity of a behavioral issue, or the complexity of the treatment planned, an attempt to treat in the dental office may not be required.

RELATED POLICIES

Corporate Medical Policy

7.01.21 Dental and Oral Care under Medical Plans

POLICY GUIDELINE(S)

I. Anesthesia provided in an outpatient facility or ambulatory surgical unit is eligible for coverage only when rendered by an anesthesiologist.

II. When there has been an unsuccessful attempt to treat in the dental office, or it is inappropriate to treat in the dental office due to the severity of a behavioral issue, the severity of a hazardous medical condition, or the complexity of the treatment planned (Policy Statement I.B. and I.D. listed above), medical record documentation is required. Documentation should include the treatment plan, the patient's health history, date(s) treatment was attempted and the patient's response.

DESCRIPTION

Anesthesia is the administration of an anesthetic agent or anesthetic drug by injection, inhalation, or ingestion to achieve loss of sensation or loss of consciousness. Anesthesia is used in dentistry to numb the patient and prevent pain during dental procedures. There are several types of anesthesia available for dental work, including: local anesthesia, sedation dentistry or general anesthesia.

SUPPORTIVE LITERATURE

Not Applicable

PROFESSIONAL GUIDELINE(S)

The American Academy of Pediatric Dentistry (AAPD) best practice document on the management for pediatric dental patients addresses the following for behavior guidance:

- "General anesthesia is indicated for patients: who cannot cooperate due to a lack of psychological or emotional maturity and/or mental, physical, or medical disability; for whom local anesthesia is ineffective because of acute infection, anatomic variations, or allergy; who are extremely uncooperative, fearful, or anxious; who are a pre-communicative or non-communicative child or adolescent; requiring significant surgical procedures that can be combined with dental procedures to reduce the number of anesthetic exposures; for whom the use of general anesthesia may protect the developing psyche and/or reduce medical risk; and requiring immediate, comprehensive oral/dental care (e.g., due to dental trauma, severe infection/cellulitis, acute pain)". Conversely, the use of general anesthesia would be contraindicated for healthy, cooperative patients with minimal dental needs; a very young patient with minimal dental needs that can be addressed with deferred treatment or therapeutic interventions; convenience of the patient or practitioner; and/or predisposing medical conditions which would make general anesthesia inadvisable." (AAPD, 2023c, 2023d)

The AAPD best practice document on the management of dental patients with special health care needs also addresses behavior guidance:

- "Behavior guidance of the patient with SHCN [special health care needs] can be challenging. Communication may be limited due to anxiety, intellectual disability, or impaired hearing or vision. Because of dental anxiety, a lack of understanding of dental care, oral aversion, or fatigue from multiple medical visits and procedures, children with SHCN may exhibit resistant behaviors. These behaviors can interfere with the safe delivery of dental treatment. With the parent's/caregiver's assistance, most patients with physical and intellectual disabilities can

receive oral health care in the dental office. Protective stabilization can be helpful for some patients (e.g., those with aggressive, uncontrolled, or impulsive behaviors; when traditional behavior guidance techniques are not adequate) for safe delivery of care and with consent. When non-pharmacologic behavior guidance techniques are ineffective, the practitioner may recommend sedation or general anesthesia to allow completion of comprehensive treatment in a safe and efficient manner." (AAPD, 2023e, 2023f)

REGULATORY STATUS

The U.S. Food and Drug Administration (FDA) is responsible for ensuring the safety, efficacy, and quality of drugs sold in the United States. This includes both prescription and over-the-counter medications. Refer to the FDA Drug website. Available from: https://www.fda.gov/drugs [accessed 2026 Mar 19]

The FDA maintains information for consumers and health professionals on new drug warnings and other safety information, drug label changes, and shortages of medically necessary drug products. Available from: Drug Safety and Availability | FDA [accessed 2026 Mar 19]

CODE(S)

- Codes may not be covered under all circumstances.
- Code list may not be all inclusive (AMA and CMS code updates may occur more frequently than policy updates).
- (E/I)=Experimental/Investigational
- (NMN)=Not medically necessary/appropriate

CPT Codes

Code	Description
00170	Anesthesia for intraoral procedures, including biopsy; not otherwise specified
41899	Unlisted procedure, dentoalveolar structures

Copyright © 2026 American Medical Association, Chicago, IL

HCPCS Codes

Code	Description
G0330	Facility services for dental rehabilitation procedure(s) performed on a patient who requires monitored anesthesia (e.g., general, intravenous sedation [monitored anesthesia care]) and use of an operating room

CDT Codes

Code	Description
D9224	Administration of general anesthesia with advanced airway - first 15-minute increment, or any portion thereof; With or without co-administration of nitrous oxide. Anesthesia time begins when the doctor administering the anesthetic agent initiates the appropriate anesthesia and non-invasive monitoring protocol and remains in continuous attendance of the patient. Anesthesia services are considered completed when the patient may be safely left under the observation of trained personnel and the doctor may safely leave the room. This procedure is determined by the provider's documentation of the presence of an advanced airway such as a supraglottic or subglottic airway device, which includes laryngeal tube, esophageal-tracheal tube (Combitube), laryngeal mask airway, or endotracheal tube.
D9225	Administration of general anesthesia with advanced airway - each subsequent 15-minute increment, or any portion thereof

CENTERS FOR MEDICARE AND MEDICAID SERVICES (CMS)

Coverage for Ambulatory Surgery Unit (ASU) and Anesthesia for Dental Surgery is not addressed in National or Regional Medicare coverage determinations or policies. Although there are several CMS communication documents regarding ambulatory surgery units and anesthesia, CMS does not specifically address coverage for ASU and Anesthesia for Dental Surgery.

PRODUCT DISCLAIMER

- Services are contract dependent; if a product does not cover a service, medical policy criteria do not apply.
- If a commercial product (including an Essential Plan or Child Health Plus product) covers a specific service, medical policy criteria apply to the benefit.
- If a Medicaid product covers a specific service, and there are no New York State Medicaid guidelines (eMedNY) criteria, medical policy criteria apply to the benefit.
- If a Medicare product covers a specific service, and there is no national or local Medicare coverage decision for the service, medical policy criteria apply to the benefit.

MEDICAL POLICY

Medical Policy Title	**Coverage for Dependents with Disabilities**
Policy Number	**10.01.08**
Current Effective Date	**November 1, 2026**
Next Review Date	**November 2027**

Our medical policies are based on the assessment of evidence based, peer-reviewed literature, and professional guidelines. Eligibility for reimbursement is based upon the benefits set forth in the member's subscriber contract. (Link to Product Disclaimer)

POLICY STATEMENT(S)

I. For purposes of coverage for a dependent child (adult or minor) after the maximum age for dependent coverage has been reached, a Health Plan Medical Director will determine whether the member's condition constitutes a disability, based upon the certification of the dependent child's condition by the treating physician/therapist **AND** the medical criteria stated in the Disability Evaluation under Social Security (Blue Book), published by the Social Security Administration.

II. Certification by the dependent child's treating physician/therapist consists of submission of a completed disabled dependent application. In determining whether a child is a disabled dependent, the Health Plan Medical Director may review the dependent's medical records and/or discuss the member's condition with the requesting physician/therapist.

RELATED POLICIES

Not Applicable

POLICY GUIDELINE(S)

I. Refer to the member's subscriber contract for specific contract age limitations (Refer to the Regulatory Status section below for information regarding the Patient Protection and Affordable Care Act).

II. In order to be considered for ongoing coverage as a dependent with a disability, the disabling condition must have existed before the member reaches the age at which dependent coverage would otherwise terminate due to dependent age limitations.

III. In order to enroll for coverage as a dependent with a disability, the disabling condition must have existed prior to the date on which coverage for the dependent would otherwise have terminated under the subscriber contract due to attainment of the limiting age. If an individual who is past the maximum age of a qualified dependent requests enrollment as a dependent with a disability, enrollment will not be permitted if the disabling condition did not exist prior to reaching the maximum age for coverage as a dependent (age 26 or 29, depending on the policy).

IV. In order for a covered dependent to continue coverage beyond the date coverage would otherwise terminate due to age, the individual must have a disabling condition and be chiefly

Proprietary Information of Capital District Physicians' Health Plan, Inc. | CDPHP Universal Benefits,® Inc. | Capital District Physicians' Healthcare Network, Inc.

dependent upon the subscriber for support and maintenance. The subscriber must request continued coverage within 31 days from the date that dependent attains the termination age and submit an application and proof of the dependent's incapacity.

V. Requests for disabled dependent status based upon a physical, developmental, or intellectual disability will be reviewed by a Health Plan Medical Director, or his/her appointed designee. Denial of disabled dependent status based upon physical, developmental, or intellectual disability will be made by a Health Plan Medical Director.

VI. Requests for disabled dependent status based upon mental illness will be reviewed by a Health Plan Behavioral Health Medical Director, or his/her appointed designee. Denial of disabled dependent status based upon mental illness will be made by a Health Plan Behavioral Health Medical Director.

VII. The subscriber and the dependent's attending physician must complete a disabled dependent application and submit it to the Health Plan for review.

DESCRIPTION

Disabled dependent status is determined based upon the certification of the dependent's condition by the treating physician/therapist and the medical criteria stated in the Disability Evaluation under Social Security (Blue Book), published by the Social Security Administration. The Blue Book outlines the medical criteria used to determine whether an individual qualifies for social security disability insurance (SSDI) or supplemental security income (SSI) benefits. It serves as a guide for physicians, healthcare professionals, and disability adjudicators in evaluating disability claims. The book is divided into two parts: Part A (Adult Listings), which covers criteria for individuals aged 18 and older, and Part B (Childhood Listings), which addresses criteria for individuals under age 18. Each section is organized by body system such as neurological, cardiovascular, or musculoskeletal and lists specific impairments along with the severity required to be considered disabling. Additionally, the evidentiary requirements section outlines the types of medical documentation needed to support a claim, including clinical findings, laboratory results, imaging studies, and treatment history.

SUPPORTIVE LITERATURE

PROFESSIONAL GUIDELINE(S)

According to the American Psychiatric Association (APA), the essential features of intellectual development disorder (intellectual disability) are deficits in general mental abilities (Criterion A), impairment in everyday adaptive functioning, in comparison to an individual's age, gender, and sociocultural matched peers (Criterion B), and onset during the developmental period (Criterion C).

Criterion A refer to deficits in general mental abilities, such as reasoning, problem-solving, planning, abstract thinking, judgment, academic learning, learning from experience, and practical understanding confirmed by clinical assessment and standardized testing of intellectual functions, standardized neuropsychological tests, and standardized tests of adaptive functioning.

Proprietary Information of Capital District Physicians' Health Plan, Inc. | CDPHP Universal Benefits,® Inc. | Capital District Physicians' Healthcare Network, Inc.

Criterion B refer to deficits how well a person meets community standards of personal independence and social responsibility, in comparison to others of similar age and sociocultural background. There are three domains of deficits in adaptive functioning:

- Conceptual (academic)- involving competence in memory, language, reading, writing, math reasoning, acquisition of practical knowledge, problem solving, and judgement in novel situations.
- Social- involving awareness of others' thoughts, feelings, and experiences; empathy; interpersonal communication skills; friendship abilities; and social judgement.
- Practical-involving learning and self-management across life settings, including personal care, job responsibilities, money management, recreation, self-management of behavior, school, and work task organization.

Criterion C, or onset during the developmental period, refer to recognition that intellectual and adaptive deficits are present during childhood or adolescence.

The American Association on Intellectual and Developmental Disabilities defines intellectual disability as a condition marked by significant limitations in both intellectual functioning such as reasoning, learning, and problem-solving and adaptive behavior, which includes everyday social and practical skills.

REGULATORY STATUS

Under the Patient Protection and Affordable Care Act (ACA), all health insurance plans regardless of product type (e.g., health maintenance organization (HMO), or Preferred provider organization (PPO) or funding arrangement (e.g., fully insured or self-funded) that offer dependent coverage are required to provide coverage for adult children until their 26th birthday. This provision became effective for plan years starting on or after September 23, 2010.

Under the New York insurance and public health laws, disabled dependent coverage will be made available to unmarried dependent children, regardless of age, who are incapable of self-sustaining employment by reason of physical handicap, mental illness, developmental disability, or intellectual disability as defined in the New York Mental Hygiene Law. This protection applies as long as the disabling condition began before the age at which dependent coverage would normally end, and the child remains dependent on the policyholder for support.

<u>Under the New York State Mental Hygiene Law</u>:

Mental illness is defined as an affliction with a mental disease or mental condition which is manifested by a disorder or disturbance in behavior, feeling, thinking, or judgment to such an extent that the person afflicted requires care, treatment, and rehabilitation.

Developmental disability is defined as a disability of a person which is attributable to:

- Intellectual disability, cerebral palsy, epilepsy, neurologic impairment, familial dysautonomia, Prader-Willi syndrome or autism;

- Any other condition of a person found to be closely related to intellectual disability because such condition results in similar impairment of general intellectual functioning or adaptive behavior to that of intellectually disabled persons or requires treatment and services similar to those required for such person; or
- Dyslexia resulting from disabilities described above;
- Originates before such person attains age twenty-two;
- Has continued or can be expected to continue indefinitely; and
- Constitutes a substantial handicap to such person's ability to function normally in society.

CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: COVERAGE WITH EVIDENCE DEVELOPMENT FOR MEDICARE ADVANTAGE

POLICY EFFECTIVE DATE:	1/1/2026
Policy Control #:	1370/20.000517
Next Annual Review:	May, 2027

DISCLAIMER

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgement when deciding the most appropriate care to enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

DESCRIPTIONS

CMS may make a National Coverage Determination (NCD) and/or Decision Memo that requires participation in certain clinical trials, longitudinal studies, or registries for coverage of an investigational item/service and routine and related items/services.

CMS decides Coverage with Evidence Development (CED) after a formal review of the medical literature to cover an item or service only in the context of an approved clinical study or when additional clinical data are collected to assess the appropriateness of an item or service.

POSITION STATEMENT

CDPHP will provide coverage of items and services in CMS approved CED studies when the member is part of an approved study for that specific NCD/Decision Memo. CDPHP covers the below services through CED:

- Allogeneic Hematopoietic Stem Cell Transplant for Multiple Myeloma
- Allogeneic Hematopoietic Stem Cell Transplant for Myelofibrosis
- Allogeneic Hematopoietic Stem Cell Transplant for Sickle Cell Disease
- Autologous Platelet-rich Plasma
- Cardiac Contractility Modulation (CCM) for Heart Failure
- Extracorporeal Photopheresis for Bronchiolitis Obliterans Syndrome Following Lung Transplant
- Implantable Pulmonary Artery Pressure Sensors for Heart Failure Management
- Leadless Pacemakers
- Monoclonal Antibodies Directed Against Amyloid for the Treatment of Alzheimer's Disease (AD) (*reviewed by CDPHP Pharmacy program)
- Percutaneous Left Atrial Appendage Closure (LAAC)
- Pharmacogenomic Testing for Warfarin Response (*reviewed by HealthHelp)
- Renal Denervation for Uncontrolled Hypertension
- Transcatheter Aortic Valve Replacement (TAVR)

CMS Coverage with Evidence

POLICY CONSIDERATIONS

For reimbursement of above CED services, claims must include the following information:

Professional Claims:

Paper claim: 8-digit NCT identifier number preceded by alpha characters 'CT' in Field 19 of Form CMS-1500 (e.g., CT12345678)

Electronic claim: 8-digit NCT identifier number on equivalent 837P in Loop 2300 REF02(REF01=P4) no 'CT' (e.g., 12345678)

Institutional claims

Paper: 8-digit NCT identifier number in the value amount value code 'D4' of FORM CMS UB-04 (Form Locators 39-41)

Electronic: 8–digit NCT identifier number on equivalent 837I in Loop 2300 REF02 (REF01=P4)

EXCLUSIONS

Investigational item/service when it is offered through a clinical trial that is not part of CED.

CDPHP PRODUCT VARIATIONS

CHILD HEALTH PLUS: **Not Applicable.**

Revised: 9/24, 11/24, 3/25, 5/25, 9/25, 1/26, 3/26

Reviewed: 5/26

POLICY HISTORY

This section is intended to provide only highlights of the policy changes. The policy should always be reviewed in its entirety to ensure a comprehensive understanding of coverage.

Effective Date	Update
1/1/2026	Removed codes from policy as HealthHelp will be reviewing these codes: 33289 C2624 33274

	33275 33361 33362 33363 33364 33365 33366 0345T 33418 0275T
10/28/2025	Added Renal Denervation for Uncontrolled Hypertension and Cardiac Contractility Modulation (CCM) for Heart Failure to policy
9/1/2025	Added new Medicare CED to policy which was effective 7/2/2025: Transcatheter Edge-to-Edge Repair for Tricuspid Valve Regurgitation (T-TEER)
3/19/2025	Added Transcatheter Tricuspid Valve Replacement (TTVR) to policy.
3/1/2025 *No change to effective date of policy	Added Vagus Nerve Stimulation to policy as there are now clinical trials for this CED.
3/1/2025	Added Implantable Pulmonary Artery Pressure Sensors for Heart Failure Management to policy which was effective 1/13/2025.
9/1/2024 *No change to effective date of policy	Added applicable CPT and ICD 10 codes.
9/1/2024 *No change to effective date of policy	Removed Allogeneic Hematopoietic Stem Cell Transplant for MDS from the list as there is now a NCD for coverage.
9/1/2024	New policy

MEDICAL POLICY

Medical Policy Title	**Cranial and Auricular Neuromodulation**
Policy Number	**1.01.58**
Current Effective Date	**August 1, 2026**
Next Review Date	**May 2027**

Our medical policies are guides to evaluate technologies or services for medical necessity. Criteria are established through the assessment of evidence based, peer-reviewed scientific literature, and national professional guidelines. Federal and state law(s), regulatory mandates and the member's subscriber contract language are considered first in the determination of a covered service. (Link to Product Disclaimer)

This policy does not address cranial electrotherapy stimulation for the treatment of behavioral health conditions, or implantable vagus nerve stimulation and vagus nerve blocking therapy.

POLICY STATEMENT(S)

I. The following neuromodulation types are **investigational**:

- A. Cranial Electrical Stimulation; (also known as transcranial electrical stimulation [tES] or cranial electrotherapy stimulation for pain (e.g., Alpha Stim-AID, Carvella, CES Ultra);
- B. External Trigeminal Nerve Stimulation (eTNS) (e.g., Monarch);
- C. Transcutaneous/Non-Implantable Vagus Nerve Stimulation (tVNS) (e.g., GammaCore Sapphire);
- D. Transcutaneous Supraorbital Neurostimulation (e.g., Cefaly);
- E. Auricular Electrostimulation, including Percutaneous Electrical Nerve Field Stimulation (PENFS) and Transcutaneous Nerve Field Stimulation (e.g., P-Stim, IB-Stim, NSS-2 Bridge device).

POLICY GUIDELINE(S)

Not Applicable

DESCRIPTION

External Trigeminal Nerve Stimulation (eTNS)

The Monarch eTNS system, (NeuroSigma) is classified as a transcutaneous electrical nerve stimulator for attention deficit hyperactivity disorder device type. It is designed to generate and deliver electrical pulses to the trigeminal nerve, which directs signals to the parts of the brain that are believed to be associated with ADHD. The device is connected to a small patch that adheres to a patient's forehead. It is meant for at-home use during sleep and requires caregiver supervision.

Transcutaneous Supraorbital Neurostimulation

The Cefaly device (CEFALY Technology) received FDA approval for the prophylactic treatment of migraines in patients ages 18 years and older. Cefaly is a small, portable, battery-powered, prescription device that resembles a plastic headband worn across the forehead and atop the ears. The user positions the device in the center of the forehead, just above the eyes, using a self-adhesive electrode. The device applies an electric current to the skin and underlying body tissues to stimulate branches of the trigeminal nerve, which has been associated with migraine headaches. The user may feel a tingling or massaging sensation where the electrode is applied. The device should only be worn daily for 20 minutes.

Cranial Electrical Stimulation (CES)

CES is also known as cranial electrotherapy, transcranial electrical stimulation, or electrical stimulation therapy. The most common CES device in the United States, is the Alpha Stim products. Alpha Stim-AID, and Alpha-Stim M is a handheld prescription device that delivers an electronic microcurrent through electrodes placed further from the brain (i.e., earlobes, scalp, eyelids) and delivers a pulsed, low-intensity current to stimulate specific groups of nerve cells. Although the exact mechanism of action is unknown, CES has been approved by the FDA for the treatment of insomnia, depression, and anxiety. The user can select the level of stimulation and increase or reduce as needed, typically for 20- minute sessions. CES is being evaluated for a variety of other conditions including pain, and functional constipation.

Transcutaneous/Non-Implantable Vagus Nerve Stimulation (tVNS)

tVNS is a medical treatment that involves delivering electrical impulses to the auricular or cervical branch of the vagus nerve. It has been proposed as an adjunctive treatment for certain types of treatment-resistant depression, tinnitus, diabetes, endotoxemia, memory, myocardial infarction, headache, pain, intractable epilepsy, and stroke.

The gammaCore-S (electroCore LLC) is a noninvasive vagus nerve stimulation device for the acute treatment of adults with episodic cluster headaches. When the device is applied to the side of the neck by the patient, a mild electrical stimulation of the vagus nerve is carried to the central nervous system. Each stimulation using gammaCore-S lasts two minutes. The patient controls stimulation

strength. In 2021, the gamma-Core Sapphire received additional approval for indications for use including the preventative treatment of migraine headache in adolescent (age 12 and older) and adult patients, the acute treatment of pain associated with migraine headache in adolescent (age 12 and older) and adult patients, and for the adjunctive use for the preventative treatment of cluster headache in adults.

Auricular Electrostimulation

Electrical stimulation of auricular acupuncture points, or auricular electrostimulation, involves the stimulation of acupuncture points on the ear. Auricular electrostimulation has been proposed for the treatment of a variety of conditions, including pain, depression, and anxiety. Devices have been developed that provide electrical stimulation to auricular acupuncture sites over a period of several days.

The P-Stim (NeuroScience Therapy Corporation) is a single-use, miniature electrical stimulator for auricular acupuncture points that is worn behind the ear with a self-adhesive electrode patch. A selection stylus that measures electrical resistance is used to identify three auricular acupuncture points. The P-Stim device connects to three inserted acupuncture needles with caps and wires. The device is pre-programmed to be on for 180 minutes, then off for 180 minutes. The maximum battery life of this single-use device is 96 hours.

The E-pulse, or Electro Acupuncture device, is a microprocessor-controlled, battery-powered unit designed to administer auricular point nerve stimulation treatment for pain therapy over a 96-hour period.

Percutaneous Electrical Nerve Field Stimulation (PENFS)

Auricular PENFS is a variation of peripheral electrical nerve stimulation (PENS) in that it uses a low-frequency electrical current to stimulate the skin and underlying tissues in a general area of pain rather than targeting a specific nerve. PENFS devices are thought to work by sending electrical stimulation of peripheral cranial neurovascular bundles in the external ear to help modulate central pain pathways, however, the exact mechanism responsible for the analgesic effects remains unknown. PENFS involves a nonimplantable device that stimulates nerves remotely from the site of pain and has been studied for a variety of musculoskeletal and neuropathic pain conditions, and patients with opioid withdrawal.

The NSS-2 Bridge device (Innovative Health Solutions, Inc.) is a small electrical nerve stimulator placed behind the ear that emits electrical pulses to stimulate branches of certain cranial nerves, which may provide relief from opioid withdrawal symptoms. This device was approved for use in reducing the symptoms of opioid withdrawal.

The IB-Stim (Innovative Health Solutions, Inc.) is a disposable, battery-powered, percutaneous electrical nerve field stimulator (PENFS) system placed behind the ear. The device has four percutaneously placed electrodes (three frontal and one dorsal) applied to auricular areas innervated by branches of four cranial nerves (CN V, VII, IX, and X). It is intended for patients 11-18 years old with functional abdominal pain disorders (FAPD) associated with irritable bowel syndrome (IBS). The device is to be used 120 hours per week for three consecutive weeks.

SUPPORTIVE LITERATURE

External Trigeminal Nerve Stimulation (eTNS)

McGough et al (2019) assessed the efficacy and safety of eTENS in a double-blind, sham-controlled pilot study of pediatric patients with attention deficit hyperactivity disorder (ADHD). The study was a four -week trial followed by one blinded week without intervention. Clinical assessments included weekly clinician-administered ADHD-Rating and Clinical Global Impression (CGI) scales, and quantitative electroencephalography (EEG) at baseline as well as at week four. The primary outcome measure was the clinician completed ADHD-Rating Scale total score. Results revealed that ADHD-Rating Scale totals showed significant group-by-time interactions, demonstrating a differential treatment effect ($F=8.12$; $df=1/228$; $p=.005$). The CGI-Improvement scale also favored active treatment over sham ($p=.003$). Quantitative EEG readings were obtained in both groups but there were no participant specific correlations to other outcomes. No serious adverse events were observed in either group, and no patient withdrew from the study due to adverse events. Significant increases in weight and pulse were seen with active eTENS over the trial period; however, no differences between active and sham eTENS with regard to blood pressure were seen. Conclusions were that eTENS therapy is efficacious and well-tolerated in pediatric patients with ADHD. Limitations cited were the small sample size and relatively short duration of treatment and follow-up.

Transcutaneous Supraorbital Neurostimulation

Schoenen et al (2013) reported the results from the Prevention of Migraine (PREMICE) trial, a multi-center, randomized, sham controlled trial. They assessed the efficacy and safety of supraorbital transcutaneous neurostimulation (STNS) in migraine prophylaxis with the Cefaly device. The trial consisted of 67 patients randomized to receive the Cefaly device or sham treatment daily for 20 minutes for three months. After the first month of treatment both the treatment and sham groups showed a decrease in migraine days by an average of 20%. This decrease disappeared in the sham group by the second and third month but continued in the treatment group. The 50% responder rate was greater in the treatment group, and the therapeutic gain of effective stimulation over sham was 26%. The monthly attack frequency from the first to the third month was reduced by 18.8% in the treatment group and by only 3.5% in the sham group. Headache severity and the monthly intake of anti-migraine medications was also reduced in the treatment group. No adverse events or side effects were found for either the treatment or sham group. Compliance was moderately satisfactory in both groups. The responder rate for electrical stimulation was within the range of those reported for other migraine treatment modalities. However, the study size was small, and the individuals in the selected cohort were not severely disabled by their migraines.

Cranial Electrical Stimulation (CES)

CES has been investigated for individuals with headache, chronic pain, depression, and Parkinson disease. Trials that studied headaches found only marginal benefits. Trials studied for chronic pain did not show a benefit. The evidence for the use of CES for psychiatric, behavioral, or neurologic conditions include a systematic review and a number of small sham controlled randomized controlled trials (RCTs), only one of which (Barclay 2014) found a significant benefit for its use in depression,

but the sample size was small with strong potential placebo effects. Additionally, studies had significant heterogeneity in study populations and treatment protocols.

Ahn et al (2020) published a double-blind, randomized, sham-controlled pilot study of the feasibility and efficacy of remotely supervised CES via secure videoconferencing in 30 older adults with chronic pain due to knee osteoarthritis. Mean age was 59.43 years. CES was delivered via the Alpha-Stim M Stimulator, which was preset at 0.1 mA at a frequency of 0.5 Hz and applied for one hour daily on weekdays for two weeks. The sham electrodes were identical in appearance and placement, but the stimulator did not deliver electrical current. The study was conducted in a single center in Houston. All 30 participants completed the study and were included in the outcome analyses. For the primary outcome of clinical pain at two weeks as assessed by a Numeric Rating Scale, a significantly greater reduction occurred in the active CES group (-17.00 vs. +5.73; $p<.01$). No patients reported any adverse effects. Important relevancy limitations include lack of assessment of important health outcomes or long-term efficacy. An important conduct and design limitation is that it is unclear how convincing the sham procedure was as it did not involve any feature designed to simulate a tingling sensation and give the patient the feeling of being treated (i.e., subtherapeutic amplitude, initial current slowly turned to zero). Therefore, findings may be subject to the placebo effect. This trial was also limited by the small number of participants. These limitations preclude drawing conclusions based on these findings.

Wu et al (2020) published a double-blind, randomized, sham-controlled trial of the efficacy and safety of CES as an add on treatment for tic disorders in 62 children and adolescents who lacked a clinical response to prior treatment of four weeks of pharmacotherapy. Cranial electrotherapy stimulation was delivered via the CES Ultra stimulator (American Neuro Fitness LLC) at 500 µA-mA and applied for 30 minutes daily on weekdays for 40 days. The sham CES was delivered at lower than 100 µA. The study was conducted at a single academic medical center in China. A total of nine participants (14.5%) discontinued the intervention early and were excluded from the analyses. There was no significant difference between the active CES and sham groups in the change in Yale Global Tic Severity Scale (YGTSS) score (-31.66% vs. 23.96%; $p=.13$).

Transcutaneous Vagus Nerve Stimulation (tVNS)

The evidence for tVNS stimulation in individuals who have epilepsy, depression, schizophrenia, headache, or impaired glucose tolerance includes at least one randomized controlled trial and case series for some of the conditions. The RCTs are small and have various methodologic problems. Definitive efficacy of tVNS in improving outcomes among patients has not been demonstrated. The evidence is insufficient to determine the effects of the technology on health outcomes.

Percutaneous Electrical Nerve Field Stimulation (PENFS)

Kovacic et al (2017) conducted an RCT comparing the Neuro-Stim PENFS device with a sham device in adolescent patients with abdominal pain-related functional gastrointestinal disorders including IBS. Patients 11 to 18 years of age with abdominal pain (pain score ≥ 3 on an 11-point scale) occurring at least twice weekly for at least two (2) months were included. The devices were worn for five (5) days each week for four (4) weeks. Baseline medications were continued except for antispasmodics which were not allowed during the study period. Enrolled patients were primarily female (91%) and White

(90%). Pain, as measured on the Pain Frequency-Severity-Duration (PFSD), was the primary outcome. The PFSD scale incorporates several aspects of the pain experience and is generally calculated over 14 days but was modified as a weekly score in this trial with a high composite score of 70. Both "worst pain" and median PFSD composite scores were better with PENFS than placebo. The Symptom Response Scale (-7 to +7 [with negative scores as worse and positive scores as better]) was used to assess the overall symptoms. Although the authors reported statistically significantly improved scores with the Neuro-Stim device at 3 weeks, numerical differences between groups were small. Longer-term pain scores obtained at a median of 9.2 weeks after treatment remained improved from baseline in the active treatment group with a decrease of composite PFSD scores of -8.4 compared with 0.0 in the sham group. Adverse events including ear discomfort and adhesive allergy were similar between groups. The study is limited by the small sample size, the heterogeneous population of gastrointestinal disorders, the lack of bowel habit measurement, and the short duration of follow-up. Krasaelap et al (2020) evaluated a subgroup of 50 patients with IBS from the Kovacic et al (2017) RCT. At three (3) weeks there were more responders with the active treatment (response defined as ≥ 30% reduction in worst abdominal pain) than with the sham device. At the extended follow-up (8-12 weeks), the percentage of responders was similar between groups (32% vs. 18%; p=.33).

PROFESSIONAL GUIDELINE(S)

In 2024, the European Society for Pediatric Gastroenterology, Hepatology and Nutrition/North American Society for Pediatric Gastroenterology, Hepatology and Nutrition Guideline Development Group (ESPGHAN/NASPGHAN GDG) published recommendations for the treatment of abdominal pain-related disorders of gut-brain interaction such as irritable bowel syndrome and functional abdominal pain-not otherwise specified in children, based upon a systematic review and comprehensive synthesis of the available literature. After evaluation of the benefits and harms of PENFS, the GDG made a conditional recommendation with a moderate certainty of evidence for its use in the reduction of pain intensity. The GDG acknowledged that the recommendation came from a single-institution study, and that the treatment comes at a relatively high initial cost, requiring weekly new device placement for the entirety of the treatment course.

REGULATORY STATUS

The United States Food and Drug Administration (FDA) regulates electrical stimulation devices as medical devices. All electrical stimulation devices including related components require FDA approval before marketing and use in the United States to ensure they are safe and effective for human use. Refer to the FDA Medical Device website. Available from: https://www.fda.gov/medical-devices [accessed 2026 Mar 26]

The FDA lists the most serious type of medical device recalls as well as early alert communications about corrective actions being taken by companies that the FDA believes are likely to be the most serious type of recalls. Available from: Medical Device Recalls | FDA [accessed 2026 Mar 26]

CODE(S)

Date	Summary of Changes
8/1/2026	• New policy in conjunction with other new policies 1.01.59, 1.01.60, 1.01.61, & 1.01.62, which will replace Neuromuscular/Functional Electrical Stimulation policy 1370/20.000073 which is being made obsolete.

MEDICAL POLICY

Medical Policy Title	**Cryotherapy (Cold Therapy) Devices**
Policy Number	**1.01.21**
Current Effective Date	**January 1, 2027**
Next Review Date	**June 2027**

Our medical policies are guides to evaluate technologies or services for medical necessity. Criteria are established through the assessment of evidence based, peer-reviewed scientific literature, and national professional guidelines. Federal and state law(s), regulatory mandates and the member's subscriber contract language are considered first in the determination of a covered service.

(Link to Product Disclaimer)

This policy does not address whole body cooling devices or the use of compression devices for venous thromboembolism prophylaxis. Refer to CMP #1.01.51 Limb Pneumatic Compression Devices for Venous Thromboembolism Prophylaxis.

POLICY STATEMENT(S)

I. The use of active or passive cryotherapy (cold therapy) devices is considered **not medically necessary** for any indication.

DESCRIPTION

Cryotherapy or "cold therapy" refers to the local or general application of therapeutic cold, whether that be through passive durable medical items such as icepacks, cold packs, compresses, and garments (e.g., vests, cuffs, or gel caps) that may or may not use gravity or a hand pump to circulate cold water, or via active cold therapy, which uses separate pumps for circulation in order to maintain temperature. These active devices may or may not include compression or vibration in addition to cooling.

Cold therapy is considered a standard part of treating pain and inflammation following injuries involving musculoskeletal tissue, trauma, or orthopedic surgery. Recent applications aim to reduce or

prevent chemotherapy-related side effects such as alopecia, mucositis, and peripheral neuropathy.

SUPPORTIVE LITERATURE

Studies supporting the use of various cooling devices for pain and inflammation have not demonstrated health outcome improvements beyond increased convenience for the user, that exceed what is achieved with standard cryotherapy and compression using ice and wraps.

Cold Therapy Following Surgery

Quesnot and colleagues (2024) conducted a single center randomized controlled trial (NCT06037824) of compressive cryotherapy versus standard cryotherapy after total knee arthroplasty (TKA) and compared knee range of position after 21 days of rehabilitation following surgery. A total of 40 patients were randomized into two groups, patients whose treatment included compressive cryotherapy (n=20) versus those that included cryotherapy alone (n=20). Authors additionally compared other skin, pain and functional outcomes including knee circumference, fluctuation tests, pain at rest and during activity, six-minute walking tests and Knee Injury and Osteoarthritis Score (KOOS) questionnaires. Reported baseline characteristics of the two groups were minimal, aside from the median age. Study participants in the cryotherapy and compression group used the Game Ready Device (Coolsystems, Inc.) which consisted of a control unit, connector hose, and knee wrap. A block of ice was placed inside the Game Ready reservoir, the wrap was placed around the patient's knee, and parameters for the controller were set. Sessions were 30 minutes long. Alternatively, patients in the standard cryotherapy group received standard ice wraps placed in sleeves to protect the skin for 30 minutes, three times per day. On day 21, there were no differences between the groups in passive or active range of motion. Authors reported significant improvements in joint effusion, pain during activity, the 6-minute walk test, and the Knee Injury and Osteoarthritis Score (KOOS) in the cryotherapy and compression group, but numerically, the differences were small, given the limitation of small sample size.

Liang and Colleagues (2024) conducted a systematic review and meta-analysis to investigate whether cryotherapy is able to improve the rehabilitation of patients undergoing TKA and to also determine which device type offered superior results, either continuous cold flow or cold packs. A literature search was conducted in May 2024 for randomized controlled trials comparing cryotherapy with no cryotherapy or continuous cold flow devices with cold packs after TKA. The primary outcome was the visual analogue scale (VAS) for pain. Secondary outcomes included adverse events, range of motion, swelling, blood loss and length of stay. A total of 31 trials were included in the metanalysis (18 cryotherapy versus no cryotherapy, and 13 comparing continuous cold flow device versus cold packs). Results indicated lower VAS scores for the cryotherapy group compared to the no cryotherapy group on post-operative days 1, 2, and 3. Additionally, cryotherapy reduced opioid consumption, improved range of motion, as well as reduced blood loss and drainage. Results of the continuous cold flow device group were comparable to all outcomes in the cold pack group. Authors concluded that the findings support the use of cryotherapy in TKA patients, but that traditional cold packs are still recommended over continuous cold flow devices.

Khan and colleagues (2024) investigated the outcomes for 200 patients post unilateral shoulder surgery in an open- label randomized controlled trial. The patients were randomized to either the

Game Ready GRPro 2.1 cooling device or standard care, which consisted of one of the following treatments: CryoCuff, ice packs or no cryotherapy. There was no difference in pain between groups at baseline, week 2, week 6, or week 12. Opioid consumption was lower in the Game Ready group versus the standard of care group, but the interquartile range was 66.1 mg -99.4mg, which is large. In addition to the open label design, the study is limited by the heterogeneity in the standard of care treatments. Further studies with improved methodologies are warranted.

A Cochrane Review by Aggarwal and colleagues (2023) investigated cryotherapy after surgery compared with other or no treatments following TKR for osteoarthritis. A total of 22 trials (20 randomized trials, two controlled trials) representing 1,839 patients were included. The authors cite several limitations of the studies which included poor design, lack of true randomization, dropouts, small number of participants, and homogeneity. The plain language summary states, "We have little confidence in the evidence showing that cold therapy may slightly improve blood loss, pain and range of motion after surgery. We are uncertain if it lowers the risk of blood transfusion, improves knee function, increases the risk of adverse events or contributed to withdrawals due to adverse events."

Oral Cryotherapy

A 2016 Cochrane Review by Riley and colleagues defined oral cryotherapy as "the cooling of the mouth using ice, ice-cold water, ice cream, or ice lollies/popsicles." An independent search was conducted by two authors and resulted in 14 randomized controlled trials (n=1,280) included in the review. The authors determined that based upon the results from the studies, oral cryotherapy reduces oral mucositis across all severities in adults receiving fluorouracil-based chemotherapy for solid cancers. Further, that it is a low cost, natural treatment without serious side effects.

In 2024, Bragues and colleagues set out to identify therapies for the prevention and treatment of oral mucositis in pediatric patients through a systematic review of the literature. The review included observational and experimental studies of children up to age 18 who had completed or were undergoing oncologic treatment. Studies were required to present outcomes for an oral mucositis therapeutic intervention. A total of 59 articles were included. The treatment that was deemed most effective for oral mucositis was chlorhexidine. The use of oral cryotherapy (i.e., ice chips), although demonstrating a reduction in incidence and severity of mucositis in adults, only showed a reduction when administered with propantheline and demonstrated no effect when administered alone in children. The authors identify that the number of studies in the pediatric population are small, and that scientific evidence for cryotherapy is lacking in this age group.

In 2022, Walladbegi and colleagues conducted a vendor-sponsored randomized, blinded, parallel group, multi-center, phase 3 trial (NCT03203733) comparing the use of conventional ice therapy with an intraoral cooling device for the prevention of chemotherapy induced oral mucositis in 172 patients diagnosed with multiple myeloma (n=146) or lymphoma (n=26), scheduled to receive high-dose chemotherapy prior to autologous hematopoietic stem cell transplantation. The primary outcome was the highest oral mucositis score during the study period. Secondary outcomes included the degree of tolerability and patient-reported oral pain. Tertiary outcomes evaluated were the quality of life upon admission and discharge, number of days with total parenteral nutrition, number of hospital days, total dose of analgesics, weight loss, number of days from transplant to bone marrow engraftment, and maximum temperature increase. Outcomes inclusive of the entire study cohort determined there

was no statistically significant difference between the use of ice and the intraoral device in the prevention of chemotherapy induced oral mucositis. A significant difference was noted in the lymphoma group, however the number of lymphoma patients included was small, with the majority enrolled from a single site which uses BEAC (carmustine, cytarabine, etoposide, cyclophosphamide) regimens as a conditioning for lymphoma, which is already known to cause less severe mucositis when compared with BEAM (carmustine, cytarabine, etoposide and melphalan). For secondary outcomes, discomfort experienced was less for the device group compared to the group randomized to ice (5% vs. 16.1%) which was statistically significant at 4.4% vs. 15.8% in the multiple myeloma group compared with 8.3% vs. 18.2% in the lymphoma group. There were no statistically significant differences identified for the tertiary outcomes. Authors concluded that the use of the device enhances the efficacy of the ice in the prevention of mucositis in lymphoma, as well as improves tolerability, although not statistically significant. Authors suggest that the use of the device would eliminate the risk of contaminated water and subsequent infection in immunodeficient patients, however, this was not included as part of the study.

There is a paucity of literature available regarding the effectiveness of the Cooral device, and therefore, conclusions regarding comparison to standard, less costly treatments with ice cannot be made.

PROFESSIONAL GUIDELINE(S)

In 2016, the American Academy of Orthopaedic Surgeons (AAOS) published guidelines on the surgical management of osteoarthritis of the knee, stating "Moderate evidence supports that the use of cryotherapy devices after knee arthroscopy do not improve outcomes". The guidelines were updated in 2022 and no longer make any reference to the use of cryotherapy as a recommendation.

In 2021, The American Academy of Orthopaedic Surgeons (AAOS) published clinical practice guidelines for pharmacologic, physical, and cognitive pain alleviation for musculoskeletal extremity and pelvic surgeries. The authors downgraded the strength of the 2015 guideline recommendation of cryotherapy two levels to "limited" and state the following, "limited evidence suggests no significant difference in patient pain, function and opioid use between cryo-compression and control/ice/circulating water."

REGULATORY STATUS

The U.S. Food and Drug Administration (FDA) regulates [device] as medical devices. All [device] including related components require FDA approval before marketing and use in the United States to ensure they are safe and effective for human use. Refer to the FDA Medical Device website. Available from: https://www.fda.gov/medical-devices [accessed 2026 Apr 02]

The FDA lists the most serious type of medical device recalls as well as early alert communications about corrective actions being taken by companies that the FDA believes are likely to be the most serious type of recalls. Available from: Medical Device Recalls | FDA [accessed 2026 April 02]

A large number of circulating and noncirculating cooling devices have been cleared for marketing by the FDA since 1976. The following list may not be all inclusive.

Device	Manufacturer	Clearance Date	Indication
Xrecovery	Shenzhen Xinrun Electric Appliances Co, LTD	11/14/2024	To treat post-surgical and acute injuries to reduce swelling and pain

Dynatron Peltier Thermostim	Dynatronics Corp.	08/20/2012	To treat post-surgical and acute injuries to reduce swelling and pain

Probe			
VibraCool	MMJ Labs, LLC	05/15/2023	Temporary relief of minor injuries (muscle or tendon aches) and the treatment of myofascial pain post-surgery. Also, for use prior to or during physical therapy to treat myofascial pain caused by trigger points, restricted motion, and muscle tension.

In 2020, the FDA published a consumer update regarding the risk of injury related to devices that circulate water to provide hot or cold therapy, when not used properly, with an emphasis on cold-induced injuries- particularly numbness to frostbite.

In 2022, the U.S. Food and Drug Administration (FDA) awarded breakthrough device designation to the Cooral intraoral cooling system (for oral mucositis prevention). The system consists of closed conduits that continuously circulates sterile, cold water via a portable thermostat unit to a mouthpiece that is fitted to the patient. The duration of treatment is dependent on chemotherapy type, with treatment typically beginning 30 minutes prior to the start of an infusion and continuing until 30 minutes after the infusion is stopped. Treatment can be administered as often as required.

CODE(S)

- Codes may not be covered under all circumstances.
- Code list may not be all inclusive (AMA and CMS code updates may occur more frequently than policy updates).
- (E/I)=Experimental/Investigational
- (NMN)=Not medically necessary/appropriate

CPT Codes

Code	Description
0881T (NMN)	Cryotherapy of the oral cavity using temperature regulated fluid cooling system, including placement of an oral device, monitoring of patient tolerance to treatment, and removal of the oral device

Copyright © 2026 American Medical Association, Chicago, IL

HCPCS Codes

Code	Description
A9273 (NMN)	Cold or hot fluid bottle, ice cap or collar, heat and/or cold wrap, any type

Code	Description
C9817 (NMN)	Electronic cryo-pneumatic compression, pain management system (e.g., Game Ready GRPro 2.1 system), including control unit, anatomically correct wrap(s), and other system component(s), non-opioid medical device (must be a qualifying Medicare non-opioid medical device for post-surgical pain relief in accordance with Section 4135 of the CAA, 2023) (Effective 01/01/26)
E0218 (NMN)	Fluid circulating cold pad with pump, any type
E0236 (NMN)	Pump for water circulating pad
E1399 (*NMN)	Durable medical equipment, miscellaneous. (*NMN when specified as an active cooling device with heating, compression, or vibration for pain therapy)

ICD10 Codes

Code	Description
C00-C96.9	Malignant neoplasm (code range)
G62.0	Drug-induced polyneuropathy
K12.31	Oral mucositis (ulcerative) due to antineoplastic therapy
M17.0-M17.9	Osteoarthritis of knee (code range)
M23.50	Chronic instability of knee, unspecified knee
Z51.11	Encounter for antineoplastic chemotherapy

RESOURCE COORDINATION POLICY

Capital District Physicians' Health Plan, Inc.
CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: CUSTODIAL CARE

POLICY EFFECTIVE DATE:	8/1/2024
Policy Control #:	1370/20.000490
Next Annual Review:	July 2027

DISCLAIMER

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgement when deciding the most appropriate care to enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

DESCRIPTION

Care is considered custodial when it is primarily for the purpose of helping an individual with functional limitations and chronic illnesses who needs assistance with activities of daily living or meeting personal needs and can be provided safely and reasonably by persons without professional skills or training. Custodial care may occur in settings other than the home. The following activities are considered custodial care:

- Help walking and getting in or out of bed;
- Assistance bathing, dressing, feeding, and using the toilet;
- Periodic turning and positioning in bed;
- Routine care of the incontinent individual, including use of diapers and protective sheets;
- Routine services to maintain satisfactory functioning of indwelling bladder catheters;
- Preparation of special diets; and
- Supervision over medication that usually can be self-administered.

RELATED POLICIES/DOCUMENTS

Resource Coordination Policy:

Home Care Services: Home Health Care/Tele-Home Care/Personal Care/ Personal Emergency Response System, 1370/20.000048.

POSITION STATEMENT

CDPHP does not provide coverage for custodial care except for Select Plan as outlined below.

CDPHP PRODUCT VARIATIONS

CHILD HEALTH PLUS:	In addition to services in a skilled nursing facility and rehabilitation facility, custodial care or rest cures and services are excluded from coverage.
MEDICARE ADVANTAGE:	Custodial care, except in the case of hospice care, is excluded from coverage.
HARP:	Long term care in a residential health care facility (RHCF) or a skilled nursing facility (SNF) is excluded from coverage.
SELECT PLAN:	Coverage for long term care in a residential health care facility (RHCF) or a skilled nursing facility (SNF) for Medicaid managed care members is available in accordance with the Medicaid Managed Care/HIV SNP Model Contract. Approval for coverage for long-term placement into a RHCF or SNF will be based upon the member's individual needs and their financial eligibility, as determined by the local Department of Social Services (DSS). Long term care services are provided in the most integrated, least restrictive setting available to meet the member's needs. Admittance to an RHCF or SNF for long-term custodial care must be authorized and is considered medically necessary for enrollees, age 21 years and older, meeting all of the following criteria: • The member meets the Nursing Facility Level of Care (NFLOC) as determined by the Uniform Assessment System for New York (UAS-NY) or other appropriate assessment; **and**

- After reviewing the appropriate documentation, CDPHP agrees with the RHCF and SNF that community-based long-term care services (e.g., home care, personal care services, consumer-directed personal assistance, adult day health care) are not sufficient to meet the needs of the member or are not available in the amount, duration, or scope necessary to meet the needs of the member; **and**
- The member is unable to self-direct their care and does not have a representative willing and able to direct their care.

For long-term care in an RHCF or SNF to be covered, after reviewing the information provided to CDPHP, CDPHP must agree with the RHCF or SNF that the member should be placed long-term in the facility. In addition, the member must have been determined financially eligible for institutional long-term care by the local DSS. Payment to the RHCF or SNF is available for services provided to members meeting the criteria above while eligibility is being assessed by the local DSS subject to the final eligibility determination. Eligibility must be determined by the local DSS within ninety (90) days that the member has been determined eligible for long-term care and authorized by CDPHP.

The following documentation will be reviewed for determination of coverage for long-term placement in an RHCF or SNF:

A. For CDPHP to review a request for long-term care placement in an RHCF or SNF, the following documents may be requested for review:
   - Care Assessment Areas (CAAS);
   - Minimum Data Set (MDS);
   - Pre-admission Screening and Resident Review (PASRR);
   - Patient Review Instrument (PRI);
   - Plan of Care
   - Clinical/Medical Records
   - LDSS3559 Form

B. For members living in the community, CDPHP will review

the most recently completed UAS-NY, the plan of care, and clinical/medical records of community-based providers.

If a member is approved for long-term placement in an RHCF or SNF, and has been determined eligible for long-term care, CDPHP will reassess the need for long-term care every six months from the initial date of the determination.

If CDPHP does not agree that the member should be placed long-term in the RHCF or SNF, CDPHP may recoup the funds paid to the provider. CDPHP will continue efforts to coordinate a safe discharge of the member.

Payment for long-term care in an RHCF or SNF can only be applied retroactively for ninety (90) days from the date the person is deemed financially eligible by the local DSS for long-term placement. If the member is deemed eligible beyond this 90-day time frame, CDPHP may recoup any days beyond 90 days. If the member is deemed ineligible, CDPHP may recoup the funds paid to the provider. CDPHP will continue efforts to coordinate a safe discharge for the member.

Members who are determined to be medically and financially eligible for long term care in an RHCF or SNF that is located outside the CDPHP Medicaid service area, or in another state, must disenroll from CDPHP Medicaid plans due to the change of residency. CDPHP will advise the RHCF or SNF of the disenrollment so that the member may pick another available plan.

Policy/Procedure Name: Cytomegalovirus (CMV) Policy **Control Number: 1350/20.000589**

Disclaimer Notice

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgment when deciding the most appropriate care to enrollees. The CDPHP coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

Background

Cytomegalovirus (CMV) is a common herpes virus that infects 1 in 3 children in the US and over half of adults by age 40 years. Infected individuals with a competent immune system typically do not require treatment but certain groups are at high risk for CMV infection: infants infected in utero (congenital CMV), very low birth weight and premature infants, and immunocompromised individuals (such as transplant patients and people infected with HIV). While infection of healthy individuals may be asymptomatic or present mild symptoms such as fatigue and sore throat, infection of patients with compromised immune systems may lead to severe clinical manifestations such as retinitis, colitis, esophagitis, pneumonia, and neurologic defects like dementia and central nervous system vasculitis.

Diagnosis of CMV in individuals at least 12 months of age is primarily done via serologic tests to detect CMV antibodies (IgM and IgG). Newborns may be tested through PCR testing of their saliva and a confirmatory urine test to verify the presence of CMV-specific IgM and or four-fold rise in CMV-specific IgG.

Initial management of CMV involves antiviral therapy with intravenous (IV) ganciclovir or oral valganciclovir as the preferred agents for both treatment and prophylaxis. For patients with resistant or refractory disease, IV foscarnet, IV cidofovir, and oral maribavir are alternative agents that may be used.

Livtencity (maribavir) is a CMV pUL97 kinase inhibitor that impedes protein phosphorylation to stop viral DNA replication and nuclear egress. It is indicated for treatment of post-transplant CMV infection or disease that is refractory to treatment, regardless of genotypic resistance, with ganciclovir, valganciclovir, cidofovir, or foscarnet in adults and pediatric patients 12 years of age and older weighing at least 35 kg.

Specific populations may be indicated for CMV prophylaxis or preemptive therapy due to their risk of developing CMV-disease related complications (e.g. hematopoietic stem cell transplantation [HSCT] recipients). Prophylactic therapy is administration of a drug to prevent infection in patients at increased risk whereas preemptive therapy is defined as administration of antiviral therapy to asymptomatic patients with laboratory markers of viremia to avoid disease progression, in which case valganciclovir, ganciclovir, or foscarnet are recommended. Medications for CMV prophylaxis include ganciclovir, foscarnet, acyclovir, valacyclovir, valganciclovir, and letermovir. Of note, foscarnet, acyclovir, and valacyclovir are not FDA-approved for this indication.

Prevymis (letermovir) is a non-nucleoside CMV inhibitor that targets the CMV DNA terminase complex which is required for viral DNA processing and packaging. It is indicated for prevention of CMV infection and disease in adults and pediatric patients 6 months of age and older weighing at least 6 kg who are CMV-seropositive recipients [R+] of an allogeneic hematopoietic stem cell transplant, as well as the prophylaxis of CMV disease in adults and pediatric patients 12 years of age and older who are kidney transplant recipients at high risk (donor CMV seropositive/recipient seronegative [D+/R-]). The NCCN guidelines for the Prevention and Treatment of Cancer-Related Infections include consideration of letermovir for primary prophylaxis in allogeneic HCT recipients who are CMV seropositive.

Summary

Effective Date of Policy:	2/12/2026
Availability	Livtencity: 200 mg tablet Prevymis: 240 or 480 mg tablets, 20 mg or 120 mg oral pellet packets, 240 mg/12 mL or 480 mg/24 mL IV solution in single dose vials
HCPCS Code	Prevymis: J3490 (no specific HCPCS Code)
Duration	Product dependent

Required Criteria for Initial Approval		
All of the following conditions for the requested indication must be met in order to approve therapy		
Specific Drug	**Inclusion Criteria**	**Dosing Regimen**
Livtencity (maribavir) Rx benefit	1. Must be 12 years of age or older and weigh at least 35 kg AND 2. Must be prescribed by, or in consultation with, a hematologist, infectious disease specialist, oncologist, or a physician affiliated with a transplant center AND 3. Must have a diagnosis of cytomegalovirus (CMV) infection/disease following a hematopoietic stem cell transplant (HSCT) or a solid organ transplant (SOT) AND 4. Must have post-transplant CMV infection/disease that is refractory to treatment (with or without genotypic resistance) to at least one of the following therapies: a. Ganciclovir b. Valganciclovir c. Cidofovir d. Foscarnet 5. Refractory infection/disease is defined below (a or b): a. Definition of Refractory CMV infection: CMV viremia (DNAemia or antigenemia) that increases (> 1 log10) or persists (< 1 log10 increase or decrease) after at least 2 weeks of antiviral therapy b. Definition of Refractory CMV end-organ disease: Worsening in signs and symptoms or progression into end- organ disease (for a patient not previously diagnosed with CMV end-organ disease) OR lack of improvement in signs and symptoms after at least two weeks of appropriately dosed antiviral therapy 6. Must not have CMV disease involving the central nervous system, including the retina AND 7. Livtencity will not be authorized for use in combination with ganciclovir or valganciclovir AND 8. Livtencity will not be approved for non-FDA approved diagnoses (such as for the prevention of CMV infection/disease). 9. Approval will be provided for a total of 8 weeks. a. As therapy with Livtencity has not been studied for longer than 8 weeks, recertification will not be authorized. 10. Quantity Limit: 120 tablets per 30-day supply. a. An increase in the quantity limit in accordance with the prescribing information may be provided with documentation Livtencity is being co-administered with certain anticonvulsants	Refer to the Livtencity prescribing information for approved dosing.
Prevymis (letermovir) Rx benefit or medical benefit	1. Member must meet ONE of the following criteria (a or b): a. Member is a recipient of an allogenic hematopoietic stem cell transplant (HSCT) AND i. Member must be 6 months of age or older and weigh least 6 kg AND ii. Member is CMV-seropositive (R+) AND iii. Prevymis is being requested for CMV prophylaxis AND iv. Member will initiate therapy with Prevymis between Day 0 and Day 28 post transplantation (documentation of date of transplant is required) OR b. Member is a recipient of a kidney transplant AND i. Member must be 12 years of age or older and weigh at least 40 kg AND ii. Member is CMV-seronegative AND iii. Member must have received a primary or secondary allograft kidney from a seropositive [D+] donor AND iv. Prevymis is being requested for CMV prophylaxis AND v. Member will initiate Prevymis between Day 0 and Day 7 post transplantation (documentation of date of transplant is required).	Refer to the Prevymis prescribing information for approved dosing.

	2. Prescriber attests member is not concurrently using medications that are contraindicated with Prevymis (i.e., pimozide, ergot alkaloids, pitavastatin and simvastatin when co-administered with cyclosporine) AND 3. All requests for Prevymis IV will require clinical justification why the oral formulation cannot be used. 4. For kidney transplant recipients, authorization will be provided for 7 months to allow for 200 days of treatment post-transplant. Reauthorization will not be permitted. 5. For allogenic HSCT recipients, initial authorization will be provided for 4 months to allow for 100 days post-transplant 6. Quantity Limits: a. Prevymis 240 mg or 480 mg tablets: 30 per 30 days b. Prevymis 20 mg or 120 mg oral pellet packets: 120 per 30 days	

Continuation Criteria

Prevymis:

- Reauthorization for kidney transplant recipients past 200 days of treatment post-transplant will not be permitted.
- For allogenic HSCT recipients recertification for an additional 4 months to allow an additional 100 days of therapy (maximum 200 days of treatment post-transplant) may be authorized with documentation of the following:
  - Member is high-risk for late CMV infection and disease with one or more of the following risk factors:
    - HLA-related (sibling) donor with at least one mismatch at one of the following three HLA-gene loci: HLA-A, -B or –DR; or
    - Unrelated donor with at least one mismatch at one of the following four HLA-gene loci: HLA-A, -B, -C and -DRB1; or
    - Haploidentical donor; or
    - Use of umbilical cord blood as stem cell source; or
    - Use of ex vivo T-cell-depleted grafts; or
    - Receipt of anti-thymocyte globulin; or
    - Receipt of alemtuzumab; or
    - Use of systemic prednisone (or equivalent) at a dose of ≥1 mg/kg of body weight per day.

Considerations

- Prior authorization is obtained through the CDPHP pharmacy department.

GOVERNMENT PROGRAMS

CHILD HEALTH PLUS: Subject to all terms and conditions noted in above application.

MEDICARE ADVANTAGE: Prevymis IV: Subject to the terms and conditions noted in above policy for those medications listed as a medical benefit when administered and provided by physician office, coverage will be provided as a medical benefit.

All other medications for Medicare Advantage with Part D members listed are subject to coverage under the current Part D benefit and Medicare Advantage Part D formulary..

SELECT/HARP PLAN: Subject to all terms and conditions noted in above application if administered under the medical benefit.

Effective April 1, 2023, the pharmacy benefit for Medicaid is administered by NYRx, the Medicaid Pharmacy Program.

MEDICAL POLICY

Medical Policy Title	**Deep Brain Stimulation**
Policy Number	**7.01.23**
Current Effective Date	**September 1, 2026**
Next Review Date	**April 2027**

Our medical policies are guides to evaluate technologies or services for medical necessity. Criteria are established through the assessment of evidence based, peer-reviewed scientific literature, and national professional guidelines. Federal and state law(s), regulatory mandates and the member's subscriber contract language are considered first in the determination of a covered service. (Link to Product Disclaimer)

This medical policy does not address occipital nerve stimulation for chronic migraines or occipital neuralgia.

POLICY STATEMENT(S)

I. Unilateral or bilateral deep brain stimulation of the ventral intermediate nucleus (VIM) thalamus is a **medically appropriate** treatment option in the management of disabling, medically unresponsive essential tremor or tremor due to Parkinson's disease when **BOTH** of the following criteria are met (Disabling, medically unresponsive tremor is defined as both of the following):

   A. Tremor causing significant limitation in daily activities; **and**

   B. Inadequate control with maximal dosage of medication for at least three (3) months before implant.

II. Conventional bilateral deep brain stimulation of the subthalamic nucleus (STN) or globus pallidus interna (GPi) is a **medically appropriate** treatment option for Parkinson's disease when **ALL** of the following criteria are met:

   A. The patient has a good response to levodopa;

   B. Motor complications are not controlled by pharmacologic therapy; **and**

   C. **ONE** of the following:

      1. a minimum score of 30 points on the motor portion of the Unified Parkinson Disease Rating Scale (UPDRS) when the individual has been without medication for approximately 12 hours; **or**

      2. Parkinson's disease for at least four (4) years.

III. Conventional unilateral or bilateral deep brain stimulation of the STN or GPi is **medically appropriate** when **BOTH** of the following criteria are met:

   A. Individual is seven (7) years of age or older;

   B. Individual has chronic, intractable primary dystonia, including **any** of following indications:

      1. generalized or segmental dystonia,

2. hemidystonia; **or**
3. cervical dystonia (torticollis).

IV. Unilateral or bilateral deep brain stimulation of the anterior nucleus of the thalamus (ANT) is **medically appropriate** when **ALL** of the following criteria are met:

A. A confirmed diagnosis of epilepsy;

B. 18 years of age or older;

C. Focal partial onset seizures with or without generalized seizure;

D. Refractory to medical therapy defined as failure to adequately control seizures after two (2) (or more) appropriate and adequately dosed anti-seizure medications or intolerance to anti-seizure medications;

E. Currently having an average of three (3) or more disabling seizures (e.g., motor partial seizures, complex partial seizures, or secondary generalized seizures) per month over the most recent three (3) months; **and**

F. Absence of progressive neurological conditions such as neurodegenerative disease.

V. Deep brain stimulation is contraindicated and therefore, **not medically necessary** for **ANY** individuals in the following situations:

A. Not a good surgical candidate due to unstable medical conditions;

B. Presence of a cardiac pacemaker;

C. A medical condition that requires repeated magnetic resonance imaging (MRI);

D. Presence of dementia that may interfere with the ability to cooperate; **or**

E. Recent treatment with botulinum toxin injections within the last six (6) months.

<u>Device Repair</u>

VI. Repair of a medically necessary DBS System or components not under warranty will be considered **medically appropriate** when the following criteria are met:

A. Physician documentation includes **ALL** of the following:

1. date of device implantation/initiation;
2. manufacturer warranty information, if applicable;
3. attestation that the patient has been compliant with the use of device and will continue to benefit from the use of device;

B. The device is no longer functioning adequately; and **BOTH** of the following criteria are met:

1. inadequate function interferes with activities of daily living; **and**
2. repair is expected to make the equipment fully functional (as defined by manufacturer).

C. Repair of equipment damaged due to patient neglect, theft, abuse, or when another available coverage source is an option (e.g., homeowners, rental, auto, liability insurance, etc.) is **ineligible for coverage**.

Device Replacement

VII. Replacement of a medically necessary DBS System or components not under warranty will be considered **medically appropriate** when **EITHER** of the following criteria are met:

A. The device is no longer functioning adequately and has been determined to be non-repairable or the cost of the repair is in excess of the replacement cost; **or**

B. There is documentation that a change in the patient's condition makes the present unit non-functional and improvement is expected with a replacement unit.

VIII. The replacement of a properly functioning DBS System, its components or accessories is considered **not medically necessary**. This includes, but is not limited to, replacement desired due to advanced technology or in order to make the device more aesthetically pleasing.

IX. The replacement of equipment damaged or lost due to patient neglect, theft, abuse, or when another available coverage source is an option (e.g., homeowners, rental, auto, liability insurance, etc.) is **ineligible for coverage**.

X. Accessories or components for DBS System that are considered not medically necessary or investigational by peer-reviewed literature will also be considered as **not medically necessary or investigational** by the Health Plan.

XI. Directional deep brain stimulation (e.g., St. Jude Medical Infinity DBS System and Vercise DBS System) is **investigational** for all indications.

XII. Conventional deep brain stimulation is **investigational** for all conditions not specifically identified in Policy Statements I through IV, including, but not limited to, the following conditions:

A. Multiple sclerosis tremor;

B. Post-traumatic dyskinesia;

C. All other movement disorders;

D. Chronic pain syndromes, including cluster headache;

E. Tardive dyskinesia;

F. Tourette syndrome;

G. Dementias, including Alzheimer's disease;

H. Eating disorders, including anorexia nervosa;

I. Alcohol addiction;

J. Treatment-resistant depression;

K. Treatment-resistant obsessive-compulsive disorder.

07.01.103 Responsive Neurostimulation for the Treatment of Refractory Focal Epilepsy

11.01.03 Experimental or Investigational Services

POLICY GUIDELINE(S)

I. Bilateral stimulators may be implanted simultaneously or in staged procedures.

DESCRIPTION

Deep brain stimulation (DBS) has been investigated as an alternative to permanent neuro-ablative procedures, such as thalamotomy and pallidotomy. The procedure involves the stereotactic placement of an electrode into a targeted region of the brain. The electrode is then attached, via a cable/wire, to a programmable stimulator implanted subcutaneously. DBS is designed to turn off overactive brain regions without destroying them. The immediate advantage of DBS over conventional destructive surgery is that the lesions are titratable and, hence, reversible. After implantation, noninvasive programming of the neurostimulator can be adjusted to the individual's symptoms.

The effect of DBS depends on where the electrodes are placed. The three common target sites are the VIM thalamus, STN and GPi. Whereas unilateral/bilateral DBS of the thalamus is utilized to treat essential tremor or tremors of advanced Parkinson's disease, DBS of the STN or of the GPi is used for treatment of the entire constellation of Parkinsonian symptoms (e.g., tremor, rigidity, and bradykinesia). DBS is performed at specialty centers.

DBS has also been investigated for the treatment of primary dystonia, defined as a neurological movement disorder characterized by involuntary and painful muscle contractions and contortions. Dystonia can be classified according to cause and the bodily distribution of symptoms. Primary or idiopathic dystonia is not associated with any other pathology, whereas secondary dystonia is caused by a known insult (e.g., trauma, infarct, stroke) to the basal ganglia. Generalized dystonia affects a wide range of body areas, while focal dystonia affects specific body parts (e.g., spasmodic torticollis/cervical dystonia, blepharospasm). Dystonia is the third most common movement disorder, behind Parkinson's disease and essential tremor. Unless contraindicated, DBS of either the STN or GPi requires a bilateral procedure.

In addition to essential tremors, Parkinson's disease, and primary dystonia, DBS is also being investigated for disorders such as major depression, cluster headaches, chronic pain syndromes, Tourette syndrome, epilepsy, and obsessive-compulsive disorder.

Unified Parkinson's Disease Rating Scale (UPDRS)

The Unified Parkinson's Disease Rating Scale (UPDRS) is the most widely applied rating instrument

for the evaluation of a person with Parkinson's Disease to determine disease severity. The total UPDRS score includes 31 items contributing to three (3) subscales: (I) Mentation, Behavior and Mood; (II) Activities of Daily Living; and (III) Motor Examination. The UPDRS does not assess general cardiovascular fitness and provides only limited information on functional performance relative to daily activities.

Conventional DBS

Conventional DBS systems use ring-shaped electrodes, which generate an approximately spherical electrical field. In these systems, programming of polarity and stimulation pulse parameters allows only limited control of the shape of the volume of tissue activated. While physicians try to target a very specific area of the brain with conventional DBS, there is a risk of stimulating neighboring regions as they cannot steer the stimulation precisely.

Directional DBS

Directional DBS systems use novel lead designs with segmented, multi-contact electrodes that allow for the activation of individual electrode contacts which also allow the physician to specify the exact amount of current needed for every contact of the electrode. By activating specific electrode contacts and defining the amount of stimulation for each contact, stimulation precision is significantly increased. More precise stimulation is thought to reduce side effects of DBS, such as muscle contractions, dysarthria, and cognitive or behavioral disturbances sometimes seen in conventional DBS.

SUPPORTIVE LITERATURE

Unilateral Stimulation of the Thalamus

Schuurman et al (2008) reported on 5-year follow-up of 68 patients comparing thalamic stimulation with thalamotomy for the treatment of tremor due to Parkinson's disease (n=45 patients), essential tremor (n=13 patients), and multiple sclerosis (MS; n=10 patients). Forty-eight (71%) patients were assessed at five years: 32 with Parkinson's disease, 10 with essential tremor, and 6 with MS. The Frenchay Activities Index, the primary study outcome measure, was used to assess change in functional status. Secondary measures included tremor severity, complication frequency, and patient-assessed outcomes. The mean difference between interventions, as measured on the Frenchay Activities Index, favored thalamic stimulation at all time points: 4.4 (95% confidence interval [CI], 1.1 to 7.7) at 6 months, 3.3 (95% CI, -0.03 to 6.6) at 2 years, and 4.0 (95% CI, 0.3 to 7.7) at 5 years. The procedures had similar efficacy for suppressing tremors. The effect of thalamic stimulation diminished in half of the patients with essential tremor and MS. Neurologic adverse effects were higher after thalamotomy. Subjective assessments favored stimulation.

Hariz et al (2008) evaluated outcomes of thalamic deep brain stimulation in patients with tremor-predominant Parkinson's disease who participated in a multicenter European study. The authors reported that at 6 years post-surgery, tremor was still effectively controlled and appendicular rigidity and akinesia remained stable compared with baseline.

Bilateral Stimulation

Jost et al (2023) conducted an observational study of the long-term effect of bilateral DBS on the subthalamus nucleus and its effects on quality of life, motor functions, and medication requirements for patients with advanced Parkinson's. The final analysis included 108 patients with 62 receiving DBS and 46 receiving medications matched to a sub cohort of 25 patients per group. At the five years follow up, the Parkinson's Disease Questionnaire 8 (PDQ-8) and ADL scores worsened only in the medication group, while remaining stable in the DBS group. The group that received DBS also experienced favorable effects on motor complications.

Epilepsy

Results of Medtronic's Stimulation of the Anterior Nuclei of Thalamus for Epilepsy (SANTÉ) trial (Fisher 2010) showed promising outcomes on the adjunct use of DBS of the ANT over placebo stimulation for patients suffering from severe, refractory, partial-onset seizures. All subjects underwent DBS implantation followed by three months of randomized and blinded active stimulation (n=54) or no stimulation (n=55), then followed by nine months of active stimulation for all subjects. Two years after implantation of the device, seizures were reduced by a median 56% compared with baseline, and 14 patients (12.7%) became seizure-free for at least six months. Longer-term studies were needed to better define its safety and efficacy, as well as the subset of patients who would benefit most from this treatment.

Salanova and others published a long-term follow-up study of the SANTÉ trial in 2015. Beginning 13 months following device implantation, 105 subjects receiving active stimulation were followed for an additional four years. The authors reported that for subjects with at least 70 diary entries recorded at one (1) year (n=99), median change for seizure frequency from baseline decreased by 41% ($p < 0.001$), and by 69% at five (5) years (n=59; $p < 0.001$). For the same population, reduction in the most severe type of seizure was 39% at one year ($p < 0.001$) and 75% at five years ($p < 0.001$). During the 5-year study, 17 of 109 subjects (16%) reported a 6-month seizure-free interval. A 2-year seizure-free interval was reported for 6 of 109 subjects (5.5%). Mean improvement in the Liverpool Seizure Severity Score (LSSS) was 13.4 at one year and 18.3 at five years ($p < 0.001$ for both). Similarly, results from the Quality of Life in Epilepsy-31 (QOLIE-31) tool improved from baseline by 5.0 points at one (1) year and 6.1 points at (5) five years ($p < 0.001$ for both). A change of 5 points on this measure is considered clinically significant and was experienced by 46% and 48% of subjects at one and five years. Device-related adverse events included site infection, leads not within the target area, depression and memory impairment. This study demonstrated significant long-term benefit from DBS for individuals with epilepsy, although the study was relatively small and unblinded.

On April 27, 2018, the FDA approved the Medtronic DBS System for Epilepsy for bilateral stimulation of the anterior nucleus of the thalamus (ANT) based on the SANTÉ trials as an adjunctive therapy for reducing the frequency of seizures in individuals 18 years of age or older who are diagnosed with epilepsy characterized by partial-onset seizures, with or without secondary generalization, that are refractory to three or more antiepileptic medications. The FDA indicated that the Medtronic DBS System for Epilepsy has demonstrated safety and effectiveness for patients who average six (6) or more seizures per month over the three (3) most recent months prior to implantation of the DBS system (with no more than 30 days between seizures). The Medtronic DBS System for Epilepsy has not been evaluated in patients with less-frequent seizures.

The effect of deep brain stimulation of the anterior nuclei of the thalamus (ANT-DBS) after implantation has been reported as approximately 50% seizure frequency reduction in approximately 60% of patients (Herrman 2019) and the seizure frequency reduction increased over the following ten years (Salanova 2018 and Salanova 2021). Multiple literature reviews of randomized and blinded clinical trials and case series with high-quality data support the use of DBS for the treatment of medically refractory epilepsy.

Other Indications

Published clinical trials have not provided evidence to support the efficacy and safety of DBS for other conditions, including, but not limited to multiple sclerosis, post-traumatic dyskinesia, treatment-resistant depression, Alzheimer's disease, and Tourette syndrome; or for bilateral DBS of the VIM thalamus. Studies of DBS for the treatment of chronic pain have not provided evidence that DBS is an effective treatment method over already-established treatment methods.

PROFESSIONAL GUIDELINE(S)

In 2003, the National Institute for Health and Care Excellence (NICE) published guidance on DBS for Parkinson's Disease stating that the evidence on the safety and efficacy of deep brain stimulation for treatment of Parkinson's disease "appears adequate to support the use of the procedure." The guidance noted that deep brain stimulation should only be offered when Parkinson's disease is refractory to best medical treatment.

The American Academy of Neurology (AAN) 2011 updated its guidelines on the treatment of essential tremor, which were reaffirmed in 2022. The guidelines stated that bilateral DBS of the thalamic nucleus may be used to treat medically refractory limb tremors in both upper limbs (level C, possibly effective) but that there were insufficient data on the risk/benefit ratio of bilateral versus unilateral deep brain stimulation in the treatment of limb tremor. There was insufficient evidence to make recommendations on the use of thalamic deep brain stimulation for head or voice tremors (level U, treatment is unproven).

In December of 2021, the American Society of Stereotactic and Functional Neurosurgery (ASSFN) published the following position statement: "Deep brain stimulation (DBS) of the bilateral anterior nucleus of the thalamus (ANT) is a Food and Drug Administration (FDA)-approved, safe, and efficacious treatment option for patients with refractory focal epilepsy" who meet specific criteria.

REGULATORY STATUS

The FDA first approved Medtronic's Activa Tremor Control System for DBS in 1997 for the unilateral treatment of tremors. This approval was expanded in 2002 to include bilateral implantation for individuals with advanced Parkinson's disease whose symptoms were inadequately managed with medication. In 2016, the FDA further broadened the indication to include patients who had been diagnosed with Parkinson's disease for at least four years and who had developed motor complications not sufficiently controlled by drug therapy. This expanded indication was supported by findings from the EARLYSTIM trial (Schuepbach WM et al., 2013), which demonstrated a 26 percent improvement in quality of life for patients treated with DBS in combination with best medical therapy,

compared with a 20 percent improvement among those receiving medical therapy alone.

In April 2003, the FDA gave Humanitarian Device Exemption (HDE) approval to the Activa Therapy System for the unilateral or bilateral stimulation of the internal STN or GPi, to aid in the management of chronic, intractable (drug-resistant) primary dystonia, including generalized and/or segmental dystonia, hemidystonia, and cervical dystonia in individuals seven years of age or older. In 2016, the FDA identified that the HDE for the Activa Therapy System remained appropriately approved for pediatric use. In 2018, the Activa deep brain stimulation system received FDA approval with an expanded indication as an adjunctive therapy for epilepsy.

The Brio Neuromodulation System (St. Jude Medical) received FDA approval in June 2015 for use in deep brain stimulation therapy. The system is indicated for bilateral stimulation of the subthalamic nucleus (STN) to reduce symptoms of advanced, levodopa-responsive Parkinson's disease that are insufficiently controlled with medication, as well as for unilateral or bilateral stimulation of the VIM of the thalamus to manage disabling upper extremity tremor in adults with essential tremor. A key distinction from Medtronic's Activa system is that the Brio device delivers stimulation using constant current rather than constant voltage. FDA approval was supported by two clinical trials involving patients with Parkinson's disease and essential tremor whose symptoms were not adequately managed with medication. "Both groups showed statistically significant improvement on their primary effectiveness endpoints when the device was turned on compared to when it was turned off," the statement notes.

Clinical studies support that deep brain stimulation (DBS) is a safe and effective treatment for several movement disorders. Unilateral DBS targeting the ventral intermediate nucleus (VIM) of the thalamus is highly effective for essential tremor and tremor associated with Parkinson's disease, producing complete or clinically meaningful tremor reduction in approximately 82–91% of patients, with sustained benefits and minimal adverse effects. When tremors recur, symptoms can often be effectively managed through adjustments to stimulation settings. Although long-term outcome data remain limited, bilateral DBS of the STN or GPi has been shown to significantly improve neurological function in individuals with advanced Parkinson's disease. Evidence from studies evaluating DBS for dystonia indicates substantial improvements in motor function and activities of daily living among patients with primary dystonia, whereas patients with secondary dystonia experience limited benefit.

Directional DBS

The St. Jude Medical Infinity DBS System was the first FDA-approved deep brain stimulation system to use directional leads, allowing more precise targeting of brain areas to reduce stimulation-related side effects. It received FDA approval on September 19, 2016, as a design and component update to the previously approved Brio Neurostimulation System. The Infinity system is indicated for bilateral stimulation of the STN to treat advanced, levodopa-responsive Parkinson's disease not adequately controlled by medication, and for unilateral or bilateral stimulation of the VIM of the thalamus to suppress disabling upper extremity tremor in adults with essential tremor. Although the system's 8-channel directional leads were recalled in 2018 due to manufacturing issues, the recall was terminated in September 2020.

In January 2020, Abbott received FDA approval to expand indications for the Infinity DBS system to

include targeting the internal GPi for treating Parkinson's disease symptoms not adequately controlled by medication. The Infinity system uses directional leads to optimize stimulation and reduce side effects.

Boston Scientific's Vercise DBS systems were FDA approved between 2019 and 2021, including the Vercise PC, Vercise Gevia, and Vercise Genus systems. These systems are indicated for bilateral stimulation of the STN or GPi for moderate to advanced levodopa-responsive Parkinson's disease, and unilateral stimulation of the VIM of the thalamus to control disabling tremor in essential tremor or parkinsonian tremor. The Vercise systems feature current steering across eight contacts per lead to enable precise and customizable stimulation.

Obsessive Compulsive Disorder (OCD)

In February 2009, the FDA granted a Humanitarian Device Exemption (HDE) to Medtronic's ReClaim Deep Brain Stimulator, making it the first DBS device approved to treat obsessive-compulsive disorder (OCD). The device is indicated for bilateral stimulation of the anterior limb of the internal capsule (AIC) as an adjunct to medication and an alternative to anterior capsulotomy for adults with chronic, severe, treatment-resistant OCD who have failed at least three SSRIs. Approval was based on a small study of 26 patients, which showed an average 40% reduction in symptoms after 12 months. However, study limitations included lack of full blinding, raising concerns about placebo effects. As of 2021, the World Society for Stereotactic and Functional Neurosurgery considered DBS for OCD to be an emerging but unproven treatment, noting that larger, well-designed studies are needed to establish long-term safety and effectiveness.

MEDICAL POLICY

Medical Policy Title	**Dental and Oral Care under Medical Plans**
Policy Number	**7.01.21**
Current Effective Date	**January 1, 2027**
Next Review Date	**May 2027**

Our medical policies are guides to evaluate technologies or services for medical necessity. Criteria are established through the assessment of evidence based, peer-reviewed scientific literature, and national professional guidelines. Federal and state law(s), regulatory mandates and the member's subscriber contract language are considered first in the determination of a covered service. (Link to Product Disclaimer)

POLICY STATEMENT(S)

Oral surgical procedures are ineligible for coverage under the medical portion of a member's subscriber contract, unless otherwise stated. Oral surgical procedures may include, but are not limited to dental extractions, periodontal treatment, or biopsies for dental related cysts or tissue of dental origin (e.g., amalgam tattoo, fibroma, or hyperkeratoses).

I. Developmental Cysts

A. Developmental cysts of epithelial remnants (e.g., globulomaxillary cysts, median alveolar cysts, median palatine cysts, nasopalatine cysts) are not tooth related. Removal of these cysts is considered **medically appropriate** under medical/surgical contracts, subject to the terms of the member's subscriber contract.

B. Removal of tooth-related cysts (e.g., follicular-dentigerous, primordial, or multilocular-cysts, cysts of mallassez, radicular cysts, residual cysts, and odontomas) is considered **medically appropriate** under dental contracts; dental benefits are contract-specific.

C. The removal of tooth-related cysts is **ineligible for coverage** as a medical/surgical benefit.

II. Oral Biopsies

A. A biopsy of the buccal mucosa, tongue, palate or floor of the mouth is considered **medically appropriate** under medical/surgical contracts; benefits are contract specific.

B. A biopsy of the gingiva or supporting structures of the teeth is a medical procedure and is considered **medically appropriate** under medical/surgical contracts, unless tissue was obtained as part of a routine tooth extraction or a routine periodontal procedure.

C. If the biopsy reveals only a dental condition, then subsequent care or treatment of that condition is **ineligible for coverage** under medical/ surgical contracts, unless otherwise stated.

III. Accidental Injury to Sound, Natural Teeth

An accidental injury is defined as a "blow to the face" and does not include biting injuries. Services for the treatment of an accidental injury to sound, natural teeth, when rendered within 12 months from the date of injury, are **eligible for coverage** in accordance with the benefits

set forth in the member's medical/surgical contract, provided that the tooth is sound and natural, with no restorative treatment and no disease prior to the injury. A sound tooth is one sufficiently supported by its natural structure (bone and gum tissue) that was formed by the human body and is not decayed or weakened by previous dental work at the injury site (for example, a tooth with no crown, root canal, periodontal condition, or fracture that is not in need of treatment for any reason other than the accidental injury).

Coverage under the medical/surgical contract will only be provided for services that include **ALL** of the following criteria:

A. Fall within a category of services for which there is a benefit provided under the member's subscriber contract;

B. Deemed medically necessary according to the criteria set forth in Corporate Medical Policy #11.01.15, which addresses Medically Necessary Services; **and**

C. Rendered within 12 months* of an accidental injury.

(*Please note that exceptions to the 12-month time frame are not granted for the staging of procedures.)

IV. Congenital Anomaly or Disease

Services for the treatment of a congenital anomaly or disease are **eligible for coverage** under the member's medical/surgical contract in accordance with the benefits set forth in the contract when:

A. The services are for the treatment or correction of functional impairment of an underlying congenital anomaly or disease that was present at birth, and medical documentation of the anomaly is provided (e.g., genetic testing records, birth defects). Congenital anomaly or disease is defined as an abnormality of structure or function that was present at birth (e.g., cleft palate, ectodermal dysplasia, ankyloglossia).

   1. Coverage under the medical/surgical contract will only be provided for frenectomy (CPT code 41115), frenotomy (CPT code 41010) or frenoplasty (CPT code 41520) of the lingual frenum related to congenital ankyloglossia, when the ankyloglossia restricts the movement of the tongue leading to problems with newborn feeding, and speech articulation in children.

   2. Frenectomy (CPT code 41115), frenotomy (CPT code 41010), and frenoplasty (CPT code 41520) of the lingual frenum are considered **not medically necessary** when performed prophylactically to promote speech development/articulation in children or adults, because the effectiveness of this approach has not been established.

B. Coverage under the medical/surgical contract will only be provided for services that fall within a category of services for which there is a benefit provided under the member's subscriber contract which are considered medically necessary in accordance with the criteria set forth in Corporate Medical Policy #11.01.15 Medically Necessary Services.

RELATED POLICIES

Corporate Medical Policy

7.03.01 Coverage for Ambulatory Surgery Unit (ASU)/ Outpatient Facility and Anesthesia for Dental Services

11.01.15 Medically Necessary Services

POLICY GUIDELINE(S)

I. X-rays, including cone beam imaging for implant placement (Computed Tomography (CT) scans), are **ineligible for coverage** under the medical benefit of a member's subscriber contract, unless otherwise stated.

II. All other dental services rendered by a dental provider (e.g., Doctor of Medical Dentistry, Doctor of Dental Surgery) not listed in the above Policy Statements are **ineligible for coverage** under the member's medical/surgical contract, unless otherwise stated.

DESCRIPTION

Oral surgery involves the correction of conditions of or damage to the mouth, teeth, and jaw. Oral surgery is commonly performed to remove wisdom teeth, prepare the mouth for dentures, repair jaw conditions, and perform more advanced procedures, as required after trauma or severe disease damage to the structure of the mouth.

There are two categories of dentoalveolar bone cysts which include cysts arising from epithelial remnants (developmental) and cysts arising from dental tissue. Developmental cysts of epithelial remnants (e.g., globulomaxillary cysts, median alveolar cysts, median palatine cysts, nasopalatine cysts) are not tooth-related. Examples of cysts arising from dental tissue (tooth-related) include follicular-dentigerous, primordial, or multilocular-cysts, cysts of mallassez, radicular cysts, residual cysts, and odontomas.

Routine dental procedures, which are not covered under medical/surgical contracts, include, but are not limited to:

I. Correction of impactions;

II. Endodontic therapy;

III. Extraction of teeth:

   A. Implant placement;

   B. Oral biopsies with a dental diagnosis;

   C. Periodontal treatment;

   D. Placement of fillings;

   E. Preventive care;

   F. Prosthetics;

G. Sedation; and

H. X-rays.

Accidental Injury to Teeth

Trauma involving the dento-alveolar region is a frequent occurrence which can result in the fracture and displacement of teeth, crushing, and/or fracturing of bone, and soft tissue injuries including contusions, abrasions, and lacerations. Traumatic dental injuries (TDIs) of permanent teeth occur most frequently in children, young adults and elderly persons. Crown fractures and luxations of these teeth are the most commonly occurring of all dental injuries. Proper diagnosis, treatment planning, and follow up are important for achieving a favorable outcome.

Congenital Anomalies

Congenital anomalies are defined by the World Health Organization as birth defects, congenital disorders or congenital malformations. Congenital anomalies can be defined as structural or functional anomalies (for example, metabolic disorders) that occur during intrauterine life and can be identified prenatally, at birth, or sometimes may only be detected later in infancy, such as hearing defects. In simple terms, congenital refers to the existence at or before birth. A clinical condition that develops after birth but is based on inherited factors (e.g., diabetes) is not considered congenital.

Ankyloglossia

Ankyloglossia, also known as tongue tie, identifies conditions ranging in severity from a malposition of the frenulum on the underside of the tongue (lingual frenum) to partial or total fusion of the tongue to the floor of the mouth. Normally the frenulum does not impede the movement of the tip of the tongue but when the frenulum is too short or attaches close to the tip of the tongue, it restricts the movement of the tongue and may cause difficulty with feeding in infants and speech development in children.

Various grading tools exist to assist practitioners with diagnosing ankyloglossia. The Coryllos classification tool is useful to determine the type of frenulum, but it does not include the evaluation of function nor a criterion for ankyloglossia. The Hazelbaker Assessment Tool for Lingual Frenulum Function (HATLFF) assesses both frenulum anatomy and function and scores ankyloglossia. Regardless of the evaluation tool used, it is essential to demonstrate restricted tongue movement and ascertain that the lingual frenulum exclusively causes this limitation.

Frenectomy for Congenital Ankyloglossia

Frenectomy for congenital ankyloglossia is a surgical procedure that removes the lingual frenum of the tongue. This differs from frenotomy for congenital ankyloglossia, where the frenum is simply incised and not removed. Frenoplasty for congenital ankyloglossia, is the surgical revision of lingual frenum with Z-plasty. All three procedures are performed under local anesthesia and result in greater range of motion of the tongue.

SUPPORTIVE LITERATURE

The published literature on ankyloglossia and its treatment is large and diverse and provides conflicting evidence due to many studies lacking appropriate control groups, and lacking systematic measurement of outcomes. There is clinical evidence to suggest that frenotomy, frenectomy or frenoplasty is associated with improvements in breastfeeding in infants or in promoting subsequent speech development in infants and children.

Bruney and colleagues (2022) performed a systematic review and meta-analysis of a total of six (6) studies (four randomized and two non-randomized) involving breastfeeding interventions for full-term infants to examine the effectiveness of ankyloglossia treatment on breastfeeding difficulties. The study sample sizes ranged from 25 to 107 mother–infant dyads, which totaled 329. The meta-analysis of standardized mean differences in breastfeeding difficulty scores in four studies showed statistically significant differences in favor of frenotomy (Pooled SMD +2.12, CI:(0.17–4.08) p = 0.03). Similarly, a statistically significant difference in favor of frenotomy was observed for pain (Pooled SMD −1.68, 95% CI: (−2.87 to−0.48). The authors concluded that infant frenotomy is effective for improving standardized scores on breastfeeding difficulty and maternal pain scales. However, future trials should also include longer-term follow-up, to determine whether observed improvements immediately following frenotomy increase the likelihood of achieving the WHO recommendations of at least six (6) months of exclusive breastfeeding.

PROFESSIONAL GUIDELINE(S)

There is no uniformity of an accepted diagnostic criteria for ankyloglossia by professional societies. There is also a lack of consensus for treatment of ankyloglossia, leading to wide practice variation in the United States and internationally.

REGULATORY STATUS

New York Insurance Law § 3217: The law provides allowable exclusions in such policies and contracts as set forth in N.Y. Comp. Codes R. & Regs. Tit, 11, § 52.16(c) (2002): (9) dental care or treatment, except for such care or treatment due to accidental injury to sound natural teeth within 12 months of the accident and except for dental care or treatment necessary due to congenital disease or anomaly.

CODE(S)

- Codes may not be covered under all circumstances.
- Code list may not be all inclusive (AMA and CMS code updates may occur more frequently than policy updates).
- (E/I)=Experimental/Investigational
- (NMN)=Not medically necessary/appropriate

Capital District Physicians' Health Plan, Inc.
CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: DENTAL SERVICES COVERED UNDER THE MEDICAL BENEFIT

POLICY EFFECTIVE DATE:	5/1/2025
Policy Control #:	1370/20.000417
Next Annual Review:	May, 2027

DISCLAIMER

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgement when deciding the most appropriate care to enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

DESCRIPTION

Dental services may be covered under the medical benefit when needed as a result of accidental injury to sound and natural teeth (accidental dental benefit), or congenital disease or anomaly (congenital dental benefit).

RELATED POLICIES/DOCUMENTS

Resource Coordination Policies:

Clinical Review Preauthorization List
Temporomandibular Joint Disorder, 1370/20.000062

Payment Policies:

Preventive Services Guidelines, 1550/20.000211

POSITION STATEMENT

CDPHP administers benefits for dental services required as a result of an accidental injury or congenital disease or anomaly under the medical benefit when all of the following criteria are met:

POLICY NAME: DENTAL SERVICES COVERED UNDER THE MEDICAL BENEFIT

- Determination as to whether there exists an accidental injury or congenital disease or anomaly as defined below.
- Determination as to whether the dental care and treatment is needed as a result of an accidental injury or congenital disease or anomaly.
- Determination that a congenital disease or anomaly has resulted in a functional impairment.
- Determination as to whether the enrollee's medical contract provides coverage for the treatment necessary for the accidental dental injury or congenital disease or anomaly.

Accidental Dental Benefit

Dental care services required due to trauma to a sound natural tooth caused by something other than a natural function. A natural function includes, but is not limited to, activities such as chewing, biting, and grinding of teeth (bruxism). A sound natural tooth is defined as a tooth that has not had prior restoration or has been restored to full function prior to the injury; examples of teeth that are not sound and natural would be, but are not limited to, dental implants, crowns, bridges or pontics, capped teeth, teeth in the presence of moderate or severe periodontal disease or teeth that have a cavity or injury that has not been restored to full function or that have had previous endodontic treatment (such as a root canal) or placement of posts.

In the event of an accidental injury to a sound natural tooth, CDPHP administers benefits under the medical contract within the first 12 months after such injury for medically necessary treatment associated with the injury.

- The 12-month limitation may be extended in cases where future growth of the member prohibits necessary treatment from being performed within 12 months of the accidental injury. Requests for extensions of the 12-month limitation will be reviewed on an individual case basis and should be approved during the initial treatment.
- Coverage ends if the member leaves CDPHP, even if 12 months have not elapsed.

CDPHP administers benefits for emergency care following an accidental injury. Emergency care is defined as care performed within 24 hours of the accidental injury, which serves to stabilize and/or prevent additional injury. Care may be rendered in an emergency room, urgent care center, a private dental office, or an oral surgeon's office.

- All services required beyond emergency care as defined above must be provided by a dentist or oral surgeon. The provider rendering services is required to submit a plan of care as well as appropriate radiographs to demonstrate the medical necessity. Whenever possible, proof that tooth/teeth in question was sound and natural, is also required.
- Coverage is provided for dental prostheses, including dental implants, made necessary due to accidental injury to sound, natural teeth and provided within 12 months of the accident, and when medically necessary in treatment of a congenital anomaly or as part

of reconstructive surgery.
- Orthodontic services will only be provided when the enrollee has a comprehensive dental and orthodontics benefit rider. This applies to bridges and other dental appliances prescribed for the sole purpose of maintaining alignment.

Congenital Dental Benefits

A congenital anomaly is defined as a malformation that occurs before birth and is present at birth. Coverage may be available under the medical benefit for dental services directly related to and an integral part of the medical and surgical correction of a functional impairment resulting from a congenital disease (such as ameliogenesis imperfecta) or anomaly (such as cleft palate). Congenital diseases or anomalies that result in a functional impairment will not be considered cosmetic.

Medical management of children with congenital cleft palate may involve what might otherwise be considered dental in nature, including orthodontics.

- CDPHP considers orthodontic treatment medically necessary for coverage under the medical benefit when it is provided in conjunction with bone graft surgery of the alveolar cleft, referred to as pre- and post-surgical orthodontics. Orthodontic appliances are used pre-surgically to align the segments of the maxillary arch prior to bone graft surgery and for stabilization following surgery to hold the maxillary alveolar segments in position until the bone grafts have stabilized.

Orthodontic services, other than those stated above for congenital cleft palate repair, will be provided only when the enrollee has a comprehensive dental and orthodontics benefit rider. This applies to bridges and other dental appliances prescribed for the sole purpose of maintaining alignment.

Routine dental services, such as cleaning or management of dental caries, will not be covered under the congenital dental benefit.

Dental Services Integral to Medical Procedures

A dental service that would otherwise be excluded from coverage under CDPHP medical plans may be a covered medical expense if the dental service is medically necessary and is incident to and an integral part of a service covered under the medical plan.

CDPHP considers the following dental services to be an integral part to a medical procedure:

- Extraction of teeth to prepare the jaw for radiation treatments of neoplastic disease (Dental reconstruction for the replacement of extracted teeth is not covered by the medical plan).

POLICY NAME: DENTAL SERVICES COVERED UNDER THE MEDICAL BENEFIT

- Reconstruction of a dental ridge performed as a result of, and at the same time as, the surgical removal of a tumor (for other than dental purposes).
- Removal of broken teeth when performed in connection with the reduction of a jaw fracture.

Dental Services Not Integral to Medical Services:

Dental services and dental-in-nature oral and maxillofacial surgery services do not become eligible for medical coverage merely by virtue of their being performed prior to a covered medical service for the treatment of systemic disease, even if the medical service makes the dental service medically necessary. Removal of teeth at risk of infection, periodontal therapies, and subsequent oral rehabilitation reconstruction (i.e., the replacement of teeth) are not covered under medical plans even where these services are medically necessary prior to major surgical procedures such as open-heart surgery, organ transplantation, joint reconstructive surgery, or other types of surgery.

POLICY CONSIDERATIONS

Reimbursement for services will be based upon CDPHP dental fee schedule at the time of the visit.

Coverage is provided for fluoride varnish treatments every 3-6 months based on caries risk (D1206, D1208, 99188) for children from birth through age five when applied by a dentist, physician or nurse practitioner.

EXCLUSIONS

Dental services are not covered under the medical benefit when:

- The procedure is not intended primarily to improve/restore bodily function or to correct significant deformity that resulted from an accidental injury; or
- The procedure is not for the correction of functional impairment related to congenital defects and anomalies.

In addition, the following exclusions will apply:

- Dental services which are not medically necessary for the diagnosis and treatment of an accidental injury or functional deficit resulting from a congenital anomaly (i.e., routine dental services to include cleaning, fillings, crowns, etc.)
- Dental services that are cosmetic in nature.

Coverage for accidental dental/congenital dental benefits end when the enrollee leaves CDPHP.

CDPHP PRODUCT VARIATIONS

POLICY NAME: DENTAL SERVICES COVERED UNDER THE MEDICAL BENEFIT

CHILD HEALTH PLUS:

Subject to all terms and conditions noted above in application with the following exceptions:

- Coverage of dental implants for congenitally missing teeth or defective teeth is excluded from the benefit plan.
- All requests for orthodontia, including those related to accidental/congenital dental, are to be submitted to Delta Dental.
- Fluoride varnish is reimbursable to physicians and nurse practitioners once per three (3) month intervals under CPT code 99188 (application of topical fluoride varnish by a physician or other qualified health care professional) for members 0-6 years of age.
- For dentists and dental hygienists, the benefit is limited to gel, foam, and varnish up to every 3 months through age 19 under CDT codes D1206 and/or D1208.

MEDICARE ADVANTAGE:

Subject to all terms and conditions noted above in the policy.

SELECT PLAN/HARP:

CDPHP utilizes the New York State Medicaid Management Information System (MMIS) Dental Policy and Procedure Code Manual for guidance with dental services covered under the medical benefit (e.g., dental implants) as described within this policy:

https://www.emedny.org/ProviderManuals/Dental/PDFS/Dental_Policy_and_Procedure_Manual.pdf

Topical fluoride treatment is reimbursable when professionally administered in accordance with appropriate standards. Benefit is limited to gel, foam, and varnish. There must be a minimum interval of three (3) months between all fluoride treatments (D1206/99188 and/or D1208).

D1206
Topical application of fluoride varnish
Reimbursable once per three (3) month period for members between six months and 20 years of age (inclusive). For individuals 21 years of age and older D1206 is only approvable for those individuals identified with a recipient exception code of RE 81 ("TBI Eligible") or RE 95 ("OPWDD/Managed Care Exemption"), or, in cases where salivary gland function has been compromised through surgery, radiation, or disease. Topical application of Fluoride Varnish is permitted by registered dental assistants, provided that such function is performed under the direct personal supervision of a licensed dentist in the course of the performance of dental services and should be billed by the supervising dentist.

Reimbursable to physicians and nurse practitioners under CPT code 99188. Fluoride varnish can be applied by licensed practical nurses, registered nurses, and physician assistants to optimize treatment and should be billed by the supervising physician.

POLICY NAME: DENTAL SERVICES COVERED UNDER THE MEDICAL BENEFIT

D1208
Reimbursable once per six (6) month period for members between 6 and 20 years of age (inclusive). Fluoride must be applied separately from prophylaxis paste. For individuals 21 years of age and older D1208 is only approvable for those individuals identified with a Restriction Exception code of RE 81 ("TBI Eligible") or RE 95 ("OPWDD/Managed Care Exemption"), or, in cases where salivary gland function has been compromised through surgery, radiation, or disease.

Fluoride treatments that are not reimbursable:

- Treatment that incorporates fluoride with prophylaxis paste;
- Topical application of fluoride to the prepared portion of a tooth prior to restoration;
- Fluoride rinse or "swish"; and,
- Treatment for desensitization.

All requests for orthodontia are to be submitted to Delta Dental.

POLICY HISTORY

This section is intended to provide only highlights of the policy changes. The policy should always be reviewed in its entirety to ensure a comprehensive understanding of coverage.

Effective Date	Update
5/1/2025 *No change to effective date of policy	Effective 4/1/2025, added additional professional types who can administer fluoride varnish under Medicaid section as per NYS Medicaid Update April 2025.
5/1/2025	Updated verbiage for fluoride varnish in main policy as well as under Child Health Plus and Select Plan/HARP sections.
1/1/2023 *No change to effective date of policy	Under the Medicaid section, updated Fluoride allowance.
1/1/2023	Under Child Health Plus section, updated fluoride allowance as per CHP expansion benefits. Under Medicaid section, removed all allowances/criteria for orthodontics as these are all reviewed by Delta Dental.
9/1/2021	Under Medicaid- Removed statement: CDPHP is responsible for managing orthodontia services in conjunction with an approved surgery.
10/1/20	Statement regarding fluoride varnish was updated to include additional provider types in the Child Health Plus and Select Plan/HARP sections.

CDPHP reserves the right to review this policy at any time and change it without notice.

DESCRIPTION

Dental services and/or oral surgery can generally be provided in an office setting. However, an acute care inpatient facility or ambulatory surgery center may be indicated for the provision of dental services due to an individual's underlying medical condition, severity of the dental procedure, or when anesthesia is indicated for patient management.

Dental Services Covered Under the Medical Benefit, 1370/20.000417

Capital District Physicians' Health Plan, Inc.
CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: DENTAL SERVICES: CRITERIA FOR USE OF HOSPITAL INPATIENT OR OUTPATIENT AMBULATORY FACILITY SERVICES

POSITION STATEMENT

CDPHP administers benefits for general anesthesia services and related inpatient hospital or ambulatory surgery center facility services under the medical benefit when performed in conjunction with a dental procedure and when medically necessary for the following conditions:

- A documented concurrent medical or mental health condition that would make the inpatient hospital or outpatient ambulatory surgery setting medically necessary to safeguard the health of the patient.
- When facility-based anesthesia services are required for safe and effective administration of dental procedures for young children (age eight and under).
- Persons exhibiting severe behavioral problems, or who are unable to cooperate for dental procedures, such as persons with developmental disabilities.
- Complex oral surgery procedure with a high probability of complications due to the nature of the surgery.

POLICY CONSIDERATIONS

This policy addresses hospital inpatient facility services and ambulatory surgery center facility services, not the provision of dental care or oral surgery. Professional dental services provided by a dentist or oral surgeon are covered only to the extent that the enrollee has dental benefits or is associated with an accidental injury or congenital dental anomaly, or a medical-oral surgical procedure covered under the medical benefit. Refer to the following policy: *Dental Services Covered Under the Medical Benefit.*

Facility services, to include anesthesia, provided by a hospital or outpatient ambulatory surgery facility in conjunction with dental treatment are covered under the medical benefit only when the conditions listed above are met.

EXCLUSIONS

Services performed inpatient or in an outpatient ambulatory surgery setting for the dentist or enrollee's convenience.

CDPHP PRODUCT VARIATIONS

CHILD HEALTH PLUS	Subject to all terms and conditions noted above in the policy with the following exceptions: • A dental rider is not required. • Professional services rendered by a dentist in an inpatient or ambulatory surgery setting must be performed by a Healthplex Dental network provider.

CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: DENTAL SERVICES: CRITERIA FOR USE OF HOSPITAL INPATIENT OR OUTPATIENT AMBULATORY FACILITY SERVICES

MEDICARE ADVANTAGE	Subject to all terms and conditions noted above in the policy for services performed in an ambulatory surgery setting. An oral or dental examination performed on an inpatient basis as part of a comprehensive workup prior to renal transplant surgery is a covered service. Inpatient hospitalization for a dental procedure not otherwise covered by original Medicare, is covered on a case-by-case basis (including charges of dentist or oral surgeon) only if inpatient care is necessary due to the severity of the disease, complexity of the procedure, or to ensure proper medical management of a non-dental impairment.
SELECT PLAN/HARP	Subject to all terms and conditions noted above in the policy. • Dental surgical services, for which it is medically necessary the procedure be performed in a hospital or in an ambulatory surgery setting, are covered. • Professional services rendered by a dentist in an inpatient or ambulatory surgery setting must be performed by a Healthplex network provider.

DISCLAIMER

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgment when deciding the most appropriate care for enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

DESCRIPTION

CDPHP may designate specific facilities to serve as the exclusive network for selected services. These designated specialty care facilities are the CDPHP participating network for transplants and transplant related services. Such facilities will have exhibited successful clinical outcomes, met quality of care standards, and have contractually agreed to participate with CDPHP for these services. The CDPHP designated specialty care network will provide for transplantation of any organ or tissue, including bone marrow and stem cell transplantation.

POLICY NAME: DESIGNATED SPECIALTY CARE NETWORK: TRANSPLANT SERVICES

- Out-of-Network Services, 11.01.14
- Pancreas Transplant (Pancreas Transplant Alone, Pancreas Transplant after Kidney Transplant, Simultaneous Pancreas Kidney Transplant) Islet Cell Transplant, 07.02.01
- Small Bowel and Multivisceral Transplants in Adults and Children, 07.02.05

Payment Policy:

- Organ Transplant-Donor, 1550/20.000207

Credentialing Policy:

- Designated Specialty Care Network: Transplant Services Credentialing & Recredentialing, 1315/20.000135.

POSITION STATEMENT

CDPHP administers benefits for transplant services only when such services are performed at participating approved transplant facilities or within the designated networks. The following identifies the designated network/facilities:

- OptumHealth Transplant Centers of Excellence Network: https://www.myoptumhealthcomplexmedical.com/gateway/public/transplants/transplants.jsp

POLICY CONSIDERATIONS

CDPHP requires prior authorization for transplants, including transplants at an OptumHealth designated transplant center of excellence.

CDPHP will consider coverage for medically necessary transplantation at centers that are not in the OptumHealth designated transplant centers of excellence network based on all the following criteria:

1. The facility is contracted with CDPHP and participates in the network for the relevant benefit plan.
2. Adequate written transplant program description including patient selection criteria.
3. Adequate patient management plans and protocols that include therapeutic and evaluative procedures for the waiting period, in-hospital period, and post-transplant phases of treatment.
4. Sufficient commitment of resources and planning to demonstrate the importance of the program at all levels, to include a multidisciplinary team that includes representatives with expertise in the appropriate organ specialty.
5. Experience and success with clinical organ transplants as follows:
    a. The facility staff must annually perform a number of transplants sufficient to demonstrate proficiency.

   b. Outcomes, to include patient and graft survival at 1, 3, and 5 years, must be comparable to outcomes attained by OptumHealth designated transplant centers.
6. Be an active member of the United Network for Organ Sharing (UNOS).
7. Facility must be Medicare approved for the requested transplant.
8. Facility meets requirements for participation in the CDPHP designated specialty care network in accordance with CDPHP Network Services policy: *Designated Specialty Care Network: Transplant Services Credentialing & Recredentialing, 1315/20.000135.*

CDPHP resource coordination department reviews all requests for transplant services.

- A registered nurse care manager will be assigned to an identified transplant patient to assist with treatment coordination, from evaluation through post-transplant recovery, and identification of potential resources available to the patient.

CDPHP allows an enrollee to be listed at more than one CDPHP designated specialty care transplant center.

- *Coverage for additional listings applies to the consultation only.* It is understood that eligibility criteria for a specific transplant may differ among transplant centers. However, CDPHP expects results of the initial evaluation, including all laboratory work and testing, be obtained from the primary facility. Requests for additional testing or treatment, beyond what was performed at the primary facility, is subject to benefit limitations stated in the enrollee's contract and will require prior authorization.

Enrollees must use CDPHP designated specialty care network to be considered in-network for coverage of transplants. Failure to use a CDPHP designated facility may result in the following:

- Non-coverage for all transplant related charges; or
- Coverage at the out-of-network level of benefits, if applicable.

Coverage of transplant services is subject to all the terms and conditions listed in the enrollee's contract.

EXCLUSIONS

Coverage for transplants of artificial or animal organs, or for procedures and/or services considered experimental and investigational.

Travel, food, and lodging expenses for transplant recipient and/or family members or companion, unless coverage for such expenses is specifically provided in the enrollee's benefit plan.

Capital District Physicians' Health Plan, Inc.
CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: DIABETIC SERVICES: SUPPLIES, PHARMACEUTICALS, EQUIPMENT, EYE EXAM, EDUCATION, AND SHOES

POSITION STATEMENT

CDPHP administers benefits for medically necessary equipment, supplies, oral agents, and insulin, for the monitoring and treatment of diabetes, to include the following:

- Diabetic supplies, equipment, insulin, and oral agents must be prescribed by a physician or other licensed health care professional legally authorized to prescribe under Title 8 of the New York Education Law and obtained through a durable medical equipment vendor or pharmacy.
  Note: Blood glucose monitors and test strips must be obtained at a participating pharmacy.
- Supplies, insulin, or oral agents may be purchased up to the maximum allowable amount per enrollee's contract, which in general, is up to a 30-day supply retail or 90-day supply at the CDPHP mail-order pharmacy.
- Diabetic test strips are subject to a maximum quantity limit of 100 test strips every 30 days for non-insulin users and 300 test strips every 30 days for insulin users. Please refer to the pharmacy policy, Medical Exception/Preauthorization Review Process, 1350/20.000021 if a member has a need to exceed this quantity.
- Diabetic supplies, insulin, oral agents, and equipment are subject to the applicable cost-share as specified in the enrollee's contract.

The following *supplies* are considered eligible for coverage:

- Alcohol swabs
- Cartridges for the visually impaired
- Control solutions used in blood glucose monitors
- Insulin pump supplies, including reservoirs, infusion sets, and batteries
- Insulin syringes
- Lancets and automatic lancing devices
- Semi-permeable transparent dressing required for the purpose of securing placement of an insulin infusion catheter
- Tests strips for glucose monitors and visual reading
- Urine testing products for glucose and ketones

The following *pharmaceuticals* are considered eligible for coverage under the medical portion of the enrollee's contract:

- All insulin preparations
- Disposable insulin cartridges and pen cartridges
- Glucagon for injection to increase blood glucose concentration
- Oral agents for treating hypoglycemia, such as glucose tablets and gels
- Oral anti-diabetic agents used to reduce blood sugar levels

The following *durable medical equipment (DME)* is considered eligible for coverage:

- Insulin aids, including insulin drawing devices for the visually impaired
- Standard blood glucose monitors (E0607)
- Specialized blood glucose monitors, including but not limited to non-invasive or subcutaneous
- Blood glucose monitors for the visually impaired
- Diabetes data-management systems for management of blood glucose
- Insulin infusion devices
- Insulin pumps (E0784)

Continuous Glucose Monitoring

Professional glucose monitoring (95249, 95250, 95251)

Professional continuous glucose monitoring may be used as an adjunct to standard care for diabetic patients meeting the following criteria:

- Recurrent unexplained or unpredictable hypoglycemia or hyperglycemia despite multiple daily finger-stick monitoring
- There is discordant data from finger-stick and HgbA1c testing

Professional continuous glucose monitoring is performed under physician supervision. The sensor is typically inserted, and data collection begins while the patient is in the office. After a minimum of 72 hours of wear, the patient returns to the office, at which time the sensor is removed, data is downloaded, and a printout is obtained for review. It is expected that the results derived from such monitoring will be used to direct changes in diabetic management, resulting in improved treatment regimens and glycohemoglobin measurements.

Professional glucose monitoring is conducted after a minimum of 72-hours of wear. It may be repeated at a subsequent time depending on the patient's level of diabetic control.

Services for professional glucose monitoring should be billed using the above-listed codes with reporting no more than once per month per code. Associated technical services including, but not limited to, monitor applications, sensors, patient training, removal of monitor, and data, downloading are included in the reimbursement for ambulatory subcutaneous continuous blood glucose monitoring (95249, 95250).

The interpretation and reporting (95251) of data from a patient-owned continuous glucose monitor may be reported once every 30 days.

POLICY NAME: DIABETIC SERVICES: SUPPLIES, PHARMACEUTICALS, EQUIPMENT, EYE EXAM, EDUCATION, AND SHOES

Diabetic Education (G0108, G0109, S9465)

CDPHP administers benefits for diabetes self-management and training program rendered in an outpatient or office-based setting to include education regarding the following:

- Monitoring of blood glucose
- Nutrition
- Exercise
- Insulin treatment plan developed specifically for the patient who is insulin-dependent

The enrollee may self-refer for diabetes education counseling.

CDPHP administers benefits for diabetic educational counseling when all of the following criteria are met:

- The services are provided by a physician or hospital, registered dietitian (ADA), certified nutritionist, or certified diabetes educator (National Certification Board for Diabetes Educators).
- The services are medically necessary for the medical management of diabetes.
- Diabetic nutrition assessment/session must include nutritional counseling plus the evaluation of the diabetic condition, including history and examination as indicated, review of medical management, evaluation of appropriate diagnostic tests and procedures, and recommendations for the adjustment of therapeutic management. It must also include the calculation of selected nutrients/energy intake, such as carbohydrates, protein, fat, and kilocalories.
- CDPHP expects the registered dietitian, certified nutritionist, or certified diabetes educator will submit a consult report of education services to the physician managing the member's care.
- Diabetic education sessions are subject to applicable office visit cost-share as stated in the enrollee's contract.

Claims for diabetic education should be submitted using HCPCS codes S9465, G0108, or G0109. Codes G0108 and G0109 are to be billed in increments of 30 minutes per unit.

CDPHP will not separately reimburse for evaluation and management codes (99202-99239, 99281-99359) in conjunction with diabetes education (G0108, G0109, S9465) when billed by the same provider for the same date of service.

Diabetes Prevention Program (0403T, 0488T)

CDPHP administers benefits for members with pre-diabetes to participate in a recognized

diabetes prevention lifestyle change program to help prevent or delay the onset of type 2 diabetes. The diabetes prevention program is a yearlong program to assist individuals in making real lifestyle changes such as eating healthier, incorporating physical activity into their daily lives, and improving problem solving and coping skills.

- *Refer to specific member contracts for availability of benefits relating to this program.*

Eye Exams for Diabetics

CDPHP administers benefits for vision care for enrollees with a diagnosis of diabetes to include:

- A self-referral for up to one routine diabetic eye examination once every 12 months.

Therapeutic Shoes for Diabetics A5500, A5501, A5503-A5507, Therapeutic Shoe Inserts: A5512, A5513, A5514

CDPHP administers benefits for therapeutic shoes, inserts, and/or modifications to therapeutic shoes that aid in the healing process and prevent further diabetic foot disease when all of the following criteria are met:

1. Patient is a diabetic; and

Description	ICD-10 codes effective 10/1/2015
Diabetes	E08.00-E13.9, O24.011-O24.93

2. Patient is being treated under a comprehensive plan of care for diabetes; and

3. Patient has one or more of the following conditions in one or both feet:
   - Partial or complete foot amputation
   - History of previous foot ulceration
   - History of pre-ulcerative calluses
   - Peripheral neuropathy with evidence of callus formation
   - Foot deformity
   - Poor circulation

For patients meeting above criteria, coverage is limited to one of the following within one calendar year:

- One pair of depth-inlay shoes (A5500) and three pairs of inserts (A5512, A5513,

A5514) (not including the non-customized removable inserts provided with such shoes); **or**

- One pair of custom-molded shoes (A5501) (which includes inserts provided with these shoes) and two additional pairs of inserts (A5512, A5513, A5514).

A custom-molded shoe is indicated when the patient has a foot deformity that cannot be accommodated by a depth shoe.

A modification of a custom-molded or depth shoe may be covered as a substitute for an insert. Examples of the most common shoe modifications are rigid rocker bottoms (A5503), roller bottoms (A5503), wedges (A5504), metatarsal bars (A5505), or offset heels (A5506). Other modifications to diabetic shoes (A5507) include flared heels. Payment for the modification(s) may not exceed the limit set for the inserts for which the individual is entitled.

A deluxe feature of a diabetic shoe (A5508) does not contribute to the therapeutic function of the shoe, and therefore is not covered.

Compression molding inserts (A5510) are considered non-covered, as they do not require total contact with the patient's foot at the time of fitting, but rather are molded to the patient's foot over time through the heat and pressure generated by wearing a shoe with the insert present.

Foot Orthotics

- CDPHP will provide coverage for custom foot orthotics (L3000-L3030) in lieu of therapeutic shoe inserts (A5512, A5513, A5514) for enrollees who meet all the criteria (1-3) outlined in the section above, *Therapeutic Shoes for Diabetics.*
- Benefits are limited to one pair of custom foot orthotics or three pairs of therapeutic shoe inserts within one calendar year.

Over-the-counter shoe inserts are not considered to be custom foot orthotics, and therefore, are not eligible for reimbursement.

Claims submitted for custom foot orthotics (L3000-L3030) will be processed as diabetic durable medical equipment when the enrollee has a diagnosis of diabetes and all of the required criteria (1-3) outlined in the section above are met.

Foot orthotics and shoe inserts (L3000-L3030, A5512-A5514) must be billed with modifier KX to ensure that coverage criteria are met, and that documentation exists to support the medical necessity.

EXCLUSIONS

POLICY NAME: DIABETIC SERVICES: SUPPLIES, PHARMACEUTICALS, EQUIPMENT, EYE EXAM, EDUCATION, AND SHOES

Equipment repair or replacement due to misuse, neglect, and/or loss.

CDPHP PRODUCT VARIATIONS

CHILD HEALTH PLUS	Subject to all terms and conditions noted above in the policy with the following exception: The Diabetic Prevention Program (DPP) is not a covered benefit.
MEDICARE ADVANTAGE	Subject to all terms and conditions noted above in the policy with the following exceptions: <u>Medicare Diabetes Prevention Program</u> Benefits are provided for the Medicare diabetes prevention program (MDPP) as outlined below. The MDPP is a structured intervention with the goal of preventing type 2 diabetes in individuals with an indication of prediabetes. The program consists of a minimum of 16 intensive "core" sessions of a Centers for Disease Control and Prevention (CDC) approved curriculum furnished over six months in a group-based, classroom-style setting that provides practical training in long-term dietary change, increased physical activity, and behavior change strategies for weight control. After completion of the core sessions, less intensive follow-up meetings are furnished monthly to help ensure participants maintain healthy behaviors. The primary goal of the program is at least 5-percent weight loss by participants. <u>Codes:</u> **Code** — **Descriptor** G9886 — Behavioral counseling for diabetes prevention, in-person, group, 60 minutes G9887 — Behavioral counseling for diabetes prevention, distance learning, 60 minutes G9880 — 5 percent WL Achieved from baseline weight G9881 — 9 percent WL Achieved from baseline weight

	G9888 Maintenance 5 percent WL from baseline in months 7-12 Core Sessions: • Beneficiaries may attend up to 16 weekly sessions during months 1-6 of the MDPP Core Services period. • The MDPP Core Services period starts with the first claim for G9886 or G9887. Beneficiaries must attend one core session to initiate MDPP services. • A supplier is paid based on the beneficiary's attendance, regardless of the beneficiary's weight loss. • A supplier is paid performance payments if the beneficiary achieves weight-loss goals. Core Maintenance Sessions: • Beneficiaries may attend up to 6 monthly sessions during months 7-12 of the MDPP Core Services period. • A supplier is paid based on the beneficiary's attendance, regardless of the beneficiary's weight loss. • A supplier is paid performance payments if the beneficiary achieves weight-loss goals and/or continues to meet the 5% weight-loss goal at each session Key Points to Remember: • Three G-codes can be used when submitting claims for beneficiary achievement of performance milestones: 1) 5% weight loss (G9880), 2) 9% weight loss (G9881), and 3) maintenance of 5% weight loss in a core maintenance session (G9888). • Note that codes G9880 and G9888 cannot be used with the same date of service (DOS), and the DOS for code G9880 must occur prior to any DOS submitted for G9888. Claims for G9888 will be rejected if 1) there is no claim for G9880 with a DOS prior to claim for G9888 and 2) DOS for G9888 is within the first 6 months of the MDPP services period. • Suppliers may bill for a maximum of 22 sessions, including

	up to 16 weekly sessions in months 1-6, and up to 6 monthly sessions in months 7-12. • Suppliers must use one of two G-codes (G9886 or G9887) when filing claims for attendance payments after every core and core maintenance session furnished to an MDPP beneficiary. Once 22 sessions have been paid for a beneficiary, any additional claims with DOS after the 22nd paid claim will be rejected, including out-of-sequence claims. • Each HCPCS G-code should be listed with the corresponding session DOS, MDPP organizational NPI, and rendering provider NPI. Note that the coach is the rendering provider on the claim Medicare Advantage members are eligible for MDPP services when all the following criteria are met: • Enrolled in Medicare Part B • Body mass index (BMI) of at least 25 (23 if self-identified as Asian) on the date of the first core session • Meet 1 of 3 blood test requirements within the 12 months prior to attending the first core session: o A hemoglobin A1c test with a value between 5.7% and 6.4%, or o A fasting plasma glucose of 110-125 mg/dL, or o A 2-hour plasma glucose of 140-199 mg/dL (oral glucose tolerance test) • No previous diagnosis of diabetes prior to the date of the first core session (with exception of gestational diabetes) • Do not have end-stage renal disease (ESRD) • Have not previously received MDPP services (program is once-per-lifetime limit) Members may self-refer to a MDPP as a physician referral is not required. <u>Diabetes Self-Management Training</u> Benefits are provided for diabetes self-management training rendered by a participating provider (refer to section on *Diabetic*

	Education) for newly diagnosed diabetics up to 10 hours during a continuous 12-month period and up to two hours follow-up training in subsequent years. Diabetes self-management training is not subject to an office visit cost-share, as stated in the enrollee's contract. Benefits for Medicare Part D prescription drugs are available only to enrollees who have elected the CDPHP Medicare Advantage product with the Part D option. The CDPHP Medicare Advantage product does not cover any prescription drugs not covered by Medicare. In addition, for those individuals enrolled in the CDPHP Medicare Advantage product who have not elected the Part D option, CDPHP covers only those prescription drugs covered by Medicare Parts A and B, not those covered by Part D.
SELECT PLAN/HARP:	Subject to all terms and conditions noted above in the policy with the following exceptions: CDPHP utilizes the New York State Medicaid Management Information System Provider Manual (MMIS) to determine a medical or surgical supply versus durable medical equipment, orthotic, or prosthetic. Durable medical equipment is not subject to a deductible or copayment. Benefits are provided for medically necessary medical supplies, including insulin and diabetic supplies. Medically necessary prescription footwear and shoe modifications and additions are a covered benefit. Prescription footwear applies to all "L" codes listed in the prescription footwear section of the MMIS provider manual (4.6), as well as codes for diabetic shoes. Enrollees diagnosed with diabetes may self-refer to any participating provider of vision services (optometrist or ophthalmologist) for a dilated eye (retinal) examination once in any 12-month period. <u>Diabetic Self-Management Training (DSMT)</u>

POLICY NAME: DIABETIC SERVICES: SUPPLIES, PHARMACEUTICALS, EQUIPMENT, EYE EXAM, EDUCATION, AND SHOES

	Benefits are provided for DSMT when rendered in a hospital outpatient department or free-standing diagnostic and treatment center and by one of the following NYS licensed, registered, or certified professionals affiliated with a DSMT program: • Registered Nurse • Registered Nurse Practitioner • Registered Dietician • Physician (MD or DO) • Pharmacist • Physician Assistant • Physical Therapist • Clinical Psychologist • Optometrist • Occupational Therapist • Podiatrist DSMT services are also allowed in an office-based setting when provided by one of the above licensed, registered, or certified health care professionals who is also certified as a Certified Diabetes Education (CDE) by the Certified Diabetes Care and Education Specialist (CBDCE). DSMT is covered for enrollees that are newly diagnosed with diabetes, have stable diabetes, or have diabetes with a medically complex condition such as poor diabetes control or another complicating factor. No more than 10 hours for newly diagnosed enrollees or enrollees with a medically complex condition will be allowed during a continuous six-month period. Enrollees with diabetes who are medically stable may receive up to one hour of DSMT in a continuous six-month period. DSMT services may be provided in individual sessions, or in group sessions of no more than eight patients. National Diabetes Prevention Program (NDPP) Services (0403T, G9880) This is an educational and support program designed to assist at-risk people from developing Type 2 diabetes. The program

	consists of group training sessions that focus on the long-term, positive effects of healthy eating and exercise. The goals for these lifestyle changes include modest weight loss and increased physical activity. NDPP sessions are taught using a trained lifestyle coach. • *Refer to specific member contracts for availability of benefits relating to this program.*

POLICY HISTORY

This section is intended to provide only highlights of the policy changes. The policy should always be reviewed in its entirety to ensure a comprehensive understanding of coverage.

Effective Date	Update
9/1/2026	Removed all information for continuous glucose monitors as CGM information is now in policy Continuous Glucose Monitoring Systems/External Insulin Pump Therapy for Diabetes, 1.01.30
4/1/2026	Removed insulin requirement for CGM's and exclusion of CGM's for diagnosis of gestational diabetes.
10/1/2025	Updated CGM verbiage to indicate "insulin dependent" only. Removed Bridge payment code from Medicare Advantage section under Medicare Diabetes Prevention Program (MDPP). This payment was removed by CMS effective 1/1/2025. Under Medicare section, added LCA information for CGM's.
2/1/2025* *No change to effective date for this update	Clarified in the Child Health Plus section that the Diabetic Prevention Program is not a covered benefit.
2/1/2025	Removed information for foot orthotics for vascular disease as this is now in the foot care policy. Updated CGM criteria. Added coverage for implantable CGM's and updated Medicare implantable CGM criteria per updated LCD.
1/1/2024* *No change to effective date for this update	Under the Foot Orthotics section added information that was in the Foot Care policy regarding coverage indications. Added information regarding billing KX modifier with codes L3000-L3030 and A5512-A5514.
1/1/2024*	Updated the coding requirements for the Medicare Diabetes Prevention Program (MDPP) in the Medicare Advantage section.

POLICY NAME: DIABETIC SERVICES: SUPPLIES, PHARMACEUTICALS, EQUIPMENT, EYE EXAM, EDUCATION, AND SHOES

*No change to effective date for this update	
1/1/2024	Removed termed code G0308 and G0309.
11/1/2023	Under Medicaid section- since CGM's are billed to Medicaid FFS (part of Medicaid carve out eff 4-1-23) removed criteria and provided link for the MMIS that outlines the criteria.
10/1/2023	Under Medicaid section updated CGM requirements per DOH mandate.
4/16/2023	Under the Position Statement for Diabetes Prevention Program, added the codes to bill for these services. Under Medicaid added info for National Diabetes Prevention Program. Under Medicare, updated CGM criteria which is effective 4/16/23.
1/1/2023 *No change to effective date of policy	Under Medicaid section 1. added updated CGM codes and guidance for A9276, A9277, and A9278.
1/1/2023	Added new CPT codes E2103 and A4239 and removed deleted codes K0553 and K0554
8/1/2022* No change to effective date	Under Medicare section for the Diabetes Prevention Program, added codes G9890, G9891 which are allowable under the program.
8/1/2022* No change to effective date	Added information to the Medicare CGM's section regarding coverage as a stand-alone device.
8/1/2022	For custom foot orthotics, expanded code range to include codes between L3000-L3030. Under the Medicare section, added coverage for Implantable Continuous Glucose Monitors.
04/01/2022* No change to effective date	CMS coverage update: Effective 2/28/2022, CMS will allow for coverage of a non-therapeutic (adjunctive) continuous glucose monitor (CGM) when it is being used with an integrated insulin pump system. New HCPCS codes (E2102 and A4238) effective 4/1/2022 for

	adjunctive CGM added to policy.
04/01/2022	Revised Select Plan/HARP section to expand CGM coverage to now include members who have type 2 diabetes and gestational diabetes.
02/01/2022	Added additional verbiage to policy regarding providers who can prescribe equipment, supplies, oral agents, and insulin: -"or other licensed Health Care Professional legally authorized to prescribe under Title 8 of the New York Education Law" Removed verbiage in the body of the policy that implantable monitors/implantable CGM devices are considered covered DME as these are listed under the exclusions section. Relocated CGM's for gestational diabetes to the exclusions section and removed the following exclusion: -Personal subcutaneous continuous blood glucose monitoring for children with diabetes
12/1/2021	Added quantity limits for diabetic test strips.
7/18/2021	Updated CGM criteria in the Medicare Advantage section in accordance with Medicare LCD update.
7/1/2021	Updated Select Plan/HARP section: effective 7/1/21, as per DOH updated guidance April 2021, CGM criteria changed to allow an enrolled Medicaid provider with experience in diabetes treatment to order the device and changed criteria of performing at least "four" finger stick glucose tests daily to "multiple". In addition, effective 4/1/2021, expanded the list of practitioners able to provide Diabetes Self-Management Training and clarified enrollees that are eligible for such training under Select Plan/HARP.
5/1/2021 (Effective date on policy remains the same)	In the Position Statement added verbiage in regards to code 95251 that was previously housed in the External Ambulatory Insulin Infusion Pump policy.
5/1/2021	Removed information under Medicaid in regards to National Diabetes Prevention Program (NDPP) as this language is now in the 2021 Member Handbook. Removed verbiage under Medicaid and Medicare in regards to

	Omnipod insulin pumps and V-Go insulin delivery systems as this information is housed in the External Ambulatory Insulin Infusion Pump policy.
4/1/2021	Updated verbiage in section on continued glucose monitoring to indicate a minimum of 72 hours.
7/15/20	Updated policy to include coverage of CGM for Type II diabetics when criteria in policy is met.
2/1/20 (Effective date on policy remains the same)	Added statement to Select Plan section to address coverage of Omnipod/Omnipod Dash as an acceptable alternative to an external ambulatory insulin infusion pump.
2/1/2020	Removed termed code K0903 and added code A5514 for shoe inserts. Removed requirement of finger sticks for individuals prescribed a therapeutic continuous glucose monitor. Made the following changes to the Select Plan section: • Added coverage for National Diabetes Prevention Program (NDPP) • Removed exclusion statement for non-coverage of Omnipod. Added Omnipod Dash to the Medicare Section to the list of insulin delivery devices covered under Part D.

Next Annual Review:	December, 2027

DISCLAIMER

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgement when deciding the most appropriate care to enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

PROCEDURE CODES

Multiple

DESCRIPTION

CDPHP administers benefits for medically necessary diabetic services to include equipment, supplies, pharmaceuticals, eye exams, therapeutic shoes, and educational counseling, used in the management and treatment of diabetes.

RELATED POLICIES/DOCUMENTS

Resource Coordination Policies:

- Durable Medical Equipment, Prosthetics/Orthotics, & Medical Supplies, 1370/20.000509
- External Ambulatory Insulin Infusion Pump, 1370/20.000457
- Foot Care, 1370/20.000106
- Medical Nutritional Counseling, 1370/20.000472
- Vision Services by Eye Care Specialists, 1370/20.000005

POLICY NAME: DIABETIC SERVICES: SUPPLIES, PHARMACEUTICALS, EQUIPMENT, EYE EXAM, EDUCATION, AND SHOES

Pharmacy Policies:

- Medical Exception/Preauthorization Review Process, 1350/20.000021

POSITION STATEMENT

CDPHP administers benefits for medically necessary equipment, supplies, oral agents, and insulin, for the monitoring and treatment of diabetes, to include the following:

- Diabetic supplies, equipment, insulin, and oral agents must be prescribed by a physician or other licensed health care professional legally authorized to prescribe under Title 8 of the New York Education Law and obtained through a durable medical equipment vendor or pharmacy.
  Note: Blood glucose monitors and test strips must be obtained at a participating pharmacy.
- Supplies, insulin, or oral agents may be purchased up to the maximum allowable amount per enrollee's contract, which in general, is up to a 30-day supply retail or 90-day supply at the CDPHP mail-order pharmacy.
- Diabetic test strips are subject to a maximum quantity limit of 100 test strips every 30 days for non-insulin users and 300 test strips every 30 days for insulin users. Please refer to the pharmacy policy, Medical Exception/Preauthorization Review Process, 1350/20.000021 if a member has a need to exceed this quantity.
- Diabetic supplies, insulin, oral agents, and equipment are subject to the applicable cost-share as specified in the enrollee's contract.

The following *supplies* are considered eligible for coverage:

- Alcohol swabs
- Cartridges for the visually impaired
- Control solutions used in blood glucose monitors
- Insulin pump supplies, including reservoirs, infusion sets, and batteries
- Insulin syringes
- Lancets and automatic lancing devices
- Semi-permeable transparent dressing required for the purpose of securing placement of an insulin infusion catheter
- Tests strips for glucose monitors and visual reading
- Urine testing products for glucose and ketones

The following *pharmaceuticals* are considered eligible for coverage under the medical portion of the enrollee's contract:

- All insulin preparations

- Disposable insulin cartridges and pen cartridges
- Glucagon for injection to increase blood glucose concentration
- Oral agents for treating hypoglycemia, such as glucose tablets and gels
- Oral anti-diabetic agents used to reduce blood sugar levels

The following *durable medical equipment (DME)* is considered eligible for coverage:

- Insulin aids, including insulin drawing devices for the visually impaired
- Standard blood glucose monitors (E0607)
- Specialized blood glucose monitors, including but not limited to non-invasive or subcutaneous
- Blood glucose monitors for the visually impaired
- Diabetes data-management systems for management of blood glucose
- Insulin infusion devices
- Insulin pumps (E0784)

Continuous Glucose Monitoring

Professional glucose monitoring (95249, 95250, 95251)

Professional continuous glucose monitoring may be used as an adjunct to standard care for diabetic patients meeting the following criteria:

- Recurrent unexplained or unpredictable hypoglycemia or hyperglycemia despite multiple daily finger-stick monitoring
- There is discordant data from finger-stick and HgbA1c testing

Professional continuous glucose monitoring is performed under physician supervision. The sensor is typically inserted, and data collection begins while the patient is in the office. After a minimum of 72 hours of wear, the patient returns to the office, at which time the sensor is removed, data is downloaded, and a printout is obtained for review. It is expected that the results derived from such monitoring will be used to direct changes in diabetic management, resulting in improved treatment regimens and glycohemoglobin measurements.

Professional glucose monitoring is conducted after a minimum of 72-hours of wear. It may be repeated at a subsequent time depending on the patient's level of diabetic control.

Services for professional glucose monitoring should be billed using the above-listed codes with reporting no more than once per month per code. Associated technical services including, but not limited to, monitor applications, sensors, patient training, removal of monitor, and data, downloading are included in the reimbursement for ambulatory subcutaneous continuous blood glucose monitoring (95249, 95250).

The interpretation and reporting (95251) of data from a patient-owned continuous glucose monitor may be reported once every 30 days.

Continuous Glucose Monitors (CGM) With or Without Combined/Integrated Insulin Pump (E0784, A9276, A9277, A9278, S1034, S1035, S1036, S1037, A4238, E2102, E2103, A4239)

CDPHP considers continuous glucose monitoring, alone or in combination with an external insulin pump, medically necessary to detect trends and patterns in glucose levels over time to optimize glycemic control and reduce incidences of hyperglycemia and hypoglycemia in patients with diabetes.

CDPHP administers benefits for personal use of a continuous glucose monitoring device for individuals with diabetes (type I, type II, gestational, etc.) meeting the following criteria:

General Requirements

- Member demonstrates adherence to a physician-ordered diabetic treatment plan.
- Members who are initiating pump therapy for the first time must meet the criteria for an insulin infusion pump (please see External Ambulatory Insulin Infusion Pump, 1370/20.000457), as well as the criteria in this policy for continuous glucose monitors, when seeking approval for combined [CGM + pump] devices)
- The age of the patient is consistent with US FDA indications for the specific CGM device

Implantable Continuous Glucose Monitor (I-CGM) (0446T, 0447T, 0448T)

CDPHP considers implantable CGM's (i.e., Eversense) medically necessary for members who meet criteria for a continuous glucose monitor as noted above and one of the following:

- Physical disability, such as an impairment in vision, hearing, or dexterity;
- Any significant condition or situation requiring vibration alerts (e.g., patient lives alone and requires additional alarms to increase awareness of highs or lows).

Diabetic Education (G0108, G0109, S9465)

CDPHP administers benefits for diabetes self-management and training program rendered in an outpatient or office-based setting to include education regarding the following:

- Monitoring of blood glucose
- Nutrition
- Exercise
- Insulin treatment plan developed specifically for the patient who is insulin-dependent

POLICY NAME: DIABETIC SERVICES: SUPPLIES, PHARMACEUTICALS, EQUIPMENT, EYE EXAM, EDUCATION, AND SHOES

The enrollee may self-refer for diabetes education counseling.

CDPHP administers benefits for diabetic educational counseling when all of the following criteria are met:

- The services are provided by a physician or hospital, registered dietitian (ADA), certified nutritionist, or certified diabetes educator (National Certification Board for Diabetes Educators).
- The services are medically necessary for the medical management of diabetes.
- Diabetic nutrition assessment/session must include nutritional counseling plus the evaluation of the diabetic condition, including history and examination as indicated, review of medical management, evaluation of appropriate diagnostic tests and procedures, and recommendations for the adjustment of therapeutic management. It must also include the calculation of selected nutrients/energy intake, such as carbohydrates, protein, fat, and kilocalories.
- CDPHP expects the registered dietitian, certified nutritionist, or certified diabetes educator will submit a consult report of education services to the physician managing the member's care.
- Diabetic education sessions are subject to applicable office visit cost-share as stated in the enrollee's contract.

Claims for diabetic education should be submitted using HCPCS codes S9465, G0108, or G0109. Codes G0108 and G0109 are to be billed in increments of 30 minutes per unit.

CDPHP will not separately reimburse for evaluation and management codes (99202-99239, 99281-99359) in conjunction with diabetes education (G0108, G0109, S9465) when billed by the same provider for the same date of service.

Diabetes Prevention Program (0403T, 0488T)

CDPHP administers benefits for members with pre-diabetes to participate in a recognized diabetes prevention lifestyle change program to help prevent or delay the onset of type 2 diabetes. The diabetes prevention program is a yearlong program to assist individuals in making real lifestyle changes such as eating healthier, incorporating physical activity into their daily lives, and improving problem solving and coping skills.

- *Refer to specific member contracts for availability of benefits relating to this program.*

Eye Exams for Diabetics

CDPHP administers benefits for vision care for enrollees with a diagnosis of diabetes to include:

- A self-referral for up to one routine diabetic eye examination once every 12 months.

Therapeutic Shoes for Diabetics A5500, A5501, A5503-A5507, Therapeutic Shoe Inserts: A5512, A5513, A5514

CDPHP administers benefits for therapeutic shoes, inserts, and/or modifications to therapeutic shoes that aid in the healing process and prevent further diabetic foot disease when all of the following criteria are met:

1. Patient is a diabetic; and

Description	ICD-10 codes effective 10/1/2015
Diabetes	E08.00-E13.9, O24.011-O24.93

2. Patient is being treated under a comprehensive plan of care for diabetes; and

3. Patient has one or more of the following conditions in one or both feet:
   - Partial or complete foot amputation
   - History of previous foot ulceration
   - History of pre-ulcerative calluses
   - Peripheral neuropathy with evidence of callus formation
   - Foot deformity
   - Poor circulation

For patients meeting above criteria, coverage is limited to one of the following within one calendar year:

- One pair of depth-inlay shoes (A5500) and three pairs of inserts (A5512, A5513, A5514) (not including the non-customized removable inserts provided with such shoes); **or**
- One pair of custom-molded shoes (A5501) (which includes inserts provided with these shoes) and two additional pairs of inserts (A5512, A5513, A5514).

A custom-molded shoe is indicated when the patient has a foot deformity that cannot be accommodated by a depth shoe.

A modification of a custom-molded or depth shoe may be covered as a substitute for an insert. Examples of the most common shoe modifications are rigid rocker bottoms (A5503), roller

bottoms (A5503), wedges (A5504), metatarsal bars (A5505), or offset heels (A5506). Other modifications to diabetic shoes (A5507) include flared heels. Payment for the modification(s) may not exceed the limit set for the inserts for which the individual is entitled.

A deluxe feature of a diabetic shoe (A5508) does not contribute to the therapeutic function of the shoe, and therefore is not covered.

Compression molding inserts (A5510) are considered non-covered, as they do not require total contact with the patient's foot at the time of fitting, but rather are molded to the patient's foot over time through the heat and pressure generated by wearing a shoe with the insert present.

Foot Orthotics

- CDPHP will provide coverage for custom foot orthotics (L3000-L3030) in lieu of therapeutic shoe inserts (A5512, A5513, A5514) for enrollees who meet all the criteria (1-3) outlined in the section above, *Therapeutic Shoes for Diabetics.*
- Benefits are limited to one pair of custom foot orthotics or three pairs of therapeutic shoe inserts within one calendar year.

Over-the-counter shoe inserts are not considered to be custom foot orthotics, and therefore, are not eligible for reimbursement.

Claims submitted for custom foot orthotics (L3000-L3030) will be processed as diabetic durable medical equipment when the enrollee has a diagnosis of diabetes and all of the required criteria (1-3) outlined in the section above are met.

Foot orthotics and shoe inserts (L3000-L3030, A5512-A5514) must be billed with modifier KX to ensure that coverage criteria are met, and that documentation exists to support the medical necessity.

EXCLUSIONS

Equipment repair or replacement due to misuse, neglect, and/or loss.

CDPHP PRODUCT VARIATIONS

CHILD HEALTH PLUS	Subject to all terms and conditions noted above in the policy with the following exception: The Diabetic Prevention Program (DPP) is not a covered benefit.

POLICY NAME: DIABETIC SERVICES: SUPPLIES, PHARMACEUTICALS, EQUIPMENT, EYE EXAM, EDUCATION, AND SHOES

MEDICARE ADVANTAGE	Subject to all terms and conditions noted above in the policy with the following exceptions: <u>Continuous Glucose Monitoring</u> E2103 (Non-adjunctive, non-implanted continuous glucose monitor or receiver) & A4239 (Supply allowance for non-adjunctive, non-implanted continuous glucose monitor (cgm), includes all supplies and accessories, 1 month supply = 1 unit of service) continuous glucose monitoring may be covered by Medicare when all the following criteria are met: 1. The beneficiary has diabetes mellitus; and, 2. The beneficiary's treating practitioner has concluded that the beneficiary (or beneficiary's caregiver) has sufficient training using the CGM prescribed as evidenced by providing a prescription; and, 3. The CGM is prescribed in accordance with its FDA indications for use; and, 4. The beneficiary for whom a CGM is being prescribed, to improve glycemic control, meets at least one of the criteria below: A. The beneficiary is insulin-treated; or, B. The beneficiary has a history of problematic hypoglycemia with documentation of at least one of the following: 1. Recurrent (more than one) level 2 hypoglycemic events (glucose <54mg/dL (3.0mmol/L)) that persist despite multiple (more than one) attempts to adjust medication(s) and/or modify the diabetes treatment plan; or, 2. A history of one level 3 hypoglycemic event (glucose <54mg/dL (3.0mmol/L)) characterized by altered mental and/or physical state requiring third-party assistance for treatment of hypoglycemia 5. Within six (6) months prior to ordering the CGM, the treating practitioner has an in-person or Medicare-approved telehealth visit with the beneficiary to evaluate their diabetes control and determined that criteria (1)-(4) above are met E2102 (Adjunctive, non-implanted continuous glucose monitor or receiver) & A4238 (Supply allowance for adjunctive, non-implanted continuous glucose monitor (cgm), includes all supplies and accessories, 1 month supply = 1 unit of service) are a covered benefit when:

- the above criteria is met AND the coverage criteria for an external insulin infusion pump is met as well (*please see External Ambulatory Infusion Pump, 1370/20.000457*)

***(Codes A9276, A9277 & A9278 are non-covered by Medicare)

As per NY Local Coverage Article, A52464, continuous glucose monitors (CGMs) are covered under the Durable Medical Equipment (DME) benefit [Social Security Act §1861(s)(6)].

Implantable Continuous Glucose Monitor (I-CGM) (0446T, 0447T, 0448T)

Therapeutic I-CGMs are considered reasonable and necessary by Medicare when all of the following coverage criteria (1-4) are met:

1. The beneficiary has diabetes mellitus (Refer to the ICD-10 code list in the LCD-related Policy Article for applicable diagnoses); and,
2. The beneficiary's treating practitioner has concluded that the beneficiary (or beneficiary's caregiver) has sufficient training using the I-CGM prescribed as evidenced by providing a prescription; and,
3. The I-CGM is prescribed in accordance with its FDA indication for use; and,
4. The beneficiary for whom a I-CGM is being prescribed, to improve glycemic control, meets at least one of the criteria below:
    A. The beneficiary is insulin-treated; or,
    B. The beneficiary has a history of problematic hypoglycemia with documentation of at least one of the following:
        i. Recurrent (more than one) level 2 hypoglycemic events (glucose < 54mg/dl (3.0mmol/L)) that persists despite multiple (more than one) attempts to adjust medication(s) and/or modify the diabetes treatment plan; or,
        ii. A history of one level 3 hypoglycemic event (glucose < 54mg/dl (3.0mmol/L)) characterized by altered mental and/or physical state requiring third-party assistance for treatment of hypoglycemia.

I-CGM devices will not be considered reasonable and necessary for the following:

1. Short-term I-CGM (72 hours to 1 week) for diagnostic use.

<u>Medicare Diabetes Prevention Program</u>

POLICY NAME: DIABETIC SERVICES: SUPPLIES, PHARMACEUTICALS, EQUIPMENT, EYE EXAM, EDUCATION, AND SHOES

Benefits are provided for the Medicare diabetes prevention program (MDPP) as outlined below.

The MDPP is a structured intervention with the goal of preventing type 2 diabetes in individuals with an indication of prediabetes.-The program consists of a minimum of 16 intensive "core" sessions of a Centers for Disease Control and Prevention (CDC) approved curriculum furnished over six months in a group-based, classroom-style setting that provides practical training in long-term dietary change, increased physical activity, and behavior change strategies for weight control. After completion of the core sessions, less intensive follow-up meetings are furnished monthly to help ensure participants maintain healthy behaviors. The primary goal of the program is at least 5-percent weight loss by participants.

Codes:

Code	Descriptor
G9886	Behavioral counseling for diabetes prevention, in-person, group, 60 minutes
G9887	Behavioral counseling for diabetes prevention, distance learning, 60 minutes
G9880	5 percent WL Achieved from baseline weight
G9881	9 percent WL Achieved from baseline weight
G9888	Maintenance 5 percent WL from baseline in months 7-12

Core Sessions:

- Beneficiaries may attend up to 16 weekly sessions during months 1-6 of the MDPP Core Services period.
- The MDPP Core Services period starts with the first claim for G9886 or G9887. Beneficiaries must attend one core session to initiate MDPP services.
- A supplier is paid based on the beneficiary's attendance, regardless of the beneficiary's weight loss.
- A supplier is paid performance payments if the beneficiary achieves weight-loss goals.

Core Maintenance Sessions:

- Beneficiaries may attend up to 6 monthly sessions during months 7-12 of the MDPP Core Services period.
- A supplier is paid based on the beneficiary's attendance, regardless of the beneficiary's weight loss.
- A supplier is paid performance payments if the beneficiary achieves weight-loss goals and/or continues to meet the 5% weight-loss goal at each session

Key Points to Remember:

- Three G-codes can be used when submitting claims for beneficiary achievement of performance milestones: 1) 5% weight loss (G9880), 2) 9% weight loss (G9881), and 3) maintenance of 5% weight loss in a core maintenance session (G9888).
- Note that codes G9880 and G9888 cannot be used with the same date of service (DOS), and the DOS for code G9880 must occur prior to any DOS submitted for G9888. Claims for G9888 will be rejected if 1) there is no claim for G9880 with a DOS prior to claim for G9888 and 2) DOS for G9888 is within the first 6 months of the MDPP services period.
- Suppliers may bill for a maximum of 22 sessions, including up to 16 weekly sessions in months 1-6, and up to 6 monthly sessions in months 7-12.
- Suppliers must use one of two G-codes (G9886 or G9887) when filing claims for attendance payments after every core and core maintenance session furnished to an MDPP beneficiary. Once 22 sessions have been paid for a beneficiary, any additional claims with DOS after the 22nd paid claim will be rejected, including out-of-sequence claims.
- Each HCPCS G-code should be listed with the corresponding session DOS, MDPP organizational NPI, and rendering provider NPI. Note that the coach is the rendering provider on the claim

Medicare Advantage members are eligible for MDPP services when all the following criteria are met:

- Enrolled in Medicare Part B
- Body mass index (BMI) of at least 25 (23 if self-identified as Asian) on the date of the first core session
- Meet 1 of 3 blood test requirements within the 12 months prior to

	attending the first core session: ○ A hemoglobin A1c test with a value between 5.7% and 6.4%, or ○ A fasting plasma glucose of 110-125 mg/dL, or ○ A 2-hour plasma glucose of 140-199 mg/dL (oral glucose tolerance test) • No previous diagnosis of diabetes prior to the date of the first core session (with exception of gestational diabetes) • Do not have end-stage renal disease (ESRD) • Have not previously received MDPP services (program is once-per-lifetime limit) Members may self-refer to a MDPP as a physician referral is not required. <u>Diabetes Self-Management Training</u> Benefits are provided for diabetes self-management training rendered by a participating provider (refer to section on *Diabetic Education*) for newly diagnosed diabetics up to 10 hours during a continuous 12-month period and up to two hours follow-up training in subsequent years. Diabetes self-management training is not subject to an office visit cost-share, as stated in the enrollee's contract. Benefits for Medicare Part D prescription drugs are available only to enrollees who have elected the CDPHP Medicare Advantage product with the Part D option. The CDPHP Medicare Advantage product does not cover any prescription drugs not covered by Medicare. In addition, for those individuals enrolled in the CDPHP Medicare Advantage product who have not elected the Part D option, CDPHP covers only those prescription drugs covered by Medicare Parts A and B, not those covered by Part D.
SELECT PLAN/HARP:	Subject to all terms and conditions noted above in the policy with the following exceptions: CDPHP utilizes the New York State Medicaid Management Information System Provider Manual (MMIS) to determine a medical or surgical supply versus durable medical equipment, orthotic, or prosthetic. Durable medical equipment is not subject to a deductible or copayment. Benefits are provided for medically necessary medical supplies, including insulin

	and diabetic supplies. Medically necessary prescription footwear and shoe modifications and additions are a covered benefit. Prescription footwear applies to all "L" codes listed in the prescription footwear section of the MMIS provider manual (4.6), as well as codes for diabetic shoes. Enrollees diagnosed with diabetes may self-refer to any participating provider of vision services (optometrist or ophthalmologist) for a dilated eye (retinal) examination once in any 12-month period. Continuous Glucose Monitoring (CGM) CDPHP utilizes the New York State Medicaid Management Information System (MMIS) Durable Medical Equipment Manual (section 4.1- Medical/Surgical Supplies) for coverage guidance: https://www.emedny.org/ProviderManuals/DME/PDFS/DME_Procedure_Codes.pdf Benefits are provided for adjunctive and non-adjunctive continuous glucose monitoring when criteria is met and should be billed to Medicaid Fee for Service. Diabetic Self-Management Training (DSMT) Benefits are provided for DSMT when rendered in a hospital outpatient department or free-standing diagnostic and treatment center and by one of the following NYS licensed, registered, or certified professionals affiliated with a DSMT program: • Registered Nurse • Registered Nurse Practitioner • Registered Dietician • Physician (MD or DO) • Pharmacist • Physician Assistant • Physical Therapist • Clinical Psychologist • Optometrist • Occupational Therapist • Podiatrist

	DSMT services are also allowed in an office-based setting when provided by one of the above licensed, registered, or certified health care professionals who is also certified as a Certified Diabetes Education (CDE) by the Certified Diabetes Care and Education Specialist (CBDCE). DSMT is covered for enrollees that are newly diagnosed with diabetes, have stable diabetes, or have diabetes with a medically complex condition such as poor diabetes control or another complicating factor. No more than 10 hours for newly diagnosed enrollees or enrollees with a medically complex condition will be allowed during a continuous six-month period. Enrollees with diabetes who are medically stable may receive up to one hour of DSMT in a continuous six-month period. DSMT services may be provided in individual sessions, or in group sessions of no more than eight patients. National Diabetes Prevention Program (NDPP) Services (0403T, G9880) This is an educational and support program designed to assist at-risk people from developing Type 2 diabetes. The program consists of group training sessions that focus on the long-term, positive effects of healthy eating and exercise. The goals for these lifestyle changes include modest weight loss and increased physical activity. NDPP sessions are taught using a trained lifestyle coach. • *Refer to specific member contracts for availability of benefits relating to this program.*

Reviewed: 10/95, 12/06, 01/17, 1/26

POLICY HISTORY

This section is intended to provide only highlights of the policy changes. The policy should always be reviewed in its entirety to ensure a comprehensive understanding of coverage.

Effective Date	Update
4/1/2026	Removed insulin requirement for CGM's and exclusion of CGM's for diagnosis of gestational diabetes.
10/1/2025	Updated CGM verbiage to indicate "insulin dependent" only. Removed Bridge payment code from Medicare Advantage section under Medicare Diabetes Prevention Program (MDPP). This payment was removed by CMS effective 1/1/2025. Under Medicare section, added LCA information for CGM's.

POLICY NAME: DIABETIC SERVICES: SUPPLIES, PHARMACEUTICALS, EQUIPMENT, EYE EXAM, EDUCATION, AND SHOES

2/1/2025* *No change to effective date for this update	Clarified in the Child Health Plus section that the Diabetic Prevention Program is not a covered benefit.
2/1/2025	Removed information for foot orthotics for vascular disease as this is now in the foot care policy. Updated CGM criteria. Added coverage for implantable CGM's and updated Medicare implantable CGM criteria per updated LCD.
1/1/2024* *No change to effective date for this update	Under the Foot Orthotics section added information that was in the Foot Care policy regarding coverage indications. Added information regarding billing KX modifier with codes L3000-L3030 and A5512-A5514.
1/1/2024* *No change to effective date for this update	Updated the coding requirements for the Medicare Diabetes Prevention Program (MDPP) in the Medicare Advantage section.
1/1/2024	Removed termed code G0308 and G0309.
11/1/2023	Under Medicaid section- since CGM's are billed to Medicaid FFS (part of Medicaid carve out eff 4-1-23) removed criteria and provided link for the MMIS that outlines the criteria.
10/1/2023	Under Medicaid section updated CGM requirements per DOH mandate.
4/16/2023	Under the Position Statement for Diabetes Prevention Program, added the codes to bill for these services. Under Medicaid added info for National Diabetes Prevention Program. Under Medicare, updated CGM criteria which is effective 4/16/23.
1/1/2023 *No change to effective date of policy	Under Medicaid section 1. added updated CGM codes and guidance for A9276, A9277, and A9278.
1/1/2023	Added new CPT codes E2103 and A4239 and removed deleted codes K0553 and K0554

POLICY NAME: DIABETIC SERVICES: SUPPLIES, PHARMACEUTICALS, EQUIPMENT, EYE EXAM, EDUCATION, AND SHOES

8/1/2022* No change to effective date	Under Medicare section for the Diabetes Prevention Program, added codes G9890, G9891 which are allowable under the program.
8/1/2022* No change to effective date	Added information to the Medicare CGM's section regarding coverage as a stand-alone device.
8/1/2022	For custom foot orthotics, expanded code range to include codes between L3000-L3030. Under the Medicare section, added coverage for Implantable Continuous Glucose Monitors.
04/01/2022* No change to effective date	CMS coverage update: Effective 2/28/2022, CMS will allow for coverage of a non-therapeutic (adjunctive) continuous glucose monitor (CGM) when it is being used with an integrated insulin pump system. New HCPCS codes (E2102 and A4238) effective 4/1/2022 for adjunctive CGM added to policy.
04/01/2022	Revised Select Plan/HARP section to expand CGM coverage to now include members who have type 2 diabetes and gestational diabetes.
02/01/2022	Added additional verbiage to policy regarding providers who can prescribe equipment, supplies, oral agents, and insulin: -"or other licensed Health Care Professional legally authorized to prescribe under Title 8 of the New York Education Law" Removed verbiage in the body of the policy that implantable monitors/implantable CGM devices are considered covered DME as these are listed under the exclusions section. Relocated CGM's for gestational diabetes to the exclusions section and removed the following exclusion: -Personal subcutaneous continuous blood glucose monitoring for children with diabetes
12/1/2021	Added quantity limits for diabetic test strips.
7/18/2021	Updated CGM criteria in the Medicare Advantage section in accordance with Medicare LCD update.

POLICY NAME: DIABETIC SERVICES: SUPPLIES, PHARMACEUTICALS, EQUIPMENT, EYE EXAM, EDUCATION, AND SHOES

7/1/2021	Updated Select Plan/HARP section: effective 7/1/21, as per DOH updated guidance April 2021, CGM criteria changed to allow an enrolled Medicaid provider with experience in diabetes treatment to order the device and changed criteria of performing at least "four" finger stick glucose tests daily to "multiple". In addition, effective 4/1/2021, expanded the list of practitioners able to provide Diabetes Self-Management Training and clarified enrollees that are eligible for such training under Select Plan/HARP.
5/1/2021 (Effective date on policy remains the same)	In the Position Statement added verbiage in regards to code 95251 that was previously housed in the External Ambulatory Insulin Infusion Pump policy.
5/1/2021	Removed information under Medicaid in regards to National Diabetes Prevention Program (NDPP) as this language is now in the 2021 Member Handbook. Removed verbiage under Medicaid and Medicare in regards to Omnipod insulin pumps and V-Go insulin delivery systems as this information is housed in the External Ambulatory Insulin Infusion Pump policy.
4/1/2021	Updated verbiage in section on continued glucose monitoring to indicate a minimum of 72 hours.
7/15/20	Updated policy to include coverage of CGM for Type II diabetics when criteria in policy is met.
2/1/20 (Effective date on policy remains the same)	Added statement to Select Plan section to address coverage of Omnipod/Omnipod Dash as an acceptable alternative to an external ambulatory insulin infusion pump.
2/1/2020	Removed termed code K0903 and added code A5514 for shoe inserts. Removed requirement of finger sticks for individuals prescribed a therapeutic continuous glucose monitor. Made the following changes to the Select Plan section: • Added coverage for National Diabetes Prevention Program (NDPP) • Removed exclusion statement for non-coverage of Omnipod.

Capital District Physicians' Health Plan, Inc.
CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: DIABETIC SERVICES: SUPPLIES, PHARMACEUTICALS, EQUIPMENT, EYE EXAM, EDUCATION, AND SHOES

	Added Omnipod Dash to the Medicare Section to the list of insulin delivery devices covered under Part D.

MEDICAL POLICY

Medical Policy Title	**Disability Determination for Extension of Benefits After Coverage Termination**
Policy Number	**10.01.11**
Current Effective Date	**November 1, 2026**
Next Review Date	**August 2027**

Our medical policies are guides to evaluate technologies or services for medical necessity. Criteria are established through the assessment of evidence based, peer-reviewed scientific literature, and national professional guidelines. Federal and state law(s), regulatory mandates and the member's subscriber contract language are considered first in the determination of a covered service. (Link to Product Disclaimer)

POLICY STATEMENT(S)

I. For purposes of determining an individual's eligibility for an extension of benefits due to total disability upon termination of coverage, a Medical Director of the Health Plan will determine whether the individual was totally disabled before and on the date of termination. To request a total disability determination, the treating physician must submit certification of the former member's total disability at the time of termination and must include evidence that the total disability existed prior to the termination.

II. The Health Plan's Medical Director will base his/her disability determination upon the review of the former member's medical records and, if deemed necessary, discussion between the treating physician and the Health Plan's Medical Director or his/her appointed designee. In conducting the review, the Health Plan's Medical Director will be guided by the medical criteria stated in the Disability Evaluation under Social Security (Blue Book), published by the U.S. Social Security Administration.

III. When the Health Plan's Medical Director determines, in his/her sole discretion, that a former member was totally disabled prior to and at the time of termination of coverage, benefits will be provided only for services directly related to the total disability, assuming that the former member is otherwise eligible for an extension of benefits.

RELATED POLICIES

Not Applicable

POLICY GUIDELINE(S)

Proprietary Information of Capital District Physicians' Health Plan, Inc. | CDPHP Universal Benefits,® Inc. | Capital District Physicians' Healthcare Network, Inc.

I. In order to be considered for an extension of benefits due to total disability after termination of coverage, the total disability must have existed prior to termination of the contract.

II. Extensions of benefits differ, depending upon whether a former member loses coverage under a group contract or individual contract and the reason for the loss of coverage. Please refer to the specific paragraph(s) in the Description section below for guidance.

DESCRIPTION

Under the Health Plan's subscriber contracts and certificates, when a member's coverage ends, benefits stop. However, when a Health Plan Medical Director determines that a former member is totally disabled on the date coverage terminates, and that the former member received services or care for the illness, condition, or injury that caused his or her total disability while covered under the subscriber contract, extended benefits may be available as follows.

Group Coverage Termination

I. When an individual who was covered under an insured group contract is determined to be totally disabled as of the date coverage terminates, extended benefits may continue for covered services to treat the total disability, if **ONE** of the following applies:

   A. Termination of employment, eligibility, or contract: When a former member's coverage is terminated due to termination of employment or termination of eligibility, or due to termination of the group contract, extended benefits will be provided during a period of total disability for a hospital stay commencing, or surgery performed, within 31 days from the date the coverage ended. The hospital stay and/or surgery must be for treatment of the injury, sickness, or pregnancy that caused the total disability.

   B. Termination of active employment: Unless coverage is provided for services in connection with the total disability under another health plan, if group coverage providing major medical-type benefits ended because the former member was no longer actively employed, extended benefits will be provided during a period of total disability for at least 12 months from the date coverage ended, but only for covered services to treat the injury, sickness, or pregnancy that caused the total disability.

II. Extended benefits terminate when all the benefits available have been exhausted, when a Health Plan Medical Director or his/her designee determines that the member is no longer totally disabled, or the maximum time period or the extended services have ended. The Health Plan will never provide more benefits than would have been provided, had the member remained covered under the contract.

Individual Coverage Termination

I. When an individual who was covered under an insured individual policy is determined to be totally disabled as of the date coverage terminates, benefits to treat the total disability will extend for 12 months or, if earlier, the end of the total disability.

Please refer to the former member's subscriber contract for the specific benefit extension that may be available to the former member.

Not applicable

CENTERS FOR MEDICARE AND MEDICAID SERVICES (CMS)

Extension of benefits for total disability after disenrollment from Medicare is not addressed in National or Regional Medicare coverage determinations or policies.

PRODUCT DISCLAIMER

- Services are contract dependent; if a product does not cover a service, medical policy criteria do not apply.
- If a commercial product (including an Essential Plan or Child Health Plus product) covers a specific service, medical policy criteria apply to the benefit.
- If a Medicaid product covers a specific service, and there are no New York State Medicaid guidelines (eMedNY) criteria, medical policy criteria apply to the benefit.
- If a Medicare product covers a specific service, and there is no national or local Medicare coverage decision for the service, medical policy criteria apply to the benefit.

Disclaimer Notice

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgement when deciding the most appropriate care for enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

Background

Duchenne muscular dystrophy (DMD) is a fatal X-linked genetic disorder that results in progressive and irreversible loss of muscle function, including the heart and lungs. Due to the X-linked nature of the disease, it almost exclusively affects males. In the United States, there are approximately 20,000 males with DMD which corressponds to one in 3,500-5,000 newborn boys. There is a poor prognosis to this condition; most patients with DMD are wheelchair bound by age 12, require breathing support by age 20, and die by age 30 due to respiratory or cardiac failure.

DMD is caused by mutations in the gene that encodes the dystrophin protein, a protein necessary for normal muscle maintenance and function. The most common mutations associated with DMD are large deletions where one or more exons are missing from the gene. The most common deletions are concentrated between exons 45 and 53. Approximately 13 percent of all DMD patients have mutations in exon 51, while about 8 percent of DMD patients have mutations in exon 53, and another 8 percent have mutations in exon 45.

Symptom management was the standard of care, and included corticosteriods because of their anti-inflammatory and immunomodulatory effects. Current FDA approved therapies for DMD inlcude the corticosteroid treatments Emflaza (deflazacort) and Agamree (vamorolone), the non-steroidal, histone deactylase inhibitor, Duvyzat (givinostat) as well as exon-skipping therapies including Exondys 51 (eteplirsen), Vyondys 53 (golodirsen), Viltepso (vitolarsen), and Amondys 45 (casimersen). The mechanism of exon-skipping therapy involves targeting the dystrophin mRNA, which allows for skipping of the mutated exons of the DMD gene that disrupts the downstream protein synthesis and nonfunctional dystrophin protein. Despite this innovative mechanism, there is little data to support that the demonstrated restoration of dystrophin slows the progression of the disease. In addition, the clinical benefits of these exon-skipping therapies have yet to be established.

Exondys 51 (eteplirsen) is an antisense oligonucleotide (ASO) developed as treatment for patients with DMD who have mutations in the gene encoding for dystrophin that are amenable to exon 51 skipping. Gene mutations with other exon deletions (e.g., exon 52 or exon 50) are also considered amenable to exon 51 skipping and therefore add to the potential eligible population for this treatment strategy. Exondys 51 was approved under the FDA accelerated approval pathway. This occurred despite the FDA Advisory Committee's recommendation against FDA approval. The approval was based on surrogate marker data; specifically, changes in treated-patient dystrophin levels compared to unmatched, historical disease-progression data from prior publications. No significant clinical improvements were identified. Therefore, continued approval for Exondys 51 is contingent upon demonstration of clinical benefit in confirmatory trials.

Vyondys 53 (golodirsen), also an antisense oligonucleotide, was developed as an exon 53-skipping agent for patients with DMD who have mutations in the gene encoding for dystrophin that are amenable to exon 53 skipping. As with Exondys 51, gene mutations with other exon deletions are considered ammenable to exon 53 skipping, and add to the eligible population. Furthermore, this agent was also approved under an accelerated approval based on an increase in dystrophin production in skeletal muscle. Therefore, continued approval is contingent upon demonstration of clinical benefit in confirmatory trials.

Viltepso, similar to Vyondys 53, is an antisense oligonucleotide, exon 53-skipping agent. It is indicated for patients with DMD who have mutations in the gene for dystrophin that are amendable to exon 53-skipping. This agent was approved under accelerated approval based on its ability to increase dystrophin levels. Notably, the initial published results for this agent have shown potential to increase dystrophin levels at a higher rate than Vyondys in a comparable patient population. While Vyondys demonstrated a dystrophin level change from 0.1% of normal at baseline to 1.02% of normal at the conclusion of the trial, Viltepso showed a change from 0.6% at baseline to 5.3% at the conclusion of the trial. Based on the lack of clinical significance of this data, continued approval for Vyondys is contingent upon demonstration of cinical benefit in confirmatory trials.

Amondys 45 (casimersen) is indicated for patients with DMD who have a confirmed mutation of the DMD gene that is amenable to exon 45 skipping. This specific mutation represents approximately 8% of the DMD patient population. The ESSENCE trial is currently underway with a completion date scheduled for April of 2024. Of note, the primary outcome of this trial is change in baseline in total distance walked during a 6-minute walk test (6MWT) at week 96 which presents the opportunity for findings with clinical application. Preliminary results have been discussed which indicate a subset of patients analyzed after 48 weeks of treatment had a mean dystrophin increase of 0.811%.

Summary	
Effective Date of Policy	8/13/2026
Indications	Duchenne Muscular Dystrophy
ICD10 Diagnosis Codes	G70
Availability	Eteplirsen: Solution for injection: 50 mg/mL Viltolarsen: Solution for injection: 50 mg/mL Golodirsen: Solution for injection: 50 mg/mL Casimersen: Solution for injection: 50 mg/mL
HCPCS codes	Exondys 51: J1428; Vyondys 53: J1429; Viltepso: J1427; Amondys 45: J1426
Duration	Initial approval: Three (3) months Continuation approval: Six (6) months

Required Criteria for Approval

All of the following conditions for the requested indication must be met in order to approve EXONDYS 51 (Eteplirsen), Viltepso (Viltolarsen), Vyondys 53 (Golodirsen), Amondys 45 (Casimersen) or any new ASO market entrant for the treatment of DMD:

Indication

Amondys 45 (casimersen)

Duchenne Muscular Dystrophy (FDA approval)
ICD10: G70

HCPCS: J1426

Criteria for Approval

1. Must have a diagnosis of DMD with a confirmed mutation of the DMD gene that is amenable to exon 45 skipping (see table below) **AND**

Exon 45 skip-amenable deletion mutation range[1,2]			
7-44	46-47	46-55	46-69
12-44	46-48	46-57	46-75
18-44	46-49	46-59	46-78
44	46-51	46-60	
46	46-53	46-67	

2. Must be on a stable dose of corticosteroids for at least 6 months prior to therapy or a documented reason not to be on corticosteroids **AND**
3. Documentation must indicate kidney function testing prior to starting therapy **AND**
4. Patient must not concurrently be on another exon skipping therapy for DMD **AND**
5. Amondys 45 will not be approved for use in patients that have previously been treated with Elevidys **AND**
6. All the below criteria must be met <u>(The below criteria are NOT applicable to Medicaid Managed Care)</u>
    a. Prescribed by or in consultation with a provider who specializes in the treatment of Duchenne Muscular dystrophy (DMD) and/or neuromuscular disorders **AND**
    b. The patients must be ambulatory and must have a baseline unassisted 6-minute walk test (6MWT) of at least 300 meters **AND**
    c. Must have stable cardiac function with left ventricular ejection fraction (LVEF) of > 40% **AND**
    d. Must have stable pulmonary function with forced vital capacity ≥ 50% of predicted and not require supplemental oxygen **AND**
    e. Dose must not exceed 30mg/kg infused over 35-60 minutes, once weekly **AND**
    f. Initial approval for new starts will be for 3 months.
    g. Continued approval in non-new starts for additional 6-month periods will require recent documentation that the patient continues to remain ambulatory with an unassisted 6MWT of at least 100 meters. In addition, the patient must meet the following criteria (Progress notes/test results must be dated after the most recent drug approval and within 3 months of the continuation period that is being requested):
        i. Must have stable cardiac function with left ventricular ejection fraction (LVEF) of > 40% **AND**
        ii. Must have stable pulmonary function with forced vital capacity ≥ 50% of predicted and not require supplemental oxygen **AND**
        iii. Must have a < 5% annual decline in percent predicted FVC (FVC% p)

Exondys 51 (eteplirsen)

Duchenne Muscular Dystrophy (FDA approval)
ICD10: G70

HCPCS: J1428

1. Must have a diagnosis of DMD with a confirmed mutation of the DMD gene that is amenable to exon 51 skipping (see below table) **AND**

Exon 51 skip-amenable deletion mutation range [12]			
3-50	19-50	33-50	47-50
4-50	21-50	34-50	48-50
5-50	23-50	35-50	49-50
6-50	24-50	36-50	50
9-50	25-50	37-50	51
10-50	26-50	38-50	52
11-50	27-50	39-50	52-61
13-50	28-50	40-50	52-63
14-50	29-50	41-50	52-64
15-50	30-50	42-50	52-66
16-50	31-50	43-50	52-76
17-50	32-50	45-50	

2. Must be on a stable dose of corticosteroids for at least 6 months prior to therapy or a documented reason not to be on corticosteroids **AND**
3. Patient must not concurrently be on another exon skipping therapy for DMD **AND**
4. Exondys 51 will not be approved for use in patients that have previously been treated with Elevidys **AND**
5. All the below criteria must be met <u>(The below criteria is NOT applicable to Medicaid Managed Care)</u>
    a. Prescribed by or in consultation with a provider who specializes in the treatment of Duchenne Muscular dystrophy (DMD) and/or neuromuscular disorders **AND**
    b. The patient must be ambulatory with a baseline unassisted 6-minutewalk test (6MWT) of at least 200 meters **AND**
    c. Must have stable cardiac function with left ventricular ejection fraction (LVEF) of > 40% **AND**
    d. Must have stable pulmonary function with forced vital capacity ≥ 50% of predicted and not require supplemental oxygen **AND**
    e. Dose must not exceed 30mg/kg of body weight infused once weekly **AND**
    f. Initial approval for new starts will be for 3 months. Continued approval in non-new starts for additional 6-month periods will require documentation that the patient continues to remain ambulatory with an unassisted 6MWT of at least 100 meters. In addition, the patient must meet the following criteria (Progress notes/test results must be dated after the most recent drug approval and within 3 months of the continuation period that is being requested):
        i. Must have stable cardiac function with left ventricular ejection fraction (LVEF) of > 40% **AND**
        ii. Must have stable pulmonary function with forced vital capacity ≥ 50% of predicted and not require supplemental oxygen **AND**
        iii. Must have a < 5% annual decline in percent predicted FVC (FVC% p)

Viltepso (viltolarsen)

Duchenne Muscular Dystrophy (FDA approval) ICD10: G70

HCPCS: J1427

1. Must have a diagnosis of DMD with a confirmed mutation of the DMD gene that is amenable to exon 53 skipping (see below table) **AND**

Exon 53 skip-amenable deletion mutation range[12]			
3-52	21-52	35-52	50-52
4-52	23-52	36-52	52
5-52	24-52	37-52	53
6-52	25-52	38-52	54-58
9-52	26-52	39-52	54-61
10-52	27-52	40-52	54-63
11-52	28-52	41-52	54-64
13-52	29-52	42-52	54-66
14-52	30-52	43-52	54-76
15-52	31-52	45-52	54-77
16-52	32-52	47-52	
17-52	33-52	48-52	
19-52	34-52	49-52	

2. Must be on a stable dose of corticosteroids for at least 3 months prior to therapy or a documented reason not to be on a corticosteroid **AND**
3. Documentation must indicate kidney function testing prior to starting therapy **AND**
4. Patient must not concurrently be on another exon skipping therapy for DMD **AND**
5. Viltepso will not be approved for use in patients that have previously been treated with Elevidys **AND**
6. All the below criteria must be met <u>(The below criteria are NOT applicable to Medicaid Managed Care)</u>
    a. Prescribed by or in consultation with a provider who specializes in the treatment of Duchenne Muscular dystrophy (DMD) and/or neuromuscular disorders **AND**
    b. The patients must be ambulatory and must have a baseline unassisted 6-minute walk test (6MWT) of at least 250 meters **AND**
    c. Must have stable cardiac function with left ventricular ejection fraction (LVEF) of > 40% **AND**
    d. Must have stable pulmonary function with forced vital capacity ≥ 50% of predicted and not require supplemental oxygen **AND**
    e. Dose must not exceed 80mg/kg infused over 60 minutes, once weekly **AND**
    f. Initial approval for new starts will be for 3 months
    g. Continued approval in non-new starts for additional 6-month periods will require recent documentation that the patients continue to be ambulatory with an unassisted 6MWT of at least 100 meters. In addition, the patient must meet the following criteria (Progress notes/test results must be dated after the most recent drug approval and within 3 months of the continuation period that is being requested):
        i. Must have stable cardiac function with left ventricular ejection fraction (LVEF) of > 40% **AND**
        ii. Must have stable pulmonary function with forced vital capacity ≥ 50% of predicted and not require supplemental oxygen **AND**
        iii. Must have a < 5% annual decline in percent predicted FVC (FVC% p)

Vyondys 53 (golodirsen)

Duchenne Muscular Dystrophy (FDA approval)
ICD10: G70

HCPCS: J1429

1. Must have a diagnosis of DMD with a confirmed mutation of the DMD gene that is amenable to exon 53 skipping (see below table) AND

Exon 53 skip-amenable deletion mutation range [12]			
3-52	21-52	35-52	50-52
4-52	23-52	36-52	52
5-52	24-52	37-52	53
6-52	25-52	38-52	54-58
9-52	26-52	39-52	54-61
10-52	27-52	40-52	54-63
11-52	28-52	41-52	54-64
13-52	29-52	42-52	54-66
14-52	30-52	43-52	54-76
15-52	31-52	45-52	54-77
16-52	32-52	47-52	
17-52	33-52	48-52	
19-52	34-52	49-52	

2. Must be on a stable dose of corticosteroids for at least 6 months prior to therapy or a documented reason not to be on corticosteroids AND
3. Documentation must indicate kidney function testing prior to starting therapy AND
4. Patient must not concurrently be on another exon skipping therapy for DMD AND
5. Vyondys 53 will not be approved for use in patients that have previously been treated with Elevidys AND
6. All the below criteria must be met (The below criteria are NOT applicable to Medicaid Managed Care)
    a. Prescribed by or in consultation with a provider who specializes in the treatment of Duchenne Muscular dystrophy (DMD) and/or neuromuscular disorders AND
    b. The patient must be ambulatory must have a baseline unassisted 6-minutewalk test (6MWT) of at least 250 meters AND
    c. Must have stable cardiac function with left ventricular ejection fraction (LVEF) of > 50% AND
    d. Must have stable pulmonary function with forced vital capacity ≥ 50% of predicted and not require supplemental oxygen AND
    e. Dose must not exceed 30 mg/kg infused IV over 35 to 60 minutes, once weekly
    f. Initial approval for new starts will be for 3 months.
    g. Continued approval in non-new starts for additional 6-month periods will require documentation that the patient continues to be ambulatory with an unassisted 6MWT of at least 100 meters. In addition, the patient must meet the following criteria (Progress notes/test results must be dated after the most recent drug approval and within 3 months of the continuation period that is being requested):
        i. Must have stable cardiac function with left ventricular ejection fraction (LVEF) of > 50% AND
        ii. Must have stable pulmonary function with forced vital capacity ≥ 50% of predicted and not require supplemental oxygen AND
        iii. Must have a < 5% annual decline in percent predicted FVC (FVC% p)

Policy Guidelines

1. Amondys 45, Exondys 51, Vyondys 53, and Viltepso are administered as an IV infusion and will be covered under the medical benefit.
2. Amondys 45, Exondys 51, Vyondys 53, and Viltepso will not be approved for patients who have lost ambulation or who have LVEF or FVC% predicted test results that indicate severe decompensation. These medications have only been evaluated in ambulatory patients, and it is unknown if patients with more advanced disease and greater muscle deterioration would receive any benefit with treatment. Pivotal studies do not provide adequate support to determine if the drug provides clinical benefit related to cardiac and respiratory complications, which can lead to morbidity and mortality in DMD. (Not applicable to **Medicaid Managed Care**)
3. Utilization Management are contract dependent. Refer to specific contract/benefit language for exclusions.
    a. Coverage criteria may be dependent on the contract renewal date.
    b. Coverage of drugs listed in this policy are contract dependent.
    c. Not all contracts/benefits allow coverage of healthcare professional administered drugs as part of their pharmacy benefit.
    d. Not all contracts/benefits cover all medical infusible drugs.

4. Clinical documentation must be submitted for each request (initial and recertification) unless otherwise specified (e.g., provider attestation required). Supporting documentation includes, but is not limited to, progress notes documenting previous treatments and treatment history, diagnostic testing, laboratory test results, genetic testing or biomarker results, imaging, and other objective or subjective measures of clinical benefit. For recertification, continued approval requires documentation demonstrating that the requested product is providing ongoing benefit to the patient, evidenced by improvement or stability in the disease state or condition, and that continued use remains medically necessary. Ongoing use of the requested product must continue to align with the current policy's preferred formulary. Recertification reviews may result in a requirement to trial more cost-effective treatment alternatives as they become available (e.g., generics, biosimilars, or other guideline-supported treatment options). Requested dosing must remain consistent with FDA-approved or off-label/guideline-supported dosing recommendations.
5. Dose and frequency should be in accordance with the FDA label or recognized compendia (for off-label uses). When services are performed in excess of established parameters, they may be subject to review for medical necessity.
6. This policy does not apply to Medicare Part D and D-SNP pharmacy benefits. The drugs in this policy may apply to all other lines of business including Medicare Advantage.
7. For members with Medicare Advantage, medications with a National Coverage Determination (NCD) and/or Local Coverage Determination (LCD) will be covered pursuant to the criteria outlined by the NCD and/or LCD. NCDs/LCDs for applicable medications ca be found on the CMS website at https://www.cms.gov/medicare-coverage-database/search.aspx. Indications that have not been addressed by the applicable medication's LCD/NCD will be covered in accordance with criteria determined by the Health Plan (which ma include review per the Health Plan's Off-Label Use of FDA Approved Drugs policy). Step therapy requirements may be imposed in additio to LCD/NCD requirements.
8. All requests will be reviewed to ensure they are being used for an appropriate indication and may be subject to an off-label review in accordance with Off-Label Uses of FDA Approved Drugs.
9. This policy is subject to ongoing revision. Newly marketed drugs and existing drugs with new indications may require prior authorization until formal coverage criteria are established. Inclusion of a drug in this policy does not guarantee its current availability on the market, as some agents may be discontinued, withdrawn, or otherwise unavailable. As product status changes, drugs may be removed from the policy.
10. All utilization management requirements outlined in this policy are compliant with applicable New York State insurance laws and regulations. Policies will be reviewed and updated as necessary to ensure ongoing compliance with all state and federally mandated coverage requirements.
11. For commercial contracts, medical necessity determinations align with the Certificate of Coverage issued by the Health Plan, which states that covered services must be clinically appropriate and not primarily for the convenience of the member, the member's family, or the provider.
12. This policy is based on available evidence as of the last review date. Coverage determinations are subject to applicable plan documents, state and federal regulations, and individual patient circumstances. This policy does not constitute medical advice.
13. Manufacturers may either discontinue participation in, or may not participate in, the Medicaid Drug Rebate Program (MDRP). Under New York State Medicaid requirements, physician-administered drugs must be produced by manufacturers that participate in the MDRP. Products made by manufacturers that do not participate in the MDRP will not be covered under Medicaid Managed Care/HARP lines of business. Drug coverage will not be available for any product from a non-participating manufacturer. For a complete list of New/Reinstated & Terminated Labelers please visit: https://www.medicaid.gov/medicaid/prescriptiondrugs/medicaid-drug-rebate-program/newreinstated-terminated-labeler-information/index.html

POLICY NAME: DURABLE MEDICAL EQUIPMENT, PROSTHETICS/ORTHOTICS & MEDICAL SUPPLIES

POLICY EFFECTIVE DATE:	8/1/2026
Policy Control #:	1370/20.000509
Next Annual Review:	November 2026

DISCLAIMER

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgement when deciding the most appropriate care to enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

PROCEDURE CODES

Multiple

DESCRIPTIONS

The Durable Medical Equipment, Prosthetics, and Orthotics policy is a resource compilation of durable medical equipment, prosthetics, orthotics, and medical supplies most frequently requested by vendors and/or providers. It is not all inclusive of codes contained in the HCPCS Level II Manual.

Durable medical equipment (DME) is defined as equipment which can withstand repeated use, is primarily and customarily used to serve a medical purpose, is generally not useful to a person in the absence of illness or injury; and is appropriate for use in the home.

Prosthetic devices are removable and not permanently implanted devices which replace all or part of a body organ, or replace all or part of a permanently non-functioning, absent, or malfunctioning body part (i.e., artificial limbs, eyes, post mastectomy breast prosthesis).

Orthotic devices are rigid or semi rigid devices which are used for the purpose of supporting a weak or deformed body part or to restrict or eliminate motion in a diseased or injured part of the body.

CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: DURABLE MEDICAL EQUIPMENT, PROSTHETICS/ORTHOTICS & MEDICAL SUPPLIES

Medical supplies are items other than drugs, prosthetic, or orthotic appliances, or DME used for the treatment of a specific medical condition which are consumable, non-reusable, disposable, and generally have no salvageable value (e.g., diapers, gauze pads, bandages). Reference should be made to specific contracts and/or summary plan designs for benefit availability.

RELATED POLICIES/DOCUMENTS

Prior Authorization Guideline, 1370/20.000425

POSITION STATEMENT

CDPHP utilizes CMS National Coverage Determinations (NCDs), Local Coverage Articles (LCAs), or Local Coverage Determinations (LCDs) as well as professional society guidelines and/or industry evidence based clinical resources when making medical necessity determinations for DME, Prosthetics/Orthotics, and medical supplies.

Purchase of DME, prosthetic and orthotic devices not exceeding an allowable amount of $1000 are administered without a prior authorization requirement when provided by a participating provider.

Prior authorization requirement applies to all the following:

- All rental items with the exception of the following:
  - Standard wheelchair rental (K0001-K0007)
  - Transport chairs (E1037-E1039)
  - Wheelchair accessory items (E0971- antitipping device, E0978- positioning belt/safety belt/pelvic strap and E0990- elevating leg rest, complete assembly)
  - Nebulizers (E0570 only)
  - TENS unit
  - Oxygen equipment and accessories (oximeter (E0445) will be allowed as a rental only and is not included in this prior authorization exception)
  - Negative pressure wound therapy electrical pump (E2402)
  - Home phototherapy devices for neonatal jaundice (E0202)
  - Enteral nutrition infusion pump (B9002)
  - Continuous Passive Motion Device (E0935) (exception, prior authorization is required for Medicare Advantage)

The following item may be rented for a period of up to 90 days without prior authorization (for any rental beyond this timeframe, prior authorization is required):

  - Hospital grade breast pump: E0604

- Total repairs exceeding an allowed amount of $1,000 on covered DME.

POLICY NAME: DURABLE MEDICAL EQUIPMENT, PROSTHETICS/ORTHOTICS & MEDICAL SUPPLIES

- *Each* purchased item exceeding an allowed amount of $1,000 (including diabetic DME) with the exception of the following:
  - CPAP/BiPAP machine purchase
  - TENS unit
  - Oxygen equipment and accessories
  - Insulin infusion pumps
  - Continuous glucose monitors and related supplies (A9276, A9277, A9278, S1034, S1035, S1036, S1037, A4238, E2102, E2103, A4239)
  - Scoliosis jacket/Thoracic Lumbar Sacral Orthoses (TLSO) (L1200, L1300, L1310) when billed with diagnosis of scoliosis (M41-M41.9).
  - L1832 - Jace Tri-brace
  - L1845 - Bledsoe brace
  - Ankle foot orthotic (AFO) codes: L1900, L1902, L1904, L1906, L1907, L1910, L1920, L1930, L1932, L1940, L1945, L1950, L1951, L1960, L1970, L1971, L1980, L1990, L2106, L2108, L2112, L2114, L2116, L2200, L2210, L2220, L2230, L2232, L2240, L2250, L2260, L2265, L2270, L2275, L2280, L2300, L2310, L2320, L2330, L2335, L2340, L2350, L2360, L2370,L2375, L4002, L4090, L4205, L4210, L4350, L4360, L4361, L4370, L4386, L4387, L4392, L4394, L4396, L4397, L4398, L4631
  - L3960 – Airplane splint/shoulder
  - L3000-L3030 Custom Foot Orthotics (NOTE: These items are only reimbursed If billed with a diagnosis of diabetes or peripheral vascular disease)
  - The following orthotic codes: L0456, L1200, L5020, L5301, L5321, L5585, L5611, L5643, L5649, L5651, L5673, L5681, L5700, L5701, L5705, L5781, L5828, L5840, L5845, L5964, L5968, L5981, L5987, L5988, L6110, L6721, L6884

CDPHP administers benefits for medically necessary repair, adjustment, replacement, or maintenance and servicing of a covered item if it is not covered under a manufacturer's warranty or purchase agreement. Repair, adjustment, or replacement where the total claim is under an allowable amount of $1000 do not require prior authorization. CDPHP reserves the right to determine whether replacement or repair of the item is more appropriate.

Repair or replacement of the following items do not require prior authorization even if exceeding an allowable amount of $1000:

- Covered foot orthotics

CDPHP administers benefits for ostomy, tracheostomy, and urological products that serve as a prosthetic device.

Capital District Physicians' Health Plan, Inc.
CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: DURABLE MEDICAL EQUIPMENT, PROSTHETICS/ORTHOTICS & MEDICAL SUPPLIES

POLICY CONSIDERATIONS

DME, prosthetics/orthotics, and medical supplies are considered durable medical equipment and are subject to the terms and conditions of such as stated in the enrollee's contract.

Replacement of DME may be available in cases of loss, irreparable damage or wear, or when required because of a change in the enrollee's condition.

- Irreparable damage is damage that has been caused by a specific accident (e.g., wheelchair falling from a van) or natural disaster (e.g., flood or fire).
- Irreparable wear is the deterioration sustained from day-to-day usage over time. In cases involving irreparable wear, the useful lifetime of the equipment, which is five years, is taken into consideration (useful life of DME is considered no less than five years beginning with the date of delivery of the equipment to the member, not the actual age of the equipment). If the item of equipment has been in continuous use for the equipment's useful lifetime, the member may elect to obtain a new piece of equipment.
- Replacement due to wear is not covered during the reasonable useful lifetime of the equipment.

CDPHP follows coverage criteria from the Medicare NCD's, LCD's, or LCA's for the below listed items (please note that listed items with an asterisk (**) are only allowable for the Medicare Advantage line of business:

Refer to the link below for coverage guidelines:

Noridian - DME Jurisdiction A

Ankle-Foot/Knee-Ankle- Foot orthoses
Automatic external defibrillators
Bowel management devices
Canes and crutches
**Cervical traction devices
*For commercial products, E0849 is considered experimental
Cold therapy
Commodes
External breast prosthesis
External Infusion Pumps (*for external insulin infusion pump: see below)
**External Upper Limb Tremor Stimulator Therapy
*For commercial products, this device is considered experimental
Eye Prostheses
Facial Prostheses
Heating Pads and Heat Lamps

POLICY NAME: DURABLE MEDICAL EQUIPMENT, PROSTHETICS/ORTHOTICS & MEDICAL SUPPLIES

High Frequency Chest Wall Oscillation Devices
Hospital Beds and accessories
Infrared Heating Pads Systems
Intrapulmonary Percussive Ventilation System
Knee Orthoses
Lower limb prostheses
Manual wheelchair bases (Standard wheelchairs)
Mechanical in-exsufflation devices
Nebulizers
Negative pressure wound therapy pumps
Orthopedic footwear
Osteogenesis stimulators (Bone Growth Stimulators)
Ostomy supplies
Patient lifts
Power mobility devices (Power wheelchairs)
Pressure reducing support surfaces (group 1-3)
Respiratory assist devices
Seat lift mechanisms
Speech generating devices or augmentative communication devices
Spinal orthoses (TLSO and LSO)
Suction pumps
Surgical dressings
Tracheostomy care supplies
Tumor treatment field therapy
Urological supplies
Walkers
Wheelchair options/accessories
Wheelchair seating

Seat Elevation Equipment (Power Operated) on Power Wheelchairs:
Seat Elevation System NCD

Refer to the link below for NCD coverage guidelines on the below listed items that are either not covered or have coverage limitations:

CMS NCD: DME Reference List

Air cleaners
Air conditioners
Air fluidized bed
Alternating Pressure Pads, Mattresses, and Lamb's Wool Pads
Audible/Visible Signal/Pacemaker Monitors
Bathtub Lifts

POLICY NAME: DURABLE MEDICAL EQUIPMENT, PROSTHETICS/ORTHOTICS & MEDICAL SUPPLIES

Bathtub Seats
Bead beds
Bed Baths (home type)
Bed Lifters (bed elevators)
Bed boards
Bed Pans
Bed side rails
Beds- lounges (power or manual)
Bidet toilet seats
Blood glucose analyzers
Braille teaching texts
Canes
Carafes
Commodes
Continuous Passive Motion Devices
Crutches
Cushion lift power seats
Dehumidifiers
Diathermy machines
Digital electronic pacemaker monitor
Disposable sheets and bags
Elastic stockings
Electric Air cleaners
Electrical stimulation for wounds
Electrostatic machines
Elevators
Emesis basins
Esophageal dilators
Exercise equipment
Fabric supports
Face masks (surgical)
Fluidic breathing assisters
Fomentation devices
Gel flotation pads and mattresses
Grab bars
Heat and massage foam cushion pads
Heating and cooling plants
Heating pads
Heat lamps
Hot packs
Humidifier (room or central heating system types)
Hydraulic lifts
Incontinent pads

POLICY NAME: DURABLE MEDICAL EQUIPMENT, PROSTHETICS/ORTHOTICS & MEDICAL SUPPLIES

Injectors (hypodermic jet)
Intermittent positive pressure breathing machines
Iron lungs
Irrigating kits
Lamb's wool pads
Leotards
Lymphedema pumps
Massage devices
Mattresses
Mobile geriatric chairs
Muscle stimulators
Oscillating beds
Over bed tables
Paraffin bath units (portable)
Paraffin bath units (standard)
Parallel bars
Percussors
Portable room heaters
Portable whirlpool pumps
Postural drainage boards
Pressure leotards
Pulse tachometers
Raised toilet seats
Respirators
Rolling chairs
Safety rollers
Sauna baths
Seat lifts
Self-contained pacemaker monitors
Sitz baths
Speech teaching machines
Stairway elevators
**Standing tables (please see criteria below for Commercial products)
Steam packs
Support hose
Surgical leggings
Telephone alert systems
Toilet seats
Traction equipment
Trapeze bars
Treadmill exercisers
Ultraviolet cabinets
Urinals autoclavable

POLICY NAME: DURABLE MEDICAL EQUIPMENT, PROSTHETICS/ORTHOTICS & MEDICAL SUPPLIES

Vaporizers
Ventilators
Water and pressure pads and mattresses
Wheelchairs (manual)
Wheelchairs (power operated)
Wheelchairs (scooter/POV)
Wheelchairs (specially-sized)
Whirlpool Bath Equipment
Whirlpool pumps
White canes

For the following LCD/NCD items, please see specific CDPHP Resource Coordination or payment policies for coverage:

- Cochlear Implant:
  - Cochlear Implants and Auditory Brainstem Implants, 7.01.26
- Enteral/parenteral nutrition:
  - Nutritional Therapy: Oral/Enteral/Parenteral & Modified Solid Food Products, 1370/20.000480
- External infusion pumps: *for insulin infusion pump only:
  - External Ambulatory Insulin Infusion Pump, 1370/2.0000457
- Glucose monitors:
  - Diabetic Services: Supplies, Pharmaceuticals, Equipment, Eye Exam, Education and Shoes, 1370/20.000047
- Oral appliances for obstructive sleep apnea:
  - Obstructive Sleep Apnea: Diagnosis and Treatment, 1370/20.00006
- Oxygen and oxygen equipment or face masks (oxygen):
  - Oxygen and Oxygen Equipment, 1550/20.000148
- Positive Airway Pressure (PAP) Devices for the treatment of obstructive sleep apnea:
  - Obstructive Sleep Apnea: Diagnosis and Treatment, 1370/20.000060
- Refractive Lenses:
  - Contact Lenses, Intraocular Lenses & Eyeglasses for Medical Purposes, 1370/20.000164
- Therapeutic shoes for persons with Diabetes:
  - Diabetic Services: Supplies, Pharmaceuticals, Equipment, Eye Exam, Education and Shoes, 1370/20.000047
- Transcutaneous Electrical Joint Stimulation:
  - Electromagnetic and Pulsed Field Stimulation, 1.01.59
- Transcutaneous Electric Nerve Stimulators (TENS)
  - Non-Invasive Surface Electrical Stimulation for Pain and Rehabilitation, 1.01.61
- Vacuum erection devices (VED):
  - Erectile Dysfunction, 7.01.30

POLICY NAME: DURABLE MEDICAL EQUIPMENT, PROSTHETICS/ORTHOTICS & MEDICAL SUPPLIES

The following items are not addressed in a current Medicare LCD/NCD or CDPHP policy and may be covered if the criteria below is met:

Apnea Monitor (E0618, E0619)

Covered for infants up to 12 months of age with **any** of the following indications:

- Those who have experienced a brief resolved unexplained event (BRUE). If monitored due to BRUE, use of an apnea monitor is considered medically necessary until event free for two to three months.
- Those with tracheostomies or anatomic abnormalities of the face, tongue, jaw, or airway that make them vulnerable to airway compromise.
- Those with neurologic or metabolic disorders affecting respiratory control.
- Those with chronic lung disease (such as, bronchopulmonary dysplasia), particularly those requiring supplemental oxygen; continuous positive airway pressure; or mechanical ventilation.
- Those with apnea of prematurity, defined as sudden cessation of breathing that lasts for at least 20 seconds or is accompanied by bradycardia (heart rate less than 80 beats per minute) or oxygen (O2) desaturation (O2 saturation less than 90%) or cyanosis in an infant with early home discharge prior to term (38 weeks). Continued use is considered medically necessary up to 43 weeks postmenstrual age or event free for two weeks, whichever comes later.
- Those discharged home on a schedule of weaning narcotics.
- Those with bradycardia on caffeine, theophylline, or similar agents, until event free for two weeks off medication.
- Those with diagnosis of pertussis, with positive cultures. If monitored for pertussis, use of a monitor is considered medically necessary for up to one month post diagnosis.
- Those with diagnosis of gastroesophageal reflux disease (GERD) that results in apnea (at least 20 seconds), bradycardia (heart rate less than 80 beats per minute), or oxygen desaturation (O2 saturation less than 90% or cyanosis), until event free for six weeks.

Automatic Blood Pressure Cuff (A4670)

- Covered when there is a documented history of hypertension.

POLICY NAME: DURABLE MEDICAL EQUIPMENT, PROSTHETICS/ORTHOTICS & MEDICAL SUPPLIES

- Covered when part of an approved quality program
- Additional preventive coverage can be found in the payment policy Preventive Services Guidelines, 1550/20.000211.

Back-Up Equipment

- Coverage follows the Noridian guidelines available here: https://med.noridianmedicare.com/web/jadme/claims-appeals/billing-situations/back-up-equipment

Compression stockings, garments, wraps, bandages
Gradient compression stockings, garments and wraps are considered medically necessary for the following indications:

- Venous insufficiency
- Venous (stasis) ulcer(s);
- Varicose veins;
- Phlebitis/thrombophlebitis;
- Deep vein thrombosis (DVT) prophylaxis during pregnancy and postpartum, or immobilization due to surgery, trauma, or general debilitation;
- Orthostatic (postural) hypotension;
- Chronic lymphedema;
- Intractable lymphedema of the upper extremity subsequent secondary to lymph node dissection related to cancer surgery; and
- Edema following surgery, fracture, burns, or other trauma

The following codes will be allowed:

A6515-A6519, A6520-A6529, A6530, A6533-A6538, A6540-A6544, A6549, A6552-A6589, A6593, A6610, A6611, S8420-S8428.

We allow the above codes as follows:
- Daytime: 3 garments per affected body part every 6 months
- Nighttime: 2 garments per affected body part every 2 years

The following codes will be allowed when used as a primary or secondary dressing over wound(s) that are surgically created, modified or debrided:

- A6545, A6448-A6450, A6451-A6452, A6594-A6609

POLICY NAME: DURABLE MEDICAL EQUIPMENT, PROSTHETICS/ORTHOTICS & MEDICAL SUPPLIES

Codes A4490, A4495, A4500, A4510 are non-covered.

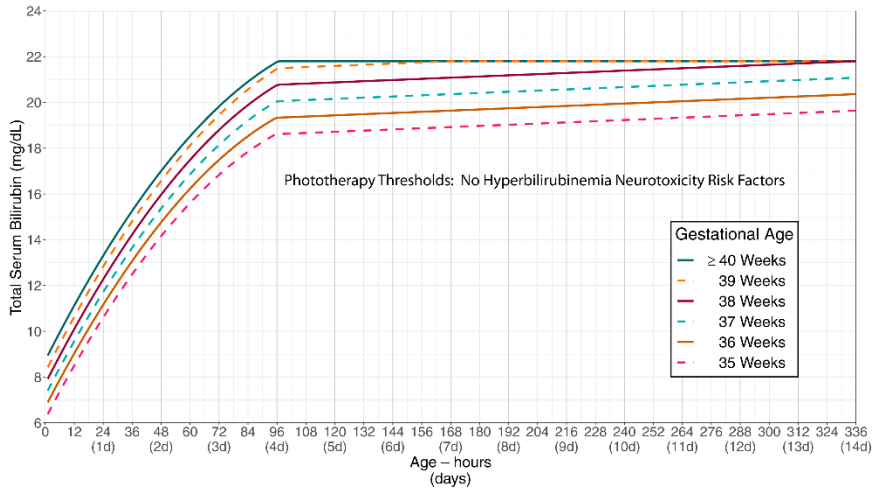
Cranial Remolding Orthosis (S1040- Prior authorization is required even if allowed amount is < $1000)

Covered for pediatric patients who have moderate to severe cranial asymmetry (plagiocephaly) associated with premature birth, restrictive intrauterine positioning, cervical abnormalities, birth trauma, torticollis, and/or sleeping positions for either of the following circumstances:

- Following surgical correction of synostotic plagiocephaly (i.e., craniosyntosis); or
- When a diagnosis of nonsynostotic plagiocephaly is documented and all the following criteria is met:
  - Infant is three to 18 months of age
  - Infant has not responded to a two-month trial of head positioning or other conservative therapies
  - Photographs and anthropometric measurements verifying moderate to severe nonsynostotic positional plagiocephaly.

Crutch substitute/knee walker (E0118)

Considered medically necessary when the below criteria has been met:



- There is a mobility limitation that significantly impairs his/her ability to participate in one or more mobility-related activities of daily living (MRADL) in the home, AND,
- The member is not a candidate for crutches or a manual wheelchair due to not having sufficient upper extremity function needed to safely use crutches or self-propel a manual wheelchair or there is no caregiver who is able to provide assistance with the wheelchair, AND
- The functional mobility deficit can be sufficiently resolved by use of a knee walker, AND,
- The member is able to safely use the knee walker

Home Phototherapy for neonatal hyperbilirubinemia (E0202)

For newborn infants who have already been discharged and then develop a total serum bilirubin (TSB) above the phototherapy threshold, treatment with a home LED-based phototherapy device rather than readmission to the hospital is an option for infants who meet the following criteria:

- Gestational age > 38 weeks
- > 48 hours old
- Clinically well with adequate feeding

- No known hyperbilirubinemia neurotoxicity risk factors
  - Gestational age < 38 week
  - Albumin < 3.0 g/dl
  - Isoimmune hemolytic disease (i.e., positive direct antiglobulin test), G6PD deficiency, or other hemolytic conditions
  - Sepsis
  - Significant clinical instability in the previous 24 hours
- No previous phototherapy
- TSB concentration no more than 1 mg/dL above the phototherapy treatment threshold (chart below)
- An LED-based phototherapy device will be available in the home without delay
- TSB can be measured daily

A microprocessor-controlled knee prosthesis (e.g., L5856)

Considered medically appropriate when ALL of the following criteria are met:
A. For persons with a knee disarticulation amputee OR transfemoral amputee;
B. Functional level 3 or above;
C. Lower level prosthetic devices (e.g., fluid, pneumatic, etc.) cannot be used or are insufficient to meet the functional needs of the individual in performing ADLs;
D. The patient has adequate cardiovascular and pulmonary reserve
E. The patient has received additional training for use of this technology and has demonstrated adequate cognitive ability to master use and care requirements;
F. The patient demonstrated a need to perform ALL of the following:

1. Long distance ambulation at variable rates;
2. Regular and frequent ambulation on uneven terrain (e.g., grass, gravel, or curbs); and
3. Regular and frequent ambulation on stairs or ramps;

G. Functional evaluation indicates that with training, use of a microprocessor-controlled knee prosthesis is likely to meet the functional needs of the individual.
H. Microprocessor-controlled knees are contraindicated for ANY of the following:

1. The patient's functional level is less than 3 or has limited ambulation due to poor balance or ataxia;
2. The patient is unable to tolerate the weight of the prosthesis;
3. The patient is unable to use the swing and stance features of the knee;
4. The patient is unable to change the prosthesis or has a condition that would cause inadequate fitting;
5. The patient has significant hip flexion contracture (over 20 degrees);
6. The patient has significant deformity of the remaining limb that would impair ability to stride;
7. The prosthesis will be used when the environmental conditions include excessive moisture or dust which invalidates the warranty.

A microprocessor-controlled ankle-foot prosthesis (L5973) (e.g., Proprio Foot, Ossur, Aliso Viejo, CA)
Considered **medically appropriate** when **ALL** of the following criteria are met:

A. For persons with a transtibial amputation;
B. Functional level of 3 or above;
C. Lower level prosthetic devices (e.g., SACH foot) cannot be used or are insufficient to meet the functional needs of the individual in performing ADLs;
D. The patient has adequate cardiovascular and pulmonary reserve;
E. The patient has received additional training for use of this technology and has demonstrated adequate cognitive ability to master use and care requirements;
F. The patient demonstrated a need to perform **ALL** of the following:

1. Long distance ambulation at variable rates;
2. Regular and frequent ambulation on uneven terrain (e.g., grass, gravel, or curbs); and
3. Regular and frequent ambulation on stairs or ramps;

G. Functional evaluation indicates that with training, use of a microprocessor-controlled ankle-foot prosthesis is likely to meet the functional needs of the individual.

The following lower extremity prosthetics or components are considered not medically necessary:

- **A.** Lower limb prosthetic devices for individuals with functional level 0
- **B.** A microprocessor-controlled ankle-foot with power assist (L5973 AND L5969)

Oximeter (E0445- Rental item only)

POLICY NAME: DURABLE MEDICAL EQUIPMENT, PROSTHETICS/ORTHOTICS & MEDICAL SUPPLIES

CDPHP allows rental (until purchase price is met) of an oximeter for members who require continuous monitoring will be covered in combination with oxygen therapy under the following circumstances:

- Weaning from oxygen.
- Changes in physical condition requiring adjustments in oxygen therapy.
- Maintaining oxygen levels within a narrow range.
- As part of a primary care provider's or physician specialist's treatment plan requiring frequent monitoring/assessment of oxygen levels that cannot be achieved using a "Spot check" oximeter.

Covered without oxygen therapy under the following circumstance:

- In cases of complex cardiac conditions, such as, but not limited to, univentricular heart or unrepaired cyanotic heart disease.

Pulse oximeter probes (A4606) are used with the oximeter (E0445) and are included in the reimbursement for the pulse oximeter rental.

Documentation Requirements for Oximeter for members who require continuous monitoring:

The following documentation is necessary to support prior approval of an oximeter:

- Diagnosis/medical condition justifying the need to monitor blood oxygen levels.
- Current oxygen orders, if applicable (Note: oxygen orders should be renewed every 12 months).
- Treatment plan listing the required parameters and interventions for abnormal readings, including corresponding oxygen titrations if applicable.
- Availability of caregivers trained to appropriately manage the listed treatment interventions.

If used with a ventilator, CPAP, BiPAP, or other respiratory assist device, the type, make, and model of the respiratory assist device must be provided to ensure oximetry is not already available on that device.

Pediatric Gait Trainer (E8000-E8002)

Gait trainers are considered medically necessary for therapeutic and functional ambulation when all the below criteria are met:

- Member is 18 years of age or younger;
- Member has an acquired injury (e.g., spinal cord, traumatic brain injury) or a chronic physical limitation that affects the ability to ambulate (e.g., cerebral palsy, neuromuscular disease, spina bifida);
- Member requires moderate to maximum support for ambulation and documentation shows that assistive devices have not been effective;

- There has been at least a one-month rental trial in which the member demonstrates capability of utilizing and tolerating the equipment safely.

Pediatric Safety Bed (E0328, E0316)

CDPHP will provide coverage of a pediatric hospital bed with enclosure frame when the below criteria is met:

1. There is a diagnosis-related cognitive/communication impairment or a severe behavioral disorder (e.g., traumatic brain injury, seizure disorder, autism)
2. Member has a risk to safety while in bed OR there is a risk to safety due to climbing out of bed/wandering
3. Other alternatives were tried and were unsuccessful or contraindicated (examples below):
    a. Putting a mattress on the floor
    b. Padding added to ordinary beds
    c. Transparent plastic shields
    d. Medications
    e. Helmets
    f. Door alarms

Replacement Batteries (Various Codes)

- Coverage will follow medical supplies section of member contract if available

Standing frame/table system (E0637, E0638, E0641, E0642)

A standing device is considered medically appropriate when BOTH of the following criteria are met:

- There is documentation that the standing device is necessary for the patient to be independent in one or more of the following activities of daily living (ADLs) in the patient's home:
    1. Eating;
    2. Personal hygiene;
    3. Toileting;
    4. Dressing;
    5. Transfer; AND
- The patient is unable to accomplish the activities identified in above with current durable medical equipment.

OR

A standing device is considered medically appropriate for decubitus ulcer management when BOTH of the following criteria are met:

- There is documentation that off-loading of a decubitus ulcer cannot be accomplished by other means; and
- The patient has completed a one-month trial using the standing device and has shown meaningful improvement after the trial period. Documentation from the referring provider that the patient has shown meaningful improvement during the trial period must be submitted, to be eligible for continued coverage.

Upper limb prostheses (L6000, L6010, L6020, L6050, L6055, L6100, L6110, L6120, L6130, L6200, L6205, L6250, L6300, L6310, L6320, L6350, L6360, L6370, L6400, L6450, L6500, L6550):

Prostheses that are worn externally and that temporarily or permanently replace all or part of an external body part that has been lost or damaged because of an injury or disease.

Vacuum drainage collection unit and tubing kit (A7048)
Covered for use in the home when provided in lieu of hospitalization or nursing home care.

CODING REQUIREMENTS AND REIMBURSEMENT

Supplies associated with DME/prosthetic/orthotic devices are covered when included in the purchase price.

All DME items must be billed with appropriate modifier to indicate purchase (NU), rental to purchase (NR), rental (RR) or used equipment that has been purchased (UE). Claims submitted without modifier will deny to resubmit with appropriate modifier.

When equipment is billed for purchase, the allowed amounts from any previously paid rental months will be subtracted from the purchase price. Payment for rental months will never exceed the total purchase price for the equipment.

DME Invoices

All DME items must be billed with appropriate modifier to indicate purchase (NU) or rental (RR). Claims submitted without modifier will deny to resubmit with appropriate modifier.

DME items not having a current CMS DME fee schedule or published NYS Medicaid fee schedule rate will be reimbursed at a rate established by CDPHP, which may be based on specific case review and/or submission of the actual manufacturers' invoice.

For items that are made by the DME vendor themselves and no manufacturer's invoice is available, an itemization of supplies utilized, and applicable charges is required in order to

consider reimbursement for the item.

CDPHP will reimburse DME items at the lesser of 150% of invoice cost or fee schedule unless otherwise stated in the provider contract.

When equipment is billed for purchase, the allowed amounts from any previously paid rental months will be subtracted from the purchase price.

Documentation Requests

CDPHP reserves the right to request medical records at any time including all dictated, handwritten notes, and the documents indicated below to support all the items billed on this claim. All pertinent information to meet policies and billing requirements must be included. Failure to supply full documentation indicated could result in partial or complete denial of services.

Required Documents*:

- Certificate of Medical Necessity (CMN) - Both initial and subsequent forms, if applicable

- Copy of unredacted manufacturer's invoice for items billed including: Product information
- Detailed Written Order (DWO)/Prescription/Fiscal Order or Standard Written Order (SWO)
- Dispensing Orders
- Face to Face Documents, if applicable
- Notes including progress notes pertinent to the DME requested
- Prior-Authorization form, if applicable
- Refill Documents
- Written Order Prior to Delivery (WOPD), if applicable
- DME Information Form (DIF)
- Model number and Manufacturer name
- Proof of Delivery (POD)/Delivery Documentation (Invoices and delivery receipts)

***Note:** Some of these documents may need to be obtained from the ordering physician while others may need to be obtained from the DME vendor who provided the equipment.

EXCLUSIONS

1. DME/Prosthetics/Orthotics designed for your comfort or convenience.
   The following list is not all inclusive but contains examples of items that are generally considered comfort or convenience:
   - Pools
   - Hot tubs

- Air conditioners
- Saunas
- Humidifiers
- Dehumidifiers
- Exercise equipment

2. Over-the-counter medical supplies.

3. Orthotic devices that are not rigid or semi rigid devices.

4. Repair or replacement of DME or a prosthetic/orthotic device due to loss, misuse, or neglect.

5. Repair or maintenance and servicing of equipment or device that is subject to the manufacturer's warranty.

6. Requests for a duplicate device to have available at various locations (e.g., one for home and one for school/work).

7. Equipment or devices prescribed solely for use during sports or employment.

8. Charges related to the shipping, handling and/or delivery of covered equipment or devices.

9. Battery powered walker (E0152) is considered non-covered since the capabilities relate to use of the walker outside the home and it does not serve as a purpose for use in the home.

CDPHP PRODUCT VARIATIONS

CHILD HEALTH PLUS	CDPHP utilizes the New York State Medicaid management information system provider manual (MMIS) to determine coverage availability and distinguish a medical/surgical supply versus durable medical equipment, prosthetic, or orthotic: http://www.emedny.org/providerManuals/Index.html
MEDICARE ADVANTAGE	Subject to all terms and conditions noted above in the policy to include the following: • Medicare Advantage provides benefits for supplies that are

	necessary for effective use of a prosthetic.
SELECT PLAN/HARP	CDPHP utilizes New York State Medicaid management information system provider manual (MMIS) to determine coverage availability and distinguish a medical/surgical supply versus durable medical equipment, prosthetic, or orthotic. There are 2 guidelines that identify these benefits: Medical Supplies Procedure Codes & Coverage Guidelines (sections 4.1, 4.2, 4.3) are billed directly to Medicaid Fee for Service: Medical Supplies Procedure Codes DME Procedure Codes & Coverage Guidelines (sections 4.4, 4.5, 4.6, and 4.7) are billed to CDPHP: DME Procedure Codes

Revised:	5/22, 9/22,11/22, 1/23, 5/23, 7/23, 9/23, 11/23, 1/24, 3/24, 5/24, 9/24, 11/24, 1/25, 3/25, 5/25, 11/25, 3/26, 5/26, 7/26

POLICY NAME: DURABLE MEDICAL EQUIPMENT, PROSTHETICS/ORTHOTICS & MEDICAL SUPPLIES

Reviewed:

POLICY HISTORY

This section is intended to provide only highlights of the policy changes. The policy should always be reviewed in its entirety to ensure a comprehensive understanding of coverage.

Effective Date	Update
8/1/2026	Under "For the following LCD/NCD items, please see specific CDPHP Resource Coordination or payment policies for coverage", added new policy Electromagnetic and Pulsed Field Stimulation, 1.01.59 and Non-Invasive Surface Electrical Stimulation for Pain and Rehabilitation, 1.01.61
7/1/2026	Removed codes L5856 and L5973 from the list of items that do not require PA and added medical necessity criteria for these codes. Added information to code S1040 on prior authorization requirement.
3/1/2026	Added prior authorization DME information that was previous housed on the now obsolete Prior Authorization Guideline policy.
12/1/2025	Updated name and policy number for Cochlear implant and removed link to Medicare Non-Covered Items.
4/1/2025	Added new codes A6515-A6519, and A6611 to Compression stockings, garments, wraps, bandages section.
3/1/2025* No change to effective date of policy for this update	Added additional information for cervical traction devices previously housed in the Non-Covered Technology policy.
3/1/2025	Added criteria for pediatric safety beds.
2/1/2025	Added criteria for standing frames. Updated criteria for compression stockings. Under Noridian, removed Pneumatic Compression Devices as

	this LCD is retired. Clarified that Oximeter is rental item only.
1/1/2025 *No change to effective date of policy	Updated Medicaid section and provided links for DME/Supplies. Under Position Statement added: External Upper Limb Tremor Stimulator Therapy to the list. Added modifiers NR & UE to policy. Added additional coverage for automated blood pressure cuff (A4670) through quality programs.
1/1/2025	Added coverage criteria for oximeters.
8/1/2024	Added information on DME rental or purchase modifiers. Added statements regarding rentals converting to purchase. Added information on code A7048 Updated criteria for knee walker to remove "and/or other physical and mental capabilities".
5/1/2024	Added criteria for pediatric gait trainers Added criteria for automated blood pressure cuff (A4670)
4/1/2024	Added battery powered walker to exclusions
3/1/2024	Removed prior authorization exceptions from the Policy Considerations section as this information is housed in the RC Prior Authorization Guideline document. Updated lymphedema compression section.
1/1/2024	Replaced termed code K1013 with new code A4457 in Select Plan/HARP section.
12/1/2023	Updated link for coverage criteria for Seat Elevation Equipment (Power Operated) on Power Wheelchairs and added link for items that are considered non-covered.
11/1/2023* *No change to effective date for this update	Added coverage criteria for lymphedema gradient pressure sleeves/gauntlets/gloves (S8420-S8428). Added criteria for rental of home phototherapy devices for neonatal jaundice, and also identified there will be no PA

	requirement for these devices. Added that wheelchair accessory items E0971- antitipping device, E0978- positioning belt/safety belt/pelvic strap and E0990- elevating leg rest, complete assembly do not require PA for rental. Removed NCA link for Seat Elevation System and replaced with NCD link. Added link for products/codes that are non-covered.
11/1/2023	Added documentation requirements to Coding Requirements and Reimbursement section. Added section for items not otherwise addressed in a Medicare LCD/NCD or CDPHP policy. Added scoliosis jackets (L1300 & L1310) as not requiring a PA when billed with a diagnosis of scoliosis (M41-M41.9).
5/16/2023	Added new Medicare NCA link for Seat Lift Systems
5/1/2023	Under Policy Considerations added information on DME replacement. Added negative pressure wound therapy (E2402) as an item that does not have a rental PA requirement.
4/1/2023	Medicaid section updated to reflect the changes for the Medicaid RX/DME Carveout.
1/1/2023* *No change to effective date for this update	Updated Child Health Plus section to mirror Select Plan/HARP coverage.
1/1/2023* *No change to effective date for this update.	No coverage criteria changes made. Minor changes/clarifications made throughout policy.
1/1/2023	Under Policy Considerations, added information on Nebulizers, standard wheelchairs, and transports chairs.
5/1/2022	Added references to maintenance and servicing coverage.
1/1/2022	New policy

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: DURABLE MEDICAL EQUIPMENT, PROSTHETICS/ORTHOTICS & MEDICAL SUPPLIES

POLICY EFFECTIVE DATE:	11/1/2026
Policy Control #:	1370/20.000509
Next Annual Review:	November 2026

DISCLAIMER

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgement when deciding the most appropriate care to enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

PROCEDURE CODES

Multiple

DESCRIPTIONS

The Durable Medical Equipment, Prosthetics, and Orthotics policy is a resource compilation of durable medical equipment, prosthetics, orthotics, and medical supplies most frequently requested by vendors and/or providers. It is not all inclusive of codes contained in the HCPCS Level II Manual.

Durable medical equipment (DME) is defined as equipment which can withstand repeated use, is primarily and customarily used to serve a medical purpose, is generally not useful to a person in the absence of illness or injury; and is appropriate for use in the home.

Prosthetic devices are removable and not permanently implanted devices which replace all or part of a body organ, or replace all or part of a permanently non-functioning, absent, or malfunctioning body part (i.e., artificial limbs, eyes, post mastectomy breast prosthesis).

Orthotic devices are rigid or semi rigid devices which are used for the purpose of supporting a weak or deformed body part or to restrict or eliminate motion in a diseased or injured part of the body.

Capital District Physicians' Health Plan, Inc.
CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: DURABLE MEDICAL EQUIPMENT, PROSTHETICS/ORTHOTICS & MEDICAL SUPPLIES

Medical supplies are items other than drugs, prosthetic, or orthotic appliances, or DME used for the treatment of a specific medical condition which are consumable, non-reusable, disposable, and generally have no salvageable value (e.g., diapers, gauze pads, bandages). Reference should be made to specific contracts and/or summary plan designs for benefit availability.

RELATED POLICIES/DOCUMENTS

Prior Authorization Guideline, 1370/20.000425

POSITION STATEMENT

CDPHP utilizes CMS National Coverage Determinations (NCDs), Local Coverage Articles (LCAs), or Local Coverage Determinations (LCDs) as well as professional society guidelines and/or industry evidence based clinical resources when making medical necessity determinations for DME, Prosthetics/Orthotics, and medical supplies.

Purchase of DME, prosthetic and orthotic devices not exceeding an allowable amount of $1000 are administered without a prior authorization requirement when provided by a participating provider.

Prior authorization requirement applies to all the following:

- All rental items with the exception of the following:
  - Standard wheelchair rental (K0001-K0007)
  - Transport chairs (E1037-E1039)
  - Wheelchair accessory items (E0971- antitipping device, E0978- positioning belt/safety belt/pelvic strap and E0990- elevating leg rest, complete assembly)
  - Nebulizers (E0570 only)
  - TENS unit
  - Oxygen equipment and accessories (oximeter (E0445) will be allowed as a rental only and is not included in this prior authorization exception)
  - Negative pressure wound therapy electrical pump (E2402)
  - Home phototherapy devices for neonatal jaundice (E0202)
  - Enteral nutrition infusion pump (B9002)
  - Continuous Passive Motion Device (E0935) (exception, prior authorization is required for Medicare Advantage)

The following item may be rented for a period of up to 90 days without prior authorization (for any rental beyond this timeframe, prior authorization is required):

  - Hospital grade breast pump: E0604

- Total repairs exceeding an allowed amount of $1,000 on covered DME.

POLICY NAME: DURABLE MEDICAL EQUIPMENT, PROSTHETICS/ORTHOTICS & MEDICAL SUPPLIES

- *Each* purchased item exceeding an allowed amount of $1,000 (including diabetic DME) with the exception of the following:
  - CPAP/BiPAP machine purchase
  - TENS unit
  - Oxygen equipment and accessories
  - Insulin infusion pumps
  - Continuous glucose monitors and related supplies (A9276, A9277, A9278, S1034, S1035, S1036, S1037, A4238, E2102, E2103, A4239)
  - Scoliosis jacket/Thoracic Lumbar Sacral Orthoses (TLSO) (L1200, L1300, L1310) when billed with diagnosis of scoliosis (M41-M41.9).
  - L1832 - Jace Tri-brace
  - L1845 - Bledsoe brace
  - Ankle foot orthotic (AFO) codes: L1900, L1902, L1904, L1906, L1907, L1910, L1920, L1930, L1932, L1940, L1945, L1950, L1951, L1960, L1970, L1971, L1980, L1990, L2106, L2108, L2112, L2114, L2116, L2200, L2210, L2220, L2230, L2232, L2240, L2250, L2260, L2265, L2270, L2275, L2280, L2300, L2310, L2320, L2330, L2335, L2340, L2350, L2360, L2370,L2375, L4002, L4090, L4205, L4210, L4350, L4360, L4361, L4370, L4386, L4387, L4392, L4394, L4396, L4397, L4398, L4631
  - L3960 – Airplane splint/shoulder
  - L3000-L3030 Custom Foot Orthotics (NOTE: These items are only reimbursed If billed with a diagnosis of diabetes or peripheral vascular disease)
  - The following orthotic codes: L0456, L1200, L5020, L5301, L5321, L5585, L5611, L5643, L5649, L5651, L5673, L5681, L5700, L5701, L5705, L5781, L5828, L5840, L5845, L5964, L5968, L5981, L5987, L5988, L6110, L6721, L6884

CDPHP administers benefits for medically necessary repair, adjustment, replacement, or maintenance and servicing of a covered item if it is not covered under a manufacturer's warranty or purchase agreement. Repair, adjustment, or replacement where the total claim is under an allowable amount of $1000 do not require prior authorization. CDPHP reserves the right to determine whether replacement or repair of the item is more appropriate.

Repair or replacement of the following items do not require prior authorization even if exceeding an allowable amount of $1000:

- Covered foot orthotics

CDPHP administers benefits for ostomy, tracheostomy, and urological products that serve as a prosthetic device.

CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: DURABLE MEDICAL EQUIPMENT, PROSTHETICS/ORTHOTICS & MEDICAL SUPPLIES

POLICY CONSIDERATIONS

DME, prosthetics/orthotics, and medical supplies are considered durable medical equipment and are subject to the terms and conditions of such as stated in the enrollee's contract.

Replacement of DME may be available in cases of loss, irreparable damage or wear, or when required because of a change in the enrollee's condition.

- Irreparable damage is damage that has been caused by a specific accident (e.g., wheelchair falling from a van) or natural disaster (e.g., flood or fire).
- Irreparable wear is the deterioration sustained from day-to-day usage over time. In cases involving irreparable wear, the useful lifetime of the equipment, which is five years, is taken into consideration (useful life of DME is considered no less than five years beginning with the date of delivery of the equipment to the member, not the actual age of the equipment). If the item of equipment has been in continuous use for the equipment's useful lifetime, the member may elect to obtain a new piece of equipment.
- Replacement due to wear is not covered during the reasonable useful lifetime of the equipment.

CDPHP follows coverage criteria from the Medicare NCD's, LCD's, or LCA's for the below listed items (please note that listed items with an asterisk (**) are only allowable for the Medicare Advantage line of business:

Refer to the link below for coverage guidelines:

Noridian - DME Jurisdiction A

Ankle-Foot/Knee-Ankle- Foot orthoses
Automatic external defibrillators
Bowel management devices
Canes and crutches
**Cervical traction devices
*For commercial products, E0849 is considered experimental
Cold therapy
Commodes
External breast prosthesis
External Infusion Pumps (*for external insulin infusion pump: see below)
**External Upper Limb Tremor Stimulator Therapy
*For commercial products, this device is considered experimental
Eye Prostheses
Facial Prostheses
Heating Pads and Heat Lamps

Capital District Physicians' Health Plan, Inc.
CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: DURABLE MEDICAL EQUIPMENT, PROSTHETICS/ORTHOTICS & MEDICAL SUPPLIES

High Frequency Chest Wall Oscillation Devices
Hospital Beds and accessories
Infrared Heating Pads Systems
Intrapulmonary Percussive Ventilation System
Knee Orthoses
Lower limb prostheses
Manual wheelchair bases (Standard wheelchairs)
Mechanical in-exsufflation devices
Nebulizers
Negative pressure wound therapy pumps
Orthopedic footwear
Osteogenesis stimulators (Bone Growth Stimulators)
Ostomy supplies
Patient lifts
Power mobility devices (Power wheelchairs)
Pressure reducing support surfaces (group 1-3)
Respiratory assist devices
Seat lift mechanisms
Speech generating devices or augmentative communication devices
Spinal orthoses (TLSO and LSO)
Suction pumps
Surgical dressings
Tracheostomy care supplies
Urological supplies
Walkers
Wheelchair options/accessories
Wheelchair seating

Seat Elevation Equipment (Power Operated) on Power Wheelchairs:
Seat Elevation System NCD

Refer to the link below for NCD coverage guidelines on the below listed items that are either not covered or have coverage limitations:

CMS NCD: DME Reference List

Air cleaners
Air conditioners
Air fluidized bed
Alternating Pressure Pads, Mattresses, and Lamb's Wool Pads
Audible/Visible Signal/Pacemaker Monitors
Bathtub Lifts
Bathtub Seats

POLICY NAME: DURABLE MEDICAL EQUIPMENT, PROSTHETICS/ORTHOTICS & MEDICAL SUPPLIES

Bead beds
Bed Baths (home type)
Bed Lifters (bed elevators)
Bed boards
Bed Pans
Bed side rails
Beds- lounges (power or manual)
Bidet toilet seats
Blood glucose analyzers
Braille teaching texts
Canes
Carafes
Commodes
Continuous Passive Motion Devices
Crutches
Cushion lift power seats
Dehumidifiers
Diathermy machines
Digital electronic pacemaker monitor
Disposable sheets and bags
Elastic stockings
Electric Air cleaners
Electrical stimulation for wounds
Electrostatic machines
Elevators
Emesis basins
Esophageal dilators
Exercise equipment
Fabric supports
Face masks (surgical)
Fluidic breathing assisters
Fomentation devices
Gel flotation pads and mattresses
Grab bars
Heat and massage foam cushion pads
Heating and cooling plants
Heating pads
Heat lamps
Hot packs
Humidifier (room or central heating system types)
Hydraulic lifts
Incontinent pads
Injectors (hypodermic jet)

POLICY NAME: DURABLE MEDICAL EQUIPMENT, PROSTHETICS/ORTHOTICS & MEDICAL SUPPLIES

Intermittent positive pressure breathing machines
Iron lungs
Irrigating kits
Lamb's wool pads
Leotards
Massage devices
Mattresses
Mobile geriatric chairs
Muscle stimulators
Oscillating beds
Over bed tables
Paraffin bath units (portable)
Paraffin bath units (standard)
Parallel bars
Percussors
Portable room heaters
Portable whirlpool pumps
Postural drainage boards
Pressure leotards
Pulse tachometers
Raised toilet seats
Respirators
Rolling chairs
Safety rollers
Sauna baths
Seat lifts
Self-contained pacemaker monitors
Sitz baths
Speech teaching machines
Stairway elevators
**Standing tables (please see criteria below for Commercial products)
Steam packs
Support hose
Surgical leggings
Telephone alert systems
Toilet seats
Traction equipment
Trapeze bars
Treadmill exercisers
Ultraviolet cabinets
Urinals autoclavable
Vaporizers
Ventilators

POLICY NAME: DURABLE MEDICAL EQUIPMENT, PROSTHETICS/ORTHOTICS & MEDICAL SUPPLIES

Water and pressure pads and mattresses
Wheelchairs (manual)
Wheelchairs (power operated)
Wheelchairs (scooter/POV)
Wheelchairs (specially-sized)
Whirlpool Bath Equipment
Whirlpool pumps
White canes

For the following LCD/NCD items, please see specific CDPHP Resource Coordination or payment policies for coverage:

- Cochlear Implant:
  - Cochlear Implants and Auditory Brainstem Implants, 7.01.26
- Enteral/parenteral nutrition:
  - Nutritional Therapy: Oral/Enteral/Parenteral & Modified Solid Food Products, 1370/20.000480
- External infusion pumps: *for insulin infusion pump only:
  - External Ambulatory Insulin Infusion Pump, 1370/2.0000457
- Glucose monitors:
  - Diabetic Services: Supplies, Pharmaceuticals, Equipment, Eye Exam, Education and Shoes, 1370/20.000047
- Lymphedema Pumps:
  - Powered Compression Devices/Lymphedema Pump, 1.01.17
- Oral appliances for obstructive sleep apnea:
  - Obstructive Sleep Apnea: Diagnosis and Treatment, 1370/20.00006
- Oxygen and oxygen equipment or face masks (oxygen):
  - Oxygen and Oxygen Equipment, 1550/20.000148
- Positive Airway Pressure (PAP) Devices for the treatment of obstructive sleep apnea:
  - Obstructive Sleep Apnea: Diagnosis and Treatment, 1370/20.000060
- Refractive Lenses:
  - Contact Lenses, Intraocular Lenses & Eyeglasses for Medical Purposes, 1370/20.000164
- Therapeutic shoes for persons with Diabetes:
  - Diabetic Services: Supplies, Pharmaceuticals, Equipment, Eye Exam, Education and Shoes, 1370/20.000047
- Transcutaneous Electrical Joint Stimulation:
  - Electromagnetic and Pulsed Field Stimulation, 1.01.59
- Transcutaneous Electric Nerve Stimulators (TENS)
  - Non-Invasive Surface Electrical Stimulation for Pain and Rehabilitation, 1.01.61

- Tumor Treatment Field Therapy:
  - Tumor-Treatment Fields Therapy, 6.01.45
- Vacuum erection devices (VED):
  - Erectile Dysfunction, 7.01.30

The following items are not addressed in a current Medicare LCD/NCD or CDPHP policy and may be covered if the criteria below is met:

Apnea Monitor (E0618, E0619)

Covered for infants up to 12 months of age with **any** of the following indications:

- Those who have experienced a brief resolved unexplained event (BRUE). If monitored due to BRUE, use of an apnea monitor is considered medically necessary until event free for two to three months.

- Those with tracheostomies or anatomic abnormalities of the face, tongue, jaw, or airway that make them vulnerable to airway compromise.

- Those with neurologic or metabolic disorders affecting respiratory control.

- Those with chronic lung disease (such as, bronchopulmonary dysplasia), particularly those requiring supplemental oxygen; continuous positive airway pressure; or mechanical ventilation.

- Those with apnea of prematurity, defined as sudden cessation of breathing that lasts for at least 20 seconds or is accompanied by bradycardia (heart rate less than 80 beats per minute) or oxygen (O2) desaturation (O2 saturation less than 90%) or cyanosis in an infant with early home discharge prior to term (38 weeks). Continued use is considered medically necessary up to 43 weeks postmenstrual age or event free for two weeks, whichever comes later.

- Those discharged home on a schedule of weaning narcotics.

- Those with bradycardia on caffeine, theophylline, or similar agents, until event free for two weeks off medication.

- Those with diagnosis of pertussis, with positive cultures. If monitored for pertussis, use of a monitor is considered medically necessary for up to one month post diagnosis.

- Those with diagnosis of gastroesophageal reflux disease (GERD) that results in apnea (at least 20 seconds), bradycardia (heart rate less than 80 beats per minute), or oxygen desaturation (O2 saturation less than 90% or cyanosis), until event free for six weeks.

POLICY NAME: DURABLE MEDICAL EQUIPMENT, PROSTHETICS/ORTHOTICS & MEDICAL SUPPLIES

Automatic Blood Pressure Cuff (A4670)

- Covered when there is a documented history of hypertension.
- Covered when part of an approved quality program
- Additional preventive coverage can be found in the payment policy Preventive Services Guidelines, 1550/20.000211.

Back-Up Equipment

- Coverage follows the Noridian guidelines available here: https://med.noridianmedicare.com/web/jadme/claims-appeals/billing-situations/back-up-equipment

Compression stockings, garments, wraps, bandages
Gradient compression stockings, garments and wraps are considered medically necessary for the following indications:

- Venous insufficiency
- Venous (stasis) ulcer(s);
- Varicose veins;
- Phlebitis/thrombophlebitis;
- Deep vein thrombosis (DVT) prophylaxis during pregnancy and postpartum, or immobilization due to surgery, trauma, or general debilitation;
- Orthostatic (postural) hypotension;
- Chronic lymphedema;
- Intractable lymphedema of the upper extremity subsequent secondary to lymph node dissection related to cancer surgery; and
- Edema following surgery, fracture, burns, or other trauma

The following codes will be allowed:

A6515-A6519, A6520-A6529, A6530, A6533-A6538, A6540-A6544, A6549, A6552-A6589, A6593, A6610, A6611, S8420-S8428.

We allow the above codes as follows:

- Daytime: 3 garments per affected body part every 6 months
- Nighttime: 2 garments per affected body part every 2 years

POLICY NAME: DURABLE MEDICAL EQUIPMENT, PROSTHETICS/ORTHOTICS & MEDICAL SUPPLIES

The following codes will be allowed when used as a primary or secondary dressing over wound(s) that are surgically created, modified or debrided:

- A6545, A6448-A6450, A6451-A6452, A6594-A6609

Codes A4490, A4495, A4500, A4510 are non-covered.

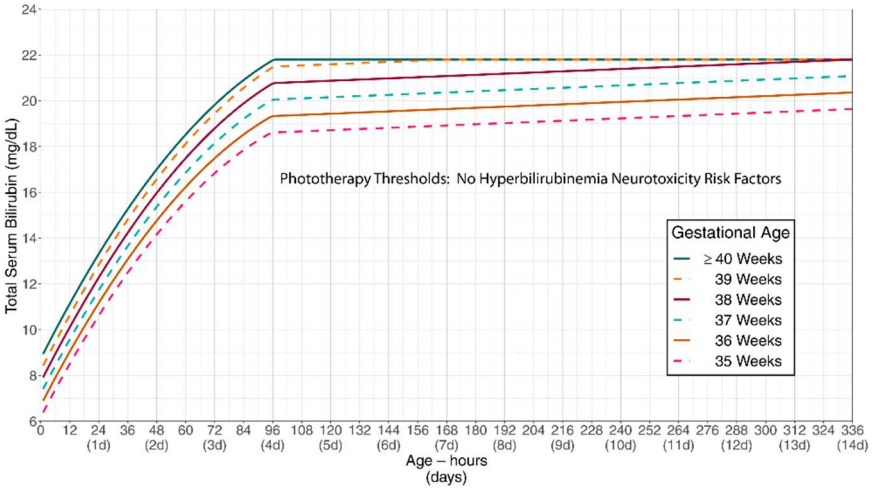
Cranial Remolding Orthosis (S1040- Prior authorization is required even if allowed amount is < $1000)

Covered for pediatric patients who have moderate to severe cranial asymmetry (plagiocephaly) associated with premature birth, restrictive intrauterine positioning, cervical abnormalities, birth trauma, torticollis, and/or sleeping positions for either of the following circumstances:

- Following surgical correction of synostotic plagiocephaly (i.e., craniosyntosis); or
- When a diagnosis of nonsynostotic plagiocephaly is documented and all the following criteria is met:
    - Infant is three to 18 months of age
    - Infant has not responded to a two-month trial of head positioning or other conservative therapies
    - Photographs and anthropometric measurements verifying moderate to severe nonsynostotic positional plagiocephaly.

Crutch substitute/knee walker (E0118)

Considered medically necessary when the below criteria has been met:



- There is a mobility limitation that significantly impairs his/her ability to participate in one or more mobility-related activities of daily living (MRADL) in the home, AND,
- The member is not a candidate for crutches or a manual wheelchair due to not having sufficient upper extremity function needed to safely use crutches or self-propel a manual wheelchair or there is no caregiver who is able to provide assistance with the wheelchair, AND
- The functional mobility deficit can be sufficiently resolved by use of a knee walker, AND,
- The member is able to safely use the knee walker

Home Phototherapy for neonatal hyperbilirubinemia (E0202)

For newborn infants who have already been discharged and then develop a total serum bilirubin (TSB) above the phototherapy threshold, treatment with a home LED-based phototherapy device rather than readmission to the hospital is an option for infants who meet the following

criteria:

- Gestational age > 38 weeks
- > 48 hours old
- Clinically well with adequate feeding
- No known hyperbilirubinemia neurotoxicity risk factors
    - Gestational age < 38 week
    - Albumin < 3.0 g/dl
    - Isoimmune hemolytic disease (i.e., positive direct antiglobulin test), G6PD deficiency, or other hemolytic conditions
    - Sepsis
    - Significant clinical instability in the previous 24 hours
- No previous phototherapy
- TSB concentration no more than 1 mg/dL above the phototherapy treatment threshold (chart below)
- An LED-based phototherapy device will be available in the home without delay
- TSB can be measured daily

A microprocessor-controlled knee prosthesis (e.g., L5856)

Considered medically appropriate when ALL of the following criteria are met:
A. For persons with a knee disarticulation amputee OR transfemoral amputee;
B. Functional level 3 or above;
C. Lower level prosthetic devices (e.g., fluid, pneumatic, etc.) cannot be used or are insufficient to meet the functional needs of the individual in performing ADLs;

D. The patient has adequate cardiovascular and pulmonary reserve
E. The patient has received additional training for use of this technology and has demonstrated adequate cognitive ability to master use and care requirements;
F. The patient demonstrated a need to perform ALL of the following:
    1. Long distance ambulation at variable rates;
    2. Regular and frequent ambulation on uneven terrain (e.g., grass, gravel, or curbs); and
    3. Regular and frequent ambulation on stairs or ramps;
G. Functional evaluation indicates that with training, use of a microprocessor-controlled knee prosthesis is likely to meet the functional needs of the individual.
H. Microprocessor-controlled knees are contraindicated for ANY of the following:
    1. The patient's functional level is less than 3 or has limited ambulation due to poor balance or ataxia;
    2. The patient is unable to tolerate the weight of the prosthesis;
    3. The patient is unable to use the swing and stance features of the knee;
    4. The patient is unable to change the prosthesis or has a condition that would cause inadequate fitting;
    5. The patient has significant hip flexion contracture (over 20 degrees);
    6. The patient has significant deformity of the remaining limb that would impair ability to stride;
    7. The prosthesis will be used when the environmental conditions include excessive moisture or dust which invalidates the warranty.

A microprocessor-controlled ankle-foot prosthesis (L5973) (e.g., Proprio Foot, Ossur, Aliso Viejo, CA)
Considered **medically appropriate** when **ALL** of the following criteria are met:

A. For persons with a transtibial amputation;
B. Functional level of 3 or above;
C. Lower level prosthetic devices (e.g., SACH foot) cannot be used or are insufficient to meet the functional needs of the individual in performing ADLs;
D. The patient has adequate cardiovascular and pulmonary reserve;
E. The patient has received additional training for use of this technology and has demonstrated adequate cognitive ability to master use and care requirements;
F. The patient demonstrated a need to perform **ALL** of the following:
    1. Long distance ambulation at variable rates;
    2. Regular and frequent ambulation on uneven terrain (e.g., grass, gravel, or curbs); and
    3. Regular and frequent ambulation on stairs or ramps;
G. Functional evaluation indicates that with training, use of a microprocessor-controlled ankle-foot prosthesis is likely to meet the functional needs of the individual.

The following lower extremity prosthetics or components are considered not medically necessary:

A. Lower limb prosthetic devices for individuals with functional level 0

B. A microprocessor-controlled ankle-foot with power assist (L5973 AND L5969)

Oximeter (E0445- Rental item only)

CDPHP allows rental (until purchase price is met) of an oximeter for members who require continuous monitoring will be covered in combination with oxygen therapy under the following circumstances:

- Weaning from oxygen.
- Changes in physical condition requiring adjustments in oxygen therapy.
- Maintaining oxygen levels within a narrow range.
- As part of a primary care provider's or physician specialist's treatment plan requiring frequent monitoring/assessment of oxygen levels that cannot be achieved using a "Spot check" oximeter.

Covered without oxygen therapy under the following circumstance:

- In cases of complex cardiac conditions, such as, but not limited to, univentricular heart or unrepaired cyanotic heart disease.

Pulse oximeter probes (A4606) are used with the oximeter (E0445) and are included in the reimbursement for the pulse oximeter rental.

Documentation Requirements for Oximeter for members who require continuous monitoring:

The following documentation is necessary to support prior approval of an oximeter:

- Diagnosis/medical condition justifying the need to monitor blood oxygen levels.
- Current oxygen orders, if applicable (Note: oxygen orders should be renewed every 12 months).
- Treatment plan listing the required parameters and interventions for abnormal readings, including corresponding oxygen titrations if applicable.
- Availability of caregivers trained to appropriately manage the listed treatment interventions.

If used with a ventilator, CPAP, BiPAP, or other respiratory assist device, the type, make, and model of the respiratory assist device must be provided to ensure oximetry is not already available on that device.

Pediatric Gait Trainer (E8000-E8002)

Gait trainers are considered medically necessary for therapeutic and functional ambulation when all the below criteria are met:

- Member is 18 years of age or younger;

- Member has an acquired injury (e.g., spinal cord, traumatic brain injury) or a chronic physical limitation that affects the ability to ambulate (e.g., cerebral palsy, neuromuscular disease, spina bifida);
- Member requires moderate to maximum support for ambulation and documentation shows that assistive devices have not been effective;
- There has been at least a one-month rental trial in which the member demonstrates capability of utilizing and tolerating the equipment safely.

Pediatric Safety Bed (E0328, E0316)

CDPHP will provide coverage of a pediatric hospital bed with enclosure frame when the below criteria is met:

1. There is a diagnosis-related cognitive/communication impairment or a severe behavioral disorder (e.g., traumatic brain injury, seizure disorder, autism)
2. Member has a risk to safety while in bed OR there is a risk to safety due to climbing out of bed/wandering
3. Other alternatives were tried and were unsuccessful or contraindicated (examples below):
    a. Putting a mattress on the floor
    b. Padding added to ordinary beds
    c. Transparent plastic shields
    d. Medications
    e. Helmets
    f. Door alarms

Replacement Batteries (Various Codes)

- Coverage will follow medical supplies section of member contract if available

Standing frame/table system (E0637, E0638, E0641, E0642)

A standing device is considered medically appropriate when BOTH of the following criteria are met:

- There is documentation that the standing device is necessary for the patient to be independent in one or more of the following activities of daily living (ADLs) in the patient's home:
    1. Eating;
    2. Personal hygiene;
    3. Toileting;
    4. Dressing;
    5. Transfer; AND
- The patient is unable to accomplish the activities identified in above with current durable

medical equipment.

OR

A standing device is considered medically appropriate for decubitus ulcer management when BOTH of the following criteria are met:

- There is documentation that off-loading of a decubitus ulcer cannot be accomplished by other means; and
- The patient has completed a one-month trial using the standing device and has shown meaningful improvement after the trial period. Documentation from the referring provider that the patient has shown meaningful improvement during the trial period must be submitted, to be eligible for continued coverage.

Upper limb prostheses (L6000, L6010, L6020, L6050, L6055, L6100, L6110, L6120, L6130, L6200, L6205, L6250, L6300, L6310, L6320, L6350, L6360, L6370, L6400, L6450, L6500, L6550):

Prostheses that are worn externally and that temporarily or permanently replace all or part of an external body part that has been lost or damaged because of an injury or disease.

Vacuum drainage collection unit and tubing kit (A7048)

Covered for use in the home when provided in lieu of hospitalization or nursing home care.

CODING REQUIREMENTS AND REIMBURSEMENT

Supplies associated with DME/prosthetic/orthotic devices are covered when included in the purchase price.

All DME items must be billed with appropriate modifier to indicate purchase (NU), rental to purchase (NR), rental (RR) or used equipment that has been purchased (UE). Claims submitted without modifier will deny to resubmit with appropriate modifier.

When equipment is billed for purchase, the allowed amounts from any previously paid rental months will be subtracted from the purchase price. Payment for rental months will never exceed the total purchase price for the equipment.

DME Invoices

All DME items must be billed with appropriate modifier to indicate purchase (NU) or rental (RR). Claims submitted without modifier will deny to resubmit with appropriate modifier.

DME items not having a current CMS DME fee schedule or published NYS Medicaid fee schedule

rate will be reimbursed at a rate established by CDPHP, which may be based on specific case review and/or submission of the actual manufacturers' invoice.

For items that are made by the DME vendor themselves and no manufacturer's invoice is available, an itemization of supplies utilized, and applicable charges is required in order to consider reimbursement for the item.

CDPHP will reimburse DME items at the lesser of 150% of invoice cost or fee schedule unless otherwise stated in the provider contract.

When equipment is billed for purchase, the allowed amounts from any previously paid rental months will be subtracted from the purchase price.

Documentation Requests

CDPHP reserves the right to request medical records at any time including all dictated, handwritten notes, and the documents indicated below to support all the items billed on this claim. All pertinent information to meet policies and billing requirements must be included. Failure to supply full documentation indicated could result in partial or complete denial of services.

Required Documents*:

- Certificate of Medical Necessity (CMN) - Both initial and subsequent forms, if applicable

- Copy of unredacted manufacturer's invoice for items billed including: Product information
- Detailed Written Order (DWO)/Prescription/Fiscal Order or Standard Written Order (SWO)
- Dispensing Orders
- Face to Face Documents, if applicable
- Notes including progress notes pertinent to the DME requested
- Prior-Authorization form, if applicable
- Refill Documents
- Written Order Prior to Delivery (WOPD), if applicable
- DME Information Form (DIF)
- Model number and Manufacturer name
- Proof of Delivery (POD)/Delivery Documentation (Invoices and delivery receipts)

***Note:** Some of these documents may need to be obtained from the ordering physician while others may need to be obtained from the DME vendor who provided the equipment.

EXCLUSIONS

POLICY NAME: DURABLE MEDICAL EQUIPMENT, PROSTHETICS/ORTHOTICS & MEDICAL SUPPLIES

1. DME/Prosthetics/Orthotics designed for your comfort or convenience.
   The following list is not all inclusive but contains examples of items that are generally considered comfort or convenience:
   - Pools
   - Hot tubs
   - Air conditioners
   - Saunas
   - Humidifiers
   - Dehumidifiers
   - Exercise equipment

2. Over-the-counter medical supplies.

3. Orthotic devices that are not rigid or semi rigid devices.

4. Repair or replacement of DME or a prosthetic/orthotic device due to loss, misuse, or neglect.

5. Repair or maintenance and servicing of equipment or device that is subject to the manufacturer's warranty.

6. Requests for a duplicate device to have available at various locations (e.g., one for home and one for school/work).

7. Equipment or devices prescribed solely for use during sports or employment.

8. Charges related to the shipping, handling and/or delivery of covered equipment or devices.

9. Battery powered walker (E0152) is considered non-covered since the capabilities relate to use of the walker outside the home and it does not serve as a purpose for use in the home.

CDPHP PRODUCT VARIATIONS

CHILD HEALTH PLUS	CDPHP utilizes the New York State Medicaid management information system provider manual (MMIS) to determine coverage availability and distinguish a medical/surgical supply versus durable medical equipment, prosthetic, or orthotic: http://www.emedny.org/providerManuals/Index.html

POLICY NAME: DURABLE MEDICAL EQUIPMENT, PROSTHETICS/ORTHOTICS & MEDICAL SUPPLIES

MEDICARE ADVANTAGE	Subject to all terms and conditions noted above in the policy to include the following: • Medicare Advantage provides benefits for supplies that are necessary for effective use of a prosthetic.
SELECT PLAN/HARP	CDPHP utilizes New York State Medicaid management information system provider manual (MMIS) to determine coverage availability and distinguish a medical/surgical supply versus durable medical equipment, prosthetic, or orthotic. There are 2 guidelines that identify these benefits: Medical Supplies Procedure Codes & Coverage Guidelines (sections 4.1, 4.2, 4.3) are billed directly to Medicaid Fee for Service: Medical Supplies Procedure Codes DME Procedure Codes & Coverage Guidelines (sections 4.4, 4.5, 4.6, and 4.7) are billed to CDPHP: DME Procedure Codes

POLICY APPROVAL DATES

Capital District Physicians' Health Plan, Inc.
CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: DURABLE MEDICAL EQUIPMENT, PROSTHETICS/ORTHOTICS & MEDICAL SUPPLIES

New: 11/21

Revised: 5/22, 9/22,11/22, 1/23, 5/23, 7/23, 9/23, 11/23, 1/24, 3/24, 5/24, 9/24, 11/24, 1/25, 3/25, 5/25, 11/25, 3/26, 5/26, 7/26

Reviewed:

POLICY HISTORY

This section is intended to provide only highlights of the policy changes. The policy should always be reviewed in its entirety to ensure a comprehensive understanding of coverage.

Effective Date	Update
11/1/2026	Under "For the following LCD/NCD items, please see specific CDPHP Resource Coordination or payment policies for coverage", added new policy Powered Compression Devices/Lymphedema Pump, 1.01.17
8/1/2026	Under "For the following LCD/NCD items, please see specific CDPHP Resource Coordination or payment policies for coverage", added new policy Electromagnetic and Pulsed Field Stimulation, 1.01.59 and Non-Invasive Surface Electrical Stimulation for Pain and Rehabilitation, 1.01.61
7/1/2026	Removed codes L5856 and L5973 from the list of items that do not require PA and added medical necessity criteria for these codes. Added information to code S1040 on prior authorization requirement.
3/1/2026	Added prior authorization DME information that was previous housed on the now obsolete Prior Authorization Guideline policy.
12/1/2025	Updated name and policy number for Cochlear implant and removed link to Medicare Non-Covered Items.
4/1/2025	Added new codes A6515-A6519, and A6611 to Compression stockings, garments, wraps, bandages section.
3/1/2025* No change to effective date of policy for this	Added additional information for cervical traction devices previously housed in the Non-Covered Technology policy.

POLICY NAME: DURABLE MEDICAL EQUIPMENT, PROSTHETICS/ORTHOTICS & MEDICAL SUPPLIES

update	
3/1/2025	Added criteria for pediatric safety beds.
2/1/2025	Added criteria for standing frames. Updated criteria for compression stockings. Under Noridian, removed Pneumatic Compression Devices as this LCD is retired. Clarified that Oximeter is rental item only.
1/1/2025 *No change to effective date of policy	Updated Medicaid section and provided links for DME/Supplies. Under Position Statement added: External Upper Limb Tremor Stimulator Therapy to the list. Added modifiers NR & UE to policy. Added additional coverage for automated blood pressure cuff (A4670) through quality programs.
1/1/2025	Added coverage criteria for oximeters.
8/1/2024	Added information on DME rental or purchase modifiers. Added statements regarding rentals converting to purchase. Added information on code A7048 Updated criteria for knee walker to remove "and/or other physical and mental capabilities".
5/1/2024	Added criteria for pediatric gait trainers Added criteria for automated blood pressure cuff (A4670)
4/1/2024	Added battery powered walker to exclusions
3/1/2024	Removed prior authorization exceptions from the Policy Considerations section as this information is housed in the RC Prior Authorization Guideline document. Updated lymphedema compression section.
1/1/2024	Replaced termed code K1013 with new code A4457 in Select Plan/HARP section.

POLICY NAME: DURABLE MEDICAL EQUIPMENT, PROSTHETICS/ORTHOTICS & MEDICAL SUPPLIES

12/1/2023	Updated link for coverage criteria for Seat Elevation Equipment (Power Operated) on Power Wheelchairs and added link for items that are considered non-covered.
11/1/2023* *No change to effective date for this update	Added coverage criteria for lymphedema gradient pressure sleeves/gauntlets/gloves (S8420-S8428). Added criteria for rental of home phototherapy devices for neonatal jaundice, and also identified there will be no PA requirement for these devices. Added that wheelchair accessory items E0971- antitipping device, E0978- positioning belt/safety belt/pelvic strap and E0990- elevating leg rest, complete assembly do not require PA for rental. Removed NCA link for Seat Elevation System and replaced with NCD link. Added link for products/codes that are non-covered.
11/1/2023	Added documentation requirements to Coding Requirements and Reimbursement section. Added section for items not otherwise addressed in a Medicare LCD/NCD or CDPHP policy. Added scoliosis jackets (L1300 & L1310) as not requiring a PA when billed with a diagnosis of scoliosis (M41-M41.9).
5/16/2023	Added new Medicare NCA link for Seat Lift Systems
5/1/2023	Under Policy Considerations added information on DME replacement. Added negative pressure wound therapy (E2402) as an item that does not have a rental PA requirement.
4/1/2023	Medicaid section updated to reflect the changes for the Medicaid RX/DME Carveout.
1/1/2023* *No change to effective date for this update	Updated Child Health Plus section to mirror Select Plan/HARP coverage.
1/1/2023* *No change to effective date for this update.	No coverage criteria changes made. Minor changes/clarifications made throughout policy.

Policy/Procedure Name: Elahere (mirvetuximab soravtansine-gynx) **Control Number: 1350/20.000470**

Disclaimer Notice

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgment when deciding the most appropriate care to enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

Background

Ovarian cancer includes cancers that start in cells from the ovary, fallopian tube, or peritoneum. These cancers are grouped together often because they are treated using similar therapies. In the United States, approximately 20,000 patients are diagnosed with ovarian cancer a year and of those, 13,000 result in death. Most of the time, the disease has already advanced at the time of diagnosis. Surgery and platinum-based combination chemotherapy, with or without bevacizumab is typically used for treatment depending on the stage. Platinum-resistant ovarian cancer, (PROC) occurs in about 15 to 30% of women with ovarian cancer. Recurrence is frequent and up to 80% of patients will acquire progressive resistance over time.

If a patient has recurrence within six months after completion of platinum-based chemotherapy it is classified as PROC. Currently, there is no standardized treatment for PROC however, NCCN guidelines recommend non-platinum-based agents such as bevacizumab (if not previously received), docetaxel, oral etoposide, gemcitabine, weekly paclitaxel with or without pazopanib, liposomal doxorubicin with or without bevacizumab, weekly paclitaxel with or without bevacizumab, or topotecan with or without bevacizumab.

The folate receptor 1 (FOLR1) is elevated in 70 to 80% of ovarian cancers and highly expressed in up to 40% of all high-grade ovarian cancers. This receptor serves as an ideal target for therapies such as Elahere because it has limited expression in normal tissues. Elahere is an antibody-drug conjugate (ADC). The antibody is a chimeric immunoglobulin G1 (IgG1) directed against FRα. The small molecule, DM4, is a microtubule inhibitor attached to the antibody via a cleavable linker. Upon binding to FRα, mirvetuximab soravtansine-gynx is internalized followed by intracellular release of DM4 via proteolytic cleavage. DM4 disrupts the microtubule network within the cell, resulting in cell cycle arrest and apoptotic cell death.

In the SOROYA trial, all patients were required to have received prior bevacizumab treatment and be positive for FRα expression as defined by the Ventana FOLR1 Assay. The overall response rate was 31.7% and the median duration of response was 6.9 months. The most common (≥ 20%) adverse reactions, including laboratory abnormalities, were vision impairment, fatigue, nausea, increased alanine aminotransferase, keratopathy, abdominal pain, decreased lymphocytes, peripheral neuropathy, diarrhea, decreased albumin, constipation, increased alkaline phosphatase, dry eye, decreased magnesium, decreased leukocytes, decreased neutrophils, and decreased hemoglobin.

Summary

Effective Date of Policy:	2/1/2023
Indications	FRα-positive, platinum resistant epithelial ovarian, fallopian tube, or primary peritoneal cancer
ICD10 Diagnosis Codes	C56.9, C57.0, C48.2
Availability	Injection: 100 mg/20 mL (5 mg/mL) in a single-dose vial
Duration	Six months
Limitations	Elahere contains a black box warning for ocular toxicity. It can cause severe ocular toxicities, including visual impairment, keratopathy, dry eye, photophobia, eye pain, and uveitis.

Required Criteria for Initial Approval

All of the following conditions for the requested indication must be met in order to approve therapy:

	Inclusion Criteria	Recommended Dosing Regimen
Indication (FDA approval) Treatment of adult patients with FRα positive, platinum-resistant epithelial ovarian, fallopian tube, or primary	• Enrollee ≥ 18 years old • Therapy is requested by an oncology specialist • Enrollee has diagnosis of FRα positive, platinum-resistant epithelial ovarian, fallopian tube, or primary peritoneal cancer through the following:	• 6 mg/kg adjusted ideal body weight administered as an intravenous infusion every three weeks until disease progression or unacceptable toxicity • Premedication includes corticosteroid, antihistamine, antipyretic, antiemetic,

peritoneal cancer	○ Tumor must be positive for FRα expression as defined by the Ventana FOLR1 Assay (≥ 75% positive tumor cells) ○ Enrollee must have platinum-resistant disease defined as: ▪ Members who have only had one line of platinum-based therapy must have received at least four cycles of platinum, must have had a response and then progressed between > three months and ≤ six months after the date of the last dose of platinum ▪ Patients who have received two or three lines of platinum therapy must have progressed on or within six months after the date of the last dose of platinum • Patients must have received at least one but no more than three prior systemic lines of anticancer therapy, including at least one line of therapy containing bevacizumab, and for whom single-agent therapy is appropriate as the next line of treatment ○ See NCCN guidelines for recommended therapies for treatment • Enrollee has documentation of an ophthalmic exam including visual acuity and slit lamp exam prior to treatment initiation, every other cycle for the first eight cycles, and as clinically indicated ○ Enrollee will receive artificial tears and ophthalmic topical corticosteroids	ophthalmic topical steroids, and lubricating eye drops.

Exclusion Criteria

Therapy will not be authorized if any of the above Inclusion Criteria are not met OR any of the below noted Exclusion Criteria are met:

- Members with active or chronic corneal disorders, history of corneal transplantation, or active ocular conditions requiring ongoing treatment/monitoring, such as uncontrolled glaucoma, wet age-related macular degeneration requiring intravitreal injections, active diabetic retinopathy with macular edema, macular degeneration, presence of papilledema, and/or monocular vision

Continuation Criteria

- Requests will be reviewed per criteria every six months
- Therapy will be reauthorized if clinical documentation supports ongoing disease stability and acceptable adverse reaction tolerability
  - See above for ocular toxicity black box warning

Considerations

- Prior authorization is obtained through the CDPHP pharmacy department.

MEDICAL POLICY

Medical Policy Title	**Electromagnetic and Pulsed Field Stimulation**
Policy Number	**1.01.59**
Current Effective Date	**August 1, 2026**
Next Review Date	**May 2027**

Our medical policies are guides to evaluate technologies or services for medical necessity. Criteria are established through the assessment of evidence based, peer-reviewed scientific literature, and national professional guidelines. Federal and state law(s), regulatory mandates and the member's subscriber contract language are considered first in the determination of a covered service.
(Link to Product Disclaimer)

POLICY STATEMENT(S)

I. The following forms of electromagnetic and pulsed field stimulation are **investigational**:

A. Peripheral Magnetic Stimulation, including Transcutaneous Electro Magnetic Peripheral Nerve Stimulation (mPNS) (e.g., Axon Therapy, MagVenture Pain Therapy) for chronic neuropathic pain;

B. Pulsed Electrical Stimulation (PES), including BioniCare when used to facilitate repair of cartilage in patients with arthritis (e.g., MedRelief ST Series, and Jstim1000);

C. Targeted Electromagnetic Field Stimulation (e.g., SofPulse);

D. Electromagnetic Stimulation (e.g., OrthoCor Active Knee System);

DESCRIPTION

Proprietary Information of Capital District Physicians' Health Plan, Inc. | CDPHP Universal Benefits,® Inc. | Capital District Physicians' Healthcare Network, Inc.

Peripheral sensory nerve fibers are classified according to their diameter, myelination, and conduction velocity. A fibers are sub-classified into A-alpha, A-beta, and A-delta types. These types of fibers are large, fast, myelinated and have the lowest activation threshold. When activated, they inhibit pain transmission in the spinal cord via proprioceptive and motor afferent signals. B fibers are small, lightly myelinated and carry preganglionic autonomic signals. They are activated after A fibers, but before C fibers and can contribute to responses in the autonomic nervous system such as vasodilation or sympathetic modulation when stimulated. They aren't often the primary targets in pain treatment. C fibers are the smallest of the fibers with the highest activation threshold and have limited capability to be selective in terms of blocking currents through the nerves.

Canonical Erlanger-Gasser Classification of fiber types in sensory peripheral nerves (Olausson et al 2024)

Fiber Type	**Function**	**Average Diameter (µm)**	**Average conduction velocity (m/s)**
Aα (A-alpha)	Myelinated, Primary muscle spindles, Golgi tendon organs	15	100
Aβ (A-beta)	Myelinated, Cutaneous touch and pressure afferents	8	50
Aδ (A-delta)	Myelinated, Cutaneous temperature (cold) and 'fast' pain	<3	15
C	Unmyelinated, Cutaneous pain ('slow' pain) and temperature (warmth and cold)	1	1

Magnetic stimulation of peripheral nerves (mPNS) has been described in the literature as a pain-free alternative to electrical stimulation. mPNS does not require tissue contact yet has a deeper penetration depth. It uses a time-varying field to generate currents through electromagnetic induction, easily targeting Aδ fibers rather than Aβ fibers through electrodes at the skin's surface (Sayed et al 2023). The activation of the Aδ fibers is thought to impact sharp pinprick type pain (Olausson et al 2024).

Neuralace Medical, the creator of Axon Therapy differentiates its device from PNS by using "low frequency magnetic pulses to engage sensory, pain, and motor fibers mechanistically" and reports to provide "long-term relief for the root cause of post-trauma and post-surgical neuropathic pain."

MagVenture Pain Therapy devices (Tonika Elektronik A/S) are intended for use in the hospital and

clinics.

Targeted Electromagnetic Field (e.g., SofPulse, OrthoCor)

Electrical and electromagnetic stimulation are being investigated to improve functional status, as well as to relieve pain related to osteoarthritis and rheumatoid arthritis that are unresponsive to other standard therapies. Noninvasive electrical stimulators generate a weak electrical current within the target site using pulsed electromagnetic fields, capacitive coupling, or combined magnetic fields. In capacitive coupling, small skin pads or electrodes are placed on either side of the knee or wrist. Electrical stimulation is provided by an electronic device that noninvasively delivers a subsensory low-voltage, monophasic electrical field to the target site of pain. Pulsed electromagnetic fields are delivered via treatment coils placed over the skin. Combined magnetic fields deliver a time-varying field by superimposing that field onto an additional static magnetic field.

In basic research studies, pulsed electrical stimulation has been shown to alter chondrocyte-related gene expression in vitro and to have regenerative effects in animal models of cartilage injury. It is proposed that the device treats the underlying cause of the disease by stimulating the joint tissue and improving the overall health of the joint and that it provides a slow-acting, but longer-lasting improvement in symptoms. Therefore, pulsed electrical stimulation is proposed to be similar to bone stimulator therapy for fracture nonunion.

The OrthoCor Active Knee System (OrthoCor Medical; acquired by Caerus Corp) uses pulsed electromagnetic field energy at a radiofrequency of 27.12 MHz to treat pain. The OrthoCor Knee System is classified as a short-wave diathermy device for use other than applying therapeutic deep heat. It is indicated for adjunctive use in the palliative treatment of postoperative pain and edema in superficial soft tissue and for the treatment of muscle and joint aches and pain associated with overexertion, strains, sprains, and arthritis. the SofPulse (also called Torino II, 912-M10, and Roma; Ivivi Health Sciences, renamed Amp Orthopedics) was cleared for marketing as a short-wave diathermy device that applies electromagnetic energy at a radiofrequency of 27.12 MHz. The device is indicated for adjunctive use in the palliative treatment of postoperative pain and edema in superficial soft tissue.

SUPPORTIVE LITERATURE

Soliman and colleagues (2025) conducted a meta-analysis of 313 double-blind randomized controlled trials (RCTs) evaluating participants of any age with neuropathic pain. A total of 284 studies were pharmacological, while only 29 were related to neuromodulation. Included in the analysis were any pharmacological or neuromodulation intervention if administered for at least 3 weeks of follow up if after a single administration, had at least 3 weeks of follow up. The primary efficacy outcome was the proportion of responders (defined as having at least a 50% reduction in baseline pain intensity. The primary safety outcome was the number of participants who withdrew from the treatment due to adverse events. Duration of the included trials was 3-24 weeks, with a median of 8 weeks. Given the low certainty of evidence, authors were not able to confidently make treatment recommendations for specific populations, and there were no evidence of superiority to any of the drugs included in head-to-head trials. Tri-cyclic antidepressants, serotonin and norepinephrine reuptake inhibitors (SNRIs)

and α2δ-ligands are recommended as first line treatments, followed by topical treatments. Regarding neuromodulation (which included 29 sham-controlled trials of both invasive and non-invasive techniques) trials, the majority of results were inconclusive, stating a need for large, double-blind sham controlled, parallel trials over clinically relevant timeframes to examine efficacy and safety.

Pulsed Electrical Stimulation

PES has been investigated over several decades. There have been no clinical studies to date that have developed standardized stimulation parameters, provided accurate comprehensive reporting of electrical conditions, or consistent clinical results (Zimmerman et al 2024). Given this, conclusions cannot be formulated as to its ability to positively impact the net health outcome.

Pulsed Electromagnetic Fields

Yang et al (2020) published a systematic review evaluating the effects of pulsed electromagnetic field therapy on pain, stiffness, physical function, and quality of life in patients with osteoarthritis. The meta-analysis included 15 small, sham- or placebo-controlled studies published between 1993 and 2016. Only two studies were deemed to be at low risk of bias. Overall, the quality of evidence was deemed low or very low. A statistically significant beneficial treatment effect was noted for pain (standardized mean difference [SMD], 1.06; 95% confidence interval [CI], 0.61 to 1.51), stiffness (SMD, 0.37; 95% CI, 0.07 to 0.67), and physical function (SMD, 0.46; 95% CI, 0.14 to 0.78), but not quality of life (SMD, 1.49; 95% CI, -0.06 to 3.04). Only pain outcomes were considered clinically significant. Studies were limited to the short-term effects of pulsed electromagnetic field therapy, with study follow-up durations ranging from 10 days to 12 weeks. Additionally, the high levels of heterogeneity across the outcome measures made harmonization difficult, the included studies had small sample sizes, and there was a lack of an intention-to-treat analysis in many of the included studies.

Tong et al (2022) conducted a systematic review of 11 randomized trials in which patients with osteoarthritis received pulsed electromagnetic fields or control treatment. Of the studies, six had a sham group and five studies used other treatments including hot packs, TENS, physiotherapy, and ultrasound. Many of the trials described below were included in the analysis, along with some additional studies. Risk of bias was high in six studies, moderate in two studies, and low in three studies. The main outcomes measured the efficacy of pulsed electromagnetic field stimulation on osteoarthritis-related soreness, stiffness, and physical function assessed by visual analog scale (VAS) and/or Western Ontario and McMaster University Arthritis Index (WOMAC) scores. Compared to controls, pulsed electromagnetic field stimulation significantly reduced pain (SMD, 0.71; 95% CI, 0.08 to 1.34; p=.03; I^2=93%). There were also significant differences in stiffness (SMD, 1.34; 95% CI, 0.45 to 2.23; p=.003; I^2=99%) and physical function (SMD, 1.52; 95% CI, 0.49 to 2.55; p=.004; I^2=95%) with pulsed electromagnetic field stimulation. All three outcomes were significantly better with pulsed electromagnetic field stimulation compared to sham treatment but not compared to other treatments. Limitations of the analysis included the small number of studies, high heterogeneity, and the combined analysis of sham and other interventions.

Yabroudi et al (2024) evaluated the effects of pulsed electromagnetic field therapy combined with progressive resistance exercise (PRE) in improving physical function and pain in patients with knee osteoarthritis. Patients were randomized to receive either 24 sessions of pulsed electromagnetic field therapy plus PRE (n=17) or PRE alone (n=17). Compared to baseline assessments, both groups scored higher on post-treatment, 3-month, and 6-month follow-up scores of Knee Injury and Osteoarthritis Outcome Score (KOOS) and Numeric Pain Rating Scale (NPRS). Both groups were also able to complete the 5-times chair stand test and walking speed test faster at post-treatment timepoints compared to baseline; however, none of the discussed study outcomes were significantly different between the pulsed electromagnetic field therapy plus PRE or PRE alone groups.

de Paula Gomes et al (2020) conducted a prospective, randomized, sham-controlled trial evaluating the effects of an exercise program alone or combined with electrophysical modalities in patients with knee osteoarthritis (N=100). Patients were equally allocated into five groups (n=20): exercise, exercise plus sham, exercise plus interferential current therapy (ICT), exercise plus pulsed shortwave diathermy therapy (SDT), and exercise plus photobiomodulation. Patients received treatment three times weekly for a duration of eight weeks. A significant improvement in WOMAC function and pain scores was observed in the exercise-only group compared to all other groups, including SDT. The addition of ICT, SDT, or photobiomodulation did not result in any clinically meaningful benefits. No long-term follow-up assessments were performed after the eight-week treatment period and use of analgesics was not controlled in the study.

Magnetic Peripheral Nerve Stimulation (mPNS)

Kapural et al 2025, conducted a vendor funded randomized controlled trial to assess the safety and efficacy of mPNS in combination with conventional medical management (CMM) in patients with post-traumatic or post-surgical pain. A total of 65 patients were randomized (CMM+mPNS n=35, CMM n=30) and evaluated for one year. Patients in the CMM alone group were allowed to crossover to the treatment group at 90 days. The primary efficacy endpoint was subjects with ≥50% pain relief at day 90, without an increase in pain medication. The treatment protocol included three consecutive daily sessions in the first week, followed by a weekly session for the remainder of the month for a total of six treatments. Assessments included the visual analog scale (VAS), average change in pain score from baseline, reduction in morphine-equivalent daily dose (MEDD), initiation of new pain medication, and increases in new pain medication. Secondary outcomes included patient reported quality of life outcomes (European Quality of Life 5 Dimensions 3 Level [EQ-5D-3L]) at 365 days, the Patient Global Impression of Change (PGIC) scores and Pain Disability Index (PDI) scores. At the 90-day mark, 71% of the subjects were considered responders in the CMM +mPNS cohort vs. 13% in the CMM group ($p<0.0001$). At the end of the study, 94% of participants were responders in the CMM+mPNS cohort and 69.2% in the crossover group. Improvements were noted in the EQ-5D-3L and PGIC responder rates. Treatment -related adverse events were reported by seven participants in the CMM+mPNS, three in CMM alone, and five in crossover participants. None of the adverse events led to withdrawal and were mostly composed of mild skin irritation and short-term increases in pain around the treatment area. A primary limitation of the study was the design-it was not originally designed as a crossover study at 90 days but was added on IRB-approved protocol revision. Additionally, the authors note that a stipend was provided to the mPNS+CMM subjects to enhance retention. Prior to

the stipend increase only 3/14 subjects completed day 365. The retention rate increased from 21.4% to 76.5% after the stipend increase. Longer studies, with sound methodology are needed to determine if the use of mPNS improves the net health outcome.

PROFESSIONAL GUIDELINE(S)

In 2019, the American College of Rheumatology released guidelines for the management of osteoarthritis of the hand, hip, and knee. The guidelines do not mention pulsed electrical or electromagnetic stimulation, but they recommend against transcutaneous electrical stimulation for patients with knee and/or hip osteoarthritis.

In 2019, the Osteoarthritis Research Society International published updated evidence-based consensus guidelines for the nonsurgical management of knee, hip, and polyarticular osteoarthritis. Sixty treatment modalities were evaluated for three patient groups: knee-only, hip, and multijoint osteoarthritis. Neuromuscular electrical stimulation was considered " strongly recommended against" for all groups due to low quality evidence from trials with small sample sizes and insufficient duration of follow-up. Electromagnetic therapy was considered "strongly recommended against" for all groups due to low quality evidence and an implausible biological mechanism.

In 2021, the American Academy of Orthopaedic Surgeons published updated guidelines on the treatment of osteoarthritis of the knee. The guidelines noted that there was only one study "that examined the use of a wearable pulsed electromagnetic field device for pain management in subjects with knee osteoarthritis." The strength of recommendation was downgraded to "limited" from inconclusive since there is only this single "moderate" quality study recommending for or against the intervention."

In 2021, the American College of Rheumatology released updated recommendations for the treatment of rheumatoid arthritis. All recommended treatments were pharmacologic. Use of electrical stimulation for treating rheumatoid arthritis was not addressed.

REGULATORY STATUS

The United States Food and Drug Administration (FDA) regulates stimulation devices as medical devices. All electrical stimulation devices including related components require FDA approval before marketing and use in the United States to ensure they are safe and effective for human use. Refer to the FDA Medical Device website. Available from: https://www.fda.gov/medical-devices [accessed 2026 March 26]

The FDA lists the most serious type of medical device recalls as well as early alert communications about corrective actions being taken by companies that the FDA believes are likely to be the most serious type of recalls. Available from: Medical Device Recalls | FDA [accessed 2026 Mar 26]

CODE(S)

- Codes may not be covered under all circumstances.
- Code list may not be all inclusive (AMA and CMS code updates may occur more frequently than policy updates).

- (E/I)=Experimental/Investigational
- (NMN)=Not medically necessary/appropriate

CPT Codes

Code	Description
0766T (E/I)	Transcutaneous magnetic stimulation by focused low-frequency electromagnetic pulse, peripheral nerve, initial treatment, with identification and marking of the treatment location, including noninvasive electroneurographic localization (nerve conduction localization), when performed; first nerve
0767T (E/I)	Transcutaneous magnetic stimulation by focused low-frequency electromagnetic pulse, peripheral nerve, initial treatment, with identification and marking of the treatment location, including noninvasive electroneurographic localization (nerve conduction localization), when performed; each additional nerve (List separately in addition to code for primary procedure)
97039 (*E/I)	Unlisted modality (specify type and time if constant attendance) (*E/I when utilized for any of the modalities addressed within this policy.)
97139	Unlisted therapeutic procedure (specify)

Copyright © 2026 American Medical Association, Chicago, IL

HCPCS Codes

Code	Description
97139	Unlisted therapeutic procedure (specify)
E0761	Nonthermal pulsed high frequency radiowaves, high peak power electromagnetic energy treatment device
E0762 (E/I)	Transcutaneous electrical joint stimulation device system, includes all accessories
E0769 (E/I)	Electrical stimulation or electromagnetic wound treatment device, not otherwise classified
E1399	Durable medical equipment, miscellaneous

CDPHP reserves the right to review this policy at any time and change it without notice.

Background

Duchenne muscular dystrophy (DMD) results from mutation of the DMD (also known as Dystrophin) gene, the largest known human gene, which is carried on the X chromosome. DMD affects about 1 in 3,300 boys. Although histologic and laboratory evidence of myopathy may be seen at birth, the clinical onset of skeletal muscle weakness usually does not become evident until early childhood, average age at diagnosis is approximately five years.

Therapy for DMD includes exon-skipping agents (for those with specific DMD mutations) which were approved through accelerated approval pathway. Importantly, the confirmatory trials demonstrating clinical benefit has yet to be verified. The four exon-skipping anti-sense oligonucleotide agents that are available include Exondys-51 (Eteplirsen), Viltepso (Viltolarsen), Vyondys 53 (Golodirsen), and Amondys 45 (Casimersen). In addition to exon-skipping agents, corticosteroids remain a primary pharmacologic treatment for DMD.

Elevidys (formerly SRP-9001) is an adeno-associated virus (AAV) vector-based gene therapy product FDA approved for treatment of ambulatory patients aged 4-5 years with DMD with a confirmed mutation in the DMD gene. Elevidys encodes a novel protein, Sarepta's micro-dystrophin. Elevidys was approved under the accelerated pathway, and continued approval may be contingent upon verification and description of clinical benefit as confirmed in clinical trials.

According to the FDA Briefing Document for the Cellular, Tissue, and Gene Therapies Advisory Committee Meeting[1],

> Sarepta's micro-dystrophin is a novel, engineered protein; no epidemiologic or pathophysiologic evidence of its function is available. The protein differs in important ways from both the endogenous shortened forms of dystrophin in patients with [Becker muscular dystrophy] BMD, and the internally-truncated dystrophins expressed through exon-skipping drugs. Measurement of levels of Sarepta's micro-dystrophin in muscle tissue only provides information about expression of the transgene product in cells transduced by SRP-9001, rather than insight into a pharmacologic effect on a biomarker in the pathway of the disease.
>
> Having reviewed nonclinical data and three clinical studies, including a randomized, double-blinded, placebo-controlled trial demonstrating expression of Sarepta's micro-dystrophin at week 12 following infusion of SRP-9001, FDA notes that the clinical studies conducted to date do not provide unambiguous evidence that SRP-9001 is likely beneficial for ambulatory patients with DMD. It is challenging to conclude with reasonable certainty from the data provided by the Applicant either that SRP-9001 is likely effective for younger patients, or that it is likely ineffective for older patients or those with somewhat poorer functional status. Additionally, FDA has safety concerns related to the possibility of administering an ineffective gene therapy.

Following the discussion topics, the panel was asked to vote on whether SRP-9001 was deserving of accelerated approval, while considering the benefits and risks of the treatment, and using micro-dystrophin expression at week 12 as a surrogate end point. The panel voted 8–6 (8 Yes; 6 No; 0 Abstain) in favor of the agent. Importantly two "YES" votes came from a patient and consumer representative.

Therapy was investigated in Study 102 (NCT03769116), a randomized, double-blind, placebo controlled trial, described in two parts (part 1 described below, part 2 included treatment of the Part 1 placebo arm with SRP-9001). In the 48-week randomized, double-blind, placebo-controlled Part 1, 41 ambulatory subjects with DMD 4-7 years old were studied. Subjects either had a confirmed frameshift mutation or premature stop codon mutation between exons 18 to 58 in the DMD gene and were randomized in a 1:1 ratio to receive either a single intravenous infusion of SRP-9001 (N=20) at the intended dose of 1.33×10^{14} vg/kg or placebo (N=21). However, in the SRP-9001 group it was retrospectively determined, eight subjects received the intended dose, six subjects received approximately two-thirds of the intended dose (8.94×10^{13} vg/kg), and six subjects received about half of the intended dose (6.29×10^{13} vg/kg) and this was driven by a change in the analytical method. Randomization was stratified by age (4-5 years old vs 6-7 years old).

One primary objective was evaluation of the effect of SRP-9001 on North Star Ambulatory Assessment (NSAA) total scores, a validated rating scale used to measure the impact of Duchenne muscular dystrophy on ambulatory performance. It is important to note that NSAA is process and effort dependent, susceptible to bias. Baseline NSAA scores were 19.8 in the SRP-9001 group versus 22.6 in the placebo group. Based on the study analysis, the least square mean changes in the NSAA total score from baseline to week 48 were 1.7 (0.6 standard error) and 0.9 (0.6 standard error) for SRP-9001 and placebo, respectively. **The LS mean (SE) treatment difference (0.8 [0.9]) at week 48 between**

SRP-9001 and placebo is not statistically significant (95% confidence interval [CI]: -1.0, 2.7; p=0.37). Age was an important factor in this study, in the subgroup of 4-5 years of age, a more significant difference in NSAA scoring from baseline to week 48 was demonstrated (4.3 (SE 0.7) vs 1.9 (SE 0.7), p = 0.0172), although not prespecified and listed as hypothesis-generating only.

The micro-dystrophin outcomes of Study 102 were based on different dose levels of SRP-9001: half of intended dose (6.29×10^{13} vg/kg, SRP-9001-DL1), two-thirds of intended dose (8.94×10^{13} vg/kg, SRP9001-DL2), and intended dose (1.33×10^{14} vg/kg, SRP-9001-DL3). At Week 12 of Study 102 Part 1, the mean (SD) change from baseline levels of Sarepta's micro-dystrophin (% of control) were 3.6 (5.7), 28.2 (52.2), and 43.4 (48.6) for subjects receiving SRP-9001-DL1, SRP-9001-DL2, and SRP-9001-DL3, respectively. At week 12 of Study 102 Part 2, the mean (SD) change from baseline levels of Sarepta's micro-dystrophin (% of control) were 10.6 (17.0), 10.4 (14.7), and 43.5 (55.6) for subjects receiving SRP9001-DL1, SRP-9001-DL2, and SRP-9001-DL3, respectively.

Safety was evaluated in the aforementioned studies, and importantly no deaths occurred during any of the studies. The most frequent adverse reactions (incidence ≥5%) observed in the studies include vomiting (61%), nausea (40%), acute liver injury (37%), pyrexia (24%), and thrombocytopenia (12%). Acute serious liver injury were reported in the clinical trials, however all resolved without clinical sequelae spontaneously or with additional corticosteroid treatment. One case of immune-mediated myositis was reported, presenting with muscle weakness, dysphagia, dysphonia, and other findings. The symptoms partially resolved with supportive care, plasmapheresis, and corticosteroid treatment. As a result, Sarepta has proposes that SRP-9001 be contraindicated in patients with any deletion that fully includes exons 9 through 13 in the DMD gene (due to the mutations involved in the affected subject). Lastly, myocarditis and elevated troponin-I were experienced by a few subjects within the clinical trials, though none of these events were associated with acute cardiac imaging changes from baseline, at this time the long-term effects of increased troponin-I and the associated risk of myocarditis on the underlying pathologic process of DMD, is unknown.

Ongoing Phase 3 trial, EMBARK (NCT05096221) is being proposed as a confirmatory trial, and the FDA is considering a non-age restriction, depending on the results of that study.

On June 15, 2025, Sarepta Therapeutics announced a suspension of commercial shipments of Elevidys for non-ambulatory patients with Duchenne muscular dystrophy (DMD), following two treatment-related deaths attributed to acute liver failure. Both fatalities occurred in non-ambulatory patients over the age of 15.

On July 18, 2025, The U.S. Food and Drug Administration announced it has placed Sarepta Therapeutics investigational gene therapy clinical trials for limb girdle muscular dystrophy on clinical hold following three deaths potentially related to these products and new safety concerns that the study participants are or would be exposed to an unreasonable and significant risk of illness or injury. The FDA has also revoked Sarepta's platform technology designation..

On July 21, 2025 Sarepta Therapeutics then notified the U.S. Food and Drug Administration (FDA) of its decision to voluntarily and temporarily pause all shipments of ELEVIDYS (delandistrogene moxeparvovec) for Duchenne muscular dystrophy in the United States, effective close of business Tuesday, July 22, 2025. This occurred after the 4th reported death in an 8-year-old boy. Sarepta then resumed shipping Elevidys for ambulatory patients after the FDA recommended removing the voluntary pause and resume shipment for ambulatory patients.

Summary	
Effective Date of Policy:	6/7/2023
Indications	Duchenne Muscular Dystrophy in patients 4-5 years of age
ICD10 Diagnosis Codes	G71.01
Availability	*Suspension for intravenous infusion; nominal concentration of 1.33 x 10^{13}vg/mL*
Duration	Not applicable, if approved, only one lifetime administration will be authorized.

Required Criteria for Initial Approval

All of the following conditions for the requested indication must be met in order to approve therapy:

Specific Indication	Inclusion Criteria	Recommended Dosing Regimen
Duchenne Muscular Dystrophy (pending FDA approval) ICD10: G71.01	• Therapy is prescribed by neurologist with expertise in the treatment of DMD • Enrollee has diagnosis of DMD with confirmed frameshift mutation (deletion or duplication) or premature stop codon mutation between exons 18 to 58 in the DMD gene • Enrollee is between four and five years of age	• Therapy involves a one-time intravenous infusion of Delandistrogene moxeparvovec • Dosing and administration considerations per FDA prescribing information.

	• Enrollee is ambulatory, walking without the assistance of durable medical equipment or wheelchair • Enrollee has baseline anti-AAVrh74 total binding antibody titer ≤ 1:100 • Enrollee has baseline NorthStar Ambulatory Assessment (NSAA) score documented in medical record, and physician agrees to post infusion clinical monitoring (see Considerations section for details) • Enrollee will not concurrently, or post administration of Elevidys, receive any exon-skipping ASO agents, including but not limited to, Exondys-51 (Eteplirsen), Viltepso (Viltolarsen), Vyondys 53 (Golodirsen), and Amondys 45 (Casimersen) • Enrollee has not previously received Delandistrogene moxeparvovec or any other gene therapy to treat DMD	• Enrollee will not concurrently, or post administration of Elevidys, receive any exon-skipping ASO agents, including but not limited to, Exondys-51 (Eteplirsen), Viltepso (Viltolarsen), Vyondys 53 (Golodirsen), and Amondys 45 (Casimersen)

Exclusion Criteria

- Enrollee has elevated anti-AAVrh74 total binding antibody titers > 1:100
- Enrollee is unable to walk without assistance or enrollee is wheelchair-dependent

Continuation Criteria

- Not applicable, if approved, only one lifetime administration will be authorized

Considerations

- Prior authorization is obtained through the CDPHP pharmacy department
- In clinical trials, baseline corticosteroid therapy was increased by 1mg/kg of prednisone equivalent daily and continued at this level for at least 60 days after infusion, unless clinical indicated otherwise
- Physician acknowledges that CDPHP will request documentation, not more frequently than biannually, of follow-up patient assessments including serial NSAA assessments or other clinical assessments while the patient is under the care of the physician

Background/Literature Summary

Macular telangiectasia (Mac Tel) is a disease that causes abnormalities of capillaries of the fovea or perifoveal region that are associated with loss of outer nuclear layers and the ellipsoid zone, Eventually, these abnormalities can progress to cystic cavitation-like changes in all retinal layers, or to development of full-thickness macular hole or subretinal neovascularization in advanced stages.

Mac Tel is divided into 2 main types:

- **Type 1**: blood vessels dilate and tiny aneurysms form, which leak and cause macular edema and damages macular cells. The disease almost always occurs in one eye, which differentiates it from Type 2.
- **Type 2**: blood vessels around the fovea become abnormal and may dilate and there may be macular neovascularization. Tissue in the macula or the fovea may thin out or form a scar, causing loss of detail vision. Type 2 affects both eyes but not always with the same severity.

In the United States, MacTel type 2 has a prevalence of about 0.1% in individuals over 40 years of age.

On March 5, 2025, the FDA approved Neurotech Pharmaceuticals' Encelto (revakinagene taroretcel-lwey, previously known as NT-501) for the treatment of adults with idiopathic macular telangiectasia (MacTel) type 2. Encelto is the first FDA-approved treatment for MacTel type 2.

Encelto (revakinagene taroretcel-lwey) is an encapsulated, cell-based gene therapy that consists of allogenic retinal pigment epithelial (RPE) cells that secrete recombinant human ciliary neurotrophic factor (rhCNTF). rhCNTF is a neurotrophic factor endogenously produced by neurons and glia that promotes photoreceptor survival by initiating a protective signaling cascade. Although the full mechanism of action of Encelto is not fully understood, the proposed mechanism involves slowing the progression of ellipsoid zone (EZ) loss, which is a marker of photoreceptor degeneration, and increases retinal integrity in MacTel type 2.

The approval of Encelto was based on results from two Phase 3, randomized, multicenter studies (Study 1: NTMT-03-A [NCT03316300] and Study 2: NTMT-03-B [NCT03319849]). Of a combined 228 patients, those who were treated with Encelto (Study 1, n = 58; Study 2, n = 59) demonstrated a statistically significant reduction in the rate of change in ellipsoid zone area loss over 24 months compared with that of patients who received sham treatment. Results for the mean change in aggregate retinal sensitivity loss from baseline to 24 months were statistically significant in Study 1 but not in Study 2. Best-corrected visual acuity (BCVA) was essentially the same between the Encelto-treated group and the sham-treated group.

Adverse events occurring more frequently than sham included conjunctival hemorrhage (31%), delayed dark adaptation (23.1%), suture-related complications (15.4%), and vitreous hemorrhage (8.5%). Rare but serious adverse events have occurred with Encelto, including suture-related complications in five patients and an implant extrusion in one patient.

Summary

Effective Date of Policy:	8/13/2026
ICD10 Diagnosis Codes	H35.0 Macular Telangiectasia
HCPCS	J3403
Dosage Forms	Intravitreal implant
Duration	Initial approval: 6 months Continuation approval: not applicable

This Pharmacy Policy is the exclusive property of Capital District Physicians' Health Plan, Inc. (CDPHP®) and its affiliated companies, CDPHP Universal Benefits,® Inc. (CDPHP UBI), and Capital District Physicians' Healthcare Network, Inc. (CDPHN). The contents and form of this policy are proprietary to CDPHP. Any reproduction or replication of this policy without the express written permission of CDPHP, CDPHP UBI, and CDPHN is strictly prohibited. This policy is subject to contractual limitations and/or parameters established in any Employer sponsored Summary Plan Description (SPD) and/or Benefit Design Document (BDD).

Criteria

1. Must be 18 years of age or older AND
2. Must be prescribed by and administered by an ophthalmologist AND
3. Must have a diagnosis of idiopathic macular telangiectasia type 2 (MacTel) AND
4. Provider must indicate which eye(s) will be treated AND
5. For the eye(s) being treated, the following must be true (a, b, c, and d):
    a. Must have evidence of fluorescein leakage typical of MacTel on fluorescein angiography AND
    b. Must have at least one of the following features (i, ii, iii, iv, or v):
        i. Hyperpigmentation that is outside of a 500-micron radius from the center of the fovea
        ii. Retinal opacification
        iii. Crystalline deposits
        iv. Right-angle vessels
        v. Inner/outer lamellar cavities AND
    c. Must have an Inner Segment - Outer Segment (IS/OS) Photo Receptor (PR) break (area of IS/OS loss) in ellipsoid zone (EZ) between 0.16 mm^2 and 2.00 mm^2 as measured by spectral domain optical coherence tomography (SD-OCT) AND
    d. Must have best corrected visual acuity (BCVA) of 54-letter score or better as measured by the Early Treatment Diabetic Retinopathy Study (ETDRS) chart OR have a BCVA of 20/80 or better as measured by the Snellen Chart.
        i. Documentation within the last 6 months must be provided. AND
6. Must not have evidence of intraretinal neovascularization or subretinal neovascularization (SRNV), as evidenced by hemorrhage, hard exudate, subretinal fluid or intraretinal fluid in either eye AND
7. Encelto will not be authorized in patients with MacTel type 1 AND
8. Encelto will not be authorized for any non-FDA approved indication AND
9. Encelto will be limited to a single implant per eye per lifetime. Approval duration will be for 6 months to allow time for procedure to take place.

Policy Guidelines

1. Utilization Management is contract dependent. Refer to specific contract/benefit language for exclusions.
    a. Coverage criteria may be dependent on the contract renewal date.
    b. Coverage of drugs listed in this policy are contract dependent.
    c. Not all contracts/benefits allow coverage of healthcare professional administered drugs as part of their pharmacy benefit
    d. Not all contracts/benefits cover all medical infusible drugs.
2. Unless otherwise indicated within drug specific criteria, the drugs listed in this policy are administered by a health care professional and therefore are covered under the medical benefit.
3. This policy does not apply to Medicare Part D and D-SNP pharmacy benefits. The drugs in this policy may apply to all other lines of busine including Medicare Advantage.
4. For members with Medicare Advantage, medications with a National Coverage Determination (NCD) and/or Local Coverage Determination (LCD) will be covered pursuant to the criteria outlined by the NCD and/or LCD. NCDs/LCDs for applicable medications can be found on the CMS website at https://www.cms.gov/medicare-coverage-database/search.aspx. In the absence of a Medicare National Coverage Determination (NCD), Local Coverage Determination (LCD), or other Medicare coverage guidance, CMS permits a Medicare Advantage Organization (MAO) to establish its own coverage determinations in accordance with 42 CFR § 422.101(b)(6). Indications that have not been addressed by the applicable medication's LCD/NCD will be covered in accordance with criteria determined by the Health Plan. Step therapy requirements may be imposed in addition to LCD/NCD requirements.
5. Clinical documentation must be submitted for each request (initial and recertification [if applicable]) unless otherwise specified (e.g., provider attestation required). Supporting documentation includes, but is not limited to, progress notes documenting previous treatments and treatment history, diagnostic testing, laboratory test results, genetic testing or biomarker results, imaging and other objective or subjective measures of clinical benefit.

This Pharmacy Policy is the exclusive property of Capital District Physicians' Health Plan, Inc. (CDPHP®) and its affiliated companies, CDPHP Universal Benefits,® Inc. (CDPHP UBI), and Capital District Physicians' Healthcare Network, Inc. (CDPHN). The contents and form of this policy are proprietary to CDPHP. Any reproduction or replication of this policy without the express written permission of CDPHP, CDPHP UBI, and CDPHN is strictly prohibited. This policy is subject to contractual limitations and/or parameters established in any Employer sponsored Summary Plan Description (SPD) and/or Benefit Design Document (BDD).

6. All utilization management requirements outlined in this policy are compliant with applicable New York State insurance laws and regulations. Policies will be reviewed and updated as necessary to ensure ongoing compliance with all state and federally mandated coverage requirements.
7. Manufacturers may either discontinue participation in, or may not participate in, the Medicaid Drug Rebate Program (MDRP). Under New York State Medicaid requirements, physician-administered drugs must be produced by manufacturers that participate in the MDRP. Products made by manufacturers that do not participate in the MDRP will not be covered under Medicaid Managed Care/HARP lines of business. Drug coverage will not be available for any product from a non-participating manufacturer. For a complete list of New/Reinstated & Terminated Labelers please visit: https://www.medicaid.gov/medicaid/prescriptiondrugs/medicaid-drug-rebate-program/newreinstated-terminated-labeler-information/index.html
8. This policy is based on available evidence as of the last review date. Coverage determinations are subject to applicable plan documents, state and federal regulations, and individual patient circumstances. This policy does not constitute medical advice.
9. For commercial contracts, medical necessity determinations align with the Certificate of Coverage issued by the Health Plan, which states that covered services must be clinically appropriate and not primarily for the convenience of the member, the member's family, or the provider.
10. This policy is subject to ongoing revision. Newly marketed drugs and existing drugs with new indications may be subject to prior authorization until formal coverage criteria are established. Inclusion of a drug in this policy does not guarantee its current availability on the market, as some agents may be discontinued, withdrawn, or otherwise unavailable. As product status changes, drugs may be removed from the policy.
11. The requested site of care may impact approval timeframe and is subject to review.
12. The following applies to all gene and cellular therapies unless otherwise specified within the drug-specific coverage criteria:
    a. Administration, Retreatment, and Treatment with Additional or Other Gene/Cellular Therapies
        i. One-Time Administration
            1. Most gene and cellular therapies, whether autologous, allogeneic ("off-the-shelf"), or in vivo gene-transfer therapies, are designed and studied as one-time treatments.
            2. Repeat dosing, reinfusion, or sequential therapy with other gene or cellular products has not been established as safe, effective, or clinically appropriate.
        ii. Retreatment/Repeat Administration
            1. Retreatment with the same gene or cellular therapy product is considered experimental and investigational because:
                a. Clinical trials evaluated these therapies as single-administration interventions
                b. Safety, efficacy, and durability of a second administration have not been established
                c. Risks immune activation, insertional mutagenesis, or vector immunity may be increased with repeat dosing
        iii. Treatment with an Additional or Other Gene/Cellular Therapy
            1. Treatment with an additional or different gene or cellular therapy after prior exposure to any gene or cellular therapy is currently considered experimental and investigational as there is lack of evidence demonstrating the following (a-c):
                a. Anticipated clinical benefit beyond available standard therapies
                b. Safety of sequential administration
                c. Justification for selecting a second gene/cellular intervention after a prior one
            2. This includes, but is not limited to:
                a. Switching between CAR-T products (e.g., CD19 → CD19 or CD19 → BCMA)
                b. Switching between autologous and allogeneic cellular therapies
                c. Sequential use of CAR-T, TCR-T, NK-cell therapies, or other genetically engineered cell therapies
                d. Receiving a gene therapy after previous gene or cellular therapy exposure

This Pharmacy Policy is the exclusive property of Capital District Physicians' Health Plan, Inc. (CDPHP®) and its affiliated companies, CDPHP Universal Benefits,® Inc. (CDPHP UBI), and Capital District Physicians' Healthcare Network, Inc. (CDPHN). The contents and form of this policy are proprietary to CDPHP. Any reproduction or replication of this policy without the express written permission of CDPHP, CDPHP UBI, and CDPHN is strictly prohibited. This policy is subject to contractual limitations and/or parameters established in any Employer sponsored Summary Plan Description (SPD) and/or Benefit Design Document (BDD).

e. Receiving an in vivo gene therapy following any prior vector-based therapy

iv. Prior Gene/Cell Therapy Exposure

1. An is generally not eligible for additional gene or cellular therapy if they have previously received:
   a. Any autologous cellular therapy (e.g., CAR-T, TCR-T, TIL),
   b. Any allogeneic genetically modified cellular therapy,
   c. Any in vivo gene therapy (e.g., AAV, lentiviral vector)
   d. Any ex vivo gene-modified cell product
   e. Are being considered for any other gene or cellular therapy without documented evidence supporting safety and anticipated benefit.

MEDICAL POLICY

Medical Policy Title	**Endometrial Ablation**
Policy Number	**4.01.01**
Current Effective Date	**November 1, 2026**
Next Review Date	**February 2027**

Our medical policies are guides to evaluate technologies or services for medical necessity. Criteria are established through the assessment of evidence based, peer-reviewed scientific literature, and national professional guidelines. Federal and state law(s), regulatory mandates and the member's subscriber contract language are considered first in the determination of a covered service.

(Link to Product Disclaimer)

Please refer to Corporate Medical Policy #3.01.22 Gender Affirming Behavioral Health and Medical Services for those members with a diagnosis of gender dysphoria.

POLICY STATEMENT(S)

I. Endometrial ablation is considered **medically appropriate** when **ALL** of the following criteria are met:

A. The patient has experienced menorrhagia/menometrorrhagia ("abnormal uterine bleed") for greater than three (3) menstrual cycles;

B. The patient has been treated with and has failed to respond to hormone therapy (contraceptives, progestin) for three consecutive menstrual cycles, or there is a contraindication to hormone therapy;

C. The symptoms are severe enough to warrant surgical intervention (e.g., hysterectomy);

D. The symptoms interfere with activities of daily living (ADLs) or results in anemia that is unresponsive to treatment;

E. The results of a Pap smear within the past 12 months are within normal limits;

F. Endometrium is normal within the last six (6) to 12 months, as evidenced by **ONE** of the following:

1. Hysteroscopy with dilation and curettage (D & C);
2. Transvaginal ultrasound; **or**
3. Sonohysterogram;

G. The patient is not pregnant, and there is no desire for future pregnancy; **and**

H. The device is approved by the U.S. Food and Drug Administration (FDA).

Contraindications:

I. Contraindications for endometrial ablation include:
   1. Known or suspected endometrial carcinoma or pre-malignant change of the endometrium (e.g., pre-cancerous endometrial abnormalities);
   2. Enlarged uterus (e.g., greater than 10 cm in length or comparable to 12 or more weeks of gestation;
   3. Any anatomic or pathologic condition in which weakness of the myometrium could exist (e.g., history of previous classical cesarean section(s), transmural myomectomy, history of previous endometrial ablation procedure or endometrial resection);
   4. The patient is on medications that could thin the myometrial muscles, such as long-term steroid use (except for inhaler or nasal therapy for asthma);
   5. Uterine prolapse;
   6. Submucosal myomas;
   7. Active genital or urinary tract infection (e.g., cervicitis, vaginitis, endometritis, salpingitis, or cystitis);
   8. Pregnancy or desire to become pregnant in the future;
   9. Intrauterine device (IUD) in place; **or**
   10. Active pelvic inflammatory disease.

J. Thermal balloon endometrial ablation is contraindicated in patients who have a history of latex allergy or who have demonstrated sensitivity to latex material.

K. Microwave ablation is contraindicated in patients who have **ALL** of the following:
   1. Essure contraceptive micro-inserts in place;
   2. Myometrial thickness less than 10 mm; **and**
   3. Uterine sounding length less than 6 cm.

II. Other methods of endometrial ablation (e.g., chemoablation, photodynamic endometrial ablation) are considered **investigational**.

RELATED POLICIES

Corporate Medical Policy

Gender Reassignment Therapies, 1370/20.000447

11.01.03 Experimental or Investigational Services

POLICY GUIDELINE(S)

I. Individuals with abnormal uterine bleeding (menorrhagia) should be screened for possible reasons for the condition, and, if results appear positive, further hematologic work-up should be

performed. Examples of "red flags" indicating that further work-up should be completed for a patient include:

A. A relative who has an inherited bleeding disorder,
B. Prolonged bleeding from small wounds or following dental procedures,
C. Heavy and prolonged bleeding following surgical procedures,
D. Easy bruising,
E. Spontaneous nosebleeds,
F. Blood in the stool or bleeding ulcer requiring urgent medical care,
G. Anemia requiring transfusion,
H. Heavy menses resulting in anemia,
I. Passing of large clots with menses or soaking more than one pad hourly, or
J. Heavy bleeding during or following childbirth.

DESCRIPTION

Endometrial ablation is a method of treating abnormal uterine bleed through destruction of the endometrial lining. Endometrial ablation is an alternative to hysterectomy for women with abnormal uterine bleed from benign causes, who have found medical therapy ineffective or contraindicated.

In addition, in order to exclude other conditions, thyroid stimulating hormone (TSH) and human chorionic gonadotropin (HCG) testing are often performed prior to endometrial ablation, to confirm that these are within normal limits.

Several devices have been developed that utilize various modalities to accomplish endometrial ablation, including, but not limited to laser therapy, resecting loop rollerball using electric current, thermal ablation using a liquid-filled balloon, microwave, electrode array or cryosurgical device.

Thermal fluid-filled balloon, cryosurgical endometrial ablation, instillation of heated saline, and radiofrequency ablation can be performed without general anesthesia in a physician's office and do not require hysteroscopic guidance. Microwave ablation with the Microwave Endometrial Ablation System (MEA) may also be performed in a physician's office but does require use of the hysteroscope.

Methods that utilize direct hysteroscopic visualization include, but are not limited to:

I. Hydrothermal (e.g., Hydro ThermAblator, Genesys HTA System);
II. Neodymium-yttrium aluminum garnet (Nd-YAG) laser;
III. Resectoscope/resecting loop; and
IV. Rollerball.

Methods that do not utilize direct hysteroscopic visualization include, but are not limited to:

I. Cryoablation (e.g., Her Option);

II. Laser interstitial hyperthermy;

III. Microwave (e.g., MEA System, Minitouch 3.8);

IV. Radiofrequency (e.g., NovaSure); and

V. Thermal balloon (e.g., ThermaChoice).

SUPPORTIVE LITERATURE

Several studies have been published that address the various techniques of endometrial ablation as an alternative to hysterectomy for the treatment of abnormal uterine bleed (menorrhagia). In summary, the studies show that endometrial ablation has become the surgical treatment of choice for dysfunctional uterine bleeding when hysterectomy is not desired. In the short-term, hysteroscopic and non-hysteroscopic endometrial ablation techniques have been proven to be safe and effective in reducing excessive menstrual bleeding, when specific criteria are met.

In a 2017 article by Klebanoff et al, the authors sought to determine the incidence and predictors of failed standard of care associated with second-generation endometrial ablation. "Failed" is defined as need for surgical re-intervention. The retrospective cohort study was conducted on subjects undergoing second-generation endometrial ablation between October 2003 and March 2016. Second-generation devices utilized during the study period included the radiofrequency ablation device (RFA), hydrothermal ablation device (HTA), and uterine balloon ablation system (UBA). Of the 5,936 women participating in the study, the surgical re-intervention rate was found to be 15.6%. Age, ethnicity, and radiofrequency ablation were significant risk factors for failed endometrial ablation, and menorrhagia was the leading indication for re-intervention.

Deehan et al (2024) conducted a systematic review and meta-analysis to evaluate the clinical efficacy, safety, and cost-effectiveness of endometrial ablation or resection (E:A/R) compared to hysterectomy for the treatment of heavy menstrual bleeding. Twelve randomized controlled trials (RCTs) with 2,028 women (hysterectomy: n=977 vs. n=1,051) were included in the analysis. Authors concluded that (E:A/R) offers alternatives to hysterectomy. Both procedures have high effectiveness rates, impact on QoL, and safety. Hysterectomy is associated with greater improvement in the bleeding symptoms, both subjectively and objectively, and higher patient-satisfaction up-to two years. However, it has longer operating times, longer recovery periods, and higher rates of postoperative complications. On the other hand, (E:A/R) has lower initial cost than hysterectomy but the need for further surgery is common; therefore, there is no difference in the costs in the long-follow-up. These results should be interpreted with caution due to the heterogeneity of the trials included. An adequately powered and carefully-planned non-inferiority RCT comparing between the different methods of (E:A/R) to those of hysterectomy with long term follow-up periods is required to inform the surgeons, patients, and decision makers with the most clinically-effective and cost-effective surgical treatment for heavy menstrual bleeding.

Marchand et al (2024) conducted a network meta-analysis to determine the efficacy of first- and second-generation ablation techniques compared with medical treatment, invasive surgery and

different modalities of the endometrial ablation (EA) techniques themselves. 49 RCTs that compared 8,038 premenopausal women with abnormal uterine bleeding (AUB) receiving the intervention of second-generation EA techniques were included in the study. The uterine balloon ablation had significantly higher amenorrhoea rates than other techniques in both short (hydrothermal ablation (risk ratio (RR)=0.51, 95%CI 0.37; 0.72), microwave ablation (RR=0.43, 95%CI 0.31; 0.59), first-generation techniques (RR=0.44, 95%CI 0.33; 0.59), endometrial laser intrauterine therapy (RR=0.18, 95%CI 0.10; 0.32) and bipolar radio frequency treatments (RR=0.22, 95%CI 0.15; 0.31)) and long-term follow-up (microwave ablation (RR=0.11, 95%CI 0.01; 0.86), bipolar radio frequency ablation (RR=0.12, 95%CI 0.02; 0.90), first generation (RR=0.12, 95%CI 0.02; 0.90) and endometrial laser intrauterine thermal therapy (RR=0.04, 95%CI 0.01; 0.36)). When calculating efficacy based only on calculated bleeding scores, the highest scores were achieved by cryoablation systems (p-score=0.98). Authors concluded that most second-generation EA systems were superior to first-generation systems but that there is no evidence at this time that any one of the examined second-generation systems is clearly superior to the others.

PROFESSIONAL GUIDELINE(S)

The American College of Obstetricians and Gynecologists (ACOG) issued a committee opinion (number 557) in 2013 on the management of acute abnormal bleeding in nonpregnant women of reproductive age. ACOG recommended medical management as first-line treatment and stated that surgical management be considered for patients who failed or are not suitable for medical management, or who are not clinically stable. Endometrial ablation was listed as a surgical option, along with dilation and curettage, uterine artery embolization, and hysterectomy. ACOG also stated that endometrial ablation should only be considered for patients who have failed other treatments or have a contraindication when women have no plans for future childbearing, and when endometrial and uterine cancer have been ruled out as the cause of acute uterine bleeding.

The World Professional Association for Transgender Health (WPATH) is a 501(c)(3) non-profit, interdisciplinary professional and educational organization that promotes evidence-based care, education, research, advocacy, public policy and respect in transgender health. WPATH publishes documents supporting medical necessary and appropriate care for transgender or transition-related treatments. These are known as the Standards of Care (SOC). WPATHs SOC states that menstrual suppression may impact gender dysphoria and can function as an initial step allowing for "…further exploration of gender-related goals of care, prioritization of other mental health care, or both, especially for those who experience worsening gender dysphoria from unwanted uterine bleeding." Testosterone therapy typically causes cessation of menstruation within six months, but is impacted by the dose, route, frequency, body habitus, and other co-occurring medical conditions that may exist. Residual bleeding can occur after hormone therapy. Endometrial ablation can be offered for those that decline hysterectomy and/or hormone therapy (e.g., nonbinary) or in situations where those considerations may be contraindicated. The American College of Obstetricians and Gynecologists agrees with WPATHs statement regarding the impact of menstrual suppression to decrease gender dysphoria associated with menses, public restroom use for menstrual hygiene and its impact on individuals' attitudes and safety.

REGULATORY STATUS

Several first-generation hysteroscopically aided and second-generation non-hysteroscopically aided devices have been approved by the FDA as a safe and effective alternative to hysterectomy in premenopausal patients with heavy menstrual bleeding due to benign causes for whom childbearing is complete. In 2021, the FDA published guidelines listing contraindications for endometrial ablation which include, but are not limited to, pregnancy, previous endometrial ablation or endometrial resection, previous cesarean section, or infection at the time of treatment.

In 1997, the U.S. Food and Drug Administration (FDA) approved ThermaChoice, the first non-hysteroscopic ablation device to treat excessive uterine bleeding (menorrhagia) due to benign (non-cancerous) causes. The ThermaChoice Uterine Balloon Therapy System (Gynecare) consists of a balloon that is inserted through the neck of the cervix and into the uterus.

In 2001, the FDA approved the Her Option Uterine Cryoblation Therapy System (CryoGen Inc.) uses a cryoprobe capable of producing temperatures down to minus 148˚F (minus 100˚C) at the tip. This extreme cold is applied to the tissue for 10 mins to freeze and destroy the uterine lining. Ultrasound is used to guide and monitor the procedure.

Also, in 2001, the FDA approved the NovaSure-Endometrial Alation System, which utilizes a metallized mesh electrode array that is introduced into the uterine cavity, applying bipolar electrical energy that creates heat to ablate the endometrium.

In 2003, the FDA approved the Microsulis Microwave Endometrial Ablation (MEA) System. The MEA system is a surgical device that uses microwave energy to treat excessive menstrual bleeding by destroying tissue lining the uterus (womb). Endometrial ablation is a minimally invasive surgery that can be a viable alternative to hysterectomy.

The Genesys HTA – Hydro-Thermal Ablation System, FDA approved in 2010, is a hysteroscopic thermal ablation device intended to ablate the endometrial lining of the uterus in premenopausal women with menorrhagia due to benign causes for whom childbearing is complete.

In 2023, the Minitouch 3.8 Era System (Minitouch System) received the Premarket approval (PMA) from the FDA. This device is intended for ablation of the endometrial lining of the uterus for the treatment of menorrhagia caused by non-malignant conditions in pre-menopausal women who do not wish to become pregnant in the future.

The U.S. Food and Drug Administration (FDA) regulates ablation devices as medical devices. All ablation devices including related components require FDA approval before marketing and use in the United States to ensure they are safe and effective for human use. Refer to the FDA Medical Device website. Available from: https://www.fda.gov/medical-devices [accessed 2026 Jan 7]

The FDA lists the most serious type of medical device recalls as well as early alert communications about corrective actions being taken by companies that the FDA believes are likely to be the most serious type of recalls. Available from: Medical Device Recalls | FDA [accessed 2026 Jan 7]

CODE(S)

Background

Cold agglutinin disease (CAD) is rare form of autoimmune hemolytic anemia. It is characterized by premature hemolysis of red blood cells by cold agglutinins. Cold agglutinins are autoantibodies that trigger hemolysis at low temperatures (optimum temperature of 3-4 degrees Celsius). When red blood cells are exposed to temperatures below normal core body temperature, they can be recognized by the cold agglutinins, and the cold agglutinins bind to the I surface antigen on red blood cells and agglutination, or clumping occurs, and the classical complement pathway is activated. This destruction of red blood cells results in hemolytic anemia and increases patient's requirement of red blood cell transfusions. Symptoms of CAD include fatigue, shortness of breath, dizziness, palpitations or chest pain, acrocyanosis (discoloration of extremities), and Raynaud's phenomenon (coldness of the fingers and toes). Cold agglutinin disease can be primary (unknown cause) or secondary to infection, rheumatologic disease, or active hematologic malignancy. Secondary CAD may also be referred to as cold agglutinin syndrome (CAS). Primary CAD has an incidence of one individual per million per year. Because of the pathophysiology of the disease, diagnosis typically occurs during the winter months, and prevalence may be higher in cooler climates. CAD typically affects adults between 40 and 80 years old.

For patients with secondary CAD, treating the underlying cause is the mainstay of therapy. For patients with primary CAD who are asymptomatic, watch and wait is the preferred treatment option. Nonpharmacological treatment for CAD, especially in mild cases, can include avoiding exposure to cold temperatures. For patients experiencing symptoms such as fatigue, Raynaud's phenomenon, and decreased hemoglobin levels, historically, off-label rituximab in combination with bendamustine has been a first line therapy. In a prospective trial from 2017, the combination has showed a 71% overall response ratio with 40% of patients achieving complete response. Median response to treatment was 1.9 months, but even longer time to best response was seen to take a median of seven months. Ninety percent of responders did not relapse after 32 months. Follow-up data on these same patients was published in 2020 and even higher response rate and complete response were noted, 78% and 53% of participants, respectively. Seventy-seven percent of these patients were still in remission after five years.

Enjaymo is a humanized monoclonal antibody that inhibits the C1 complex of the classical complement pathway, which is responsible for hemolysis among patients with CAD. Specifically, Enjaymo binds to complement protein C1 which prevents the deposition of complement proteins that induce phagocytosis on the surface of red blood cells. This inhibition prevents hemolysis from occurring in patients with CAD. Initially, Enjaymo was approved based on a 26-week, open label, single arm Phase III study (CARDINAL) in 24 CAD patients with a history of transfusion led to FDA approval in early 2022. The primary endpoint encompassed an increase from baseline hemoglobin level of > 2g/dL or a hemoglobin level > 12 g/dL at the treatment assessment time point in conjunction with no blood transfusion or additional CAD treatment during weeks five through 26. 71% of patients remained transfusion free during weeks 5 through 26 and 54% of patients reached the composite primary endpoint. The mean increase in hemoglobin level at week three was 2.29 g/dL, and 3.18 g/dL at the treatment assessment time point. It is important to note, that treatment with Enjaymo does not influence symptoms such as coldness in fingers or toes. It is also a chronic treatment, as opposed to historical rituximab containing regimens.

In January 2023, the FDA expanded the approved indication of Enjaymo based on the 26-week phase III, randomized, double-blind, placebo-controlled CADENZA trial. The expanded indication now includes adults without a transfusion history who have CAD. CADENZA assessed safety and efficacy of Enjaymo in 42 total patients (22 in the treatment group and 20 in the placebo group) with CAD without recent (within 6 months prior to enrollment) transfusion history. Composite primary endpoint criteria (hemoglobin increase ≥ 1.5 g/dL at treatment assessment timepoint [mean of weeks 23, 25, 26], avoidance of transfusion, and study-prohibited CAD therapy [weeks 5-26]) were met by 16 patients (73%) on Enjaymo, and 3 patients (15%) on placebo (odds ratio, 15.9 [95% confidence interval, 2.9, 88.0; $P < .001$]).

Summary

Effective Date of Policy:	9/10/2025
Indications	Cold agglutinin disease, Cold autoimmune hemolytic anemia
ICD10 Diagnosis Codes	D59.12
Availability	1,100 mg/22 mL (50 mg/mL) in a single-dose vial
J - Code	J1302

Duration	See continuation criteria

Required Criteria for Initial Approval

All of the following conditions for the requested indication must be met in order to approve therapy:

Specific Indication	Inclusion Criteria	Recommended Dosing Regimen
Indication Cold autoimmune hemolytic anemia (FDA approval) ICD10: D59.12	1. Enrollee is at least 18 years old 2. The prior authorization is being obtained by a hematologist or prescriber who specializes in the treatment of cold agglutinin disease 3. Enrollee must be ≥ 39 kg 4. There is a confirmed diagnosis of primary CAD: a. Cold agglutinin titer ≥ 1:64 at 4⁰ Celsius b. Prescriber attestation that enrollee has chronic hemolysis (i.e. not a result of a transient cause such as infection) c. Positive polyspecific direct antiglobulin test (DAT) d. Monospecific DAT shows both of the following: i. C3d DAT: strongly positive ii. IgG DAT: ≤ 1+ 5. Presence of at least one of the following symptoms associated with CAD: a. Symptomatic anemia b. Acrocyanosis c. Raynaud's phenomenon 6. Secondary CAD has been ruled out (cold agglutinin syndrome secondary to infection, rheumatologic disease, or active hematologic malignancy) 7. Hemoglobin ≤ 10 g/dL a. Consideration may be given to patients who are symptomatic with hemoglobin > 10 mg/dL 8. Trial and failure, contraindication, OR clinically significant intolerance to at least six months of treatment with rituximab in combination with bendamustine or rituximab monotherapy if not a candidate for bendamustine	• Initially administered intravenously weekly for the first two weeks, then administered every two weeks thereafter ○ 39 to less than 75 kg ▪ 6,500 mg ○ 75 kg or more ▪ 7,500 mg

Exclusion Criteria

Therapy will not be covered if any of the above noted inclusion criteria are not met or if any of the below exclusion criteria are met

- Coverage will not be provided for Secondary CAD (i.e., cold agglutinin syndrome secondary to infection, rheumatologic disease, or active hematologic malignancy)
- Enrollee must not be receiving combination therapy with rituximab or another complement inhibitor

Continuation Criteria

- Requests will be reviewed per criteria every six months
- Enrollee positively responds to therapy as evidenced by an increase in hemoglobin of at least 2 g/dL or a hemoglobin level ≥ 12 g/dL AND has been transfusion free after the first 5 weeks of treatment

Considerations

- Prior authorization is obtained through the CDPHP pharmacy department
- Patients should be vaccinated against encapsulated bacteria at least two weeks prior to treatment, according to the most current Advisory Committee on Immunization Practices (ACIP) Recommendations for patients with persistent completement deficiencies

Policy/Procedure Name: Enzyme Replacement Therapy for Fabry Disease **Control Number: 1350/20.000490**

Disclaimer Notice

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgment when deciding the most appropriate care to enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

Background

Fabry disease is a rare, X-linked, progressive genetic disorder characterized by a defective gene (GLA) that causes a deficiency of the enzyme alpha-galactosidase A (α-Gal A). Without alpha-Gal A, patients may experience progressive cardiovascular, neurologic, and renal complications, which are potentially fatal. There are two types of Fabry disease, Type 1 (classic, more severe, shorter life span) and Type 2 (atypical, later-onset, less severe, increased lifespan in comparison).

Treatment for Fabry disease focuses on enzyme replacement therapy (ERT) and related products. Galafold (migalastat) was approved by the FDA in 2018, for the treatment of adults with Fabry disease who have a genetic mutation determined to be amenable to treatment with Galafold based on laboratory data. It is estimated that 35%–50% of patients with Fabry disease may have an amenable GLA variant. Galafold differs from ERT in that it increases the activity of the deficient enzyme rather than replacing it. Currently available ERT includes Fabrazyme (agalsidase beta), approved in 2003, to be used in those at least two years of age. Elfabrio represents the third agent for Fabry disease, providing PEGylated exogenous source of alpha-Gal A enzyme. In comparison to Fabrazyme, Elfabrio was designed as a "biobetter", to have a longer half-life, lower immunogenicity, and an improved safety profile.

Summary

Effective Date of Policy:	2/25/2026
Indications	See agents below
ICD10 Diagnosis Codes	E75.21
HCPCS Code	Fabrazyme: J0180 Elfabrio: J2508
Availability	*See below*
Duration	Initial: 1 year Continuation: 2 years

Required Criteria for Initial Approval

All of the following conditions for the requested indication must be met in order to approve therapy:

Specific Drug	Inclusion Criteria	Recommended Dosing

Fabrazyme (agalsidase beta)
 	
Indication
Treatment of adult and pediatric patients two years of age and older with confirmed Fabry disease
 	
(FDA approval)
ICD10: E75.21
 	
HCPCS: J0180
	• Enrollee is at least two years of age
	• Therapy is prescribed by geneticist, nephrologist, or other physician who specializes in the treatment of Fabry disease
	• Enrollee has confirmed Fabry disease as follows:
	  ○ Male patients:
	  ▪ Enzyme assay test in leukocytes, plasma, fibroblasts, or dried blood spots demonstrating complete deficiency or less than 3% of normal of alpha-galactosidase A activity (alpha-Gal A) OR
	  ▪ Documented GLA gene mutation by gene sequencing.
	  ○ Female patients:
	  ▪ Documented GLA gene mutation by gene sequencing is required for diagnosis
	• Must have clinical symptoms of disease as noted below (except for classically affected males)
	  ○ Males: Classically affected of any age with complete deficiency or less than 3% of normal alphaGal A activity treatment should begin treatment at time of diagnosis. Classically affected pediatric males typically begin treatment between 8–13 years of age.
		• Dosing: 1 mg/kg every two weeks administered as an intravenous infusion
		• See FDA prescribing information for additional administration details.

	○ Atypically affected Males with residual alpha-Gal A activity (3-35% of normal mean): institute treatment if significant symptoms (see below) or evidence of progression of organ involvement ○ Females (all ages): Monitor; institute treatment if significant symptoms (see below) or evidence of progression of organ involvement • Enrollee has clinical manifestations of disease including: ○ Neuropathic pain, acroparesthesias (excruciating pain the hands and feet which occur with exercise, fevers, stress) ○ Angiokeratomas (clusters of red to blue rash-liked discolorations on the skin) ○ Anhidrosis or hypohidrosis (absent or markedly decreased sweating) ○ Gastrointestinal symptoms (abdominal pain, cramping, frequent bowel movements) ○ Corneal dystrophy (star-burst pattern of cornea seen by slit lamp ophthalmologic examination) ○ Cardiovascular complications (arrhythmias, left ventricular hypertrophy, hypertrophic cardiomyopathy) ○ Renal complications (progressive proteinuria, renal insufficiency, renal failure) ○ Cerebrovascular disease (transient ischemic attack, stroke) • For new starts on Formularies 3, 4, and CHP only: Enrollee must have experienced serious side effects or drug failure to Galafold (migalastat) except in the following circumstances: ○ Pediatric patients between the ages of 8 years old to less than 18 years old ○ Patients with severe, classical phenotype who demonstrate no alpha galactosidase activity OR ○ those who exhibit severe clinical Fabry disease symptoms (as previously noted) where the provider has determined that Fabrazyme is medically necessary. ○ Patients with estimated glomerular filtration rate (eGFR) < 30 mL/min/1.73 m2 OR end-stage renal disease (ESRD) ○ Patients who do not have an amenable GLA gene mutation for treatment with Galafold based on the human embryonic kidney (HEK) 293 assay • Will not be used concomitantly receive Galafold (migalastat) or Elfabrio (pegunigalsidase alfa) • Current body weight and requested dose regimen must be submitted for initial review and each recertification request	
Elfabrio (pegunigalsidase alfa) **Indication** Treatment of adults with confirmed Fabry disease (FDA approval) ICD10: E75.21 HCPCS: J2508	• Enrollee is at least 18 years of age • Therapy is prescribed by geneticist, nephrologist, or other physician who specializes in the treatment of Fabry disease • Enrollee has confirmed Fabry disease as follows: ○ Male patients: ▪ Enzyme assay test in leukocytes, plasma, fibroblasts, or dried blood spots demonstrating complete deficiency or less than 3% of normal of alpha-galactosidase A activity (alpha-Gal A) OR ▪ Documented GLA gene mutation by gene sequencing.	• Dosing: 1 mg/kg every two weeks administered as an intravenous infusion • See FDA prescribing information for additional administration details.

- Female patients:
  - Documented GLA gene mutation by gene sequencing is required for diagnosis

- Must have clinical symptoms of disease as noted below (except for classically affected males)
  - Males: Classically affected of any age with complete deficiency or less than 3% of normal alphaGal A activity treatment should begin treatment at time of diagnosis. Classically affected pediatric males typically begin treatment between 8–13 years of age.
  - Atypically affected Males with residual alpha-Gal A activity (3-35% of normal mean): institute treatment if significant symptoms (see below) or evidence of progression of organ involvement
  - Females (all ages): Monitor; institute treatment if significant symptoms (see below) or evidence of progression of organ involvement
- Enrollee has clinical manifestations of disease including:
  - Neuropathic pain, acroparesthesias (excruciating pain the hands and feet which occur with exercise, fevers, stress)
  - Angiokeratomas (clusters of red to blue rash-liked discolorations on the skin)
  - Anhidrosis or hypohidrosis (absent or markedly decreased sweating)
  - Gastrointestinal symptoms (abdominal pain, cramping, frequent bowel movements)
  - Corneal dystrophy (star-burst pattern of cornea seen by slit lamp ophthalmologic examination)
  - Cardiovascular complications (arrhythmias, left ventricular hypertrophy, hypertrophic cardiomyopathy)
  - Renal complications (progressive proteinuria, renal insufficiency, renal failure)
  - Cerebrovascular disease (transient ischemic attack, stroke)
- For new starts on Formularies 3, 4, and CHP only: Enrollee must have experienced serious side effects or drug failure to Galafold (migalastat) except in the following circumstances:
  - Pediatric patients between the ages of 8 years old to less than 18 years old
  - Patients with severe, classical phenotype who demonstrate no alpha galactosidase activity OR
  - those who exhibit severe clinical Fabry disease symptoms (as previously noted) where the provider has determined that Fabrazyme is medically necessary.
  - Patients with estimated glomerular filtration rate (eGFR) < 30 mL/min/1.73 m2 OR end-stage renal disease (ESRD)
  - Patients who do not have an amenable GLA gene mutation for treatment with Galafold based on the human embryonic kidney (HEK) 293 assay
- Will not be used concomitantly receive Galafold (migalastat) or Fabrazyme (agalsidase beta)
- Current body weight and requested dose regimen must be submitted for initial review and each recertification request

Exclusion Criteria

Therapy will not be approved if any of the above Inclusion Criteria are not met OR any of the below Exclusion Criteria are met:

- Enrollee has non-compliance with > 50% of treatments and/or failure to regularly attend follow up visits
- Enrollee has persistent life threatening or severe infusion reactions that do not respond to prophylaxis (e.g., anaphylaxis)
- End stage renal disease without an option for kidney transplantation, in combination with advanced heart failure (NYHA Class IV)
- End stage Fabry disease or other comorbidities with a life expectancy of less than one year
- Cognitive decline of any cause
- Lack of treatment response for one year, when the primary indication for ERT is neuropathic pain while receiving maximum supportive care

Continuation Criteria

- Requests will be reviewed per criteria every six months
- Enrollee continues to meet above noted Inclusion Criteria and does not meet any Exclusion Criteria
- Enrollee has disease response as demonstrated by improvement or stabilization of the disease including neuropathic pain and/or the rate of decline of the estimated glomerular filtration rate (eGFR)

Considerations

- Prior authorization is obtained through the CDPHP pharmacy department

MEDICAL POLICY

Medical Policy Title	**Erectile Dysfunction**
Policy Number	**7.01.30**
Current Effective Date	**June 1, 2026**
Next Review Date	**October 2026**

Our medical policies are based on the assessment of evidence based, peer-reviewed literature, and professional guidelines. Eligibility for reimbursement is based upon the benefits set forth in the member's subscriber contract. (Link to Product Disclaimer)

POLICY STATEMENT(S)

Diagnosis

I. Diagnosing of ED with **ANY** of the following procedures is considered **medically appropriate**:
   A. Nocturnal penile tumescence (NPT) test, only when the clinical evaluation is unable to distinguish psychogenic from organic impotence;
   B. Duplex scan in conjunction with intracorporeal papaverine;
   C. Pharmacological response test (PRT) using vasoactive medications such as papaverine HCL, prostaglandin E1;
   D. Dynamic infusion cavernosonogram and cavernosometry, for patients who meet the criteria for penile revascularization;
   E. Pudendal arteriography/angiography, for patients who meet the criteria for penile revascularization;
   F. Penile biothesiometry (considered an integral part of evaluation and management during an office visit).

II. Diagnosing ED with **ANY** of the following procedures is considered **not medically necessary**:
   A. Dorsal nerve conduction latencies;
   B. Penile plethysmography;
   C. Cavernosal nerve mapping;
   D. Evoked potential measurements;
   E. Corpora cavernosal electromyography.

Treatment

III. Treatment modalities for individuals with known erectile dysfunction (ED) are considered **medically appropriate** when **ALL** of the following criteria have been met:
   A. Symptoms have lasted more than six (6) months (See Policy Guidelines for treatment prior to six (6) months); **AND**
   B. **One** of the following treatment modalities:

Proprietary Information of Capital District Physicians' Health Plan, Inc. | CDPHP Universal Benefits,® Inc. | Capital District Physicians' Healthcare Network, Inc.

1. Oral Drug Therapy (i.e., sildenafil citrate (Viagra), vardenafil (Levitra, Staxyn), avanafil (Stendra), and tadalafil (Cialis);
2. Intracavernous Injection Therapy (e.g., Caverject, Edex);
3. Transurethral Delivery System (i.e., Medicated Urethral System for Erection [MUSE]);
4. Vacuum Constriction Devices (i.e., ErecAid);
5. Penile Prosthetic Implants (i.e., semi-rigid, malleable and inflatable): Only medically appropriate in patients who fail or refuse other forms of therapy. Penile prosthesis implantation should not be performed in men with psychogenic ED, unless a psychiatrist or psychologist participates in the preoperative evaluation and concurs with the need for prosthesis implantation;
6. Arterial Revascularization: Only medically appropriate in men with normal corporeal venous function who have arteriogenic ED secondary to pelvic or perineal trauma.

IV. Electroejaculation is considered **medically appropriate** for the following indications:

A. For men with spinal cord injury who desire to become biological fathers;

B. The inability to ejaculate is a consequence of retroperitoneal lymph node dissection (REPLND);

C. Insulin-dependent diabetes;

D. Multiple Sclerosis (MS);

E. Spina bifida or other neural tube deficit, complications due to bladder or rectal surgery, or idiopathic anejaculation (neurogenic, psychogenic or a combination of both).

V. Treatment of ED using **ANY** of the following modalities is considered **not medically necessary**:

A. Topical medications containing vasodilators;

B. Arterial (penile) revascularization (except for the indication listed above in Policy Statement I);

C. Venous ligation in the treatment of venous leak impotency (venous ligation attempts to close off the natural drainage of the penis to maintain blood in the penis during an erection);

D. Crural ligation for primary venous leakage ED;

E. Temporary or permanent lumbar ganglionic block or sympathectomy for ED secondary to cavernous adrenergic hypertone.

VI. Treatment of ED or Peyronie's Disease using **ANY** of the following modalities is considered **investigational**, including but not limited to:

A. Extracorporeal Shock Wave Therapy (ESWT);

B. Penile contracture devices (e.g., RestoreX).

RELATED POLICIES

Corporate Medical Policy

11.01.03 Experimental or Investigational Services

POLICY GUIDELINE(S)

I. Treatment may be initiated prior to six (6) months, in the case of an acute event such as penile trauma or radical pelvic surgery (e.g., prostatectomy or cystectomy), or in the case of drug-induced ED caused by treatment of a co-morbid condition.

II. The least invasive procedure should be the first line of treatment. If a member fails oral therapy, a durable medical equipment (DME) modality should generally be the next step in treatment.

III. Vacuum constriction devices are considered to be durable medical equipment.

IV. The following treatment modalities are dependent upon a member's subscriber contract with a prescription drug benefit: oral drug therapy, intracavernous injection therapy, and transurethral delivery system. (Refer to Pharmacy Management for information regarding coverage of oral drug therapy).

V. With the exception of oral drug therapy, a statement of medical necessity from the urologist is required documenting results of clinical evaluation and any diagnostic test results.

VI. Oral drugs such as Sildenafil citrate (Viagra), vardenafil (Levitra, Staxyn), avanafil (Stendra), and tadalafil (Cialis) inhibit (block) the effect of an enzyme, phosphodiesterase-5 (PDE5), causing an increase in penile blood flow necessary for an erection.

   A. PDE5 inhibitors should not be used in combination with other treatment modalities for ED.

   B. PDE5 inhibitors are contraindicated if the patient is actively taking nitrates in any form.

   C. PDE5 inhibitors should be used with caution in patients who take alpha-blockers.

   D. Vardenafil should be used with caution if a patient, or a patient's family member, has a rare heart condition known as "prolongation of the QT interval."

VII. Patients using vasoactive drug injection therapy should be informed that a prolonged erection can occur and that they should present for treatment if the erection lasts longer than four (4) hours such as papaverine, phentamine, and/or prostaglandin E1 (alprostadil).

DESCRIPTION

ED, or impotence, is defined as the inability, over time, to consistently achieve or maintain an erection of sufficient rigidity for sexual penetration. ED involves the inability to achieve or maintain an erection and have sexual activity 80% of the time it is attempted.

ED may be psychogenic in origin; or caused by penile trauma, spinal cord injuries, abnormalities of the penis (e.g., penile fibrosis or Peyronie's disease), veno-occlusive dysfunction; or result from a radical pelvic surgery (e.g., radical prostatectomy or cystectomy). ED may also be a secondary

Proprietary Information of Capital District Physicians' Health Plan, Inc. | CDPHP Universal Benefits,® Inc. | Capital District Physicians' Healthcare Network, Inc.

symptom of a systemic disease or its treatment (e.g., diabetes mellitus, hypertension, blood lipid abnormalities, coronary artery disease or peripheral vascular disease). Brief, sporadic episodes of erectile failure are common occurrences and are often related to psychological stress.

The evaluation of a patient with ED usually consists of a structured interview and a thorough physical examination. Adjunctive testing, such as vascular assessment, neurological assessment, and monitoring of nocturnal erections, may be indicated in select patients.

Peyronie's Disease (PD) is a localized connective tissue disorder of unknown cause and is characterized by the formation of inelastic fibrous plaques within the tunica albuginea or erectile tissue of the penis. For many patients, PD results in sexual problems due to the difficulty in attaining and/or maintaining erections.

ED Treatment Modalities

- Vacuum constriction devices (e.g., ErecAid) use a hand pump and cylindrical component to create a vacuum around the penis, drawing blood into the penis, which results in an erection.
- Medicated Urethral System for Erection (MUSE) is a method in which alprostadil (prostaglandin E1) is given transurethrally to treat ED.
- Intracavernous Injection Therapy (e.g., Caverject, Edex) are vasodilating agents such as papaverine, phentamine, and/or prostaglandin E1 (alprostadil) are injected into the corpora of the penis to produce an erection.
- Arterial revascularization refers to taking a blood vessel from another part of the body and using it to surgically bypass a blockage in the natural blood vessel of the penis.
- Electroejaculation (EE) has had a large degree of success in enabling men with spinal cord injuries to become biological fathers. Up to 95% of men with spinal cord injury are unable to ejaculate normally. Vibratory and electrical stimulation, along with an appropriate method of semen collection followed by intrauterine insemination, has resulted in successful conception in a large number of cases.
- Extracorporeal Shock Wave Therapy (ESWT) uses energy from the acoustic waves in an attempt to increase the expression of local growth factors, improving endothelial function, angiogenesis and potentially regenerating nerve fibers.
- Penile Contracture Device (e.g., RestoreX) is used for the treatment of Peyronie's disease and is also now available to correct penile curvature or indentation/hourglass deformity, restore penile length loss secondary to medical conditions or due to prior surgery/trauma, and to limit loss of erectile function post-prostatectomy.

SUPPORTIVE LITERATURE

Sildenafil citrate (Viagra), vardenafil (Levitra, Staxyn), avanafil (Stendra), and tadalafil (Cialis) are phosphodiesterase type 5 inhibitors and are the only oral therapy approved by the FDA for the treatment of ED.

Eroxon (MED3000) is a topical gel for the treatment of ED, it was approved for over-the-counter use without a prescription based on its low risk profile and rapid onset. It is considered a medical device rather than a drug due to its mechanical mode of action by stimulating the nerve endings to trigger natural erection pathways.

Phase III clinical trials of alprostadil topical cream for the treatment of mild to severe ED have recently concluded. Topical alprostadil cream appears to have improved ED in a broad range of patients and was safe and well-tolerated in the trials; however, it has not received U.S. Food and Drug Administration (FDA) approval for this use.

There is rarely any indication for the routine use of nocturnal penile tumescence (NPT) or rigidity testing. These tests have been difficult to standardize, and their actual benefit in determining therapy is unclear. NPT and rigidity testing may be useful in a patient who reports a complete absence of erections or when a primary psychogenic etiology is suspected. Ultrasound, angiography, and intracavernosal papaverine injections are widely used for the diagnosis of vasculogenic impotence, such as when a patient has sustained a groin trauma. Biothesiometry is the accepted technique for the neurological assessment of impotence. More extensive neurology tests, including nerve conduction latencies, evoked potential measurements, and corpora cavernosal electromyography, are of limited clinical value and are usually not medically necessary for diagnostic purposes.

Low intensity extracorporeal shock wave therapy has been utilized by urologists since the 1980s for the non-invasive fragmentation of kidney stones in the form of extracorporeal shockwave lithotripsy (ESWL). Within the realm of sexual medicine there has been tremendous interest for LiSWT in the treatment of ED with a handful of preclinical studies followed by several clinical trials.

Abou Zahr et al (2022) conducted a systematic review and meta-analysis evaluating the effectiveness of intra-cavernosal injection (ICI) of botulinum toxin (BoNT-A) as a treatment for erectile dysfunction (ED). The authors reviewed literature from 1990 to 2021, ultimately including seven studies (five clinical and two pre-clinical). The meta-analysis focused on three key outcomes: Erection Hardness Score (EHS), Peak Systolic Velocity (PSV) in the cavernosal artery, and the Sexual Health Inventory for Men (SHIM) score. Results showed statistically significant improvements in EHS and PSV with BoNT-A compared to placebo, suggesting potential benefits in erectile function. However, no significant improvement was found in SHIM scores. The authors caution that these findings should be interpreted carefully due to limitations such as small sample sizes, heterogeneity among studies, and potential biases. They conclude that while BoNT-A shows promise, its use should remain within clinical research settings until further evidence supports broader application.

Vinay et al (2021) conducted a randomized, double-blinded, sham -controlled study, the aim of the trail was to assess the effects of electromagnetic low-intensity (LI-ESWT) on the erectile dysfunction of vascular phosphodiesterase type 5 inhibitor (PDE5I) refractory ED patients. There were 76 participants with vascular PDE5I refractory ED, 40 were treated with LI-ESWT (one session/ week for 4 weeks, 5000 shocks/session, 0.09 mJ/mm^2 energy density), and 26 were treated with a sham probe. Three-month follow-up, median change in IIEF-EF score for active and sham groups was 3.5 (IQR 0–10) and −0.5 (IQR −11 to 1). Six months after treatment, 52.5% of patients (21/40) in the active group and 27.8% of patients (10/36) in the sham group presented an EHS>2. At the same

evaluation, 40.0% (16/40) and 13.9% (5/36) of patients had positive answers to GAQ-1, in the treated and sham groups. While this therapy is promising longer follow-up is needed that compares different ED etiologies and protocol characteristics.

Toussi et al (2021) conducted a randomized single-center controlled study, they studied at 82 men post prostatectomy. with 6-month data available in 25 controls and 30 penile traction therapy cases. More penile traction therapy men reported satisfaction or improvement in penile length than controls. Adverse events were transient and mild; 87% would choose to repeat therapy, and 93% would recommend it to others. Although the use of the penile contracture device showed improvements in objective and subjective penile length post prostatectomy and measures of erectile dysfunction, intercourse satisfaction, external validation is warranted. Currently there is limited clinical trials, peer reviewed or supporting literature that supports the use of contracture devices for the treatment of Peyronie's Disease to aide with ED.

Joseph et al (2020) investigated the clinical outcomes of the RestoreX penile traction therapy device in men with Peyronie's disease. This open-label and follow-up phase study demonstrated that the device significantly improved penile curvature, length, and erectile function. Participants used the device for short daily sessions (typically 30–90 minutes), and those who adhered to the protocol experienced statistically significant reductions in curvature (up to 30°), gains in penile length (up to 1.5 cm), and improvements in sexual function scores. The study also noted that the device was well-tolerated, with minimal adverse effects, supporting its role as a non-invasive, first-line or adjunctive treatment for Peyronie's disease.

PROFESSIONAL GUIDELINE(S)

The American Urological Association (AUA) 2018 guidelines for Erectile Dysfunction state:

- For men with ED, low intensity extracorporeal shock wave therapy (ESWT) should be considered investigational. (Conditional Recommendation; Evidence Level: Grade C)
- For men with ED, intracavernosal stem cell therapy should be considered investigational. (Conditional Recommendation; Evidence Level: Grade C.)
- For men with ED, platelet rich plasma (PRP) therapy should be considered experimental. (Expert Opinion)
- For young men with ED and focal pelvic/penile arterial occlusion and without documented generalized vascular disease or veno-occlusive dysfunction, penile arterial reconstruction may be considered. (Conditional Recommendation; Evidence Level: Grade C)
- For men with ED, penile venous surgery is not recommended. (Moderate Recommendation; Evidence Level: Grade C)

National Comprehensive Cancer Network (NCCN) guidelines for Prostate Cancer V.2.2025

- "Recovery of erectile function is directly related to age at radical prostatectomy, preoperative erectile function, and the degree of preservation of the cavernous nerves. Replacement of

resected nerves with nerve grafts has not been shown to be beneficial. Early restoration of erections may improve late recovery."

REGULATORY STATUS

In 2008, New York State mandated that Medicaid, Family Health Plus, Healthy New York, and standardized HMO and HMO/POS direct payment policies exclude coverage of drugs, procedures, and supplies for the treatment of ED when provided to, or prescribed for use by, a person who is required to register as a sex offender under state law. In addition, in 2005, a federal law was enacted that excludes coverage of drugs to treat erectile dysfunction for all Family Health Plus enrollees.

Sildenafil citrate (Viagra), vardenafil (Levitra, Staxyn), avanafil (Stendra), and tadalafil (Cialis) are phosphodiesterase type 5 inhibitors and are the only oral therapy approved by the FDA for the treatment of ED.

Eroxon (MED3000) is an over-the-counter topical gel for the treatment of ED that received FDA approval in 2023.

CODE(S)

- Codes may not be covered under all circumstances.
- Code list may not be all inclusive (AMA and CMS code updates may occur more frequently than policy updates).
- (E/I)=Experimental/Investigational
- (NMN)=Not medically necessary/appropriate

CPT Codes

Code	Description
37788	Penile revascularization, artery, with or without vein graft
37790 (NMN)	Penile venous occlusive procedure
54220	Irrigation of corpora cavernosa for priapism
54230	Injection procedure for corpora cavernosography
54231	Dynamic cavernosometry, including intracavernosal injection of vasoactive drugs (e.g., papaverine, phentolamine)
54235	Injection of corpora cavernosa with pharmacologic agent(s) (e.g., papaverine, phentolamine)
54240 (NMN)	Penile plethysmography
54250	Nocturnal penile tumescence and/or rigidity test
54400	Insertion of penile prosthesis; non-inflatable (semi-rigid)
54401	Insertion of penile prosthesis; inflatable (self-contained)

Code	Description
54405	Insertion of multi-component, inflatable penile prosthesis, including placement of pump, cylinders, and reservoir
54406	Removal of all components of a multi-component, inflatable penile prosthesis without replacement of prosthesis
54408	Repair of component(s) of a multi-component, inflatable penile prosthesis
54410	Removal and replacement of all component(s) of a multi-component, inflatable penile prosthesis at the same operative session
54411	Removal and replacement of all components of a multi-component, inflatable penile prosthesis through an infected field at the same operative session, including irrigation and debridement of infected tissue
54415	Removal of non-inflatable (semi-rigid) or inflatable (self-contained) penile prosthesis, without replacement of prosthesis
54416	Removal and replacement of non-inflatable (semi-rigid) or inflatable (self-contained) penile prosthesis at the same operative session
54417	Removal and replacement of non-inflatable (semi-rigid) or inflatable (self-contained) penile prosthesis through an infected field at the same operative session, including irrigation and debridement of infected tissue
55870	Electroejaculation
93980	Duplex scan of arterial inflow and venous outflow of penile vessels; complete study
93981	Duplex scan of arterial inflow and venous outflow of penile vessels; follow-up or limited study
0864T (E/I)	Low-intensity extracorporeal shock wave therapy involving corpus cavernosum, low energy

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgment when deciding the most appropriate care to enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

Background

Management of high cholesterol levels, particularly elevated low-density lipoprotein cholesterol (LDL-C), is recommended to reduce risk of cardiovascular adverse events. The most recent recommendations from the 2018 American College of Cardiology/American Heart Association (ACC/AHA) Guideline on the Management of Blood Cholesterol are based on evidence from primary sources of randomized controlled trials (RCTs). This guideline emphasizes LDL-C lowering drugs in high-risk patients produces marked reductions in atherosclerotic cardiovascular disease (ASCVD). Among lipid lowering drugs, statins are the cornerstone of therapy (statin intensities described in the guideline) as an adjunct to diet and other lifestyle modifications for cholesterol management and cardiovascular risk reduction. Other lipid lowering drugs include Zetia (ezetimibe), bile acid sequestrants and proprotein convertase subtilisin kexin-type 9 (PCSK9) inhibitors.

Familial hypercholesterolemia (FH) is an inherited genetic condition (chromosome 19) that results in very high LDL-C levels, usually starting at a younger age. FH leads to a twenty-fold increase in the risk of premature ASCVD. Diagnosis of this condition is important as early aggressive treatment may lower a patient's risk of heart disease or stroke. There are two forms of FH: heterozygous familial hypercholesterolemia (HeFH) and homozygous familial hypercholesterolemia (HoFH). Both forms of FH increase a patient's risk of ASCVD, however, the latter is a more severe and rare condition. It is estimated to affect as many as 1 in 300,000 people all over the world, whereas HeFH is more common affecting 1 in 250 people. Patients with HeFH have LDL-C levels > 190mg/dL, with coronary heart disease (CHD) onset between the ages of 30 to 60. Consequently, patients with HoFH have LDL-C levels typically > 400mg/dL, with CHD onset at childhood. Most patients with HeFH respond to drug therapy, whereas HoFH patients generally have poor response. HoFH patients may have serious cholesterol deposits in the arteries or aortic valve of the heart which may cause heart attacks in patients as early as < 10 years old.

In addition to elevated LDL-C levels, patients with FH may experience physical findings such as xanthomas, which are fatty deposits under the skin (often on the Achilles tendon or joints of the hand) and xanthelasmas, which are fatty deposits under the skin on the eyelids or corneal arcus, which is a grayish ring on the periphery of the cornea.

As mentioned, FH is inherited and passed down through families. Each child of a person with FH has a 50% chance of inheriting the disorder. Presently, most people with FH have genetic variants which may affect LDL-R, apolipoprotein B (APOB) or PCSK9, among others. Depending on how many mutations a person inherits determines whether they have HeFH or HoFH. If one abnormal mutation is passed down to a child, typically from one parent, the patient will have HeFH. When the mutation for HeFH is passed on from both parents to their children, this will result in HoFH (more rare and severe). HoFH is most often caused by a loss-of-function variant in the LDL-R, which leads to low or absent hepatic clearance of LDL from the circulation. Those with null homozygotes have higher LDL cholesterol levels due to very minimal to no LDL-R expression. Patients with two non-null alleles or one non-null allele/null allele, may have a partial reduction in LDL-R activity. Mechanistically, agents such as statins, ezetimibe and PCSK9 inhibitors rely heavily on upregulating LDL-receptor expression, which may have little efficacy on patients with null/null HoFH who may have no LDL receptor activity.

The standard of care for treatment of FH may consist of a combination of one or more medications in addition to dietary and lifestyle modifications (exercise and smoking cessation) for adequate management of LDL-C. Treatment options may include high-dose statins (used in most individuals), ezetimibe, bile acid sequestrants and PCSK9 inhibitors. Patients diagnosed with HoFH are more resistant to treatment and will have substantially high LDL-C levels despite combination treatment with these agents. As mentioned above, patients with HoFH may have reduced LDL receptor activity, which can lead to efficacy concerns when using conventional treatments (statins, ezetimibe and PCSK9 inhibitors).

Therefore, advanced treatment options are available for patients once they have exhausted other available treatments or those who

still remain with substantially high LDL-C levels. The effects of these treatments work independently of the LDL receptor, eliminating the concerns with LDL receptor expression and the use of statins, ezetimibe and PCSK9 inhibitors. These treatments include lipoprotein apheresis, which is a procedure done every week to every other week to remove LDL-C from the bloodstream.

Angiopoietin-like 3 (ANGPTL3) is molecule produced by the liver which inhibits lipoprotein lipase and endothelial lipase. Lipase plays a key role in lipid metabolism. Loss of function variants with ANGPTL3 have been associated with low levels of LDL-C and triglycerides and with a 41% lower risk of coronary artery disease (CAD). Pharmacological inhibition of ANGPTL3 with Evkeeza (evinacumab-dgnb), a fully human monoclonal antibody has shown to reduce LDL-C by 49% from baseline as well as lower levels of APOB, non-HDL and total cholesterol. The ELIPSE-HoFH has further shown evinacumab to be generally well tolerated, with reported incidence of nasopharyngitis and influenza-like illness. The safety and effectiveness of Evkeeza has have not been established in patients with other causes of hypercholesterolemia, including those with HeFH.

The 2022 ACC Expert Consensus Decision Pathway on the role of non-statin therapies for LDL-C lowering in the management of atherosclerotic cardiovascular disease includes Evkeeza as an optional intervention to consider in HoFH patients that fail to respond adequately to maximally-tolerated statin therapy.

Summary	
Effective Date of Policy:	9/10/2025
Indications	Homozygous familial hypercholesterolemia
ICD10 Diagnosis Codes	Select codes include: E78.01
Availability	Single dose vials for intravenous injection 345mg/2.3mL (150mg/mL) and 1,200mg/8mL (150mg/mL) solution J1305
Duration	Initial: Six months Continuation: 12 months

Required Criteria for Initial Approval	
All of the following conditions for the requested indication must be met in order to approve therapy:	
Indication	**Criteria**
Homozygous Familial Hypercholesterolemia (FDA approval) ICD10: E78.01	1. Evkeeza is prescribed by or in consultation with a cardiologist, lipid specialist, or endocrinologist **AND** 2. Member is ≥5 years of age or older with a diagnosis of homozygous familial hypercholesterolemia (HoFH) **AND** a. Genetic testing must demonstrate evidence of two mutant alleles at the low-density lipoprotein receptor (*LDLR*) apolipoprotein B (*APOB*), proprotein convertase subtilisin kexin type 9 (*PCSK9*) or low-density lipoprotein receptor adaptor protein 1 (*LDLRAP1*) gene **OR** b. Member has a history of untreated LDL-C plasma concentration of > 400 mg/dL or treated LDL-C ≥ 300 with one of the following: i. Xanthoma before the age of 10 years **OR** ii. At least one parent having clinically diagnosed familial hypercholesterolemia **AND** 3. One of the following must be met (a or b): a. For individuals 10 years of age and older, member must have failed to reach target LDL-C while receiving treatment with maximally tolerated high potency statin (goal is atorvastatin 40-80 mg daily or rosuvastatin 20-40 mg daily), in combination with ezetimibe, and a PCSK9 inhibitor (Repatha, Praluent) for at least 8 weeks. A trial with a PCSK9 inhibitor is not required if the member is known to have two LDL-receptor negative alleles (null homozygous). **OR** b. For individuals 5-9 years of age, member must have failed to reach target LDL-C while receiving treatment with at least one lipid lowering therapy (e.g., statins, ezetimibe, lipoprotein apheresis) for at least 8 weeks

	4. LDL-C must be > 70 mg/dL for patients with clinical atherosclerotic cardiovascular disease (ASCVD) OR LDL-C must be > 100 mg/dL for patients without documented clinical ASCVD o Clinical ASCVD defined as having a history of acute coronary syndrome, myocardial infarction (MI), stable or unstable angina, coronary/other arterial revascularization, stroke, TIA, peripheral arterial disease, or other documented atherosclerotic disease (such as coronary atherosclerosis, renal atherosclerosis, aortic aneurysm secondary to atherosclerosis, or Carotid plaque with ≥ 50% stenosis) 5. Prescriber must attest that a discussion with the patient has taken place regarding a heart healthy diet, the importance of exercise, and smoking cessation (if applicable) 6. Documentation of baseline LDL-C level must be provided-measurement must occur within 60 days prior to treatment

Exclusion Criteria

- Evkeeza will not be approved for other causes of hypercholesterolemia, including those with heterozygous familiar hypercholesterolemia (HeFH)
- Evkeeza will not be approved in combination with Juxtapid unless the patient demonstrated failure to achieve target LDL-C while on a minimum therapy duration of 8 weeks of combination Juxtapid, high-intensity or maximally tolerated statin therapy and a PCSK9 inhibitor

Continuation Criteria

- After the initial six-month approval, further approval will require evidence of an adequate reduction in LDL-C level compared to baseline. Continuation approvals will be granted for 12 months.

Considerations

- Prior authorization is obtained through the CDPHP pharmacy department.
- Evkeeza will be covered under the medical benefit
- The recommended dosage is 15 mg/kg administered by intravenous (IV) infusion every 4 weeks.
- Members should be involved with care plan towards optimal lifestyle, including, but not limited to:
  - Eating a heart-healthy diet
  - Regular exercise
  - Weight loss plan if BMI ≥ 30
  - Smoking cessation plan
- Based on the findings in animal reproduction studies, Evkeeza may cause fetal harm when administered to pregnant patients.
- If patient is unable to tolerate statin therapy, documentation in progress notes must include:
  - A contraindication to statin therapy according to FDA labeling OR
  - History of statin-related rhabdomyolysis
    - Must have symptoms consistent with rhabdomyolysis (i.e., muscle pain, swelling, and weakness, dark urine) AND
    - Must have creatine kinase (CK) level > 10 times upper limit of normal, myoglobinuria, or acute renal failure (increase in serum creatinine > 0.5 mg/dL) AND
    - Patient was receiving a statin at the time of the event and symptoms resolved upon discontinuation of the statin OR
  - History of statin intolerance. Documentation must include the following:
    - Inability to tolerate at least 2 different statins
      - At least 1 statin must be hydrophilic (such as pravastatin, fluvastatin, or rosuvastatin) starting at the lowest starting average daily dose AND

- Intolerance associated with confirmed, intolerable statin-related adverse effects (i.e., muscle related symptoms) or significant biomarker abnormalities (i.e., ALT/AST > 3 times the upper limit of normal accompanied by increase in total bilirubin > 2 times the upper limit of normal) AND
- Non-statin causes of muscle symptoms or biomarker abnormalities have been ruled out (for example, hypothyroidism, reduced renal function, reduced hepatic function, rheumatologic disorders such as polymyalgia rheumatic, steroid myopathy, vitamin D deficiency, or primary muscle disease)

CDPHP Pharmacy Services 9/10/2025

Policy History

Date	Notes
04/2021	New Policy
04/2022	Reviewed with no changes
04/2023	Revised - Added limitation of Evkeeza from package insert to background, added most recent guideline recommendation for using Evkeeza in HoFH.
04/2024	Revised: • Evkeeza can now be used in ages 5 years and older. • Updated diagnostic criteria in line with ACC publication.
04/2025	Revised – added ezetimibe as a prerequisite medication trial in combination with statin and PCSK9. Added lipid specialist and endocrinologist as appropriate prescribers. Separated the prerequisite trial of medication by age group requiring only one lipid lowering therapy for individuals ages 5-9. Changed continuation approval duration from six months to twelve months.
9/2025	Updated pre-requisite drug requirement Added language in considerations for statin intolerance

MEDICAL POLICY

Medical Policy Title	**Evoked Potentials**
Policy Number	**2.01.27**
Current Effective Date	**September 1, 2026**
Next Review Date	**May 2027**

Our medical policies are guides to evaluate technologies or services for medical necessity. Criteria are established through the assessment of evidence based, peer-reviewed scientific literature, and national professional guidelines. Federal and state law(s), regulatory mandates and the member's subscriber contract language are considered first in the determination of a covered service. (Link to Product Disclaimer)

POLICY STATEMENT(S)

I. Visual-evoked potentials are considered **medically appropriate** for **ANY** of the following indications:

- A. To diagnose and monitor multiple sclerosis;
- B. To localize the cause of a visual field defect that is not explained by lesions seen on CT, or MRI, metabolic disorder, or infectious disease;
- C. To diagnose or evaluate deficits or damage to the visual system of infants or unresponsive/nonverbal patients.

II. Somatosensory-evoked potentials are considered **medically appropriate** for **ANY** of the following indications:

- A. To assess any decline that may be considered emergent to surgery in unconscious spinal cord injury patients who show specific structural damage to the somatosensory system and who are candidates for emergency spinal cord surgery;
- B. To diagnose and monitor multiple sclerosis;
- C. To evaluate patients with suspected brain death;
- D. To diagnose unexplained myelopathy;
- E. To localize the cause of a neurologic deficit seen on exam and not explained by lesions on CT or MRI.

III. Auditory-evoked potentials are considered **medically appropriate** for **ANY** of the following indications:

- A. To evaluate brainstem function in acquired metabolic disorders;
- B. To assess recovery of brainstem function after a lesion compressing the brainstem has been surgically removed;
- C. To localize the cause of a neurologic deficit seen on exam, not explained by lesions seen on computed tomography (CT) scan or magnetic resonance imaging (MRI);

Proprietary Information of Capital District Physicians' Health Plan, Inc. | CDPHP Universal Benefits,® Inc. | Capital District Physicians' Healthcare Network, Inc.

D. To diagnose and monitor demyelinating and degenerative diseases affecting the brain stem (e.g., multiple sclerosis, central pontine myelinolysis, olivopontocerebellar degeneration, and others);

E. To diagnose lesions in the auditory system;

F. To evaluate the irreversibility of coma or brain death, along with an electroencephalogram (EEG);

G. For children under age five (5), to determine the type and degree of hearing problems or to determine the developed status of nerves.

IV. Intra-operative neurophysiologic monitoring is **medically appropriate** during high-risk thyroid or parathyroid surgery, or during spinal, intracranial, or vascular procedures.

V. All other indications for intra-operative neurophysiologic monitoring are considered **not medically necessary.**

VI. Vestibular evoked myogenic potentials (cVEMPs and oVEMPs) are considered **investigational.**

VII. Intra-operative monitoring of visual-evoked potentials is considered **investigational.**

VIII. Visual-evoked potential testing for the diagnosis and evaluation of glaucoma is considered **investigational.**

IX. The use of transcranial magnetic stimulation to elicit motor-evoked potentials is considered **investigational.**

POLICY GUIDELINE(S)

Not Applicable

DESCRIPTION

Evoked potentials (EP) are responses (electrical signals) produced by the nervous system in response to a stimulus. These computerized tests help diagnose nerve disorders, locate the site of nerve damage, and evaluate the individual's condition after treatment or during surgery. There are several types of EP tests. Each uses mild stimulus to cause the nerves to react and send a message to the brain. Electrodes placed on the skin surface record how the brain and spinal cord respond to stimulus. The responses are analyzed by a computer and printed as a waveform pattern. The wave pattern may reveal certain problems and show where any damage is located along the nerve pathway(s) being tested. EPs can be further broken down into the following categories, according to the type of stimulation used:

Somatosensory-Evoked Potentials

Somatosensory-evoked potentials (SSEPs) are electrical waves that are generated by the response of sensory neurons to stimulation. Peripheral nerves, such as the median, ulnar or tibial nerves, are typically stimulated, but in some situations the spinal cord may be stimulated directly. Recording is done either cortically or at the level of the spinal cord above the surgical procedure.

Auditory-Evoked Potentials

Auditory-evoked potentials, also called auditory brainstem response (ABR), are electrophysiologic measures of auditory function that utilizes responses produced by the auditory nerve and brainstem and helps differentiate sensory from neural hearing loss. The response is the waveform averaged over many auditory clicks.

Brainstem auditory-evoked potentials (BAEPs) are generated in response to auditory clicks and can define the functional status of the auditory nerve. Surgical resection of a cerebellopontine angle tumor, such as an acoustic neuroma, places the auditory nerves at risk, and BAEPs have been extensively used to monitor auditory function during these procedures. The clinical utility of BAEP over standard auditory testing is due to BAEP's characteristics: (1) BAEP's resistance to alteration by systemic metabolic abnormalities, medications or pronounced changes in the state of consciousness of the patient; and (2) the close association of BAEP waveform abnormalities to underlying structural pathology. BAEP has been proven effective for differentiating conductive from sensory hearing loss, for detecting tumors and other disease states affecting central auditory pathways (e.g., acoustic neuromas, subclinical lesions in MS), and for non-invasively detecting hearing loss in patients who cannot cooperate with subjective auditory testing (e.g., infants, comatose patients). BAEP is the test of choice to assess hearing in infants and young children. It is most useful for following asphyxia, hyperbilirubinemia, intracranial hemorrhage, or meningoencephalitis or for assessing an infant who has trisomy. BAEP also is useful in the assessment of MS or other demyelinating condition, coma, or hysteria. Audiometric analysis using multiple sound frequencies is usually preferred over BAEP for testing hearing in cooperative patients who are able to report when sounds are heard.

Vestibular Evoked Myogenic Potentials

Vestibular-evoked myogenic potentials (VEMPs) testing is described as an alternative method of assessing otolith organs and their function, with a goal of diagnosing suspected vestibular disorders. VEMPs are performed by repeatedly stimulating the ears using loud sounds such as clicks and tone bursts or bone vibration. These sounds/vibrations create a pressure stimulus. VEMPs are recorded using slightly modified standard evoked potential equipment. The cervical VEMP (cVEMP) pathway begins in the saccule, that travels through the inferior vestibular nerve, vestibular nucleus, medial vestibulospinal tract, the accessory nucleus, the eleventh nerve, and then to a contracted ipsilateral sternocleidomastoid muscle where it is recorded via surface electrode. An abnormality in any part of the pathway is thought to affect the response.

Ocular VEMPs (oVEMPs) stimulate the otolithic membrane, traveling to the vestibule to trigger the utricle and the vestibular ocular reflex causing contraction of the extraocular muscle and is measured by surface electrodes placed under the contralateral eye during an upward gaze. VEMPS have been investigated for the diagnosis of vestibular neuritis, benign paroxysmal positional vertigo, vestibular

schwannoma, Meniere disease, vestibular migraine, superior semicircular canal dehiscence (SCDS), and other vestibular disorders.

Visual-Evoked Potentials

Visual-evoked potentials (VEPs) are used to track visual signals from the retina to the occipital cortex. VEP monitoring has been used for surgery on lesions near optic chiasm. However, intra-operatively recorded VEPs are very difficult to interpret, due to their sensitivity to anesthesia, temperature, and blood pressure.

Motor-Evoked Potentials

Motor-evoked potentials (MEPs) are elicited by either electrical or magnetic stimulation of the motor cortex or the spinal cord. Transcranial electrical stimulation involves stimulation of the motor cortex via electrodes placed on the scalp, or, if the brain is exposed by a craniotomy, placed directly on the brain surface. Magnetic stimulation delivers a pulsed magnetic field over the scalp in the region of the primary motor cortex. Magnetic stimulation is regarded as unsuitable for intra-operative monitoring because it is more sensitive to anesthesia.

Intra-Operative Neurophysiologic Monitoring

Intra-operative neurophysiologic monitoring (IONM) describes a variety of procedures used to monitor the integrity of neural pathways during high-risk neurosurgical, orthopedic, and vascular surgeries. It involves the detection of electrical signals produced by the nervous system in response to sensory or electrical stimuli, to provide information about the functional integrity of neuronal structures. Different methodologies include, but may not be limited to, SSEPs, MEPs using transcranial electrical stimulation, BAEPs, electromyography (EMG) of cranial nerves, electroencephalography, and electrocorticography. IONM has been utilized in attempts to minimize neurological morbidity from operative manipulations. The goal of such monitoring is to identify changes in brain, spinal cord, and peripheral nerve function prior to irreversible damage. Intraoperative monitoring also has been effective in localizing anatomical structures, including peripheral nerves and sensorimotor cortex, which helps guide the surgeon during dissection. SSEP has been the standard of intraoperative monitoring, with excellent ability to assess dorsal column and lateral sensory tract function; it may also be able to detect changes in function of anterior motor tracts by stimulating mixed sensorimotor peripheral nerves. However, significant motor deficits have been seen in individuals undergoing spinal surgery, despite normal SSEPs. MEPs were developed to better monitor the motor neurophysiological pathways.

In individuals with pre-operative spinal cord compromise, MEPs may be present when SSEPs are absent or ill-defined. This is because MEPs and SSEPs are conducted in different spinal cord pathways and have different blood supplies. Consequently, being able to perform MEP monitoring makes spinal cord monitoring possible in cases where SSEP signals are unobtainable. In the operating room, transcranial electrical stimulation is preferable to transcranial magnetic stimulation, because the electrical stimulus is more reproducible.

SUPPORTIVE LITERATURE

There is sufficient data published in the medical literature to conclude that measurement of evoked potentials (EPs) and intra-operative monitoring of EPs, in appropriate situations, improves health outcome. Improved health outcomes have been achieved outside the investigational setting.

Visual-Evoked Potentials

Clinical studies have demonstrated a statistically significant association between abnormal VEPs and an increased risk of developing clinically definite multiple sclerosis (CDMS). In these studies, individuals with suspected multiple sclerosis (MS) were 2.5 to 9 times as likely to develop CDMS as patients with normal VEPs. VEP sensitivities ranged from 25% to 83% (Gronseth 2000). VEPs improved the ability to predict which MS suspects will develop CDMS by as much as 29%. Measurement of visual-evoked responses (VERs) is the primary means of objectively testing vision in infants and young children. VER measurements are useful in infants and young children suspected of having disorders of the visual system, where the child is too young to report differences in color vision or to undergo assessment of visual fields and visual acuity. Lesions affecting the visual pathways can be localized by noting the presence of decreased amplitudes or increased latencies of VERs, and by determining whether VER abnormalities involve one or both eyes.

Several small studies (Pillai 2013; Mousa 2014; Jha 2017; Waisbourd 2017) have investigated the use of VEP technology to differentiate between normal, healthy eyes and eyes with early-to-advanced visual field loss resulting from glaucoma. The authors indicated that VEP signals may discriminate between normal eyes and glaucomatous eyes. However, larger studies are needed to confirm these findings. Additionally, VEP has not been shown to be superior to standard visual field testing in the diagnosis of glaucoma or management of clinical outcomes.

Published studies mostly assess how cVEMP and oVEMP change with various disease states as opposed to assessing the diagnostic accuracy or determination of appropriate populations. The evidence is insufficient to determine that the technology results in an improvement in the net health outcome.

Intra-Operative Neurophysiologic Monitoring

For individuals who receive IONM while undergoing thyroid or parathyroid surgery due to high risk of injury to the recurrent laryngeal nerve (RLN), the evidence includes a large, randomized, controlled trial (RCT) and systematic reviews. Relevant outcomes are morbid events, functional outcomes, and quality of life. The strongest evidence on neurophysiologic monitoring derives from an RCT of 1,000 patients undergoing thyroid surgery (Barczynski 2009). This RCT found a significant reduction in RLN injury in patients at high risk for injury. "High risk" in this trial was defined as surgery for cancer, thyrotoxicosis, retrosternal or giant goiter, or thyroiditis. The high-risk category may also include patients with prior thyroid or parathyroid surgery or total thyroidectomy. A low volume of surgeries might also contribute to a higher risk for RLN injury. The evidence is sufficient to determine that the technology results in a meaningful improvement in the net health outcome.

Cozzi et al (2023) reported on a systematic review of 164 studies examining intraoperative neurophysiologic monitoring during thyroid surgery. The overall rates of temporary and permanent recurrent laryngeal nerve injury were 3.15% and 0.422%, respectively, across all procedures. In

cases where intraoperative neurophysiologic monitoring was utilized, these rates were 3.29% and 0.409% for permanent injury. In contrast, the rates were 3.16% and 0.463%, respectively. The pooled rates of temporary recurrent laryngeal nerve injury were 2.48% for intermittent intraoperative neurophysiologic monitoring and 2.913% for continuous monitoring, while the pooled rates for definitive injury rates, the pooled rates were 0.395% and 0.40%, respectively. The authors noted that pooled rates had overlapping 95% confidence intervals (CI), concluding that intraoperative neurophysiologic monitoring does not significantly impact the rates of temporary or definitive recurrent laryngeal nerve injury following thyroidectomy.

Vestibular Evoked Myogenic Potential Testing

A cohort study by Verrecchia et al (2019) evaluated oVEMP testing in individuals experiencing dizziness. The study included ten patients diagnosed with superior canal dehiscence syndrome and 135 individuals with dizziness that were not already diagnosed as superior canal dehiscence syndrome (SCDS). The study included four oVEMP parameters (amplitude, latency, amplitude asymmetry ratio, and interaural latency difference). oVEMP was able to identify all subjects affected by SCDS, in a large cohort of unselected dizzy patients. Of the parameters, the amplitude to air-conducted stimulation had the greatest diagnostic accuracy (area under the curve score, 0.96). A cutoff point of 16.7 μV resulted in a sensitivity of 100% and specificity of 89%. The available evidence has indicated that the use of VEMP tests to evaluate suspected vestibular disorders is at a very early stage of development. Standardization of procedures and studies on the diagnostic accuracy of these procedures in the appropriate populations are needed.

PROFESSIONAL GUIDELINE(S)

The 2017 Practice Guidelines from American Academy of Neurology (AAN) (reaffirmed in 2024) assessed the diagnostic value of vestibular evoked myogenic potential testing in individuals with vestibular symptoms. The conditions of interest included superior canal dehiscence syndrome, vestibular neuritis or migraine, Meniere disease, and benign paroxysmal positional vertigo (BPPV). The evidence for testing in BPPV was drawn from two class III studies, neither of which presented sufficient diagnostic value of vestibular evoked myogenic potential testing for the treatment to be recommended (level C evidence).

In 2020, the Scoliosis Research Society published an information statement on neurophysiologic monitoring during spinal deformity surgery. The Society concluded that neurophysiologic monitoring facilitates early detection of complications and may help prevent postoperative neurologic injury. It is regarded as optimal care when the spinal cord is at risk which warrants a strong recommendation unless contraindications are present period the standard method for intraoperative monitoring should include transcranial motor evoked potentials and somatosensory evoked potentials with or without additional electromyographic monitoring.

In 2022, the American Head and Neck Society Endocrine Surgery Section and the International Neural Monitoring Study Group published a clinical review on intraoperative nerve monitoring during pediatric thyroid surgery. The review indicated that intraoperative neurophysiological monitoring can be considered for all pediatric thyroid surgeries. Procedures for which monitoring may be particularly

beneficial include total thyroidectomy, hemithyroidectomy in cases where the contralateral vocal cord is paralyzed, and reoperative surgeries.

In 2023, the American Association of Neuromuscular & Electrodiagnostic Medicine (AANEM) recommended that intraoperative sensory-evoked potentials have demonstrated usefulness for monitoring of spinal cord, brainstem, and brain sensory tracts. The AANEM stated that intraoperative somatosensory-evoked potential monitoring is indicated for select spine surgeries in which there is a risk of additional nerve root or spinal cord injury. Indications for somatosensory-evoked potential monitoring may include, but are not limited to, complex, extensive, or lengthy procedures.

CODE(S)

- Codes may not be covered under all circumstances.
- Code list may not be all inclusive (AMA and CMS code updates may occur more frequently than policy updates).
- (E/I)=Experimental/Investigational
- (NMN)=Not medically necessary/appropriate

CPT Codes

Code	Description
92517 (E/I)	Vestibular evoked myogenic potential (VEMP) testing, with interpretation and report, cervical (cVEMP)
92518 (E/I)	Vestibular evoked myogenic potential (VEMP) testing, with interpretation and report, ocular (oVEMP)
92519 (E/I)	Vestibular evoked myogenic potential (VEMP) testing, with interpretation and report, cervical (cVEMP) and ocular (oVEMP)
92650	Auditory evoked potentials; screening of auditory potential with broadband stimuli, automated analysis
92651	Auditory evoked potentials; for hearing status determination, broadband stimuli, with interpretation and report
92652	Auditory evoked potentials; for threshold estimation at multiple frequencies, with interpretation and report
92653	Auditory evoked potentials; neurodiagnostic, with interpretation and report
95925-95927, 95938	Somatosensory-evoked potentials (code range)
95928-95929, 95939	Central motor evoked potential study (transcranial motor stimulation) (code range)

Code	Description
95930	Visual-evoked potential (VEP) checkerboard or flash testing, central nervous system except glaucoma, with interpretation and report
95940	Continuous intraoperative neurophysiology monitoring in the operating room, one on one monitoring requiring personal attendance, each 15 minutes (List separately in addition to code for primary procedure)
95941	Continuous intraoperative neurophysiology monitoring, from outside the operating room (remote or nearby) or for monitoring of more than one case while in the operating room, per hour (List separately in addition to code for primary procedure)
0333T (E/I)	Visual evoked potential, screening of visual acuity, automated, with report
0464T (E/I)	Visual evoked potential, testing for glaucoma, with interpretation and report

Copyright © 2026 American Medical Association, Chicago, IL

HCPCS Codes

Code	Description
G0453	Continuous intraoperative neurophysiology monitoring, from outside the operating room (remote or nearby) per patient (attention directed exclusively to one patient) each 15 minutes (List separately in addition to code for primary procedure)

ICD10 Codes

Code	Description
C71.6	Malignant neoplasm of cerebellum
C79.31	Secondary malignant neoplasm of brain
D33.0-D33.2	Benign neoplasm of brain (code range)
D33.3	Benign neoplasm of cranial nerves
D43.0-D43.2	Neoplasm of uncertain behavior of brain (code range)
D43.4	Neoplasm of uncertain behavior of spinal cord
D49.6	Neoplasm of unspecified behavior of brain
H40.001-H40.9 (E/I)	Glaucoma (code range)
H53.411-H53.419	Scotoma involving central area (code range)
H53.421-H53.429	Scotoma of blind spot area (code range)
H53.431-H53.439	Sector or arcuate defects (code range)

Code	Description
H53.451-H53.459	Other localized visual field defect (code range)
H53.461-H53.469	Homonymous bilateral field defects (code range)
H53.47	Heteronymous bilateral field defects
H53.481-H53.489	Generalized contraction of visual field (code range)
I63.031-I63.039	Cerebral infarction due to thrombosis of carotid artery (code range)
I63.131-I63.139	Cerebral infarction due to embolism of carotid artery (code range)
I63.231-I63.239	Cerebral infarction due to unspecified occlusion or stenosis of carotid arteries (code range)
I65.21-I65.29	Occlusion and stenosis of carotid artery (code range)
I71.00-I71.03	Dissection of aorta (code range)
M40.00-M40.05	Postural kyphosis (code range)
M40.202-M40.209	Unspecified kyphosis (code range)
M40.292-M40.299	Other kyphosis (code range)
M40.30-M40.37	Flatback syndrome (code range)
M40.40-M40.57	Lordosis (code range)
M41.00-M41.27	Idiopathic scoliosis (code range)
M41.30-M41.35	Thoracogenic scoliosis (code range)
M41.80-M41.87	Other forms of scoliosis (code range)
M41.9	Scoliosis, unspecified
M43.6	Torticollis
M48.00-M48.08	Spinal stenosis (code range)

Code	Description
M50.10-M50.13	Cervical disc disorder with radiculopathy (code range)
M50.20-M50.23	Other cervical displacement (code range)
M53.0	Cervicocranial syndrome
M53.1	Cervicobrachial syndrome
M53.80-M53.88	Other specified dorsopathies (code range)
M54.11	Radiculopathy, occipito-atlanto-axial region
M54.13	Radiculopathy, cervicothoracic region
M54.81	Occipital neuralgia
M96.3	Postlaminectomy kyphosis
M96.4	Postsurgical lordosis
M99.20-M99.29	Subluxation stenosis of neural canal (code range)
M99.30-M99.39	Osseous stenosis of neural canal (code range)
M99.40-M99.49	Connective tissue stenosis of neural canal (code range)
M99.50-M99.59	Intervertebral disc stenosis of neural canal (code range)
M99.60-M99.69	Osseous and subluxation stenosis of intervertebral foramina (code range)
M99.70-M99.79	Connective tissue and disc stenosis of intervertebral foramina (code range)

MEDICAL POLICY

Medical Policy Title	**Experimental or Investigational Services**
Policy Number	**11.01.03**
Current Effective Date	**October 1, 2026**
Next Review Date	**March 2027**

Our medical policies are guides to evaluate technologies or services for medical necessity. Criteria are established through the assessment of evidence based, peer-reviewed scientific literature, and national professional guidelines. Federal and state law(s), regulatory mandates and the member's subscriber contract language are considered first in the determination of a covered service. (Link to Product Disclaimer)

POLICY STATEMENT(S)

I. Services, devices, delivery systems, drugs or biological products are considered **experimental/investigational** when there is insufficient peer-reviewed scientific evidence to support **ALL** of the following, for the requested indication:

   A. It is recognized by the Health Plan, in accordance with its standard policies and procedures, as standard medical care;

   B. It has final approval by applicable governmental agencies (e.g., U.S. Food and Drug Administration);

   C. Its safety and effectiveness have been proven;

   D. It improves the net health outcome;

   E. The health outcome improvements can be achieved outside the clinical investigational setting; **and**

   F. It is at least as beneficial as any established service or technology alternatives.

POLICY GUIDELINE(S)

Proprietary Information of Capital District Physicians' Health Plan, Inc. | CDPHP Universal Benefits,® Inc. | Capital District Physicians' Healthcare Network, Inc.

I. Governmental approval of a service will be considered in determining whether a service is experimental or investigational. The fact that a service has received governmental approval does not necessarily mean that it is of proven benefit or appropriate or effective treatment for a particular diagnosis or for a particular condition.

II. The experimental/investigational services exclusion shall not limit in any way the benefits available for prescription drugs that are otherwise covered under the member's subscriber contract and that have been approved by the FDA for the treatment of certain types of cancers, when those drugs are prescribed for the treatment of a type of cancer for which they have not been approved by the FDA, so long as the drugs so prescribed meet the requirements of Section 4303(q) of the New York Insurance Law.

III. Experimental/investigational procedures and/or services are excluded from coverage under Health Plan contracts unless mandated by state or federal law.

DESCRIPTION

Experimental or investigational services are those treatments, procedures (including organ transplantation), drugs, biological products, or medical devices which, in the judgment of the Health Plan, are experimental/investigational in nature.

MEDICAL POLICY

Medical Policy Title	**Expanded Molecular Testing for Infectious Disease Pathogens in the Outpatient Setting**
Policy Number	**2.02.62**
Current Effective Date	**February 15, 2027**
Next Review Date	**October 2027**

Our medical policies are guides to evaluate technologies or services for medical necessity. Criteria are established through the assessment of evidence based, peer-reviewed scientific literature, and national professional guidelines. Federal and state law(s), regulatory mandates and the member's subscriber contract language are considered first in the determination of a covered service. (Link to Product Disclaimer)

POLICY STATEMENT(S)

I. Expanded molecular testing for infectious disease pathogen identification is **medically necessary** when **ALL** the following criteria are met:

- A. Individual is in the outpatient setting (See Policy Guidelines);
- B. Initial focused diagnostic evaluation has not identified a causative pathogen (e.g., sputum culture, urine culture);
- C. The results of the testing are expected to directly influence clinical management (e.g., antibiotic/antiviral selection) and avoid unnecessary treatment or additional testing;
- D. The number of pathogens tested does not exceed those reasonably necessary to evaluate the member's clinical presentation;
- E. Individual has signs and symptoms of acute infection and **any** of the following indication-specific testing categories are met:
  1. Expanded Respiratory Pathogen testing when **either** of the following criteria are met:
     - a. Individual is being evaluated in the outpatient setting and is considered at risk for hospitalization due to illness severity;
     - b. Individual is considered high risk (i.e., Age ≥ 65, immunocompromised, with significant comorbidities) **or**;
  2. Expanded Genitourinary/Urinary Tract Infection (UTI) testing when **any** of the following criteria are met:
     - a. Individual is being evaluated in the outpatient setting and is considered at risk for hospitalization due to illness severity;
     - b. Individual is considered high risk (i.e., Age ≥ 65, immunocompromised, with significant comorbidities);
     - c. Complicated UTI (e.g. chronic indwelling catheter or ileal conduit);
     - d. Recurrent infections that have failed empiric therapy **or**;

3. Expanded Sexually Transmitted Infection (STI) testing when **any** of the following criteria are met:
    a. Individual is being evaluated in the outpatient setting and is considered at risk for hospitalization due to illness severity;
    b. Documentation supports the individual is considered high risk (i.e., high risk of exposure, age ≥ 65, immunocompromised, significant comorbidities);
    c. There is clinical concern due to a high-risk or symptomatic presentation requiring broad evaluation **or**;
4. Expanded Gastrointestinal Pathogen testing when **all** the following criteria are met:
    a. Individual is being evaluated in the outpatient setting and is considered at risk for hospitalization due to illness severity;
    b. Individual is considered high risk (i.e., Age ≥ 65, immunocompromised, with significant comorbidities, travel outside of the country);
    c. Individual with acute or persistent diarrhea and risk factors or signs of severe disease (e.g., bloody diarrhea, dysentery, dehydration, severe abdominal pain).

II. Expanded molecular testing is **not medically necessary** for **ANY** of the following:
    A. Routine screening;
    B. Duplicate/repeat panel within the same illness episode or before the appropriate re-test interval;
    C. Initial evaluation when standard testing/culture is appropriate (e.g., uncomplicated cystitis);
    D. Individual is asymptomatic and without risk factors;
    E. Symptoms are mild and self-limited;
    F. Documentation does not support clinical utility (e.g. when a single-pathogen test or smaller targeted testing can provide the information necessary for clinical management);
    G. Convenience or rapid turnaround time alone.

Administrative Policy

AP-55 Sexually Transmitted Infection (STI) Testing

POLICY GUIDELINE(S)

I. Expanded molecular testing refers to multiplex molecular assays that evaluate numerous pathogens associated with a clinical syndrome (e.g., respiratory, gastrointestinal, urinary tract, bloodstream, or sexually transmitted infections) from a single patient specimen.

II. Targeted single- or low-target assays (e.g., influenza/RSV/SARS-CoV-2, Chlamydia trachomatis/Neisseria gonorrhoeae NAAT), standard urine culture, or guideline-directed serology are expected within urgent care or in-office settings, as the use of expanded molecular tests should be reserved for settings where rapid identification of polymicrobial infections is critical (i.e., ventilator-associated pneumonia or blood stream infections).

III. If individual and expanded molecular tests are requested on the same date of service, the clinical rationale must be documented to establish that each test is separate and distinct from any other procedure performed on that date.

DESCRIPTION

Targeted diagnostic testing is laboratory testing performed to detect, identify, confirm, or rule out a specific suspected infectious pathogen or a limited number of pathogens based on the patient's clinical presentation, medical history, exposure risk, or other diagnostic information. Expanded molecular testing for infectious disease pathogens involves the use of multiplex molecular diagnostic assays to simultaneously identify multiple microorganisms associated with a clinical syndrome from a single specimen. These tests may include detection of bacterial, viral, fungal, parasitic, and antimicrobial resistance targets and are intended to provide comprehensive pathogen identification beyond traditional targeted diagnostic testing.

Targeted diagnostic testing is most commonly used to confirm or rule out a specific suspected disease, condition, or pathogen when clinical findings point to a likely diagnosis. Common applications include respiratory tract infections, gastrointestinal infections, urinary tract infections, central nervous system infections, bloodstream infections, and sexually transmitted infections and may utilize molecular, culture-based, antigen, serologic, or other laboratory methodologies and is directed toward a focused diagnostic hypothesis.

Advantages of using targeted diagnostic testing:

- Aligns testing with the patient's symptoms and clinical findings.
- Reduces unnecessary broad testing.
- Helps confirm or exclude a suspected disease or infection.
- Identifies the specific condition or pathogen responsible for illness.
- Supports targeted therapy and may reduce inappropriate antimicrobial use.
- Focused testing is less likely to identify incidental findings, asymptomatic colonization, or organisms of uncertain clinical significance.
- Results may be easier to interpret in the clinical context.

Limitations of using targeted diagnostic testing:

- Evaluates only the specific pathogen, condition, or analyte selected for testing.
- May fail to identify the actual cause of illness if the suspected diagnosis is incorrect.
- If initial testing is negative, additional testing may be needed to evaluate alternative diagnoses.
- This can increase diagnostic delays and healthcare utilization.
- When the etiology is uncertain, sequential targeted testing may take longer than broad testing approaches that evaluate multiple pathogens simultaneously.
- Targeted testing only identifies organisms included in the test.

Expanded molecular testing is most commonly used to evaluate infectious disease syndromes in which multiple pathogens may produce similar clinical manifestations. Common applications include respiratory tract infections, gastrointestinal infections, central nervous system infections, bloodstream infections, and sexually transmitted infections where molecular techniques are used to simultaneously detect multiple pathogens from a single specimen, facilitating rapid and comprehensive pathogen identification.

Advantages of using expanded molecular testing:

- Multiple targets can be detected from a single specimen.
- Increases the likelihood of identifying the causative organism when symptoms may be caused by a variety of pathogens.
- Can detect coinfections involving more than one pathogen.
- May facilitate appropriate patient isolation and infection control measures.
- Particularly valuable when symptoms are nonspecific and multiple pathogens could be responsible.

Limitations of expanded molecular testing:

- Higher cost than singleplex assays.
- Detection of an organism does not necessarily indicate active infection.
- Panels may identify colonization or asymptomatic carriage.
- Broad testing may detect organisms of uncertain clinical significance.

Diagnostic stewardship is the coordinated approach to the selection, timing, performance, and interpretation of diagnostic tests to improve patient outcomes, promote appropriate clinical management, reduce unnecessary testing, support antimicrobial stewardship, and optimize the efficient use of healthcare resources. Inappropriate testing can lead to misdiagnosis, detection of colonization rather than active infection, increased healthcare costs and unnecessary antimicrobial use. By promoting appropriate test selection and interpretation, diagnostic stewardship helps ensure that laboratory results support meaningful clinical decision-making. Testing should be based on the patient's clinical presentation, risk factors, and suspected diagnosis, with consideration given to the

benefits and limitations of both targeted diagnostic testing and expanded molecular testing. Broad molecular panels may not be necessary when a focused diagnostic approach is sufficient to answer the clinical question.

SUPPORTIVE LITERATURE

Expanded molecular panels, commonly referred to as syndromic or multiplex assays, are capable of simultaneously detecting viral, bacterial, and parasitic pathogens from a single specimen. These assays offer high analytic sensitivity and rapid turnaround times. However, the primary consideration for their use is not diagnostic performance alone, but whether the additional pathogen information meaningfully influences clinical decision-making and improves patient outcomes. Across respiratory, urinary, sexually transmitted, and gastrointestinal applications, a consistent pattern is demonstrated: expanded molecular panels offer the greatest benefit in patients who are acutely ill, high-risk, or clinically complicated, and when targeted testing has proven inconclusive. In contrast, broad and routine use in mild or uncomplicated outpatient presentations generates findings of uncertain significance and can risk antibiotic overtreatment (Nairz and Weiss 2025; Reddy 2026).

Respiratory Pathogen Panels

Professional society recommendations tend to steer clinicians away from routine use of broad respiratory panel testing when the results will not influence management. Through the Choosing Wisely initiative, the American Society for Clinical Pathology recommends against routinely ordering broad respiratory pathogen panels because specific viral identification rarely alters the treatment for most immunocompetent patients in whom most non-influenza viral infections will resolve on their own and only influenza has a targeted treatment (Greenberg 2020). The American Thoracic Society clinical practice guideline on nucleic acid–based testing for non-influenza viral pathogens in suspected community-acquired pneumonia arrived at similar conclusions, and its evidence review highlights a limited and inconsistent effect on antibiotic use (Evans 2021).

Clinical studies have demonstrated mixed results regarding the impact of multiplex respiratory testing on outcomes. A randomized trial of 432 emergency-department patients with acute lower respiratory tract illness found that the patients who received multiplex PCR testing had a greater likelihood of reduced antibiotic prescribing among patients compared with immunofluorescence testing (Echavarría 2018). In contrast, a multicenter randomized trial of 107 hospitalized patients with lower respiratory tract infection found that reporting multiplex PCR results within 48 hours produced no significant reduction in antibiotic duration and no effect on length of stay compared with the control (Oosterheert 2021).

Observational outpatient data supports a targeted approach. Among 295 adult outpatients undergoing FilmArray respiratory panel testing, a positive influenza result was associated with fewer antibiotic prescriptions, but detection of a non-influenza virus produced no difference in reduction compared to a negative test. This prompted the authors to conclude that influenza-specific testing alone may be sufficient and more cost-effective than multiplex testing for most outpatients (Green 2016). Nairz and Weiss 2025, published a narrative review of point-of-care testing in primary care similarly concluded that multiplex panels are most useful in severely immunocompromised patients

and that routine multiplex use in community-acquired respiratory infections is not recommended unless they can be shown to be a benefit for patient-important outcomes.

As a whole, these findings support restricting expanded respiratory panels to patients with moderate-to-severe illness or elevated risk of deterioration and to high-risk hosts (age ≥ 65, immunocompromised, or with significant comorbidities), where pathogen identification is more likely to alter antiviral or antibiotic decisions and infection-control measures (Greenberg 2020; Nairz and Weiss, 2025).

Genitourinary (GU)/ Urinary Tract Infection (UTI) Panels

Guidelines and reviews emphasize that the increased sensitivity of molecular testing has not produced a proven benefit for uncomplicated infection and may promote overtreatment. The microbiology utilization guide from the Infectious Diseases Society of America and the American Society for Microbiology (IDSA/ASM) explicitly states that expanded urine culture and molecular methods often obtain additional low-count organisms of uncertain clinical significance. It therefore does not recommend routine use across all patient populations and reserves modified workups for chronic or recurrent UTI following discussion with the laboratory (Miller 2024). Likewise, the American Urological Association, Canadian Urological Association and Society of Urodynamics, Female Pelvic Medicine & Urogenital Reconstruction (AUA/CUA/SUFU) recurrent UTI guideline specifies PCR and next-generation sequencing as investigational, pointing out that these techniques identify bacteria in a large portion of asymptomatic controls and warns outright that their use for lower urinary tract symptoms may stimulate antibiotic overtreatment (Anger 2022).

Primary studies mirror these concerns. In a prospective within-subject study of women ≥ 60 years presenting with acute cystitis symptoms, multiplex PCR was positive significantly more often than standard culture (81.6% vs 41.4%), with inconsistent findings in 43.7% of patients. Even so, there was no significant overall difference in how quickly the correct antibiotic therapy was started, and the only real advantage was limited to detecting non–E. coli organisms such as Enterococcus faecalis (Bauer 2025). Reddy 2026 similarly determined that, despite faster turnaround and broader organism detection, the effect of molecular urine diagnostics on clinical outcomes remains uncertain, with particular concern that detection of coexisting urinary-microbiome organisms may lead to overdiagnosis. This evidence supports the exclusion of expanded UTI panels for uncomplicated cystitis and asymptomatic patients, while allowing them in high-risk hosts, complicated UTI (e.g., chronic indwelling catheter or ileal conduit), and recurrent infections that have failed empiric therapy (Miller 2024; Bauerl 2025).

Sexually Transmitted Infection (STI) Panels

Multiplex sexually transmitted infection (STI) assays provide excellent analytic performance and can accurately detect multiple pathogens simultaneously. Karellis 2022 published a systematic review spanning 24 studies and 26,126 individuals, most platforms demonstrated sensitivity and specificity exceeding 95%, which supports their application in screening, confirmatory testing, and antimicrobial stewardship among suitable populations. Such testing makes the most sense when coinfection is likely or when multiple pathogens need to be ruled out, since coinfection rates climb to 25% or more in high-risk groups (Dichtl 2023).

The chief drawback is that broad panels often identify organisms of uncertain pathogenic significance. A retrospective evaluation by Dichtl 2023 of multiplex STI testing found that the most common secondary discovery were Mycoplasma hominis and Ureaplasma spp.—organisms that the necessity of treatment has been debated as that may simply be benign—prompting the investigators to recommend that only true pathogens be routinely reported for clinical action. A 2026 real-world analysis arrived at the same view, noting that the organisms detected most often (U. parvum, U. urealyticum, M. hominis) frequently occur in asymptomatic people, and concluding that a diagnostic approach centered on clinically significant pathogens can improve appropriate treatment while curbing unnecessary antimicrobial use (Özgen-Top 2026). For these reasons, expanded STI panels are best reserved for high-risk hosts and for symptomatic or high-risk presentations that call for broad evaluation, with all results interpreted in clinical context.

Gastrointestinal Pathogen Panels

Among the major applications of expanded molecular testing, gastrointestinal pathogen panels have demonstrated some of the most consistent evidence for clinical utility. These panels substantially increase pathogen detection rates and have been associated with reductions in downstream diagnostic testing, healthcare utilization, and inappropriate antibiotic exposure, particularly among patients with more significant illness. A large retrospective U.S. outpatient study by Moon 2023, comprised of 36,787 patients found that large multiplex panels (≥ 12 targets) identified a pathogen in 73.1% of tested patients compared with 45.4% using traditional workup, along with faster turnaround, fewer stool tests, a lower likelihood of in-hospital antibiotics, reduced 30-day GI-related follow-up cost, and a lower 30-day GI-related hospitalization risk (1.7% vs 2.7%). In a single-center comparative analysis of more than 15,000 patients, GI panel testing—relative to conventional stool testing—was associated with less endoscopy, less abdominal imaging, and fewer antibiotic prescriptions during the follow-up window (Axelrad 2019). A prospective study pairing multiplex GI testing with an antimicrobial stewardship program showed a significant reduction in inappropriate antibiotic use and better detection of organisms that are difficult to isolate by routine culture (Keske 2018). Despite these benefits, gastrointestinal panels may also detect colonizing organisms or pathogens associated with self-limited disease, creating the potential for unnecessary treatment. The greatest clinical value is observed in patients with severe symptoms, prolonged illness, immunocompromising conditions, significant comorbidities, or other features suggesting a higher likelihood that test results will meaningfully influence clinical management.

PROFESSIONAL SOCIETY GUIDELINE(S)

In 2024 the Infectious Disease Society of America (IDSA) and the American Society for Microbiology (ASM) published the Guide to Utilization of the Microbiology Laboratory for Diagnosis of Infectious Diseases: 2024 Update. The overall theme suggests the provider should choose the most appropriate testing based on the clinical scenario.

Respiratory Infections:

- Nucleic Acid Amplification Tests (NAAT's) have largely replaced rapid antigen tests and cultures for respiratory virus detection.

- Multiplex syndromic respiratory panels, when used judiciously may provide earlier opportunity for therapeutic optimization than traditional cultures.
- Comprehensive/pneumonia panels used on lower respiratory specimens (including semiquantitative bacterial targets and resistance markers) may optimize therapy earlier than culture but should be used selectively.
- For fastidious pathogens (e.g., Bordetella pertussis), consult the laboratory's test directory before collection; for bacterial culture, first-morning expectorated sputum is preferred, with blood cultures useful in high-risk CAP and those at risk for MRSA or Pseudomonas.

Gastrointestinal infections:

- Fecal testing for causes of infectious gastroenteritis using culture or culture independent methods is indicated for patients with moderate to severe, bloody, febrile, dysenteric, nosocomial, or persistent diarrheal illnesses or immunocompromised patients.
- Culture-independent multiplex molecular panels are reported to be more sensitive than culture (which has a longer TAT and often misses the agent), result in higher rates of detection, and often cost more than culture methods.

Genitourinary infections:

- In the absence of signs and symptoms consistent with urinary tract infections a urine culture is typically not recommended.
- Reflexing to culture based on a positive pyuria screen may be considered. If a reflexive algorithm is implemented, it should be a locally approved policy guided by clinicians and laboratorians.
- Standard testing is urine culture (Gram stain optional, low sensitivity) on midstream or straight-catheter urine, with mycobacterial culture (first-void urine) and specific NAATs for viruses (adenovirus, BK polyomavirus) as indicated.

Sexually transmitted infections:

- For genital/sexually transmitted infections, HIV testing is recommended for all persons with unknown status seeking STI evaluation; many STIs are reportable.
- Managing appropriate and directed therapy is an important strategy in antimicrobial stewardship and resistance development in STI's.
- Some NAAT technologies require a specific manufacturer collection/transport device for STI's, or results could be compromised and specimens rejected. Use devices recommended by the laboratory.

REGULATORY STATUS

Clinical laboratories may develop and validate tests in-house and market them as a laboratory service. Laboratory-developed tests must meet the general regulatory standards of the Clinical Laboratory Improvement Amendments (CLIA).

Laboratories that offer laboratory-developed tests must be licensed by CLIA for high-complexity testing. More information is available at: Clinical Laboratory Improvement Amendments (CLIA) | FDA [accessed 2026 Sept 18]

CODE(S)

CPT Codes

Code	Description
81513	Infectious disease, bacterial vaginosis, quantitative real-time amplification of RNA markers for Atopobium vaginae, Gardnerella vaginalis, and Lactobacillus species, utilizing vaginal-fluid specimens, algorithm reported as a positive or negative result for bacterial vaginosis
81514	Infectious disease, bacterial vaginosis and vaginitis, quantitative real-time amplification of DNA markers for Gardnerella vaginalis, Atopobium vaginae, Megasphaera type 1, Bacterial Vaginosis Associated Bacteria-2 (BVAB-2), and Lactobacillus species (L. crispatus and L. jensenii), utilizing vaginal-fluid specimens, algorithm reported as a positive or negative for high likelihood of bacterial vaginosis, includes separate detection of Trichomonas vaginalis and/or Candida species (C. albicans, C. tropicalis, C. parapsilosis, C. dubliniensis), Candida glabrata, Candida krusei, when reported
81515	Infectious disease, bacterial vaginosis and vaginitis, real-time PCR amplification of DNA markers for Atopobium vaginae, Atopobium species, Megasphaera type 1, and Bacterial Vaginosis Associated Bacteria-2 (BVAB-2), utilizing vaginal-fluid specimens, algorithm reported as positive or negative for high likelihood of bacterial vaginosis, includes separate detection of Trichomonas vaginalis and Candida species (C. albicans, C. tropicalis, C. parapsilosis, C. dubliniensis), Candida glabrata/Candida krusei, when reported
87505	Infectious agent detection by nucleic acid (DNA or RNA); gastrointestinal pathogen (eg, Clostridium difficile, E. coli, Salmonella, Shigella, norovirus, Giardia), includes multiplex reverse transcription, when performed, and multiplex amplified probe technique, multiple types or subtypes, 3-5 targets
87506	Infectious agent detection by nucleic acid (DNA or RNA); gastrointestinal pathogen (eg, Clostridium difficile, E. coli, Salmonella, Shigella, norovirus, Giardia), includes multiplex reverse transcription, when performed, and multiplex amplified probe technique, multiple types or subtypes, 6-11 targets

Code	Description
87507	Infectious agent detection by nucleic acid (DNA or RNA); gastrointestinal pathogen (eg, Clostridium difficile, E. coli, Salmonella, Shigella, norovirus, Giardia), includes multiplex reverse transcription, when performed, and multiplex amplified probe technique, multiple types or subtypes, 12-25 targets
87631	Infectious agent detection by nucleic acid (DNA or RNA); respiratory virus (eg, adenovirus, influenza virus, coronavirus, metapneumovirus, parainfluenza virus, respiratory syncytial virus, rhinovirus), includes multiplex reverse transcription, when performed, and multiplex amplified probe technique, multiple types or subtypes, 3-5 targets
87632	Infectious agent detection by nucleic acid (DNA or RNA); respiratory virus (eg, adenovirus, influenza virus, coronavirus, metapneumovirus, parainfluenza virus, respiratory syncytial virus, rhinovirus), includes multiplex reverse transcription, when performed, and multiplex amplified probe technique, multiple types or subtypes, 6-11 targets
87633	Infectious agent detection by nucleic acid (DNA or RNA); respiratory virus (eg, adenovirus, influenza virus, coronavirus, metapneumovirus, parainfluenza virus, respiratory syncytial virus, rhinovirus), includes multiplex reverse transcription, when performed, and multiplex amplified probe technique, multiple types or subtypes, 12-25 targets
87800	Infectious agent detection by nucleic acid (DNA or RNA), multiple organisms; direct probe(s) technique
87801	Infectious agent detection by nucleic acid (DNA or RNA), multiple organisms; amplified probe(s) technique
0068U	Candida species panel (C. albicans, C. glabrata, C. parapsilosis, C. kruseii, C tropicalis, and C. auris), amplified probe technique with qualitative report of the presence or absence of each species
0112U	Infectious agent detection and identification, targeted sequence analysis (16S and 18S rRNA genes) with drug-resistance gene
0115U	Respiratory infectious agent detection by nucleic acid (DNA and RNA), 18 viral types and subtypes and 2 bacterial targets, amplified probe technique, including multiplex reverse transcription for RNA targets, each analyte reported as detected or not detected
0202U	Infectious disease (bacterial or viral respiratory tract infection), pathogen-specific nucleic acid (DNA or RNA), 22 targets including severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2), qualitative RT-PCR, nasopharyngeal swab, each pathogen reported as detected or not detected

Code	Description
0223U	Infectious disease (bacterial or viral respiratory tract infection), pathogen-specific nucleic acid (DNA or RNA), 22 targets including severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2), qualitative RT-PCR, nasopharyngeal swab, each pathogen reported as detected or not detected
0225U	Infectious disease (bacterial or viral respiratory tract infection) pathogen-specific DNA and RNA, 21 targets, including severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2), amplified probe technique, including multiplex reverse transcription for RNA targets, each analyte reported as detected or not detected
0321U	Infectious agent detection by nucleic acid (DNA or RNA), genitourinary pathogens, identification of 20 bacterial and fungal organisms and identification of 16 associated antibiotic-resistance genes, multiplex amplified probe technique
0371U	Infectious agent detection by nucleic acid (DNA or RNA), genitourinary pathogen, semiquantitative identification, DNA from 16 bacterial organisms and 1 fungal organism, multiplex amplified probe technique via quantitative polymerase chain reaction (qPCR), urine
0373U	Infectious agent detection by nucleic acid (DNA and RNA), respiratory tract infection, 17 bacteria, 8 fungus, 13 virus, and 16 antibiotic-resistance genes, multiplex amplified probe technique, upper or lower respiratory specimen
0374U	Infectious agent detection by nucleic acid (DNA or RNA), genitourinary pathogens, identification of 21 bacterial and fungal organisms and identification of 21 associated antibiotic-resistance genes, multiplex amplified probe technique, urine
0416U	Infectious agent detection by nucleic acid (DNA), genitourinary pathogens, identification of 20 bacterial and fungal organisms, including identification of 20 associated antibiotic-resistance genes, if performed, multiplex amplified probe technique, urine
0504U	Infectious disease (urinary tract infection), identification of 17 pathologic organisms, urine, real-time PCR, reported as positive or negative for each organism

MEDICAL POLICY

Medical Policy Title	**Extracorporeal Photochemotherapy/Photopheresis**
Policy Number	**8.01.01**
Current Effective Date	**November 1, 2026**
Next Review Date	**October 2027**

Our medical policies are based on the assessment of evidence based, peer-reviewed literature, and professional guidelines. Eligibility for reimbursement is based upon the benefits set forth in the member's subscriber contract. (Link to Product Disclaimer)

POLICY STATEMENT(S)

I. Extracorporeal photochemotherapy (ECP), or photopheresis is considered **medically appropriate** for **ANY** of the following indications:

   A. Palliative treatment of the skin manifestations of cutaneous T-cell lymphoma (CTCL) [also called mycosis fungoides (MF)] Sézary syndrome (SS) that have not responded to other therapy;

   B. Acute and chronic extensive graft-versus-host disease (GVHD) that is refractory to conventional therapy;

   C. Cardiac allograft rejection that is recurrent or refractory to immunosuppressive treatment.

II. The use of ECP (photopheresis) is considered **investigational** for **ALL** other indications, including, but not limited to, the treatment of:

   A. Acute or chronic GVHD in previously untreated patients or those responding to conventional therapy;

   B. Lyme disease;

   C. Scleroderma (a.k.a. progressive systemic sclerosis (PSS), systemic sclerosis (SS), dermatosclerosis, or CREST syndrome);

   D. Autoimmune diseases (e.g., pemphigus vulgaris, pemphigus foliaceus, psoriatic arthritis, rheumatoid arthritis, systemic lupus erythematosus, severe atopic dermatitis);

   E. Crohn's disease;

   F. Allograft rejections of solid organs other than the heart;

   G. Diabetes Mellitus.

DESCRIPTION

ECP, or photopheresis, is an immune-modulating therapy technique used in the treatment of certain skin disorders. It involves an oral intake of 8-methoxypsoralen (8-MOP) and cytopheresis, or addition of 8-MOP to the cells after removal, followed by ultraviolet actinotherapy (UVA) irradiation and reinfusion of leukocytes into the patient.

SUPPORTIVE LITERATURE

Connelly-Smith et al (2023) states the overall response rate of CTCL to ECP is approximately 60% with complete response rates of 14% to 26%. Response to ECP correlates with short duration of disease, early use of ECP in the treatment paradigm, lower blood Sézary cell burden and significant early response of skin lesions (i.e., > 50% regression within 6 months).

Sener et al (2025) noted that primary CTCLs are characterized by high relapse rates to initially highly effective therapies. Combination therapies have proven beneficial, especially if they incorporate ECP. This study investigated the synergistic effects of dimethyl fumarate (DMF) and ECP in treating CTCL, particularly SS. In vitro experiments using CTCL cell lines (HH, HuT 78, SeAx) and patient-derived SS cells demonstrated that the combination therapy significantly enhanced cell death compared to either treatment alone. Mechanistically, the combination led to increased inhibition of NF-κB signaling, elevated reactive oxygen species (ROS) production, and reduced thioredoxin reductase activity and glutathione levels—indicating oxidative stress-mediated cytotoxicity. A cell death inhibitor screen revealed that the DMF/ECP combination induced multiple cell death pathways, including apoptosis and necroptosis. Clinically, four patients with advanced CTCL were treated with this combination therapy, achieving a 100% overall response rate. Notably, the time to next treatment in skin and blood compartments extended up to 57 months, suggesting durable remission. These findings support the DMF/ECP combination as a potent and long-lasting therapeutic strategy for CTCL, warranting further clinical investigation in larger cohorts. There are several limitations to this study which suggest that, while the DMF/ECP combination is promising, larger, controlled clinical trials are needed to validate its efficacy and safety across diverse patient populations.

Evidence supporting the use of ECP for the treatment of GVHD relates to both acute GVHD (aGVHD) and chronic GVHD (cGVHD) in pediatric and adult populations. The published literature lacks randomized trials. Evidence comprises retrospective reviews and non-randomized comparisons. The data consistently show improvement in GVHD that is unresponsive to standard therapy. Additionally, there is a lack of other treatment options for these patients, and this option has the added benefit of minimal side effects from ECP, as well as the possibility of reduction and often cessation of treatment with corticosteroids and other immunosuppressive agents, if there is a response to ECP. For patients with untreated disease or those who are showing improvement on standard therapy, there is no data to support the use of ECP.

Scleroderma is the most studied of the autoimmune diseases utilizing photopheresis, but the efficacy of photopheresis for these diseases, as yet, has not been demonstrated in well-designed clinical trials.

Photopheresis alone, or in combination with immunosuppressive therapy is also being investigated in the treatment of solid organ transplant rejection. While ECP has been utilized for prevention of cardiac allograft rejection and acute rejection, the strongest evidence in cardiac transplant patients revolves around its use for recurrent and refractory allograft rejection. While the evidence consists of non-randomized studies, the outcomes from these studies provide consistent evidence of the beneficial effect of ECP for cardiac transplant patients with rejection refractory to standard therapy. There is insufficient evidence to support the use of ECP for graft rejection in other solid organs, such as lung, liver, and kidney. Though preliminary results are promising, additional studies with longer follow-up are needed, to evaluate the ultimate effect of photopheresis on patient survival.

Benazzo et al (2024) conducted a prospective randomized controlled trial that evaluated the efficacy of ECP as a prophylactic treatment to prevent rejection after lung transplantation. The study included 62 patients with COPD who underwent lung transplantation, split evenly between a treatment group receiving ECP alongside standard triple-drug immunosuppression and a control group receiving only the standard regimen. The primary composite endpoint, incidence of high-grade acute cellular rejection (ACR), cytomegalovirus (CMV) infection, or chronic lung allograft dysfunction (CLAD) within 24 months, was significantly lower in the ECP group (19.4%) compared to the control group (61.3%) ($p<0.001$). Freedom from high-grade ACR was notably higher in the ECP group ($p=0.045$), and cumulative A scores were significantly reduced at both three months (0.18 ± 0.44 vs. 0.56 ± 0.94; $p<0.05$) and 12 months (0.25 ± 0.48 vs. 1.0 ± 1.45; $p=0.002$). Additionally, the ECP group experienced fewer infections (five cases vs. 22 cases) and significantly fewer hospital days (67 vs. 309; $p=0.002$). At three years post-transplant, freedom from CLAD was also significantly greater in the ECP group ($p=0.015$). These findings suggest that adding ECP to standard immunosuppressive therapy can substantially reduce the risk of both acute and chronic rejection, improve infection outcomes, and enhance long-term transplant success. However, there are several limitations to this study including single-center design, small sample size, heterogeneous patient selection, lack of blinding, limited mechanistic insight, short follow up and need for multicenter validation.

PROFESSIONAL GUIDELINE(S)

National Comprehensive Cancer Network guidelines on primary cutaneous lymphomas (v.3.2025) list the use of ECP as a category 2A treatment alone or in combination with other agents as first-line systemic therapy for advanced (stages III-IV) disease, as well as for patients with earlier stage mycosis fungoides with Sézary syndrome involvement. The guidelines add that ECP may be more appropriate as systemic therapy in patients with or at risk of blood involvement (B1 or B2).

The terms B1 and B2 refer to levels of blood involvement as part of the TNMB staging system:

- B1 (Low blood involvement): Indicates a moderate presence of malignant T-cells in the blood. This level may occur at any disease stage except for stage IIIA. It is associated with inferior survival, even in early-stage Mycosis Fungoides.
- B2 (High blood involvement): Represents advanced disease with a high burden of malignant T-cells in the blood. It is typically seen in Sézary Syndrome and is linked to significantly worse prognosis, including a 4.6-fold increased risk of disease progression.

In 2024, the European Society for Blood and Marrow Transplantation published updated prophylaxis and management guidelines for acute and chronic GVHD. The guidelines state that while there is no standard second-line treatment for both acute and chronic GVHD, ECP is listed as therapy for use for second-line treatment. The guideline does comment that not enough data exists to compare the efficacy of different second-line treatments.

The National Cancer Institute lists ECP (alone or in combination with total-skin electron-beam radiation) as a phototherapeutic option for patients with stage III or IV Sezary syndrome or erythrodermic mycosis fungoides.

REGULATORY STATUS

The U.S. Food and Drug Administration (FDA) has approved, via premarket application, two photopheresis systems manufactured by Therakos, Inc. (West Chester, PA). Both systems are approved for use in ultraviolet A (UVA) irradiation treatment, in the presence of the photoactive drug 8-methoxypsoralen (8-MOP), of extracorporeally circulating leukocyte-enriched blood, in the palliative treatment of skin manifestations of cutaneous T-cell lymphoma (CTCL), in persons who have not been responsive to other forms of treatment. The two systems are: the UVAR XTS Photopheresis System, FDA-approved in 1987, and CELLEX, FDA-approved in 2009. Treatment of GVHD is considered an off-label use of the device. Therefore, the use for treatment of autoimmune disease is considered off-label use.

The United States Food and Drug Administration (FDA) regulates photopheresis systems as medical devices. All photopheresis systems including related components require FDA approval before marketing and use in the United States to ensure they are safe and effective for human use. Refer to the FDA Medical Device website. Available from: https://www.fda.gov/medical-devices [accessed 2025 Sept 15].

The FDA lists the most serious type of medical device recalls as well as early alert communications about corrective actions being taken by companies that the FDA believes are likely to be the most serious type of recalls. Available from: Medical Device Recalls | FDA [accessed 2025 Sept 15].

CDPHP reserves the right to review this policy at any time and change it without notice.

Background

Fasenra (benralizumab) is an interleukin (IL)-5 receptor alpha-directed cytolytic antagonist monoclonal antibody. This inhibition reduces the production and survival of eosinophils thus decreasing eosinophilic airway inflammation. Fasenra is indicated for add-on maintenance treatment of patients with severe asthma aged ≥ 6 years who have an eosinophilic phenotype. Fasenra should not be used in other eosinophilic conditions or for relief of acute bronchospasm or status asthmaticus.

The Global Initiative for Asthma Global Strategy for Asthma Management and Prevention (2024) proposes a stepwise approach to asthma treatment. Fasenra is listed as an option for add-on therapy in patients with severe eosinophilic asthma. Severe asthma is defined as asthma that is uncontrolled despite adherence to optimized high-dose ICS/LABA therapy or that worsens when high-dose treatment is decreased.

Poor asthma symptom control itself substantially increases the risk of exacerbations. Other contributing risk factors include history of ≥ 1 exacerbation in the previous year, poor adherence, incorrect inhaler technique, chronic sinusitis and smoking.

In September 2024, the Food and Drug Administration (FDA) approved Fasenra to be used for the treatment of adult patients with Eosinophilic granulomatosis with polyangiitis (EGPA, also known as Churg-Strauss Syndrome). The approval was based on the results from the MANDARA Phase 3 trial which compared the efficacy and safety of Fasenra to the only other approved EGPA treatment Nucala (mepolizumab). In the trial, nearly 60% of Fasenra-treated patients achieved remission which was comparable to Nucala treated patients. The study data revealed that 41% of Fasenra-treated patients fully tapered off oral corticosteroids.

Summary

Effective Date of Policy:	6/10/2026
Indications	• Add-on maintenance treatment of patients aged six years and older with severe asthma, and with eosinophilic phenotype • Treatment of adult patients with eosinophilic granulomatosis with polyangiitis (EGPA) • Treatment of adult and pediatric patients aged 12 years and older with hypereosinophilic syndrome (HES) without an identifiable non-hematologic secondary cause
Availability	Prefilled syringe: 10 mg/0.5 mL (00310-1745-01) and 30 mg/mL (00310-1730-30) Autoinjector solution for injection: 30 mg/mL (00310-1830-30)
HCPCS Code	J0517
Duration	Initial: Six months Continuation: Two years

Required Criteria for Initial Approval

All of the following conditions for the requested indication must be met in order to approve all:

Indication	Inclusion	Recommended Dosing Regimen
Severe eosinophilic asthma (FDA approval) ICD10: J82	1. The prior authorization is requested by or in consultation with a specialist (pulmonologist, allergist, or immunologist) 2. The enrollee must be six years or older 3. The enrollee must be a non-smoker defined as someone who has not smoked in the preceding 6 months. 4. The enrollee has documented evidence of severe persistent asthma. 5. Patient must have well-documented use of high-dose inhaled corticosteroids (ICS) (see Tables 1-3 in policy guidelines section) for at least 3 months, be compliant with existing therapy, and have followed GINA guidelines for asthma treatment including an	Adults and children 12 years and older: 30 mg every four weeks for the first three doses followed by once every eight weeks thereafter Note: Maximum dose of 30 mg once every eight weeks after loading doses Pediatric patients six to 11 years of

<table>
<tr>
<td></td>
<td>adequate trial of a high-dose inhaled steroid in combination with a long-acting beta agonist
a. Compliance will be assessed based on pharmacy refill history. If the patient does not have pharmacy benefits through this health plan, a recent pharmacy profile will be requested. Progress notes documenting usage of sample medication may also be requested.
b. If there is a contraindication to use of a long-acting beta agonist, then an alternative controller drug may be used in combination with a high-dose inhaled steroid such as a leukotriene inhibitor or long-acting muscarinic antagonist.
c. Patient must have documentation of inadequate control despite optimal therapy (above) for a period of at least 3 months AND
6. Must be used in combination with existing asthma therapy (as defined above)
a. Monotherapy will not be authorized as these agents are only FDA approved as an add-on maintenance treatment AND
7. Patient must have a peripheral blood eosinophil count of at least 150 cells per microliter within the preceding 6 weeks
8. Patient must have experienced 2 or more asthma exacerbations within the preceding 12 months that required medical intervention (defined as non-routine doctor visits, urgent care visits, emergency room visits, hospital admissions, or documented need for acute systemic steroids) despite existing therapy as outlined in criterion #5</td>

<td>1. The enrollee must be 18 years or older
2. The prior authorization is requested by or in consultation with a specialist (pulmonologist, rheumatologist, cardiologist or other specialist based on the organ/tissue involvement)
3. Patient must have a diagnosis of eosinophilic granulomatosis with polyangiitis (EGPA)
a. There must be a history or presence of asthma AND
b. There must be a history or presence of blood eosinophil level of at least 10% or an absolute eosinophil count of more than 1000 cells per microliter (See links to eosinophil calculators in policy guidelines section below) AND
c. There must be history of two or more of the following clinical findings:
i. Histopathological evidence of eosinophilic vasculitis via biopsy, motor deficit or nerve conduction abnormality, pulmonary infiltrates, sino-nasal abnormality, cardiomyopathy, glomerulonephritis, alveolar hemorrhage, palpable purpura, or positive test for antineutrophil cytoplasmic antibody (ANCA)
4. Provider must attest that the patient has 'Active, Non-Severe disease.' This criterion is based upon the most recent clinical guidelines published by the ACR/Vasculitis Foundation (2021).</td>
<td>Adults:
30 mg every four weeks</td>
</tr>
</table>

	Current guidelines do not support use for 'Active, Severe disease.' a. Non-severe disease is defined as vasculitis without life- or organ-threatening manifestations. Examples of symptoms in patients with non-severe disease include rhinosinusitis, asthma, mild systemic symptoms, uncomplicated cutaneous disease, mild inflammatory arthritis i. Remission induction: Fasenra + corticosteroids is recommended over other traditional treatments (such as corticosteroids +/- methotrexate, azathioprine, or mycophenolate mofetil) ii. Relapsed disease: For patients receiving maintenance therapy with only low dose corticosteroids or methotrexate, azathioprine, or mycophenolate mofetil, Fasenra 'add-on' to these treatments is recommended over other interventions b. Severe EGPA is defined as vasculitis with life-or organ-threatening manifestations (within 3 months), such as alveolar hemorrhage, glomerulonephritis, central nervous system vasculitis, mononeuritis multiplex, cardiac involvement, mesenteric ischemia, or limb/digit ischemia i. Remission induction: Cyclophosphamide or rituximab is recommended over Fasenra ii. Remission maintenance: Methotrexate, azathioprine, or mycophenolate mofetil are recommended over Fasenra 5. Fasenra will not be approved for granulomatosis with polyangiitis (also known as GPA or Wegener's granulomatosis) or microscopic polyangiitis 6. Initial approval will be for 6 months.	
Hypereosinophilic Syndrome (FDA Approval) ICD10: D72.11	1. Patient must be at least 12 years old AND 2. Must have a diagnosis of Hypereosinophilic Syndrome (HES) for ≥ 6 months, without an identifiable non-hematologic secondary cause. a. Please note, this excludes patients with non-hematologic secondary HES (such as drug hypersensitivity, parasitic helminth infection, HIV infection, non-hematologic malignancy, FIP1L1-PDGFRα kinase-positive HES, and eosinophilia of unknown clinical significance (unexplained HE, but without apparent complications/clinical manifestations related to organ/tissue infiltration)) AND 3. Patient must be followed by an Allergist/Immunologist, or an appropriate specialist based on the involved organ/tissue (ex. Pulmonologist for lung involvement) AND 4. Must have a blood eosinophil count of ≥ 1000 cells/microL within the last 6 weeks AND	Adults: 30 mg every 4 weeks

	5. Must have experienced ≥ 2 HES flares within the past 12 months (HES flare defined as HES-related worsening of clinical symptoms or blood eosinophil counts requiring escalation in therapy (ex. increased doses or addition of other drugs). a. Note: Background HES therapy includes, but is not limited to, chronic or episodic oral corticosteroids (ex. prednisone), immunosuppressive (ex. interferon alfa, methotrexate, cyclosporine, azathioprine), and/or cytotoxic therapy (ex. hydroxyurea, imatinib, cyclophosphamide) AND 6. Initial approval will be for 6 months.	

Exclusion Criteria

CDPHP will not administer benefits for replacement doses of Fasenra due to the improper storage or reconstitution of this drug. It is the responsibility of the requesting practitioner to ensure that all medical staff are following the unique guidelines for the stability, storage, and reconstitution of Fasenra as indicated in the product insert for this drug.

The efficacy of Fasenra is considered unproven and will not be approved for:

- Chronic Obstructive Pulmonary Disease (COPD)
- Acute bronchospasm
- Status asthmaticus
- Hypereosinophillic syndrome
- Used concurrently with other biologics (Cinqair, Nucala, Dupixent, Tezspire, Xolair, Adbry)
- Used as monotherapy

Continuation Criteria

Severe Asthma

- Subsequent recertifications after the initial 6-month approval will require an objective assessment of response from the provider (reductions in hospitalizations, ER visits, and rescue medication use) as well as compliance history with the inhaled corticosteroid and controller medication.
- Recertification will not be granted if the patient starts or re-starts smoking.
- Approval will be contingent on the continued use of standard of care for asthma (inhaled corticosteroids and additional controlled medications such as long-acting beta-agonist inhalers). Fasenra is not FDA approved for monotherapy.
- CDPHP expects that the use of Fasenra therapy will be part of a comprehensive asthma treatment regimen that includes, but is not limited to, intensive counseling on the importance of medication compliance and avoidance of allergic asthma triggers.

Eosinophilic Granulomatosis with Polyangiitis (EGPA)/Churg-Strauss Syndrome

- Recertification will be for 2 years and require documentation of attainment and maintenance of remission.
- Remission defined as absence of clinical signs/symptoms attributed to EGPA while maintained on an oral corticosteroid dose no greater than 7.5 mg per day prednisone or equivalent.
- Given the heterogenous nature of this disease that may have multi-organ involvement, consideration may be given on recertification when there is additional subjective evidence or statement of medical necessity from provider showing clear improvement in symptoms attributed to the use of Nucala OR Fasenra which warrants continued use (such as reduced rate of relapse, corticosteroid dose reduction, and reduced eosinophil level).

Hypereosinophilic Syndrome

- Recertification will be for 2 years and require documentation of a decrease in the frequency/severity of HES flares compared to baseline.
- Given the heterogeneous nature of the disease and variability in affected organs, consideration may be given on recertification when there is additional subjective evidence or statement of medical necessity from provider showing clear improvement in

symptoms attributed to the use of Nucala which warrants continued use of the drug (such as an improvement of symptoms, a reduction of background HES therapy, and/or a significant reduction in eosinophil count).

Considerations

- Prior authorization is obtained through the CDPHP pharmacy department.
- Fasenra approved for coverage as a medical benefit will be treated as buy and bill.
- A prescription drug benefit is required for covered under the pharmacy benefit.

Table 1:

Estimated comparative daily doses for inhaled glucocorticoids in adolescents ≥12 years and adults

Drug	Low dose (total daily dose)	Medium dose (total daily dose)	High dose (total daily dose)*
Beclomethasone HFA (Qvar RediHaler product available in United States) Administer as 2 divided doses	80 to 160 mcg	>160 to 320 mcg	>320 to 640 mcg
40 mcg per actuation	2 or 4 inhalations	¶	¶
80 mcg per actuation	2 inhalations	4 inhalations	6 or 8 inhalations
Beclomethasone HFAΔ (Qvar product available in Canada, Europe, and elsewhere) Administer as 2 divided doses	100 to 200 mcg	>200 to 400 mcg	>400 to 800 mcg
50 mcg per actuation	2 to 4 inhalations	¶	¶
100 mcg per actuation	2 inhalations	4 inhalations	6 or 8 inhalations
Budesonide DPI (Pulmicort Flexhaler product available in United States) Administer as 2 divided doses	180 to 360 mcg	>360 to 720 mcg	>720 to 1440 mcg
90 mcg per actuation	2 or 4 inhalations	¶	¶
180 mcg per actuation	2 inhalations	4 inhalations	6 or 8 inhalations
Budesonide DPIΔ (Pulmicort Turbuhaler or Turbohaler product available in Canada, Europe, and elsewhere) Administer low doses (ie, ≤400 mcg/day) once daily; administer higher doses (ie, >400 mcg/day) as 2 to 4 divided doses	200 to 400 mcg	>400 to 800 mcg	>800 to 2400 mcg
100 mcg per actuation	2 to 4 inhalations	¶	¶
200 mcg per actuation	1 to 2 inhalations	3 to 4 inhalations	¶
400 mcg per actuation	1 inhalation	2 inhalations	3 to 6 inhalations
Ciclesonide HFA (Alvesco product available in United States, Europe, and elsewhere) United States: Administer as 2 divided doses Australia, Europe, and elsewhere: Administer lower doses (ie, 160 to 320 mcg/day) once daily; administer 640 mcg dose as 2 divided doses	160 mcg	320 mcg	640 mcg
80 mcg per actuation	2 inhalations	4 inhalations	¶
160 mcg per actuation	◇	2 inhalations	4 inhalations
Ciclesonide HFAΔ (Alvesco product available in Canada) Administer lower doses (eg, 100 to 400 mcg) once daily; administer 800 mcg dose as 2 divided doses	100 to 200 mcg	>200 to 400 mcg	>400 to 800 mcg
100 mcg per actuation	1 to 2 inhalations	3 to 4 inhalations	¶
200 mcg per acutation	1 inhalation	2 inhalations	3 to 4 inhalations

Fluticasone propionate HFA (Flovent HFA product available in United States) Administer as 2 divided doses	176 to 220 mcg	>220 to 440 mcg	>440 to 1760 mcg
44 mcg per actuation	4 inhalations	¶	¶
110 mcg per actuation	2 inhalations	4 inhalations	¶
220 mcg per actuation	◇	2 inhalations	4 to 8 inhalations
Fluticasone propionate HFAΔ (Flovent HFA product available in Canada; Flixotide Evohaler product available in Europe and elsewhere) Administer as 2 divided doses	100 to 250 mcg	>250 to 500 mcg	>500 to 2000 mcg
50 mcg per actuation	2 to 4 inhalations	¶	¶
125 mcg per actuation	2 inhalations	4 inhalations	¶
250 mcg per actuation	◇	2 inhalations	4 to 8 inhalations
Fluticasone propionate DPI (Flovent Diskus product available in United States and Canada; Flixotide Accuhaler product available in Europe and elsewhere) Administer as 2 divided doses	100 to 250 mcg	>250 to 500 mcg	>500 to 2000 mcg
50 mcg per actuation	2 to 4 inhalations	¶	¶
100 mcg per actuation	2 inhalations	4 inhalations	¶
250 mcg per actuation	◇	2 inhalations	4 to 8 inhalations
500 mcg per actuation (strength not available in United States)	◇	◇	2 or 4 inhalations
Fluticasone propionate DPI (Armonair Digihaler product available in United States; Aermony Respiclick product available in Canada) Administer as 2 divided doses	110 mcg	226 mcg	464 mcg
55 mcg per actuation	2 inhalations	¶	¶
113 mcg per actuation	◇	2 inhalations	¶
232 mcg per actuation	◇	◇	2 inhalations
Fluticasone furoate DPI (Arnuity Ellipta product available in United States, Canada, Australia, and elsewhere, but not available in Europe or UK) Administer once daily **NOTE:** Inhaled fluticasone furoate has a greater anti-inflammatory potency per microgram than fluticasone propionate inhalers. Thus, fluticasone furoate is administered at a lower daily dose and used only once daily.	50 mcg (by use of pediatric DPI, which is off-label in adolescents and adults)	100 mcg	200 mcg
50 mcg per actuation	1 inhalation	¶	¶
100 mcg per actuation	◇	1 inhalation	2 inhalations
200 mcg per actuation	◇	◇	1 inhalation
Mometasone DPI (Asmanex Twisthaler product available in United States) May administer lower doses (ie, 220 to 440 mcg/day) once daily; administer 880 mcg dose as 2 divided doses	220 mcg	>220 to 440 mcg	>440 to 880 mcg
110 mcg per actuation	2 inhalations	¶	¶
220 mcg per actuation	1 inhalation	2 inhalations	4 inhalations

Mometasone DPI (Asmanex Twisthaler product available in United States) May administer lower doses (ie, 220 to 440 mcg/day) once daily; administer 880 mcg dose as 2 divided doses	220 mcg	>220 to 440 mcg	>440 to 880 mcg
110 mcg per actuation	2 inhalations	¶	¶
220 mcg per actuation	1 inhalation	2 inhalations	4 inhalations
Mometasone HFA (Asmanex HFA product available in United States) Administer as 2 divided doses	200 mcg	>200 to 400 mcg	>400 to 800 mcg
100 mcg per actuation	2 inhalations	4 inhalations	¶
200 mcg per actuation	◇	2 inhalations	4 inhalations
Mometasone DPIΔ (Asmanex Twisthaler product available in Canada, Europe, and elsewhere) May administer lower doses (ie, 200 to 400 mcg/day) once daily; administer 800 mcg dose as 2 divided doses	200 mcg	>200 to 400 mcg	>400 to 800 mcg
200 mcg per actuation	1 inhalation	2 inhalations	¶
400 mcg per actuation	◇	1 inhalation	2 inhalations

- **The most important determinant of appropriate dosing is the clinician's judgment of the patient's response to therapy.** The clinician must monitor the patient's response on several clinical parameters and adjust the dose accordingly. The stepwise approach to therapy emphasizes that once control of asthma is achieved, the dose of medication should be carefully titrated to the minimum dose required to maintain control, thus reducing the potential for adverse effects.
- Suggested total daily doses for low, medium, and high dose inhaled glucocorticoid regimens are based on daily doses recommended by Global Initiative for Asthma (GINA), National Asthma Education and Prevention Program (NAEPP), and/or product labeling[1-5]. This is not a table of equivalence.
- Depending on the specific product, total daily doses are administered once or divided and given twice daily. Refer to local product information or a clinical drug reference (eg Lexicomp).
- Some doses are outside the approved product information recommendations.

DPI: dry powder inhaler; HFA: hydrofluoroalkane propellant metered dose inhaler.

* Evidence for additional improvement with dose increases >1000 mcg/day is limited.

¶ Select alternate preparation with higher mcg/actuation to improve convenience.

Δ Products shaded in light gray color are not available in the United States but are available widely elsewhere.

◇ Select preparation with fewer mcg/actuation.

Table 2:

Usual doses of combined inhaled glucocorticoids and bronchodilators

Medication	Low dose	Medium dose	High dose
ICS-SABA combination			
Budesonide-albuterol HFA (Brand name: Airsupra)*			
NOTE: Not used for maintenance therapy.			
Acute symptom relief: Budesonide-albuterol (80 mcg/90 mcg) 2 inhalations as needed (usual maximum: 12 inhalations/day).			
ICS-LABA combinations			
Beclomethasone [beclometasone]-formoterol DPI or HFA (Not available in United States or Canada, but available elsewhere [sample brand names: Formodual, Fostair, Foster])¶Δ			
100 mcg/6 mcg	1 inhalation twice a day	2 inhalations twice a day	
200 mcg/6 mcg			2 inhalations twice a day
Budesonide-formoterol HFA (Brand name: Symbicort)¶			
80 mcg/4.5 mcg	2 inhalations twice a day		
160 mcg/4.5 mcg		2 inhalations twice a day	
Fluticasone furoate-vilanterol DPI (Brand name: Breo Ellipta)Δ			
NOTE: Inhaled fluticasone furoate has a greater anti-inflammatory potency per microgram than fluticasone propionate inhalers. Thus, fluticasone furoate is administered at a lower daily dose and used only **once** daily.			
50 mcg/25 mcg◇	1 inhalation once daily		
100 mcg/25 mcg		1 inhalation once daily	
200 mcg/25 mcg			1 inhalation once daily
Fluticasone propionate-formoterol MDI (Not available in United States or Canada, but available elsewhere [sample brand name: Flutiform])			
50 mcg/5 mcg	2 inhalations twice daily		
125 mcg/5 mcg		2 inhalations twice daily	
250 mcg/10 mcg			2 inhalations twice daily
Fluticasone propionate-salmeterol DPI (Brand names: Advair Diskus, Wixela Inhub)Δ			
100 mcg/50 mcg	1 inhalation twice a day		
250 mcg/50 mcg		1 inhalation twice a day	
500 mcg/50 mcg			1 inhalation twice a day
Fluticasone propionate-salmeterol HFA (Brand name: Advair HFA)			
45 mcg/21 mcg	2 inhalations twice a day		
115 mcg/21 mcg		2 inhalations twice a day	
230 mcg/21 mcg			2 inhalations twice a day
Fluticasone propionate-salmeterol DPI (Brand names: AirDuo RespiClick, AirDuo Digihaler)Δ§			
55 mcg/14 mcg	1 inhalation twice a day		
113 mcg/14 mcg	1 inhalation twice a day	1 inhalation twice a day	
232 mcg/14 mcg			1 inhalation twice a day
Mometasone-formoterol HFA (Brand name: Dulera)			
100 mcg/5 mcg		2 inhalations twice a day	
200 mcg/5 mcg			2 inhalations twice a day
Mometasone-indacaterol DPI (Brand name: Atectura Breezhaler; available in Canada)Δ			
80 mcg/150 mcg	1 inhalation (capsule) once a day		
160 mcg/150 mcg		1 inhalation (capsule) once a day	
320 mcg/150 mcg			1 inhalation (capsule) once a day
ICS-LAMA-LABA combinations¥			
Fluticasone furoate-umeclidinium-vilanterol DPI (Brand name: Trelegy Ellipta)Δ			
100 mcg/62.5 mcg/25 mcg		1 inhalation once daily	
200 mcg/62.5 mcg/25 mcg			1 inhalation once daily
Mometasone-glycopyrrolate (glycopyrronium)-indacaterol DPI (Brand name: Enerzair Breezhaler; available in Canada)*Δ			
160 mcg/50 mcg/150 mcg			1 inhalation (capsule) once a day

Do not exceed the maximum number of inhalations/puffs per day listed in the table due to the risk of toxicity from an excess dose of long-acting beta-agonist (ie, salmeterol, formoterol, or vilanterol). Brand names and dose per puff or per inhalation of commercially available fixed dose combinations are according to United States prescribing information, unless otherwise noted. Consult local product information before use.

ICS: inhaled glucocorticoid (inhaled corticosteroid); SABA: short-acting beta-agonist; LABA: long-acting beta-agonist; LAMA: long-acting muscarinic antagonist; HFA: metered dose inhaler with hydrofluoroalkane propellant; DPI: dry powder inhaler; SMI: soft mist inhaler.

* Not approved for use in patients <18 years old.

¶ When using ICS-formoterol as reliever, use one to two inhalations as needed. Maximum daily dose of maintenance and rescue is 12 inhalations.

Δ DPI contains lactose which may have small amounts of milk protein.

◇ Fluticasone furoate-vilanterol 50 mcg/25 mcg DPI is approved for use in patients 5 to 11 years old; use in adolescents and adults is off-label.

§ In AirDuo inhalers, the daily dose of salmeterol is approximately one-fourth of the dose in Advair, and the daily dose of fluticasone is approximately one-half that of the comparable low-, medium-, and high-dose strengths of Advair.

¥ Alternatively, tiotropium SMI (Brand name: Spiriva Respimat) can be used with an ICS or ICS-LABA inhaler. The dose in asthma is two inhalations (1.25 mcg/inhalation) once daily.

Fluticasone DPI (breath activated)§ 50, 100, or 250 mcg/inhalation	NA	50 mcg/inhalation - 1 to 2 inhalations twice per day	NA	50 mcg/inhalation - 3 to 4 inhalations twice per day 100 mcg/inhalation - 1 inhalation in AM and 2 inhalations in PM to 2 inhalations twice per day	NA	100 mcg/inhalation - 2 inhalations in AM and 3 inhalations in PM 250 mcg/inhalation - 1 inhalation twice per day
Mometasone aerosol DPI (breath activated)* 110 or 220 mcg/inhalation	NA	110 mcg/inhalation - 1 inhalation once daily	NA	110 mcg/inhalation - 2 to 3 inhalations once daily	NA	110 mcg/inhalation - 4 inhalations once daily or 2 inhalations twice per day 220 mcg/inhalation - 2 inhalations once daily or 1 inhalation twice per day
Mometasone HFA MDI 50, 100, or 200 mcg/puff	NA	50 mcg/puff - 1 puff once or twice per day	NA	50 mcg/puff - 2 to 3 puffs twice per day 100 mcg/puff - 1 puff twice per day	NA	100 mcg/puff - 2 puffs twice per day 200 mcg/puff - 1 inhalation twice per day

Some doses may be outside approved package labeling, especially in the high-dose range. Doses shown and strengths (ie, mcg per puff or inhalation) are based upon product descriptions approved in the United States, which may differ from how strengths are described for products available in other countries. Consult local product information before use.

HFA: hydrofluoroalkane; NA: not approved and no data available for this age group; DPI: dry-powder inhaler; AM: in morning; PM: in evening; US FDA: US Food and Drug Administration; MDI: metered-dose inhaler.

* Contains milk protein.

¶ Budesonide suspension is compatible with albuterol, ipratropium, and levalbuterol nebulizer solutions in the same nebulizer. Use only jet nebulizers as ultrasonic nebulizers are ineffective for suspensions.

Δ Ciclesonide is not approved by the US FDA for use in children under 12. It is approved for use in children 6 years of age and older in Canada, some European countries, and elsewhere.

◇ For fluticasone HFA, the low dose for children <4 years is higher than for children 5 to 11 years of age due to lower dose delivered with facemask and data on efficacy in young children.

§ Contains lactose.

GOVERNMENT PROGRAMS

CHILD HEALTH PLUS: Subject to all terms and conditions noted in above application.

MEDICARE ADVANTAGE: Subject to the terms and conditions noted in above policy for those medications listed as a medical benefit when administered and provided by physician office, coverage will be provided as a medical benefit. All other medications for Medicare Advantage with Part D members listed are subject to coverage under the current Part D benefit and Medicare Advantage Part D Formulary.

SELECT/HARP PLAN:

Medical Benefit - Subject to all terms and conditions noted in above application.
Pharmacy Benefit - Effective April 1, 2023, the pharmacy benefit for Medicaid is administered by NYRx, the Medicaid Pharmacy Program.

CDPHP Pharmacy Services 6/10/2026

New: 02/2018

Policy History

Date	Notes
02/2019, 02/2020, 02/2023	Reviewed with no changes
02/2024	Additional formulation available as auto-injector. Removed criteria around not having a parasitic infection within the last six months. Changed the criteria related to smoking status from "The enrollee must not use tobacco products or have had a greater than 10 pack-year past history of smoking" to "must be non-smoker, defined as someone who has not smoked in the preceding 6 months".
9/2024	Revised – Updated to reflect use in pediatric patients aged six and older. Added NDCs for the three available products.
12/2024	Revised with new indication for the treatment of adult patients with eosinophilic granulomatosis with polyangiitis (EGPA).
6/2025	Revised – aligned criteria with that of Nucala for shared indications, corrected/added back smoking status and extended continuation duration to two years.
9/2025	Revised - Updated EGPA criteria, including diagnostic criteria and attestation of non-severe disease
6/2026	Added new indication Hypereosinophilic Syndrome Updated EGPA continuation Updated eosinophilic asthma criteria language Added tables to considerations

This policy is subject to contractual limitations and/or parameters established in any Employer sponsored Summary Plan Description (SPD) and/or Benefit Design Document (BDD).

Disclaimer Notice

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to healthcare practitioners how to provide appropriate healthcare to their patients. Healthcare practitioners shall exercise their own medical judgment when deciding the most appropriate care to enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing healthcare services. CDPHP reserves the right to review this policy at any time and change it without notice.

Background

Mucopolysaccharidosis type III (MPS III), also known as Sanfilippo syndrome, is a rare genetic condition that causes fatal brain damage. It is caused by the lack of an enzyme that normally breaks down and recycles a large, complex sugar molecule called heparan sulfate. This heparan sulphate accumulates and causes damage to the cells of the body, particularly in the central nervous system (brain and spinal cord).

There are four subtypes of MPS III: types A, B, C and D. Each type is caused by a change (variant or mutation) in a different gene (see below). All types of MPS III are associated with mental deterioration, but the severity and rate of progression depends on the type of MPS III. There is also variability in severity within the subtypes and even between affected siblings.

All four types of MPS III are caused by variants in different genes that contain the instructions for making enzymes that break down heparan sulfate.

TYPE……GENE……ENZYME
MPS IIIA……..*SGSH*……heparan N-sulfatase
MPS IIIB……..*NAGLU*……alpha-N-acetylglucosaminidase
MPS IIIC……..*HGSNAT*……..heparan-alpha-glucosaminide N-acetyltransferase
MPS IIID……..*GNS*……..N-acetylglucosamine 6-sulfatase

MPS III is inherited in an autosomal recessive manner. This means that both parents have one copy of the altered gene and one normal copy – they are known as carriers and do not show signs of the condition. A child with MPS III inherits two copies of the altered gene, one from each parent.

Children with MPS III usually appear healthy at birth, but developmental delay is usually evident by age 2-5 years. A mild speech delay is often one of the first presenting features. Mental and motor development peak by 3-6 years of age, after which intellectual decline usually occurs Severe behavioral disturbances, such as hyperactivity and irritability, are a very common feature of Sanfilippo syndrome, and one of the more difficult aspects of the disorder to manage. The nature of the behavioral symptoms can often lead to an initial diagnosis (misdiagnosis) of autism and/or attention deficit/hyperactivity disorder (ADHD).

Other symptoms can include coarse hair, excess hair growth (hirsutism), slightly coarse facial features, severe sleeping problems, mildly enlarged liver and/or spleen, speech delay, respiratory and ear infections, diarrhea, hernias, seizures and a wobbly and erratic walk. The heart may also be affected and children with MPS III also often have hearing loss and vision impairment.

Children with Sanfilippo syndrome usually start to lose their intellectual functions, especially speech, before their motor function declines. **Death can occur from before the age of 10 or not until the third or fourth decades of life, with the average being around 15 to 20 years of age**. Children with MPS IIIC have a longer life expectancy into the mid-twenties on average. There are other forms of MPS III which result in slower progression and a longer life expectancy.

The combined estimated prevalence of Sanfilippo syndrome (types A, B, C, and D) is between 1:50,000 and 1:250,000 depending on the population studied. Type A is the most common globally; however, the prevalence of subtypes can vary depending on the region, with type A being more prevalent in Northern Europe and Eastern Europe than in the Mediterranean countries. Type B is the most prevalent subtype in Southern Europe. Types C and D are much less common overall, with estimated global incidences of 1:1,500,000 and 1:1,000,000 respectively.

To diagnose MPS III, mucopolysaccharides are usually first measured in urine, followed by measurement of enzyme activity in blood or a small skin sample. Increased heparan sulfate in urine, and a decrease in the activity of any one of the four enzymes (shown in the table above) is usually consistent with a diagnosis of MPS III and will identify the MPS III type (A, B, C, or D). It is important to know the MPS III type as many of the treatments being developed are only for specific types.

Fayuvi (rebisufligene etisparvovec) is an in vivo adeno-associated virus serotype 9 (AAV9) gene therapy administered as a one-time IV infusion. It uses a self-complementary AAV9 vector to deliver a functional copy of N-sulfoglucosamine sulfohydrolase (SGSH) gene to cells. The transduced cells then produce and secrete functional sulfamidase (heparan N-sulfatase or SGSH enzyme), which can be taken up by surrounding neurons and other cells and transported to lysosomes. This is intended to reduce the abnormal accumulation of heparan sulfate, a glycosaminoglycan, and prevent further lysosomal storage–related cellular injury and neurodegeneration

A Phase I/II, open-label study evaluated a single IV dose of Fayuvi 3×10^{13} vg/kg in 5 patients with middle-to-advanced MPS IIIA and cognitive developmental quotient (DQ) < 60. The study was terminated due to lack of efficacy in patients with advanced MPS IIIA, with annual safety follow-up planned through 5 years after dosing.

The safety and effectiveness of Fayuvi was evaluated in an open-label, single-arm, multicenter clinical study in pediatric patients with MPS IIIA (**NCT02716246)**. The study measured mean changes in cognitive scores in patients between the ages of 2 and 5 years. Fayuvi-treated patients maintained or improved cognitive function compared to an untreated historical control cohort. The overall efficacy set (N=27), CSF heparan sulfate decreased within the first month following treatment with Fayuvi 3×10^{13} vg/kg. Median CSF-HS exposure decreased by 63.98% ($p<0.001$), and ≥ 50% reductions were achieved by 88.2% of younger patients and 81.5% of the overall efficacy set

There is an ongoing Phase 3, multicenter long-term follow-up study (**NCT04360265)** evaluating the long-term safety, tolerability, and efficacy of UX111 in patients previously treated in NCT02716246 or NCT04088734. No additional UX111 dose is administered. The study is expected to enroll in approximately 41 patients and follows safety and neurodevelopmental outcomes for up to 5 years.

Fayuvi will be distributed through a network of Qualified Treatment Centers.

Summary	
Effective Date of Policy:	10/7/2026
Indications	Treatment of neurologic manifestations of mucopolysaccharidosis type IIIA (MPS IIIA, Sanfilippo syndrome type A) in pediatric patients with preserved neurodevelopmental function
ICD10 Diagnosis Codes	E76.22
HCPCS	J3590 (non-specific)
Availability	suspension for intravenous infusion with a concentration of 1.0×10^{13} vg/m
Duration	6 months to allow completion of the one-time administration

Required Criteria for Approval

1. Must have a confirmed diagnosis of Mucopolysaccharidosis type IIIA (Sanfilippo syndrome type A), demonstrated by either:
    a. Genetic testing confirming biallelic pathogenic or likely pathogenic variants of the SGSH gene (homozygous or compound heterozygous) **OR**
    b. Deficiency of N-sulphoglucosamine sulphohydrolase enzyme
2. Fayuvi must be prescribed by or in consultation with a specialist experienced in the diagnosis and treatment of MPS IIIA, such as a metabolic/genetics specialist or neurologist.
3. Must be less than 18 years of age.
4. Must have preserved neurodevelopmental function as assessed by at least of one the following:
    a. Patients 2 years of age or younger must have documented preserved cognitive developmental skills assessed using the Bayley Scales of Infant and Toddler Development, Third Edition (Bayley-III), or the Mullen Scales of Early Learning, with confirmation from the treating specialist
    b. Patients older than 2 years of age must have a Cognitive Developmental Quotient (DQ) of 60 or greater, calculated using either the Bayley-III or the Mullen Scales of Early Learning.
5. The provider must attest to completing the following baseline laboratory assessments within 30 days prior to the planned Fayuvi infusion:
    a. Liver function tests, including alanine aminotransferase (ALT), aspartate aminotransferase (AST), gamma-glutamyl transferase (GGT), and total bilirubin.
    b. Platelet count, prothrombin time (PT), and activated partial thromboplastin time (aPTT).
6. Must have documentation of a baseline anti-AAV9 total binding antibody titer of less than 1:100 prior to Fayuvi administration.
    a. The laboratory report must specify the assay type, collection date, and reported titer.
7. Must not have previously received Fayuvi or another gene/cell therapy for MPS IIIA. Fayuvi is administered as a one-time intravenous gene therapy and will not be authorized for retreatment.
8. Use of Fayuvi in MPS IIIA patients who failed to meet the preserved-neurodevelopmental-function criterion is considered not medically necessary based on previous clinical trials.

9. Use of Fayuvi is considered experimental and investigational when the above criteria are not met.
10. Fayuvi must be dosed and administered per the FDA approved prescribing information.
    a. Single-dose 3.0×10^{13} vector genomes per kilogram (vg/kg) body weight, administered as a single intravenous infusion
    b. Required corticosteroid regimen (prednisone or prednisolone 1 mg/kg/day beginning one day prior to infusion, continued for 8 weeks followed by gradual taper)
    c. Post-treatment monitoring of liver function and platelet counts as specified in the prescribing information
11. Initial authorization will be for 6 months to allow completion of the one-time administration.

Policy Guidelines

1. Utilization Management are contract dependent. Refer to specific contract/benefit language for exclusions.
    a. Coverage criteria may be dependent on the contract renewal date.
    b. Coverage of drugs listed in this policy are contract dependent.
    c. Not all contracts/benefits allow coverage of healthcare professional administered drugs as part of their pharmacy benefit
    d. Not all contracts/benefits cover all medical infusible drugs.
2. Clinical documentation must be submitted for each request (initial and recertification [if applicable]) unless otherwise specified (e.g., provider attestation required). Supporting documentation includes, but is not limited to, progress notes documenting previous treatments and treatment history, diagnostic testing, laboratory test results, genetic testing or biomarker results, imaging and other objective or subjective measures of benefit. Requested dosing must remain consistent with FDA-approved dosing recommendations.
3. This policy does not apply to Medicare Part D and D-SNP pharmacy benefits. The drugs in this policy may apply to all other lines of business including Medicare Advantage.
4. Unless otherwise indicated within drug specific criteria, the drugs listed in this policy are administered by a healthcare professional and therefore are covered under the medical benefit.
5. All utilization management requirements outlined in this policy are compliant with applicable New York State insurance laws and regulations. Policies will be reviewed and updated as necessary to ensure ongoing compliance with all state and federally mandated coverage requirements.
6. For commercial contracts, medical necessity determinations align with the Certificate of Coverage issued by the Health Plan, which states that covered services must be clinically appropriate and not primarily for the convenience of the member, the member's family, or the provider.
7. This policy is based on available evidence as of the last review date. Coverage determinations are subject to applicable plan documents, state and federal regulations, and individual patient circumstances. This policy does not constitute medical advice.
8. This policy is subject to ongoing revision. Newly marketed drugs and existing drugs with new indications may be subject to prior authorization until formal coverage criteria are established. Inclusion of a drug in this policy does not guarantee its current availability on the market, as some agents may be discontinued, withdrawn, or otherwise unavailable. As product status changes, drugs may be removed from the policy.
9. For members with Medicare Advantage, medications with a National Coverage Determination (NCD) and/or Local Coverage Determination (LCD) will be covered pursuant to the criteria outlined by the NCD and/or LCD. NCDs/LCDs for applicable medications can be found on the CMS website at https://www.cms.gov/medicare-coverage-database/search.aspx. In the absence of a Medicare National Coverage Determination (NCD), Local Coverage Determination (LCD), or other Medicare coverage guidance, CMS permits a Medicare Advantage Organization (MAO) to establish its own coverage determinations in accordance with 42 CFR § 422.101(b)(6). Indications that have not been addressed by the applicable medication's LCD/NCD will be covered in accordance with criteria determined by the Health Plan. Step therapy requirements may be imposed in addition to LCD/NCD requirements.
10. Manufacturers may either discontinue participation in, or may not participate in, the Medicaid Drug Rebate Program (MDRP). Under New York State Medicaid requirements, physician-administered drugs must be produced by manufacturers that participate in the MDRP. Products made by manufacturers that do not participate in the MDRP will not be covered under Medicaid Managed Care/HARP lines of business. Drug coverage will not be available for any product from a non-participating manufacturer. For a complete list of New/Reinstated & Terminated Labelers please visit: https://www.medicaid.gov/medicaid/prescriptiondrugs/medicaid-drug-rebate-program/newreinstated-terminated-labeler-information/index.html
11. The requested site of care may impact approval timeframe and is subject to review.
12. The following applies to all gene and cellular therapies unless otherwise specified within the drug-specific coverage criteria:
    a. Administration, Retreatment, and Treatment with Additional or Other Gene/Cellular Therapies
        i. One-Time Administration

1. Most gene and cellular therapies, whether autologous, allogeneic ("off-the-shelf"), or in vivo gene-transfer therapies, are designed and studied as one-time treatments.
2. Repeat dosing, reinfusion, or sequential therapy with other gene or cellular products has not been established as safe, effective, or clinically appropriate.

ii. Retreatment/Repeat Administration
1. Retreatment with the same gene or cellular therapy product is considered experimental and investigational because:
   a. Clinical trials evaluated these therapies as single-administration interventions
   b. Safety, efficacy, and durability of a second administration have not been established
   c. Risks of immune activation, insertional mutagenesis, or vector immunity may be increased with repeat dosing

iii. Treatment with an Additional or Other Gene/Cellular Therapy
1. Treatment with an additional or different gene or cellular therapy after prior exposure to any gene or cellular therapy is also considered experimental and investigational, unless supported by evidence demonstrating (a-c):
   a. Anticipated clinical benefit beyond available standard therapies
   b. Safety of sequential administration
   c. Justification for selecting a second gene/cellular intervention after a prior one
2. This includes, but is not limited to:
   a. Switching between CAR-T products (e.g., CD19 → CD19 or CD19 → BCMA)
   b. Switching between autologous and allogeneic cellular therapies
   c. Sequential use of CAR-T, TCR-T, NK-cell therapies, or other genetically engineered cell therapies
   d. Receiving a gene therapy after previous gene or cellular therapy exposure
   e. Receiving an in vivo gene therapy following any prior vector-based therapy

iv. Prior Gene/Cell Therapy Exposure
1. An individual is generally not eligible for additional gene or cellular therapy if they have previously received:
   a. Any autologous cellular therapy (e.g., CAR-T, TCR-T, TIL),
   b. Any allogeneic genetically modified cellular therapy,
   c. Any in vivo gene therapy (e.g., AAV, lentiviral vector)
   d. Any ex vivo gene-modified cell product
   e. Are being considered for any other gene or cellular therapy without documented evidence supporting safety and anticipated benefit.

Policy/Procedure Name: Fc Receptor Blocker Drugs for Generalized Myasthenia Gravis **Control Number: 1350/20.000493**

Disclaimer Notice

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgment when deciding the most appropriate care to enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

Background

Generalized myasthenia gravis is a chronic autoimmune, neuromuscular disease that causes muscle weakness and fatigue. The muscle weakness presenting in MG is due to an antibody-mediated immunologic attack directed at proteins in the postsynaptic membrane of the neuromuscular junction. Myasthenia gravis has been associated with antibodies against 3 postsynaptic proteins: acetylcholine receptor (AChR), muscle-specific kinase (MuSK), and low-density lipoprotein receptor-related protein 4 (LRP4). AChR antibody–positive patients represent the vast majority of gMG patients. There are two classifications of MG: ocular and generalized. In the ocular form the weakness is limited to the eyelids and extraocular muscles whereas in generalized the weakness involves the ocular, limb, and the respiratory tract. Many patients suffer from bulbar weakness (impairment of lower cranial nerves). This results in difficulty chewing, swallowing, talking, and even holding the head up. The degree of muscle weakness can fluctuate and vary in severity from person to person; however, it will generally improve with rest and worsen with physical activity. Other precipitating factors include pregnancy, infection, surgery, and stress. There is no cure for gMG, with symptoms progressing and often reaching their worst after a few years of disease onset.

Treatment options are aimed as managing the disease as no cure is known. Goals are restoring muscle strength and reducing disease activity as well as preventing myasthenic crisis. Therapeutic options are:

1. Symptomatic therapy with acetylcholinesterase inhibitors (e.g., oral pyridostigmine) to increase acetylcholine at the neuromuscular junction
2. Chronic immunosuppressive therapies to manage immune dysregulation (e.g., glucocorticoids, nonsteroidal immunosuppressants)
3. Rapid immunomodulatory therapies (e.g., intravenous [IV] immunoglobulin [IVIG], plasma exchange) for patients with severe disease or those experiencing myasthenic crisis
4. Thymectomy (i.e., surgical removal of the thymus gland); usually reserved for patients with a thymoma (10%–15% of MG patients) or for those < 60 years of age without a thymoma with AChR antibodies (the thymus plays a role in the pathogenesis of MG in seropositive patients)

Initial therapy is oral pyridostigmine for mild to moderate disease, whereas more severe disease is treated with IVIG (myasthenic crisis) followed by immunosuppressive therapy (corticosteroids, azathioprine, mycophenolate mofetil, cyclosporine, tacrolimus). It is noted that individuals will very likely utilize more than one of these medications in combination with each other. Those that are eligible for a thymectomy typically continue their medications and see an improvement approximately one year after surgery. Unfortunately, between 10 and 30 percent of those with MG do not respond to conventional immunosuppressive therapy and will require treatment with other therapies such as off-label Rituximab, IVIG, Plasma Exchange, or Soliris.

Rystiggo (rozanolixizumab) was approved by the FDA under the priority review designation for the treatment of generalized myasthenia gravis in adult patients who are an anti-acetylcholine receptor (AChR) or anti-muscle-specific tyrosine kinase (MuSK) antibody positive. Approval was based on the results of the phase 3 MycarinG trial, where patients were randomized to either Rystiggo at roughly 7 mg/kg, 10 mg/kg or placebo. At day 43, patients in the Rystiggo groups had an improvement in MG-ADL score of -2.6 points in the 7 mg/kg group (-4.1,-1.2; p <0.001) and -2.6 points in the 10 mg/kg group (-4.0,-1.2; p<0.001) when compared to placebo. Rystiggo is the first treatment option approved by the FDA for the treatment of patients with anti-MuSK antibody positive gMG.

Imaavy (nipocalimab-aahu) was approved by the FDA for the treatment of generalized myasthenia gravis in adults and pediatric patients 12 years of age and older who are anti-AChR or anti-MuSK antibody positive. Approval was based on the results of phase 3 Vivacity-MG3 trial, where patients were randomized to either Imaavy or placebo. At weeks 22, 23, and 24, patients in the Imaavy group had a mean improvement in MG-ADL score of -1.5 points (-2.4, -0.5; p = 0.002) compared to placebo. Imaavy is the first treatment option approved by the FDA for the treatment of anti-AChR and anti-MuSK antibody positive gMG in pediatric patients 12 years of age and older.

Summary

Effective Date of Policy:	6/10/2026
Indications	Rystiggo: Treatment of generalized myasthenia gravis (gMG) in adult patients who are anti-acetylcholine receptor (AChR) or antimuscle-specific tyrosine kinase (MuSK) antibody positive Imavvy: Treatment of generalized myasthenia gravis (gMG) in adult and pediatric patients 12 years of age and

	older who are anti-acetylcholine receptor (AChR) or anti-muscle-specific tyrosine kinase (MuSK) antibody positive
ICD10 Diagnosis Codes	G70.0
Availability	*Rystiggo – Injection: 280 mg/2 mL in a single-dose vial* *Imaavy – Injection: 300 mg/1.62 mL or 1,200 mg/6.5 mL in a single-dose vial*
HCPCS Code	Rystiggo: J9333 Imaavy: J9256
Duration	Initial: 6 months Recertification: 12 months

Required Criteria for Approval

All of the following conditions for the requested indication must be met in order to approve therapy:

Indication	Criteria for Approval
Rystiggo (rozanolixizumab-noli) **Medical benefit**	1. Enrollee is ≥ 18 years of age 2. Must be prescribed by or in consultation with a neurologist. If geographically available, it is also recommended for patients to have been evaluated by a neuromuscular specialist 3. Must have a diagnosis of generalized myasthenia gravis (gMG) **AND** 4. Must have Myasthenia Gravis Foundation of America (MGFA) clinical classification class II to IVa **AND** 5. Must be antibody positive for either (a or b): a. Anti-acetylcholine receptor (AChR) **OR** b. Muscle-specific kinase (MuSK) **AND** 6. Must documentation of a baseline Myasthenia Gravis Activities of Daily Living (MG-ADL) score of at least 5 7. Must meet one of the following (a or b) a. Must have had serious side effects or drug failure to ONE of the following treatments for gMG (i or ii). i. Corticosteroids for at least 3 months of treatment **OR** ii. Non-steroidal immunosuppressive therapy (i.e., azathioprine, mycophenolate mofetil, cyclosporine) for at least 6 months of treatment **OR** b. Despite treatment with at least ONE immunosuppressant agent (i.e., corticosteroid, non-steroidal immunosuppressive therapy), the member required at least ONE treatment with plasma exchange, plasmapheresis, or intravenous immunoglobulin within the previous 12 months. 8. Must have had serious side effects or drug failure with Vyvgart Hytrulo prefilled syringe (PFS). This applies to New Starts only for all lines of business. 9. Rystiggo will not be approved in combination with Uplizna, Soliris/Bkemv/Epysqli, Ultomiris, Vyvgart, Vyvgart Hytrulo, Imaavy, Zilbrysq, intravenous immunoglobulin (other than when used as rescue therapy), or rituximab-containing products as Rystiggo has not been studied in combination with these therapies. 10. The recommended dosage of Rystiggo is weight based (see Table 1) and is administered as a subcutaneous infusion once weekly for 6 weeks. Administer subsequent treatment cycles based on clinical evaluation. The safety of initiating subsequent cycles sooner than 63 days from the start of the previous treatment cycle has not been established. 11. Initial approval will be for 6 months. Continued approval will require documentation of ≥ 2-point improvement in the MG-ADL scale from baseline **OR** provider attests that patient is experiencing clinical benefit from treatment (i.e., reduction of myasthenia gravis exacerbations, improvement in symptoms such as swallowing, mobility, breathing). Recertification will be required every 12 months. **Table 1: Recommended Dose Based on Body Weight** **Body Weight of Patient** / **Dose** / **Volume to be Infused** Less than 50 kg / 420 mg / 3 mL 50 kg to less than100 kg / 560 mg / 4 mL 100 kg and above / 840 mg / 6 mL

Imaavy (nipocalimab-aahu) **Medical benefit**	1. Must be 12 years of age or older **AND** 2. Must be prescribed by or in consultation with a neurologist. If geographically available, it is also recommended for patients to have been evaluated by a neuromuscular specialist **AND** 3. Must have a diagnosis of generalized myasthenia gravis (gMG) **AND** 4. Must have Myasthenia Gravis Foundation of America (MGFA) clinical classification class II to IV **AND** 5. Must be antibody positive for either (a or b): a. Anti-acetylcholine receptor (AChR) **OR** b. Muscle-specific kinase (MuSK) **AND** 6. Must have documentation of a baseline Myasthenia Gravis Activities of Daily Living (MG-ADL) score of at least 6 **AND** 7. Must meet one of the following (a or b): a. Must have had serious side effects or drug failure to ONE of the following treatments for gMG (1 or 2). i. Corticosteroids for at least 3 months of treatment **OR** ii. Non-steroidal immunosuppressive therapy (i.e., azathioprine, mycophenolate mofetil, cyclosporine) for at least 6 months of treatment **OR** b. Despite treatment with at least ONE immunosuppressant agent (i.e., corticosteroid, non-steroidal immunosuppressive therapy), the member required at least ONE treatment with plasma exchange, plasmapheresis, or intravenous immunoglobulin within the previous 12 months 8. For individuals 18 years of age and older with AChR antibody positive gMG, must have serious side effects or drug failure to Vyvgart/Vyvgart Hytrulo. 9. Imavvy will not be approved in combination with Uplizna, Soliris/Bkemv/Epysqli, Ultomiris, Vyvgart, Vyvgart Hytrulo, Rystiggo, Zilbrysq, intravenous immunoglobulin (other than when used as rescue therapy), or rituximab-containing products as Imavvy has not been studied in combination with these therapies. 10. The recommended initial dosage of Imaavy is 30 mg/kg administered once via intravenous infusion over at least 30 minutes. Two weeks after the initial dosage administer a maintenance dosage of 15 mg/kg via intravenous infusion over at least 15 minutes. Continue the maintenance dosage every two weeks thereafter. 11. Initial approval will be for 6 months. Continued approval will require documentation of > 2-point improvement in the MG-ADL scale from baseline OR provider attests that patient is experiencing clinical benefit from treatment (i.e., reduction of myasthenia gravis exacerbations, improvement in symptoms such as swallowing, mobility, breathing). Recertification will be required every 12 months.

Exclusion Criteria

Rystiggo	Therapy will not be authorized if any of the above Inclusion Criteria are not met OR any of the below noted Exclusion Criteria are met: • Enrollee has Myasthenia Gravis Foundation of America Class I or V • Enrollee has worsening muscle weakness secondary to concurrent infections or medications
Imaavy	Imavvy will not be approved in combination with Soliris/Bkemv/Epysqli, Ultomiris, Vyvgart, Vyvgart Hytrulo, Rystiggo, Zilbrysq, intravenous immunoglobulin (other than when used as rescue therapy), or rituximab-containing products as Imavvy has not been studied in combination with these therapies.

Continuation Criteria

Rystiggo	• Requests will be reviewed per criteria every six months • Continuation of therapy will be authorized if disease response occurs defined as at least a two-point improvement in the MG-ADL score from the members pre-treatment baseline
Imaavy	• Initial approval will be for 6 months. Recertification will be required every 12 months. • Continued approval will require documentation of ≥ 2-point improvement in the MG-ADL scale from baseline **OR** • Provider attests that patient is experiencing clinical benefit from treatment (i.e., reduction of myasthenia gravis exacerbations, improvement in symptoms such as swallowing, mobility, breathing).

Considerations

• Prior authorization is obtained through the CDPHP pharmacy department

MEDICAL POLICY

Medical Policy Title	**Fecal Microbiota Transplantation**
Policy Number	**2.01.48**
Current Effective Date	**November 1, 2026**
Next Review Date	**September 2027**

Our medical policies are guides to evaluate technologies or services for medical necessity. Criteria are established through the assessment of evidence based, peer-reviewed scientific literature, and national professional guidelines. Federal and state law(s), regulatory mandates and the member's subscriber contract language are considered first in the determination of a covered service. (Link to Product Disclaimer)

POLICY STATEMENT(S)

I. Fecal microbiota transplantation (FMT) is considered **medically appropriate** for the treatment of adults with recurrent Clostridioides difficile infection (CDI), when **BOTH** the following criteria have been met:

   A. The individual has a history of two (2) or more recurrences after the initial episode, despite standard antibiotic treatment (total of three [3] or more episodes);

   B. The appropriate donor stool screening has been completed.

II. Fecal microbiota transplantation (FMT) is considered **investigational** for all other indications, including but not limited to, the first line treatment for CDI or the treatment of inflammatory bowel disease.

RELATED POLICIES

Corporate Medical Policy

11.01.03 Experimental or Investigational Services

POLICY GUIDELINE(S)

I. FMT should be performed with appropriately screened donor stool. Rigorous evaluation of all candidate stool donors is important to minimize the risk for transmitting infection and to maximize the likelihood of successful treatment outcome.

DESCRIPTION

Fecal microbiota transplantation (FMT), also called fecal bacteriotherapy or intestinal microbiota transplantation, involves the administration of intestinal microorganisms from a healthy, screened donor into a patient's gastrointestinal tract to restore normal colonic flora. FMT can be delivered via colonoscopy, oral capsules, nasogastric or nasoduodenal tube, or rectal enema. The goal is to replace disordered native microbiota (dysbiosis) with a stable donor microbial community.

The primary clinical application of FMT is recurrent Clostridioides difficile infection (CDI). C. difficile is a major cause of clinically significant diarrhea and colitis, most commonly following disruption of

Proprietary Information of Capital District Physicians' Health Plan, Inc. | CDPHP Universal Benefits,® Inc. | Capital District Physicians' Healthcare Network, Inc.

normal colonic flora by antibiotics and often becomes recurrent. When severe or fulminant, CDI can cause life-threatening complications including toxic megacolon and colonic perforation. Recurrent CDI, defined as reappearance of symptoms after resolution on appropriate therapy, typically within 8 weeks of treatment completion. Risk factors for recurrence include advancing age, concomitant antibiotic exposure, defective humoral immune response to C. difficile toxins, severe underlying disease, and proton pump inhibitor use. Standard first-line treatment for initial and recurrent CDI is antibiotic therapy.

The principal potential risk associated with FMT is transmission of contagious agents contained in the donor stool. There are risks of transmitting agents that do not cause a disease immediately after transplantation but may complicate the treatment of the patient in the future. The fecal transplant material (donor stool) must be appropriately screened for infectious diseases and pathogens.

SUPPORTIVE LITERATURE

Recurrent CDI

Based on published outcomes from case series/case reports and randomized controlled trials (RCT), FMT is a highly effective therapy for recurrent CDI when standard treatments have failed.

A Cochrane systematic review (Minkoff 2023) of 6 RCTs (320 participants) found moderate-certainty evidence that FMT leads to a large increase in resolution of recurrent CDI compared with alternative treatments such as antibiotics, with an approximately 77% cure rate.

First-Line FMT for CDI

The evidence for FMT as a first-line therapy for CDI is insufficient to determine that first-line FMT therapy results in an improvement in the net health outcome. The American Gastroenterological Association's clinical practice guidelines indicate that trials are needed to assess FMT therapies as primary prevention in patients at high risk of CDI and as first-line treatment after short course of anti-CDI therapy (Peery 2024).

Baunwall et al (2022) conducted the EarlyFMT trial, a small randomized, double-blind, placebo-trial to compare the efficacy and safety of FMT compared with placebo after vancomycin for first or second C difficile infection. Eligible patients were aged 18 years or older with first or second C difficile infection. Patients were randomly assigned (1:1) to FMT (n=21) or placebo (n=21) administered on day 1 and between day 3 and 7, after they had received 125 mg oral vancomycin four times daily for 10 days. The trial was stopped early after interim analysis showed significantly higher resolution in the FMT group (19/21) versus placebo (7/21; p=0.00031). The absolute risk reduction for recurrence following FMT compared with placebo was 57%. The authors indicated that the results should not be interpreted as evidence for FMT alone, but for its use in combination with antibiotics. The authors concluded that FMT after vancomycin is superior to standard-of-care vancomycin alone in achieving sustained cure of first or second C difficile infection.

Irritable Bowel Syndrome (IBS)

Ianiro et al (2019) conducted a systematic review with meta-analysis reviewed 5 randomized controlled trials (RCTs) and reported mixed outcomes for FMT in patients with IBS. When all studies

were pooled, no net benefit was found for active FMT.

Lahtinen et al (2020) reported the results of a double-blind RCT evaluating the efficacy of FMT in patients with IBS. The intervention group (n=23) received donor FMT via colonoscopy and the control group (n=26) received autologous FMT placebo via the same route. Approximately 35% of patients experienced adverse events, with no significant difference between groups.

Holvoet et al (2021) reported the results of a double-blind RCT evaluating the efficacy of FMT in patients with refractory IBS, defined as failure of ≥3 conventional therapies. The intervention group (n=43) received donor FMT via the nasojejunal route and the control group (n=19) received autologous FMT placebo via the same route. A daily symptom diary was used to assess IBS-related symptoms and improvement in IBS symptoms at 12 weeks was the primary outcome of the trial. After a single FMT, more patients in the treatment group versus placebo reported efficacy for more than 1 year (21% vs. 5%). A second FMT reduced symptoms in 67% of patients with an initial response to donor stool, but not in patients with a prior non-response.

Madsen et al (2021) reported the results of a double-blind RCT evaluating the efficacy of FMT capsules (n=26) versus placebo capsules (n=25) in patients with moderate-to-severe IBS (IBS-SSS score ≥175 points). Both groups administered capsules for 12 days and patients were allowed to continue any concomitant IBS medications, including laxatives or agents for constipation. Patients tracked their symptoms in a diary and were followed for 6 months. The primary outcome was not specified, but investigators evaluated abdominal pain, stool frequency, and stool form. Subgroup analyses by IBS subtype were not performed.

El-Salhy et al (2022) published 3-year follow-up results of a double-blind, placebo-controlled study that randomized 165 patients with IBS, published in 2020 by the same researcher. The current study included 125 patients (n=38 placebo group; n=42 received 30 grams (g) of donor feces; n=45 received 60 g of donor feces). Two years after FMT, response rates were 26.3%, 69.1%, and 77.8% in the placebo, 30 g, and 60 g groups, respectively. Three years after FMT, response rates were 27.0%, 64.9%, and 71.8%, respectively. The response rates were significantly higher in the 30-g and 60-g groups than in the placebo group. Patients in the 30-g and 60-g groups had significantly fewer IBS symptoms and fatigue, and a greater quality of life both at 2 and 3 years after FMT. No long-term adverse events were recorded.

Wang et al (2023) performed a meta-analysis of 9 RCTs (n=516) and found that a single FMT significantly decreased IBS-SSS scores at months 1, 3, 6, 24, and 36 compared with placebo, with improved clinical response rates and quality of life at months 3, 24, and 36. FMT did not increase adverse event risk. The authors conclude that a single FMT is effective and safe for patients with IBS, however, the authors noted that the relationship between the gut microbiome and FMT efficacy in IBS remains unclear.

Inflammatory Bowel Disease (IBD) – Crohn's Disease

Sokol et al (2020) conducted a pilot RCT investigating endoscopic delivery of FMT in patients with Crohn's disease (CD). This small, multicenter, single-blind, placebo-controlled RCT was conducted in France and randomized patients to FMT (n=8) and sham transplantation (n=9). The primary

endpoint was the colonization of donor microbiota at week 6, which was not reached by any patient. The rate of clinical flares in the 24 weeks following FMT was a secondary endpoint in the study. Only those patients who achieved clinical remission within the 3 weeks following the commencement of corticosteroids were randomized to treatment or placebo. The treatment group received FMT after colon cleansing with polyethylene glycol. The steroid-free clinical remission rate at 10 and 24 weeks was 44.4% (4/9) and 33.3% (3/9) in the sham transplantation group and 87.5% (7/8) and 50.0% (4/8; one patient loss of follow-up while in remission at week 12 and considered in flare at week 24) in the FMT group. Crohn's Disease Endoscopic Index of Severity decreased 6 weeks after FMT ($p = 0.03$) but not after sham transplantation ($p = 0.8$). Conversely, the CRP level increased 6 weeks after sham transplantation ($p = 0.008$) but not after FMT ($p = 0.5$). None of the adverse events observed in the trial was related to FMT. These results must be confirmed in larger studies.

Zhou et al (2023) conducted a systematic review and meta-analysis to examine the safety and effectiveness of FMT in patients with CD. Eleven cohort studies and one RCT involving 228 patients were included. In a meta-analysis, the pooled proportion of adult patients with active CD that achieved clinical remission 2 to 4 weeks after FMT was 57%. Results showed that FMT reduced Crohn's disease activity index scores 4 to 8 weeks after FMT. Subgroup analyses showed no difference between FMT methodologies, except for pre-FMT treatment with antibiotics ($P = 0.02$). Most adverse events were self-limiting and disappeared spontaneously within hours or days after FMT. The authors concluded that FMT could be a promising therapy in the short-term treatment of active CD; however, more placebo-controlled RCTs, with long-term-up follow-up, are necessary.

Kao et al (2024) conducted the first placebo-controlled multicenter RCT of FMT in active Crohn's disease (CD). Patients with mild-to-moderate CD were randomized 1:1 and received FMT (n=17) or placebo (n=12). The first treatment was administered by colonoscopy followed by weekly oral capsules for 7 weeks. Primary end point was clinical and endoscopic remission at week 8. Secondary outcomes included clinical and endoscopic response, adverse events, and health-related quality of life using generic and disease-specific instruments. At week 8, 0% (0/15) of patients in the FMT group versus 8.3% (1/11) in the placebo group reached the primary end point of combined clinical and endoscopic remission as per protocol analysis. There were no differences between the groups in clinical or endoscopic responses. One patient in each group had worsening of CD. Although both groups experienced statistically significant improvements in health-related quality of life, only the FMT group had a significant decrease in activity impairment. FMT was not effective at inducing clinical and endoscopic remission in CD using the FMT regimen in this study. Future studies should use an adequately powered multicenter trial and use a longer intervention period to improve clinical efficacy.

Inflammatory Bowel Disease (IBD) – Ulcerative Colitis

A Cochrane review (Imdad 2023) of 12 studies (N=550 participants) evaluated the efficacy and safety of FMT for the treatment of IBD. The follow-up duration across studies ranged from 6 to 12 weeks for the evaluation of induction and from 48 to 56 weeks for the evaluation of remission. Comparators included autologous FMT, placebo, standard medication, and no intervention. The results showed that FMT may increase rates of clinical remission induction in UC compared with controls (risk ratio, 1.79; 95% CI, 1.13 to 2.84; low certainty), but FMT did not significantly improve

the likelihood of induction of endoscopic remission. FMT did not significantly improve the maintenance of clinical or endoscopic remission of UC. There were no statistically significant differences in the rates of adverse events or serious adverse events. Evidence was very uncertain regarding serious adverse events, quality of life, and maintenance of remission.

Caenepeel et al (2025) conducted a multi-centric, double-blind, sham-controlled, randomized trial with repeated FMTs to induce clinical remission in patients with active UC through rigorous donor screening and by applying an anerobic workflow to create cell-density-standardized FMT preparations. Thereby, targeting the identification and characterization of potentially highly effective donors (also referred to as 'superdonors') for treatment of UC. Patients (n=66) were randomized to receive 4 infusions of allogenic donor or autologous FMT (allogenic FMT, n=30; and autologous FMT, n=36). At week 8, respectively, 3 and 5 patients reached the primary endpoint of steroid-free clinical remission (P= .72), indicating no treatment difference of at least 5% in favor of allogenic FMT. The trial did not meet its primary endpoint of increased steroid-free clinical remission and was halted at 66% of intended inclusions due to futility. The authors concluded that strict allogenic donor selection could not increase the efficacy of FMT in active UC. Nevertheless, key lessons for future research were learned.

Gefen et al (2025) indicated that FMT has been shown to restore gut microbiome composition with an acceptable safety profile. A systematic review and meta-analysis of randomized controlled trials was conducted to assess the efficacy of FMT in inducing UC remission. A total of 14 studies (n= 600 patients with a median age of 40.7 years) were assessed. FMT was used in 299 patients and associated with significantly higher odds of combined clinical and endoscopic remission ($p<0.0001$), clinical remission ($p=0.0002$), and endoscopic remission ($p=0.011$). Compared with baseline, FMT was more effective when biologics, steroids, or methotrexate were used as pre-FMT treatment. Oral delivery of FMT and pooled donors led to higher odds of remission. On meta-regression, pooled donors and methotrexate pre-treatment were associated with an increased likelihood of remission. Current evidence shows that oral delivery of FMT and multi-donor FMT may confer better results than transanal delivery and single-donor FMT. Standardization of the administration method, dosage, donors, and pre-FMT treatment is needed.

Other Indications

FMT has been shown to have some effect in alleviating symptoms in patients with other difficult-to-treat conditions (e.g., diabetes, obesity and metabolic syndrome, neurological disorders); however, most studies of these diseases consist of case series, case reports, and cohort studies. While outcome data are promising, there is insufficient evidence currently to implement FMT as a treatment regimen. Additional RCTs and longer-term studies are still needed to determine efficacy and safety profiles.

Pediatric Population

Ulcerative colitis (UC) and FMT in children was studied in the first pilot RCT, the Pediatric FEcal microbiota Transplant in ulcerative Colitis (PediFETCh) (Pai 2021). During a 36-month study period, patients aged 4 to 17 years with active UC for less than 1-year were randomized to FMT (n=13) or placebo (n=12) arms. Seven patients randomized to the placebo arm crossed over to the open-label

arm, and six patients completed the 30-week arm. The study did not reach the primary feasibility outcome of achieving recruitment targets (50 patients over 2 years), which suggests that recruitment remains the most significant challenge. There were several study limitations, however, the authors indicated that this pilot RCT offers evidence that FMT may have an important role in improving symptoms and inflammatory indices in the pediatric UC.

Tun et al (2022) performed a systematic review and meta-analysis of 14 observational studies (n=904 children) assessing FMT for CDI in patients ≤21 years. The pooled clinical success rate was 86% (p<0.001). There were 47 adverse events and 38 serious adverse events with no single predominant cause. No RCTs were available. The authors concluded FMT is effective and safe in pediatric patients with CDI but remains poorly regulated and standardized.

Gu et al (2024) conducted a double-blind RCT to determine the safety and efficacy of retrograde colonic enema (RCE)-based FMT in the treatment of intractable constipation in children. A total of 110 children were randomized to the FMT with RCE group or the placebo with RCE group. All participants received a daily RCE, followed by a 4-week FMT treatment (twice a week) and a 12-week follow-up period. Spontaneous bowel movements ≥ 3 per week were the main outcome. At the end of the follow-up period, 22 patients (40.0%) in the FMT with RCE group and 10 patients (18.2%) in the placebo with RCE group had ≥ 3 spontaneous bowel movements per week (P < 0.05). Both RCE and FMT enriched the intestinal bacterial diversity of patients with constipation. The adverse events were all mild self-limiting gastrointestinal symptoms. The authors concluded that FMT enhances the efficacy of RCE, and the use of RCE-based FMT is a safe and effective method in the treatment of intractable constipation in children.

PROFESSIONAL GUIDELINE(S)

Adult Population

American Gastroenterological Association (AGA) In 2024, the AGA published a clinical practice guideline on fecal microbiota–based therapies for select gastrointestinal diseases (Peery 2024). The AGA:

- Suggests the use of fecal microbiota-based therapies upon completion of standard of care antibiotics over no fecal microbiota–based therapies in immunocompetent adults with recurrent C difficile infection, and mildly or moderately immunocompromised adults with recurrent C difficile infection. (Conditional recommendation, low certainty evidence)
- Suggests against the use of fecal microbiota–based therapies upon completion of standard of care antibiotics over no fecal microbiota–based therapies for severely immunocompromised adults with recurrent C difficile infection. (Conditional recommendation, very low certainty of evidence)
- Suggests the use of conventional FMT over no FMT in adults hospitalized with severe or fulminant C difficile infection not responding to antimicrobial therapy. (Conditional recommendation, low certainty of evidence)

- Suggests against the use of conventional FMT except in the context of clinical trial in adults with ulcerative colitis, Crohn's disease, pouchitis, and irritable bowel syndrome. (Conditional recommendation, very low certainty of evidence)

The AGA defines severely immunocompromised patients as those receiving active cytotoxic therapy for solid tumors and hematologic malignancies, patients who have received chimeric antigen receptor T-cell therapy or hematopoietic cell transplant (only when neutropenic), any neutropenia, patients with severe primary immunodeficiency, and patients with advanced or untreated HIV infection (CD4 counts <200/mm^3, AIDS-defining illness without immune reconstitution, or symptomatic HIV). Mildly or moderately immunocompromised patients are those who are immunocompromised but do not meet the definition of severe.

The AGA intentionally refrains from limiting fecal microbiota–based therapies to patients with ≥2 recurrences, noting that some patients at increased risk of recurrence or morbid recurrence may benefit after the initial CDI episode or first recurrence.

In 2026, the AGA published clinical best practice advice for the management of CDI in adults and in patients with IBD. These documents were developed through expert review of the literature and do not provide formal guideline recommendations or evidence ratings.

- CDI in adults: Conventional FMT should be offered after treatment of a second recurrence (third CDI episode) (Fischer 2026). Microbiota restoration therapy may be considered after treatment of an initial infection or first recurrence in patients who are at high risk for further recurrence or in patients whose initial CDI episode was particularly morbid or difficult to treat.
- CDI in IBD: Microbiome-based therapies (e.g., fecal microbiota) should be offered to patients with IBD with at least one (1) recurrence of CDI to prevent future infection (Khanna 2026).

American College of Gastroenterology (ACG)

In 2021, the ACG published a guideline on the management of Clostridioides difficile infection (Kelly 2021). The ACG considers FMT to be the best treatment option for multiple recurrent CDI, including immunocompromised patients who are seronegative for cytomegalovirus (CMV) and Epstein-Barr virus (EBV). Key recommendations:

- FMT should be considered for patients with severe and fulminant CDI refractory to antibiotic therapy, particularly, when patients are deemed poor surgical candidates (strong recommendation, low quality of evidence).
- Patients experiencing their second or further recurrence of CDI be treated with FMT to prevent further recurrences (strong recommendation, moderate quality of evidence).
- FMT be delivered through colonoscopy (strong recommendation, moderate quality of evidence) or capsules (strong recommendation, moderate quality of evidence) for treatment of CDI; we suggest delivery by enema if other methods are unavailable (conditional recommendation, low quality of evidence).
- Repeat FMT for patients experiencing a recurrence of CDI within 8 weeks of an initial FMT (conditional recommendation, very low quality of evidence).

- FMT should be considered for recurrent CDI in patients with IBD (strong recommendation, very low quality of evidence).

In 2021, the ACG recommends against the use of fecal transplant for the treatment of global irritable bowel syndrome (IBS) symptoms. (strong recommendation; very low quality of evidence) (Lacy 2021)

In 2019, the ACG recommends against the use of fecal transplant in adults with ulcerative colitis (UC), noting FMT requires more study and clarification of treatment before use as therapy for UC. (Rubin 2019)

American Society of Colon and Rectal Surgeons (ASCRS)

The 2021 ASCRS guideline on the management of CDI recommends (Poylin 2021):

- Patients with recurrent or refractory CDI should typically be considered for fecal bacteriotherapy (e.g., intestinal microbiota transplantation) if conventional measures, including appropriate antibiotic treatment, have failed. (Grade of recommendation: Strong recommendation based on moderate-quality evidence, 1B)
- Patients with three (3) or more CDI episodes can be managed with a vancomycin tapered and pulsed course or fidaxomicin followed by a microbiome-based therapy such as fecal microbiota transplantation.
- In general, conventional antibiotic treatment should be used for at least two (2) recurrences (i.e., 3 CD episodes) before offering fecal microbiota transplantation.

Infectious Diseases Society of America (IDSA) and Society for Healthcare Epidemiology of America (SHEA)

In 2021, the IDSA and SHEA published a focused update guideline echoing earlier recommendations for FMT (Johnson 2021). FMT is recommended only for patients with multiple recurrences of CDI who have failed appropriate antibiotic treatments and where appropriate screening of donor and donor fecal specimens have been performed, in accordance with these newer FDA recommendations.

The 2017 updated IDSA and SHEA clinical practice guidelines for the diagnosis and treatment of CDI in children and adults (McDonald 2018) recommendations include:

- Consider fecal microbiota transplantation for pediatric patients with multiple recurrences of CD following standard antibiotic treatments. (Weak recommendation, very low quality of evidence)
- Fecal microbiota transplantation is recommended for patients with multiple recurrences of CDI who have failed appropriate antibiotic treatments. (Strong recommendation, moderate quality of evidence)
- Potential candidates for FMT include patients with multiple recurrences of CDI who have failed to resolve their infection despite treatment attempts with antibiotic agents targeting CDI. Although there is no data to indicate how many antibiotic treatments should be attempted before referral for FMT, the opinion of the panel is that appropriate antibiotic treatments for at least 2 recurrences (i.e., 3 CDI episodes) should be tried.

Pediatric Population

In 2018, an international multidisciplinary panel of experts in pediatric oncology and infectious diseases performed systematic reviews of RCTs for the prevention or treatment of CDI in any population and considered the directness of the evidence to children with cancer and pediatric hematopoietic stem-cell transplantation (HSCT) patients (Diorio 2018). A strong recommendation to not use FMT was made in this population.

In 2019, a joint position paper on FMT for recurrent CDI (rCDI) and other conditions in children was issued from the North American Society for Pediatric Gastroenterology, Hepatology, and Nutrition and the European Society for Pediatric Gastroenterology, Hepatology, and Nutrition (Davidovics 2019). The group of experts acknowledge that controlled trials with FMT for rCDI have not been performed in children, and numerous clinical and regulatory considerations have to be considered when using this untraditional therapy. In general, the group concurs with current adult guidelines when considering FMT for the treatment of rCDI in children and propose FMT be considered in children with one of the following:

- For rCDI (recurrence of symptoms within 8 weeks of treatment for CDI), either:
  - At least 3 episodes of mild to moderate CDI and failure of a 6- to 8- week taper with vancomycin with or without an alternative antibiotic (eg, rifaximin, nitazoxanide), or
  - At least 2 episodes of severe CDI resulting in hospitalization and associated with significant morbidity.
- For moderate CDI not responding to standard therapy (including vancomycin) for at least 1 week. We recommend caution, however, in such cases, with repeated testing for etiologies other than CDI such as IBD.
- For severe CDI or fulminant C difficile colitis with no response to standard therapy after 48 hours.

American Academy of Pediatrics (AAP)

In 2023, the AAP published a clinical report on FMT to provide the general pediatrician with a broad overview to enable appropriate guidance to families seeking FMT as treatment of a child's condition. (Oliva-Hemker 2023). The AAP's summary states that, to date, controlled trials are not available and there are no prospective pediatric clinical trials using FMT to treat CDI. The long-term effects of FMT are unknown. Cohort studies support the use of FMT in pediatric patients with moderate to severe or recurrent CDI but is not recommended for the clinical treatment of any other medical condition.

REGULATORY STATUS

The U.S. Food and Drug Administration (FDA) views FMT as both a biologic and as a drug with the applicable regulations in respect to procedures and monitoring. The FDA regulates vaccines, blood and blood products, and biologics via the Center for Biologics Evaluation and Research (CBER) which ensures the safety, efficacy, and quality of these products. Refer to the FDA vaccines/blood/biologics website. Available from: https://www.fda.gov/vaccines-blood-biologics [accessed 2026 Aug 1]

The FDA maintains information for consumers and health professionals on vaccine, blood and biologics warnings and other safety information. Available from: https://www.fda.gov/vaccines-blood-biologics/safety-availability-biologics/recalls-biologics (Biologics) | FDA [accessed 2026 Aug 1]

The FDA issued safety alerts on the potential risk of serious or life-threatening infections with the use of FMT and safety protocols for screening protections of donor stool (e.g., multi drug-resistant organisms [MDROs], Escherichia coli, SARS-Co-V-2, COVID-19, and monkeypox virus (FDA 2023).

MEDICAL POLICY

Medical Policy Title	**Focal Therapies for Prostate Cancer Treatment**
Policy Number	**7.01.01**
Current Effective Date	**September 1, 2026**
Next Review Date	**August 2027**

Our medical policies are guides to evaluate technologies or services for medical necessity. Criteria are established through the assessment of evidence based, peer-reviewed scientific literature, and national professional guidelines. Federal and state law(s), regulatory mandates and the member's subscriber contract language are considered first in the determination of a covered service. (Link to Product Disclaimer)

POLICY STATEMENT(S)

I. Cryosurgery and high-intensity focused ultrasound (HIFU) for recurrent prostate cancer is considered **medically appropriate** when **ALL** of the following criteria have been met:

   A. Recurrence of prostate cancer after radiation therapy (as evidence by positive, repeat biopsy);

   B. Absence of metastatic disease.

II. Cryotherapy or other focal therapies (i.e., HIFU) performed for routine primary therapy for localized prostate cancer are considered **investigational**.

III. The following focal therapies for the routine treatment of prostate cancer are considered **investigational**. These treatments include, but are not limited to, **ANY** of the following:

   A. Vascular-Targeted Photodynamic, therapy (VTP);

   B. Irreversible Electroporation (IRE);

   C. NanoKnife for tissue ablation;

   D. Laser Interstitial Thermal Therapy (LITT);

   E. Transurethral Ultrasound Ablation (TULSA);

   F. Magnetic field induction (NanoTherm therapy);

   G. High energy water vapor thermotherapy.

DESCRIPTION

Cryosurgical Ablation

Cryosurgical ablation of the prostate is an alternative method of treatment for prostate cancer. The cryoablation technique involves the use of transrectal, ultrasound-guided, percutaneous placement of cryoprobes to freeze prostate tissue to produce well-demarcated areas of cell injury and destruction. Refinements in the technique, with transrectal ultrasonography, improved cryosurgical instrumentation, and the use of commercial urethral warmers have decreased the complications associated with the early attempts at cryosurgery. The benefits of cryosurgery of the prostate include a shorter surgical procedure time with minimal blood loss.

High Intensity Focused Ultrasound (HIFU)

HIFU is a noninvasive approach that uses precisely delivered ultrasound energy to achieve tumor cell necrosis without radiation or surgical excision. This technique is also referred to as ultrasonic ablation, sonablation or focal ultrasound surgery. HIFU involves the use of a transrectal probe to plan, perform, and monitor treatment in a real-time sequence to ablate the entire prostate gland or small discrete lesions. HIFU is a promising treatment for prostate cancer especially in patients with low and intermediate risk disease who chose to not undergo open surgery. HIFU is a minimally invasive, outpatient, radiation free procedure that patients can undergo then return home. This advancement in the treatment of prostate cancer is making it possible for patients with earlier stages of the disease to maintain their quality of life without open surgery. HIFU can also be used if disease recurs, despite what earlier treatment methods were deployed.

Vascular-Targeted Photodynamic Therapy (VTP) or Photodynamic Therapy (PDT)

VTP or PDT is a tissue-preserving treatment for low-risk prostate cancer which consists of intravenous 4 mg/kg padeliporfin over 10 min and optical fibers inserted into the prostate to cover the desired treatment zone and subsequent activation by laser light. For treating prostate cancer, the photosynthesizer TOOKAD soluble (WST11) is used. The technical term for this treatment is TOOKAD Soluble VTP therapy.

Irreversible Electroporation (IRE)

IRE is used as focal therapy to target areas of significant tumor burden to ablate tumors in situ or improve margins of resection. Primarily being used for pancreas, kidney, liver and prostate tumors. IRE destroys cancerous tumors with short electrical pulses without thermal heat disrupting permeabilization of cell membrane phospholipids. The NanoKnife System which became commercially available for research purposes in 2009 is being solely used for the surgical ablation of soft tissue tumors.

Laser Interstitial Thermotherapy (LITT)

LITT treatment produces focal thermal ablation leading to lesion cytoreduction through tissue coagulation, necrosis, and cellular apoptosis.

Trans-Urethral Ultrasound Ablation (TULSA)

TULSA is a transurethral prostate tissue ablation system that uses real-time MRI, robotically driven, directional thermal ultrasound and closed-loop temperature feedback control software. It provides incision- and radiation-free, whole or partial prostate gland ablation, protecting the urethra and rectum to preserve men's functional abilities.

Magnetic Field Induction (NanoTherm therapy)

The NanoTherm liquid containing the magnetic nanoparticles is specifically injected into the tumor or applied at the resection cavity wall in the course of the tumor resection.
The particles, which contain iron oxide, are then activated during six one-hour sessions in the NanoActivator by an externally applied, rapidly alternating magnetic field, which generates heat. This either destroys the tumor cells or sensitizes them to additional treatment approaches such as radiotherapy and/or chemotherapy (MagForce USA, Inc).

Transurethral Water Vapor Thermal Therapy

Transurethral water vapor thermal therapy is a transurethral needle ablation technique which injects radiofrequency-generated, sterile water vapor (~103 degrees C) into enlarged prostate tissue. As the steam encounters the prostatic tissue, it condenses back into water, releasing large amounts of thermal energy, disrupting the prostatic cell membranes and leading to cell death and necrosis. It takes approximately three months for the body to reabsorb dead tissue, decreasing prostate volume and relieving LUTS. The thermal energy is confined to the prostate, which reduces the risk of injury to other parts of the body. The procedure is performed under local anesthesia in an office or outpatient setting. Currently there is no literature or professional society that supports this therapy for prostate cancer.

SUPPORTIVE LITERATURE

HIFU

Maestroni et al (2021) conducted a systematic review that evaluated the safety and cancer control rates of HIFU following failure of External Beam Radiation Therapy (EBRT) for localized prostate cancer. The analysis of 1241 patients from predominantly retrospective studies. All patients underwent EBRT prior to HIFU for localized prostate cancer. The mean age was 68.6 years with a prostate specific antigen (PSA) value of 5.87 ng/mL before treatment. At the time of salvage HIFU, 38.3% patients were on androgen-deprivation therapy and 24.71% continued the therapy after the treatment. Follow-up was a mean follow-up of 24.3 months after salvage HIFU. The percentage of patients who had recurrence was 51.6% which was independent of the length of follow-up. The overall survival (OS) was 85.2% at five years and one study reported an OS of 72% at seven years. The authors concluded that salvage HIFU is effective in the treatment of radiorecurrent clinically localized prostate cancer. Limitations included analysis of predominantly retrospective studies, heterogeneity of data collected making it difficult to compare the results and the criterion for defining recurrence is not the same.

Ingrosso et al (2020) conducted a systematic review and meta-analysis that evaluated the role of nonsurgical salvage modalities in radiorecurrent prostate cancer and the associated clinical outcomes

with toxicity profiles. The meta-analysis included 64 case-series studies including 5585 patients. All patients underwent primary radiation therapy (RT) for localized prostate cancer. Clinical outcomes were measured using the Phoenix definition to determine biochemical control rates while toxicity was measured using the Common Terminology Criteria for Adverse Events (CTCAE) and Clavien-Dindo scales. Brachytherapy (BT) and cryotherapy (CRYO) were investigated in 22 studies, HIFU in 13 studies, and EBRT in seven studies. The median follow-up after salvage therapy was 31 months. Patients underwent different imaging modalities to assess local relapse including MRI and choline PET. Prostate biopsies were performed in 5546 patients, for which the median Gleason score was 7. Biochemical control rates were lowest for patients treated with HIFU and highest for patients treated with BT and EBRT. The lowest prevalence of incontinence was for patients treated with BT and the highest was among patients treated with HIFU. The authors concluded that nonsurgical therapeutic options, especially BT, showed good outcomes in terms of biochemical control and tolerability in the local recurrence setting. Limitations included high between-study heterogeneity potentially by the lack of prospective data and by the intrinsic bias for case series.

Irreversible Electroporation (IRE)

Faiella et al (2024) evaluated the most recent research from 2000 to 2023 to investigate the applications of IRE for prostate cancer, including the primary- and salvage-intent. Primary-intent IRE, in-field recurrence ranges from zero to 33%. Urinary continence after the treatment was greater than 86%. Preserved potency varied from 59-100%. Regarding complications, the highest occurrence rates are for those of Grades I and II (20–77% and 0–29%, respectively). Grade III complications represent less than 7%. Specific oncological outcomes, both PCa-specific survival and overall survival are 100%. Metastasis-free survival is 99.6%. In a long-term study, the Kaplan–Meier FFS rates reported are 91% at 3 years, 84% at 5 years, and 69% at 8 years. In the single study with salvage-intent IRE, the in-field recurrence was 7%. Urinary continence was still high (93%), but preserved potency was significantly lower than primary-intent IRE patients (23%). In addition, Grade III complications were slightly higher (10.8%). In conclusion, in males with localized low–intermediate-risk prostate cancer, IRE had an excellent safety profile and might have positive results for sexual and urinary function.

PROFESSIONAL GUIDELINE(S)

The American Urological Association (AUA), American Society for Radiation Oncology (ASTRO) and the Society of Urologic Oncology (SUO) released 2022 guidelines (amended 2026) for clinically localized prostate cancer. The guidelines offer the following recommendations regarding focal therapies:

- Clinicians should inform patients with low and intermediate-risk prostate cancer considering whole gland or focal ablation that there is a lack of high-quality data comparing ablation outcomes to radiation therapy, surgery, and active surveillance. (Expert Opinion)
- Clinicians should not recommend whole gland or focal ablation for patients with high-risk prostate cancer outside of a clinical trial. (Expert Opinion)

The National Comprehensive Cancer Network (NCCN) guidelines for Prostate Cancer Version 5.2026

recommend:

- Cryosurgery and high-intensity focused ultrasound (HIFU) as local therapy options for RT recurrence in the absence of metastatic disease.
- Cryotherapy or other local therapies are not recommended as routine primary therapy for localized prostate cancer due to lack of long-term data comparing these treatments to radiation or radical prostatectomy.

National Institute for Health and Care Excellence (NICE) notes that current evidence on the safety and efficacy of IRE for treating prostate cancer is inadequate in quantity and quality.

REGULATORY STATUS

The U.S. Food and Drug Administration (FDA) regulates prostate ablation devices as medical devices. All [device] including related components require FDA approval before marketing and use in the United States to ensure they are safe and effective for human use. Refer to the FDA Medical Device website. Available from: Medical Devices [accessed 2026 Jul 27]

The FDA lists the most serious type of medical device recalls as well as early alert communications about corrective actions being taken by companies that the FDA believes are likely to be the most serious type of recalls. Available from: Medical Device Recalls | FDA [accessed 2026 Jul 27]

CODE(S)

- Codes may not be covered under all circumstances.
- Code list may not be all inclusive (AMA and CMS code updates may occur more frequently than policy updates).
- (E/I) =Experimental/Investigational
- (NMN)=Not medically necessary/appropriate

CPT Codes

Code	Description
55873	Cryosurgical ablation of the prostate (includes ultrasonic guidance and monitoring)
55877 (E/I)	Ablation, irreversible electroporation, prostate, 1 or more tumors, including imaging guidance, percutaneous (Effective 01/01/26)
55880	Ablation of malignant prostate tissue, transrectal, with high intensity-focused ultrasound (HIFU), including ultrasound guidance
55899	Unlisted procedure, male genital system
0582T (E/I)	Transurethral ablation of malignant prostate tissue by high-energy water vapor thermotherapy, including intraoperative imaging and needle guidance

Code	Description
0601T (E/I)	Ablation, irreversible electroporation; 1 or more tumors, including Fluoroscopic and ultrasound guidance, when performed, open
0655T (E/I)	Transperineal focal laser ablation of malignant prostate tissue, including transrectal imaging guidance, with MR-fused images or other enhanced ultrasound imaging
0738T (E/I)	Treatment planning for magnetic field induction ablation of malignant prostate tissue, using data from previously performed magnetic resonance imaging (MRI) examination
0739T (E/I)	Ablation of malignant prostate tissue by magnetic field induction, including all intraprocedural, transperineal needle/catheter placement for nanoparticle installation and intraprocedural temperature monitoring, thermal dosimetry, bladder irrigation, and magnetic field nanoparticle activation

RESOURCE COORDINATION POLICY

Capital District Physicians' Health Plan, Inc.
CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: FOOT CARE

POLICY EFFECTIVE DATE:	6/1/2023
Policy Control #:	1370/20.000106
Next Annual Review:	May, 2027

DISCLAIMER

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgement when deciding the most appropriate care to enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

PROCEDURE CODE

See sections below.

DESCRIPTIONS

The examination, diagnosis, and treatment of conditions involving the human foot.

RELATED POLICIES/DOCUMENTS

Resource Coordination Policies:

Diabetic Services: Supplies, Pharmaceuticals, Equipment, Eye Exams, Education & Shoes, 1370/20.000047

Durable Medical Equipment, Prosthetics/Orthotics & Medical Supplies, 1370/20.000509

Physical Therapy, 1370/20.000057

POLICY STATEMENT

Routine Foot Care (11055, 11056, 11057, 11719, 11720, 11721, G0127, G0247, S0390)

Capital District Physicians' Health Plan, Inc.
CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: FOOT CARE

Routine foot care includes the cutting or removal of corns and calluses, trimming or cutting of nails, treatment of simple ingrown nails, other hygienic and preventive maintenance care in the realm of self-care, and any services performed in the absence of localized illness, injury, or symptoms involving the foot.

CDPHP does not administer benefits for routine foot care as defined above. Foot care that would otherwise be considered routine may be covered only in the following circumstances when medically necessary:

1. Presence of a systemic condition, such as metabolic, neurologic, or peripheral vascular disease of sufficient severity that performance of such services by a nonprofessional person would place the patient at risk (e.g., a systemic condition that has resulted in severe circulatory deficits or areas of diminished sensation in the patient's legs or feet).

2. In certain circumstances, services normally considered routine may be covered if they are performed as a necessary and integral part of otherwise covered services, such as the diagnosis and treatment of ulcers, wounds, or infections.

3. Treatment of mycotic nails when there is evidence of a systemic illness causing severe circulatory problems or diminished sensation in the legs or feet; or marked limitation of ambulation, pain, and/or secondary infection resulting from the thickening and dystrophy of the infected toenail plate.

The following are examples of conditions that may justify coverage of foot care that would otherwise be considered routine:

- Anticoagulated patients
- Arteriosclerosis obliterans
- Atherosclerosis
- Burger's disease (thromboangiitis obliterans)
- Chronic thrombophlebitis
- Diabetes mellitus
- Immunocompromised patients
- Peripheral neuropathies involving the feet
- Peripheral vascular disease

Nail Debridement (11720, 11721)

Mycotic nail, or onychomycosis, is a fungal infection of the nail bed, matrix, and/or plate. The infection invades the nail bed and underside of the nail plate. The infection can cause discoloration and disfigurement of the nail. In severe conditions the nail may become loosened from the nail bed and a secondary infection may develop. The resulting thickened nails may become difficult to trim and may make walking painful.

CDPHP administers benefits for debridement of mycotic nails, once every 60 days, for the following indications:

- There is presence of a qualifying systemic illness causing a peripheral neuropathy; or

POLICY NAME: FOOT CARE

- In the absence of a systemic illness, the mycosis/dystrophy of the nail is causing secondary infection and/or pain, which results or would result in marked limitation of ambulation.

In addition, procedures for treating toenails are covered for the following conditions meeting the above criteria:

- Onychogryphosis (defined as an enlargement with increased thickening and curvature of the toenails), where the nail plate is causing symptomatic indentation of or minor laceration of the distal toe, eponychium, or adjacent toe.

- Onychauxis (defined as a thickening of the base of the nail bed) where the presence of the nail plate thickness is 3 millimeters or greater and the nail is friable or lytic.

Reimbursement for the debridement of mycotic nails may be made when definitive antifungal treatment options have been reviewed and discussed with the patient at the initial visit, and the physician documents the patient's physical status as being of such severity to meet the criteria for treatment listed above.

Surgical Treatment of Nails (11730, 11732, 11750, 11765)

CDPHP covers the surgical treatment of nails for the following medically necessary indications:

- Complicated wounds of the toes involving nail components
- Deformed nails that prevent wearing shoes or otherwise jeopardize the integrity of the toe
- Paronychia
- Subungual abscess
- Symptomatic onychauxis, onychocryptosis, or onychogryphosis causing functional impairment
- Trauma (crushing injury of the toes)

Onychocryptosis, or an ingrown nail, is the growth of the nail edge into the surrounding soft tissue, resulting in pain and/or inflammation. An infection may or may not be present. This condition most commonly occurs in the great toes. Surgical options to treat complicated onychocryptosis include avulsion of the nail, excision of the nail and nail matrix, and wedge excision of the soft tissue with removal of the offending portion of the nail. In general, surgical treatment of the nails requires the use of local anesthesia.

1. **Avulsion** of a nail (11730, 11732) involves the separation and removal of a border of, or the entire nail, from the nail bed to the eponychium.
   - Avulsion of a nail plate, partial or complete, is limited to one procedure per digit every three months.
   - In cases where the procedure is repeated before the three-month period, claims must be submitted with medical records documenting medical necessity.
   - In cases where an avulsion is performed on more than one digit per date of service, claims must be submitted with the appropriate digit modifier (TA, T1-T9).

Treatment of simple onychocryptosis with removal of the offending wing or spicule of the nail is considered to be routine foot care in the absence of infection, inflammation, or functional impairment. Trimming, cutting, clipping, or debriding of a nail distal to the eponychium is also

regarded as routine foot care. These ices should not be reported with codes 11730 or 11732.

2. **Excision** of the nail and the nail matrix (11750) is generally performed for severely deformed or ingrown nails and may be performed using surgical, laser, electrocautery, or chemical techniques.
   - Excision of nail and nail matrix, partial or complete, is limited to one per digit on a given date of service.
   - In cases where an excision of nail and nail matrix is performed on more than one digit per date of service, claims must be submitted with the appropriate digit modifier (TA, T1-T9).

3. **Wedge resection** (11765) of the soft tissue with removal of the offending portion of the nail is designed to relieve pressure on the nail/soft tissue. Generally, a wedge resection of the skin of the nail fold is performed to remove hypertrophic lateral nail folds that develop as a result of chronic ingrown toenails.

Only one of the following procedures will be allowed per nail, per same date of service:
- Partial or complete avulsion (11730-11732)
- Excision (11750)
- Wedge resection (11765)
- Incision and drainage (10060-10061)

Other Procedures

Benefits for injection of tendons, ligaments, and bursae (20550, 20551) are limited to three injections every 12 months.

Arthrocentesis (20600, 20604, 20605) is limited to three procedures every six months.

Therapeutic injections for neuroma (64455, 64632) will be limited to three injections within six months without submission of medical records. For refractory cases, coverage is available for an additional five injections (totaling eight). Documentation must be submitted in this instance.

Benefits are provided for electrical stimulation (97032) when used as a means of therapeutic treatment.

Ultrasound of the foot (76882) is considered to be an integral part of the ultrasonic guidance for needle placement (76942) and therefore is not separately reimbursed.

Radiology

Benefits will be provided for foot and ankle X-rays only (CPT codes 73600-73610; 73620-73660), and are subject to the following:

- Unilateral films for reported unilateral bone pathology
- Bilateral films only when a bilateral condition is reported
- X-rays for suspected foreign body are allowable, but follow-up films only with documentation that a foreign body was found and removed

POLICY NAME: FOOT CARE

Physical Therapy

Benefits will be provided when rendered by a physical therapist.

CDPHP will not administer benefits for G0245, G0246, and G0247 (initial, follow-up and routine foot care for diabetic patients with loss of protective sensation) when reported on the same day of service as physical medicine and rehabilitation evaluation codes (97161-97164, 97165-97168, 97169-97172).

Laboratory

Benefits will be provided for lab tests that are necessary for the diagnosis or treatment of a patient's condition and that are not performed in conjunction with excluded services.

Casting and Strapping

Casting and strapping procedures for the purpose of immobilization will be allowed eight times per diagnosis per 90-day period in a calendar year. Additional casting and strapping services will require submission of office notes for medical record review.

Initial office visit will be allowed; however, subsequent office visits will not be allowed when performed in conjunction with the above procedures and for the same diagnosis.

Destruction of Warts

Treatment of warts on the foot is covered to the same extent as services provided for the treatment of warts located elsewhere on the body and is limited to 12 treatment visits. Treatment beyond the stated limitation will require submission of office notes, outlining the treatment to date and future treatment plan, along with the claim.

Extracorporeal Shock Wave Treatment (28890, 20999, 0101T)

Extracorporeal shock wave therapy (ESWT) is a noninvasive treatment option for musculoskeletal conditions that have failed to respond to conservative treatment. ESWT uses technology similar to lithotripsy in an attempt to relieve musculoskeletal symptoms of the specified affected area. There are two theories on the therapeutic effects of the shock waves. One theory is that the shock waves alleviate pain by increasing blood flow and decreasing inflammation in the affected area. Another theory is that the shock waves damage cell membranes, thus interfering with the transmission of pain signals.

CDPHP provides benefits for ESWT, using either a high-dose or low-dose protocol, when **all** the following criteria are met:

- The enrollee has a diagnosis of chronic plantar fasciitis or heel spur syndrome

Description	ICD-10 codes
Chronic plantar fasciitis	M72.2

POLICY NAME: FOOT CARE

Heel spur syndrome	M77.30-M77.32

- ESWT is being performed as an alternative to surgery.
- Documentation demonstrates failure of at least three conservative therapies (e.g., rest, physical therapy, anti-inflammatory medications, local corticosteroid injections, heel orthotics, or strappings) after six months of treatment.

Benefits for ESWT are provided for up to three times per year. Services beyond the stated limitation will be subject to retrospective review.

CDPHP considers ESWT, for indications other than those listed above, experimental, investigational, or unproven.

Foot Orthotics

CDPHP will cover customized foot orthotics (L3000-L3030) for enrollees that have peripheral vascular disease that is diagnosed by formal vascular testing.

Benefits are limited to one pair of custom foot orthotics within one calendar year.

Claims submitted for custom foot orthotics (L3000-L3030) will be processed as durable medical equipment when the enrollee has a diagnosis of peripheral vascular disease that is diagnosed by formal vascular testing.

Foot orthotics (L3000-L3030) must be billed with modifier KX to ensure that coverage criteria are met, and that documentation exists to support the medical necessity.

POLICY CONSIDERATIONS

The patient's medical record must contain documentation that supports the medical necessity for services performed.

Foot examinations for members with diabetic sensory neuropathy (G0245, G0246) with loss of protection senses (LOPS) is covered, but no more than every six months.

The use of local anesthetics at the time of surgery is considered inclusive in the surgical allowance and is not allowed as a separate procedure.

Nerve blocks (CPT 64450), when performed at the same session as a surgical procedure, are considered preoperative anesthetics and global to the procedure.

Therapeutic nerve blocks performed for the theoretical purpose of increasing blood supply to the foot and toes are not considered to be medically necessary.

Capital District Physicians' Health Plan, Inc.
CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: FOOT CARE

All foot care services are subject to retrospective review.

EXCLUSIONS

Any services performed in the absence of localized illness, injury, or symptoms involving the foot.

Routine foot care (in the absence of systemic disease) to include, but not limited to, services or care in connection with any of the following:

- Cutting, paring, or removal of corns and calluses
- Flat or weak feet
- Fallen arches
- Chronic foot strain or symptomatic complaints of the feet
- Trimming, cutting, or clipping of nails
- Other hygienic and preventive maintenance self-care (e.g., cleaning and soaking of the feet, use of skin creams, etc.)

The term "flat feet" is defined as a condition in which one or more arches of the foot have flattened out. Services or devices directed toward the care or correction of such conditions, including the prescription of supportive devices, are considered routine foot care and are not covered.

Orthopedic shoes, unless the shoes are an integral part of a covered leg brace, are included in the cost of the brace. This exclusion does not apply to therapeutic shoes and inserts for individuals with diabetes or vascular disease.

Use of nerve blocks or injections (continuous or single-injection) for treatment of multiple neuropathies or peripheral neuropathies caused by underlying systemic diseases.

Combined electrochemical therapy (CET) for treatment of peripheral neuropathy (use of electronic signal therapy (ETS) in conjunction with local anesthetics). CPT code 64450 should not be used to report this service.

Comparison X-rays are not allowed in the absence of bilateral bone pathology.

Casting for the purpose of orthotic molds except when orthotics are covered as indicated above.

CDPHP PRODUCT VARIATIONS

CHILD HEALTH PLUS: Subject to all terms and conditions noted above in the policy to include the following clarification.

Orthotic devices used to support a weak or deformed body part or eliminate motion in a diseased or injured body part, are covered. Medically necessary orthotic devices are covered except for those prescribed solely for use during sports.

POLICY NAME: FOOT CARE

MEDICARE ADVANTAGE:

Subject to all terms and conditions noted above in the policy.

In addition to diagnosis listed within this policy, extracorporeal shock wave therapy (ESWT) is covered for enrollees diagnosed with epicondylitis (0102T) for whom more conservative therapy failed for at least six months, and as an alternative to surgery.

SELECT PLAN/HARP:

Subject to all terms and conditions noted above in the policy.

Subject to all terms and conditions noted above in application with the following product-specific coverage noted:

Routine hygienic care of the feet, the treatment of corns and calluses, the trimming of nails, and other hygienic care such as the cleaning or soaking of feet, are not covered in the absence of a pathological condition.

Covered services must include routine foot care provided by qualified provider types (e.g., podiatrist) when any enrollee's (regardless of age) physical condition poses a hazard due to the presence of localized illness, injury, or symptoms involving the foot, or when performed as a necessary and integral part of otherwise covered services such as the diagnosis and treatment of diabetes, ulcers, and infections.

Services provided by a podiatrist for persons under 21 years of age must be covered upon referral of a physician, registered physician assistant, certified nurse practitioner, or licensed midwife.

CDPHP utilizes the New York State Medicaid management information system provider manual (MMIS) to determine medical/surgical supply versus durable medical equipment, orthotic, or prosthetic.

Orthopedic footwear includes shoes, shoe modifications, and shoe additions that are covered when used to correct, accommodate, or prevent a physical deformity or range-of-motion malfunction in a diseased or injured part of the ankle or foot; to support a weak or deformed structure of the ankle or foot; or to form an integral part of a brace.

- Prescription footwear applies to all "L" codes listed in the prescription footwear section of the MMIS provider manual (4.6), as well as codes for diabetic shoes.

POLICY NAME: FOOT CARE

Benefits are not provided for sneakers and athletic shoes, as they are not considered orthopedic shoes.

Prosthetics and orthotic devices are covered at 100 percent when medically necessary.

Medically necessary medical supplies related to foot care are a covered benefit and are billed to Medicaid Fee for Service as per the MMIS Medical Supplies, Procedure Codes & Coverage Guidelines manual.

Foot orthotics and shoe inserts (L3000-L3030, A5512-A5514) must be billed with modifier KX to ensure that coverage criteria are met, and that documentation exists to support the medical necessity.

MEDICAL POLICY

Medical Policy Title	**Gastric Electrical Stimulation**
Policy Number	**7.01.64**
Current Effective Date	**September 1, 2026**
Next Review Date	**January 2027**

Our medical policies are guides to evaluate technologies or services for medical necessity. Criteria are established through the assessment of evidence based, peer-reviewed scientific literature, and national professional guidelines. Federal and state law(s), regulatory mandates and the member's subscriber contract language are considered first in the determination of a covered service.
(Link to Product Disclaimer)

POLICY STATEMENT(S)

Gastric electrical stimulation (GES)/gastric pacing is considered **investigational** for all indications, including, but not limited to, gastroparesis, to predict success of GES with temporary stimulation, any other gastrointestinal dysmotility disorder, and obesity.

RELATED POLICIES

Corporate Medical Policy

11.01.03 Experimental or Investigational Services

POLICY GUIDELINE(S)

The U.S. Food and Drug Administration (FDA) granted Humanitarian Device Exemption (HDE) approval for the Enterra Therapy GES system (Medtronic, Inc.) in 2000. Under this exemption, the device is indicated for the treatment of chronic, intractable (drug-refractory) nausea and vomiting associated with gastroparesis of diabetic or idiopathic origin, in patients who have failed, cannot tolerate, or have contraindications to pharmaceutical therapy (FDA 2000). See Regulatory Status.

DESCRIPTION

Gastric electrical stimulation (GES), also referred to as gastric pacing, uses electrodes implanted on the antrum of the stomach to increase gastric contractions to aid peristaltic activity and to improve gastric emptying. There are currently two methods of electrical delivery, high energy/low frequency (gastric pacing) which has had only limited use in humans, and low energy/high frequency pulsing (neurostimulation). Gastric neurostimulators can be implanted permanently via laparoscopy or laparotomy, or temporarily placed to aid in the prediction of permanent placement success.

GES has been investigated primarily as a treatment for gastroparesis, a chronic disorder of gastric motility characterized by delayed emptying stomach in the absence of a mechanical obstruction. Currently available devices consist of a pulse generator, which can be programmed to provide electrical stimulation at different frequencies, connected to intramuscular stomach leads, which are implanted during laparoscopy or open laparotomy.

GES has also been investigated as a treatment of obesity. It is used to increase a feeling of satiety

Proprietary Information of Capital District Physicians' Health Plan, Inc. | CDPHP Universal Benefits,® Inc. | Capital District Physicians' Healthcare Network, Inc.

with subsequent reduction in food intake and weight loss. The exact mechanisms resulting in changes in eating behavior are uncertain but may be related to neurohormonal modulation and/or stomach muscle stimulation.

SUPPORTIVE LITERATURE

Gastric Electrical Stimulation for the Treatment of Gastroparesis

For individuals who have gastroparesis who receive GES, the evidence includes nonrandomized studies, randomized controlled trials (RCTs) and systematic review and meta-analysis of RCTs. Several crossover RCTs have been published. Relevant outcomes are symptoms and treatment-related morbidity.

The evidence available from studies is insufficient to support that gastric electrical stimulation is effective for the treatment of patients with gastroparesis. Though the evidence does suggest that GES can relieve nausea and vomiting and may also reduce the need for nutritional support in some patients with intractable gastroparesis, there was no documentation of improved gastric emptying or enhanced gastric motility. The studies included small numbers of patients, had limited follow-up, and were inadequate to establish that GES is an effective or durable treatment for gastroparesis. Long-term results of GES need to be validated in longer-term, randomized trials.

The data presented to the FDA documenting probable benefit of the GES system were based on a multi-center, double-blind crossover study referred to as the Worldwide Anti-vomiting Electrical Stimulation Study (WAVESS) (Abell 2003). The study included 33 patients with intractable idiopathic or diabetic gastroparesis. In the initial phase of the study, all patients underwent implantation and were randomly and blindly assigned to either stimulation ON or stimulation OFF for the first month of the study, with crossover to the opposite mode for the second month. The baseline vomiting frequency was 47 episodes per month, which declined in both the ON mode and the OFF mode to 23 and 29 episodes, respectively. However, no statistically significant differences in the number of vomiting episodes were found between the OFF and ON groups, suggesting a placebo effect. In questioning patients as to which month of treatment they preferred (ON versus OFF), a greater number of patients preferred the month of treatment in the ON mode. In the second phase of the study, patients received stimulation consistent with their preference for the ON or OFF mode. At six- and 12-month follow-up, vomiting episodes continued to decline, although only 15 patients were available for follow-up.

Abell et al (2011) evaluated temporary GES in a randomized, placebo-controlled, crossover trial of 58 patients with gastroparesis symptoms. The study measured the effects of 72 hours of temporary GES on gastroparesis symptoms and consisted of two consecutive 4-day sessions (session 1 and session 2). In session 1, vomiting decreased in both groups, greater with stimulation, resulting in a day 3 difference of −1.02 ($p < .001$). Scores did not return to baseline during washout, and on day 4 the difference persisted at −1.08 ($p = .005$). In session 2, vomiting slightly decreased with stimulation and slightly increased without it. At day 8, the nonactivated group had non-significantly greater vomiting ($p = .762$). An overall treatment effect of a slight, non-significant daily decrease in average vomiting scores ($p = .116$) was observed by pooling stimulation effects across sessions.

Levinthal et al (2017) conducted a meta-analysis of 5 RCTs (n=185) and 13 non-RCTs did not find a significant benefit of GES on the severity of symptoms associated with gastroparesis (Levinthal 2017). Patients generally reported improved symptoms at follow-up whether or not the device was turned on, suggesting a placebo effect.

Ducrotte et al (2020) evaluated permanent GES, utilizing Enterra System, in a cross-over trial of 172 patients diagnosed with refractory and chronic vomiting. After GES implantation, patients were randomized to receive stimulation or no stimulation, then were crossed over to the other treatment after 4 months. The primary endpoints were vomiting score (0 is daily vomiting and 4 is no vomiting) and the Gastrointestinal Quality of Life Index. The median vomiting score with device turned on was 2, compare to a vomiting score of 1 with the device turned off ($p<.002$). However, over 50% of patients reported similar vomiting scores during the on and off period. There was no difference between groups in the quality-of-life measure (73.3 in the on phase and 71.1 in the off; $p=.06$). Delayed gastric emptying was not different in the on versus off period. Limitations of this trial include the use of an unvalidated scale for the primary endpoint, inclusion of only refractory patients, and only 4-month duration of treatment. The authors concluded that this trial showed that GES is effective in reducing the frequency of refractory vomiting and nausea in a subset of patients with chronic vomiting.

Saleem et al (2024) conducted a systematic review and meta-analysis to address the limited use of gastric electrical stimulation (GES) due to conflicting results of studies. The authors aimed to assess the efficacy of GES for patients with gastroparesis and gastroparesis-like symptoms. A total of nine RCT (n=730 participants), which included seven blinded trials and a large (n=172 participants) cross over study by Durcotte and colleagues in 2020. Included studies were deemed of moderate quality and low risk of bias. Outcomes were divided into blind RCTs and open trials. Pooled blinded RCT studies showed positive significant results in total symptoms score (TSS) with the GES group compared with controls at the 4-day, 2-month, 4-month, and sustained at the 12-month follow-up (-4.5 to -7.65; $p<.00001$). The analysis of blinded RCT showed no significant difference between the groups in frequency of weekly vomiting episodes (WVF) (MD= 1.76; $p = 0.43$); in contrast, the analysis of open trials showed significant positive results in WVF ($p<0.00001$). The open trials analysis found significant positive results ($p<0.00001$) in TSS, in pre- and post-nausea symptoms severity (NSS), and in vomiting severity symptoms (VSS) at 12 months after treatment ($p<0.00001$). A significant positive result in gastric emptying retention after two hours or four hours after treatment. The total analysis favored post-GES compared with pre-GES (MD = 18.15% gastric retention; 95% CI, 13.05−23.35; $p<0.00001$). Limitations of this analysis include significant heterogeneity among studies that could not be resolved due to high variation of follow-up durations, the use of a variety of different scoring systems which limited the number of studies that could combined into summary statistics, and the possibility of confounding effects from concurrent pharmacologic therapy that were not controlled. The authors concluded that GES appears beneficial, with significant improvement in TSS, weekly vomiting frequency, gastric emptying study and quality of life. Additional blinded RCTs could further establish the criteria for patient selection and GEST settings for optimal effects.

Cassidy et al (2024) conducted a prospective, single-center cohort study evaluating clinical outcomes

of gastric electrical stimulation (GES) in 157 adults with refractory gastroparesis managed through a multidisciplinary preoperative optimization protocol. Patients were followed for up to five years, with outcomes assessed using the Gastroparesis Cardinal Symptom Index (GCSI), medication usage, hospitalization rates, patient satisfaction, and device-related interventions. The authors reported significant and sustained improvement in symptom severity across all GCSI domains at 1- and 5-years post-implantation ($p < 0.05$). Medication use, particularly prokinetic and antiemetic agents, decreased substantially, and gastroparesis-related hospitalizations were reduced by 91% at one year compared to baseline ($p < 0.05$). Patient satisfaction remained high (87.1% at 1 year; 79.7% at 5 years). Device-related complications, including lead dislocation and erosion, were infrequent, with explantation occurring in fewer than 3% of patients. Limitations included the lack of a randomized control group, single-center design, and potential selection bias, which reduce the certainty of evidence and limit generalizability. The study concluded that, in carefully selected and medically optimized patients, GES can provide durable symptom relief and reduce healthcare utilization, supporting its role as part of a multidisciplinary treatment approach for refractory gastroparesis.

Gastric Electrical Stimulation for the Treatment of Obesity

Shikora et al (2009) reported on a double-blind RCT that assessed GES for the treatment of obesity. In the Screened Health Assessment and Pacer Evaluation (SHAPE) trial, all participants (n=190) received an implantable gastric stimulator and were randomized to have the stimulator turned on or off. All patients were evaluated monthly, participated in support groups, and reduced their dietary intake by 500 kcal/d. At 12-month follow-up, there was no statistically significant difference in excess weight loss between the treatment group (weight loss, 11.8%) and the control group (weight loss, 11.7%) using intention-to-treat analysis (p=.717).

Small case series and uncontrolled prospective trials (2002 to 2004) have reported positive outcomes for weight loss and maintenance of weight loss along with minimal complications (Cigaina 2002 and 2003; D'Argent 2004; De Luca 2004; Favretti 2004). However, interpretation of these uncontrolled studies is limited.

Paulus et al (2020) conducted a multi-center, phase 1, open prospective clinical trial to assess the safety of the Exilis gastric electrical stimulation (GES) system and to investigate whether the settings can be adjusted for comfortable chronic use in subjects with morbid obesity. Gastric emptying and motility and meal intake were evaluated. Participants (n=20) were implanted with the Exilis and underwent two blinded baseline test days (GES ON versus OFF), after which long-term, monthly follow-up continued for up to 52 weeks. The procedure was safe, and electrical stimulation was well tolerated and comfortable in all subjects. No significant differences in gastric emptying halftime ($p > 0.05$), food intake ($p > 0.05$), insulin AUC ($p > 0.05$), and glucose AUC ($p > 0.05$) were found between GES ON and OFF. At week 4, 13, and 26, a significant ($p < 0.01$) reduction in weight loss was observed but not at week 52. The authors concluded that GES with the Exilis system was considered safe, reduction in weight loss was significant by short lasting. Further research is needed to gain insight in optimal stimulation paraments and lead localization.

PROFESSIONAL GUIDELINE(S)

In 2025, Staller et al published the American Gastroenterological Association (AGA) Clinical Practice Guideline on Management of Gastroparesis, issuing a conditional recommendation against the routine use of GES for the treatment of refractory gastroparesis. Based on a very low certainty of evidence, the AGA recommends reserving this procedure for select patients with medically refractory gastroparesis.

In 2022, the American College of Gastroenterology (ACG) Clinical Guidelines for Gastroparesis states that GES may be considered for control of gastroparesis symptoms as a humanitarian use device (conditional recommendation, low quality of evidence) (Camilleri 2022).

In 2014, the National Institute for Health and Care Excellence (NICE) issued evidence-based guidance on GES for gastroparesis that the current evidence on the efficacy and safety of gastric electrical stimulation for gastroparesis is adequate to support the use of this procedure with normal arrangements for clinical governance, consent, and audit. NICE acknowledged that some patients do not get any benefit from GES and recommend that patients should be informed of this during the consent process.

REGULATORY STATUS

The Enterra Therapy System (Medtronic) was granted FDA approval in 2000 under the Humanitarian Device Exemption (HDE) program and received an MRI-conditional labeling upgrade in 2024.

HDE is an FDA regulatory pathway for Class III medical devices intended to treat or diagnose conditions affecting no more than 8,000 individuals in the United States per year. Under HDE, manufacturers are exempt from demonstrating effectiveness; instead, FDA must determine that the device does not pose an unreasonable or significant risk and that the probable benefit outweighs the potential risks. As mandated by federal regulations, use of an HDE device requires approval and oversight by an Institutional Review Board (IRB) or an appropriate local committee to ensure compliance with the FDA-approved indication(s) (FDA 2019).

Currently, no GES devices have received FDA approval for any other indication, including for the treatment of obesity. Transneuronix, Inc., acquired by Medtronic in 2005, developed an implantable gastric stimulator, Transcend IGS, which is available in Europe for treatment of obesity.

The United States Food and Drug Administration (FDA) regulates gastric electrical stimulators as medical devices. All gastric electrical stimulators require FDA approval before marketing and use in the United States to ensure they are safe and effective for human use. Refer to the FDA Medical Device website. Available from: https://www.fda.gov/medical-devices [accessed 2025 Dec 11]

The FDA lists the most serious type of medical device recalls as well as early alert communications about corrective actions being taken by companies that the FDA believes are likely to be the most serious type of recalls. on our website by the date that the FDA posts the information on our website. Available from: https://www.fda.gov/medical-devices/medical-device-safety/medical-device-recalls-and-early-alerts [accessed 2025 Dec 11]

CODE(S)

- Codes may not be covered under all circumstances.
- Code list may not be all inclusive (AMA and CMS code updates may occur more frequently than policy updates).
- (E/I)=Experimental/Investigational
- (NMN)=Not medically necessary/appropriate

CPT Codes

Code	Description
43647 (E/I)	Laparoscopy, surgical; implantation or replacement of gastric neurostimulator electrodes, antrum
43648 (E/I)	revision or removal of gastric neurostimulator electrodes, antrum
43881 (E/I)	Implantation or replacement of gastric neurostimulator electrodes, antrum, open
43882 (E/I)	Revision or removal of gastric neurostimulator electrodes, antrum, open
64590	Insertion or replacement of peripheral or gastric neurostimulator pulse generator or receiver, direct or inductive coupling
64595	Revision or removal peripheral or gastric neurostimulator pulse generator or receiver
95980 (E/I)	Electronic analysis of implanted neurostimulator pulse generator system (e.g., rate, pulse amplitude and duration, configuration of wave form, battery status, electrode selectability, output modulation, cycling, impedance and patient measurements) gastric neurostimulator pulse generator/transmitter; intraoperative, with programming
95981 (E/I)	subsequent, without reprogramming
95982 (E/I)	subsequent, with reprogramming

DISCLAIMER

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgement when deciding the most appropriate care to enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

PROCEDURE CODES

Various Codes

DESCRIPTIONS

Gender reassignment therapy encompasses all the psychological, medical and surgical procedures involved in the transition from one gender presentation to another and may include hormone replacement therapy and various surgical procedures as well as psychological counseling and an extended period of time living completely in the desired gender role.

In accordance with the American Psychiatric Association Diagnostic and Statistical Manual of Mental Disorders, Fifth edition (DSM-5), gender dysphoria in adolescents and adults is defined as:

A. A marked incongruence between one's experienced/expressed gender and assigned gender, of at least six months duration, as manifested by at least two of the following:
    1. A marked incongruence between one's experienced/expressed gender and primary and/or secondary sex characteristics (or in young adolescents, the anticipated secondary sex characteristics).
    2. A strong desire to be rid of one's primary and/or secondary sex characteristics because of a marked incongruence with one's experienced/expressed gender (or in young adolescents, a desire to prevent the development of the anticipated secondary sex characteristics).
    3. A strong desire for the primary and/or secondary sex characteristics of the other gender.

\\

POLICY NAME: GENDER REASSIGNMENT THERAPIES

4. A strong desire to be of the other gender (or some alternative gender different from one's assigned gender).
5. A strong desire to be treated as the other gender (or some alternative gender different from one's assigned gender).
6. A strong conviction that one has the typical feelings and reactions of the other gender (or some alternative gender different from one's assigned gender).

B. The condition is associated with clinically significant distress or impairment in social, occupational, or other important areas of functioning.

Gender Affirming Pharmacological Therapies, 1350/20.000535

POSITION STATEMENT

CDPHP administers benefits for medically necessary gender reassignment therapies when all of the clinical criteria, and supporting provider documentation, outlined below are met:

General Surgical Criteria

The following requirements must be met for health care professionals assessing transgender and gender diverse adults for physical treatments:

- Licensed by their statutory body and hold, at a minimum, a master's degree or equivalent training in a clinical field relevant to this role and granted by a nationally accredited statutory institution.
- Competent using the latest edition of the World Health Organization's International Classification of Diseases (ICD) for diagnosis. practicable.
- Ability to identify co-existing mental health or other psychosocial concerns and distinguish these from gender dysphoria, incongruence, and diversity.
- Ability to assess capacity to consent for treatment.
- Have experience or be qualified to assess clinical aspects of gender dysphoria, incongruence, and diversity.
- Undergo continuing education in health care relating to gender dysphoria, incongruence, and diversity.
- Liaise with professionals from different disciplines within the field of transgender health for consultation and referral, if required.

\\

POLICY NAME: GENDER REASSIGNMENT THERAPIES

The following medical necessity criteria for gender-affirming medical and surgical treatment must all be met:

- Health care professionals assess transgender and gender diverse (TGD) adults for gender-affirming medical and surgical treatment:
- Treatment is requested by a TGD person when the experience of gender incongruence is marked and sustained.
- Ensure fulfillment of diagnostic criteria prior to initiating gender-affirming treatments
- Identify and exclude other possible causes of apparent gender incongruence prior to the initiation of gender-affirming treatments.
- Ensure that any mental health conditions that could negatively impact the outcome of gender-affirming medical treatments are assessed, with risks and benefits discussed, before a decision is made regarding treatment.
- Ensure any physical health conditions that could negatively impact the outcome of gender-affirming medical treatments are assessed, with risks and benefits discussed, before a decision is made regarding treatment.
- Assess the capacity to consent for the specific physical treatment prior to the initiation of this treatment.
- Assess the capacity of the gender diverse and transgender adult to understand the effect of gender-affirming treatment on reproduction and explore reproductive options with the individual prior to the initiation of gender-affirming treatment.
- As part of the assessment for gender-affirming hormonal or surgical treatment, professionals who have competencies in the assessment of transgender and gender diverse people wishing gender-related medical treatment consider the role of social transition together with the individual.
- Transgender and gender diverse adults who fulfill the criteria for gender-affirming medical and surgical treatment require a single opinion for the initiation of this treatment from a professional who has competencies in the assessment of transgender and gender diverse people wishing gender-related medical and surgical treatment.

Surgical (Irreversible) Intervention

1. Requirements for mastectomy for transitioning individuals assigned female at birth:

    - All criteria above under General Surgical Criteria is met; and
    - Surgeons assess transgender and gender diverse people for risk factors associated with breast cancer prior to breast augmentation or mastectomy.
    - **I**f the member is under 18 years of age, **ONE** of the following additional criteria must be met:
        - The qualified professional's letter documents the member's emotional and

\\

cognitive maturity required to provide informed assent for the mastectomy

or

- The surgeon documents documentation that all legally responsible parties (e.g., parent[s] or guardian[s]) consent to the mastectomy and confirm the surgery aligns with the member's needs and wishes.

2. Requirements for gonadectomy (hysterectomy oophorectomy, salpingectomy for transitioning individuals assigned female at birth; and orchiectomy for transitioning individuals assigned male at birth):
   - All criteria above under General Surgical Criteria is met; and
   - Age 18 years or older; *and*
   - Surgeons confirm reproductive options have been discussed with the individual prior to gonadectomy; *and*
   - Evidence they have tolerated a minimum of 6 months of hormone therapy (unless hormone replacement therapy or gonadal suppression is not clinically indicated or the procedure is inconsistent with the patient's desires, goals, or expressions of individual gender identity).

3. Requirements for genital reconstructive surgery (i.e., vaginectomy, urethroplasty, metoidioplasty, phalloplasty, scrotoplasty, and placement of a testicular prosthesis and erectile prosthesis for transitioning individuals assigned female at birth; penectomy, vaginoplasty, vulvoplasty,labiaplasty, and clitoroplasty for transitioning individuals assigned male at birth):
   - All criteria above under General Surgical Criteria is met; and
   - Age 18 years and older; *and*
   - If significant medical or mental health concerns are present, they must be reasonably well controlled; *and*
   - At least six months of continuous hormone therapy as appropriate to the member's gendergoals (unless it is documented within the clinical record that the member has a medical contraindication or is otherwise unable to take hormones); *and*
   - Twelve months of living in a gender role that is congruent with their gender identity (real life experience).

Procedures Covered with an Administrative Review of a Qualified Medical Professional's Determination of Medical Necessity

Please note: Prior Authorization Coverage will be available for the following gender reassignment surgeries, services, and procedures, based upon an administrative prior authorization review of a determination of medical necessity made by a qualified medical professional as stated above under General Surgical Criteria section:

- Mastectomy, reduction mammoplasty, hysterectomy, salpingectomy, oophorectomy,

\\

vaginectomy, urethroplasty, metoidioplasty, phalloplasty, scrotoplasty, penectomy, orchiectomy, vaginoplasty, labiaplasty, clitoroplasty, and/or placement of a testicular prosthesis and penile prosthesis

- Breast augmentation provided that the patient has completed a minimum of 6 months or more of hormone therapy as clinically indicated based on whether the individual has had sufficient benefit from hormone treatment prior to surgery.
- Electrolysis when required for vaginoplasty or phalloplasty.
    - Note: Authorization/approval for vaginoplasty/phalloplasty needs to be granted prior to approval for electrolysis.

Procedures Covered with Justification of Medical Necessity: Prior Authorization Required

Benefits are not provided for any procedures that are performed solely for the purpose of improving an individual's appearance. The following procedures and services will not be covered, unless justification of medical necessity for treatment of the member's gender dysphoria is provided and prior authorization is received following the criteria outlined above under General Surgical Criteria.

- Abdominoplasty, blepharoplasty, neck tightening, or removal of redundant skin
- Breast augmentation
- Breast, brow, face, or forehead lifts
- Brow reduction, augmentation
- Calf, cheek, chin, nose, hip or pectoral implants
- Collagen injections
- Drugs to promote hair growth or loss
- Electrolysis, unless required for vaginoplasty or phalloplasty
- Facial bone reconstruction, reduction, or sculpturing, including jaw shortening and Rhinoplasty
- Facelift/mid-facelift (following alteration of underlying skeletal structure) (+/- Platysmaplasty)
- Gluteal augmentation
- Hair transplantation and/or hair line advancement
- Lip reduction/Lip augmentation
- Liposuction
- Monsplasty or mons reduction
- Tattooing (i.e., nipple-aereola)
- Thyroid chondroplasty (i.e., Tracheal shave)
- Voice surgery
- Speech Therapy/Voice Coaching

\\

POLICY NAME: GENDER REASSIGNMENT THERAPIES

POLICY CONSIDERATIONS

The medical necessity criteria in this policy are based upon the Standards of Care (SOC) for the Health of Transgender and Gender Diverse People, Eighth Version, published by the World Professional Association for Transgender Health (WPATH) (2022), The Diagnostic and Statistical Manual of Mental Disorders, Fifth Edition (DSM-5). American PsychiatricAssociation, and NYS Law 18 CRR-NY 505.2 on Gender Dysphoria Treatment.

Gender reassignment surgery and related services, determined to be medically necessary, are covered under the enrollee's medical benefit unless such services are specifically identified as a contract exclusion.

The following related non-surgical treatment services are covered without need for medical necessity review:

- Comprehensive primary care services including all preventive care.
- Mental health care consisting of ambulatory, intermediate, and acute services for psychiatric and substance use disorders, including psychotherapy related to gender dysphoria, but also to address any issues that may interfere with the desired transition.
- Reproductive & Sexual Health Care including the following:
  - Office based care by PCP, OB/GYN, urologist, endocrinologist.
  - All recommended gynecological and urological cancer screenings before, during, and ongoing after gender affirming treatments.
  - Contraception (including for menstrual suppression)

Detransitioning: Please note that gender affirming surgery is generally considered an irreversible intervention. Although infrequent, reversal of prior gender affirming surgery may be covered when the medical necessity criteria for the requested treatment above are met.

Health care professionals assessing adults who wish to detransition and seek gender-related hormone intervention, surgical intervention, or both, should utilize a comprehensive multidisciplinary assessment that will include additional viewpoints from experienced health care professional in transgender health and that considers, together with the individual, the role of social transition as part of the assessment process

Requests for gender reassignment surgery for patients with chromosomal abnormalities will be reviewed on an individual case basis.

The Endocrine Society published a clinical practice guideline for endocrine treatment of transsexual persons (2009). As part of this guideline, the Endocrine Society recommends that transsexual persons consider genital sex reassignment surgery only after both the physician responsible for endocrine transition therapy and the mental health professional find surgery advisable; that surgery be recommended only after completion of at least one year of consistent

\\

POLICY NAME: GENDER REASSIGNMENT THERAPIES

and compliant hormone treatment, (unless it is documented within the clinical record that the member has a medical contraindication or is otherwise unable or unwilling to take hormones); and that the physician responsible for endocrine treatment medically clear the individual for sex reassignment surgery and collaborate with the surgeon regarding hormone use during and after surgery.

- For both adults and adolescents, hormonal treatment for gender dysphoria must be administered and monitored by a qualified healthcare practitioner as therapy requires ongoing medical management, including physical examination and laboratory evaluation studies to manage dosage, side effects, etc. Lifelong maintenance is usually required.

In regard to procedures that involve reassignment of gender, CDPHP accepts the enrollee's treating provider's determination of the enrollee's anatomical/body part size, shape, feature, presentation, or assessment as part of those procedures' service coverage criteria.

- Photographic documentation is not required as part of the authorization process.

Surgical Revision/Correction

If a surgical revision or correction becomes medically necessary for a previously approved surgical treatment, the revision/correction will be treated as related to the original approved surgical treatment and not as a completely new gender affirming procedure requiring a new and separate prior authorization process. This does not include reversals of gender affirming surgical procedures in cases of regret.

EXCLUSIONS

Conversion therapy is not a covered benefit. Conversion therapy refers to any practice by a mental health professional that seeks to change an individual's sexual orientation or gender identity, including efforts to change behaviors, gender expressions, or to eliminate or reduce sexual or romantic attractions or feelings toward individuals of the same sex.

CDPHP PRODUCT VARIATIONS

CHILD HEALTH PLUS: Subject to all terms and conditions noted above in the policy.

MEDICARE ADVANTAGE: Subject to all terms and conditions noted above in the policy.

SELECT PLAN/HARP: Subject to all terms and conditions noted above in the policy.

In addition, the following will apply:

- Cryopreservation, storage, and thawing of reproductive tissue, and all related services and charges are not a covered benefit.
- CDPHP will provide for at least one attempt to conduct a

\\

peer-to-peer consultation with the ordering provider prior to issuing any adverse determination.

As per DFS, although the minimum age for Medicaid coverage of gender reassignment surgery is generally 18 years of age, the revised regulations allow for coverage for individuals under 18 in specific cases if medical necessity is demonstrated and prior approval is received.

Reviewed: 05/10, 05/13, 05/18, 05/19, 7/21, 05/22, 05/23, 5/24, 9/26

POLICY HISTORY

Effective Date	Update
2/1/2026	Mandatory updates added to policy as per Office of Mental Health Standard of Care Version 81 (SOC 8).
9/1/2024 *No change to effective date for this update	Updated verbiage for male to female and female to male procedures. Removed additional coverage criteria from Medicare Advantage section.
9/1/2024	Removed Hormone Therapies section from policy as a separate pharmacy policy was created for these treatments. Added Gender Affirming Pharmacological Therapies 1350/20.000535 to the Related Policies section. Updated references to WPATH SOC 8 guidelines. Added statement about coverage for Detransitioning.
7/1/2024	Updated prior authorization requirements for surgical intervention section.
11/1/2023	Updated services in "prior authorization required" section, as clinical review is required for all.
1/1/2021	Revised in accordance with NYS regulations.

POLICY NAME: GENDER REASSIGNMENT THERAPIES

9/1/2021	Added reference to Experimental & Investigational policy. Added specific licensures to the term "Qualified mental health professional." Updated Medicare section under product variations – CMS only requires 1 letter for both top & bottom surgeries. Added DFS contract language for Medicaid under product variations – DFS allows for under 18 in specific cases if medical necessity is proven and PA obtained.

Disclaimer Notice

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to healthcare practitioners how to provide appropriate healthcare to their patients. Healthcare practitioners shall exercise their own medical judgment when deciding the most appropriate care to enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing healthcare services. CDPHP reserves the right to review this policy at any time and change it without notice.

Background

Glycogen Storage Disease Type Ia, or Von Gierke Disease, is a subtype of autosomal recessive disorders caused by an inactivating mutation in G6PC, the gene that codes the glucose-6-phosphatase-a enzyme (G6Pase-a). Between meals, blood glucose homeostasis is maintained by G6PT and G6Pase-a that hydrolyzes G6P to glucose in the final step of gluconeogenesis and glycogenolysis in the liver, kidneys, and intestines. The G6PT transports G6P from the cytoplasm to the endoplasmic reticulum, where it should be hydrolyzed to glucose and inorganic phosphates by G6Pase-a. The detrimental mutation in G6Pase-a causes metabolic imbalance, primarily seen as severe hypoglycemia alongside increased G6P levels following a short period of not eating. This causes overactivation of other metabolic pathways causing ailments including hepatomegaly, hypercholesterolemia, lactic acidemia, osteoporosis, hepatocellular adenomas, and more.

GSD-1a affects around 6,000 people in commercially accessible geographies (areas where a sponsor can legally and operationally deliver investigational/approved products), with a disease prevalence of around 1 in 100,000, with around 80% of cases being type 1a. The mutation is genetically inherited, with the strongest risk factor being familial history of GSD-1a or other related GSD1 disorder. There are no known racial or ethnic risk factors for this disease. GSD-1a is often diagnosed early in life as a neonate or an infant. Some patients present with hypoglycemia and lactic acidosis in the neonatal period. However, most do not show clinical symptoms until they are a few months old, with symptomatic hypoglycemia or hepatomegaly often being the first symptom. Guidelines from the European Study on GSD-1 (eSGSD-1) recommend that diagnosis is initially made based on clinical presentation and biochemical abnormalities. Genetic testing for identification of pathogenic variants of the G6PC1 gene confirms diagnosis. If inconclusive, liver biopsies are often performed to assess the presence of mutation

The core goals of management of the disease is to maximize time in euglycemia, avoid fasting, and limit disease related metabolic complications. Children under 3 years old typically receive a nocturnal nasogastric infusion of glucose to avoid hypoglycemia. Patients over 3 years of age are prescribed uncooked cornstarch, which is a slow-releasing carbohydrate that prolongs euglycemia between meals. Dietary interventions are often effective with very few deaths or developmental effects, however, are disruptive to daily life and prone to error. About 95% of patients reported hypoglycemia despite their best efforts to manage it. Adjunct therapies have also been used to manage complications of the disease such as ACE-I for renal dysfunction and lipid lowering agents for hypercholesterolemia. Liver transplantation is considered for patients with unresectable hepatocellular adenomas that are not responsive to dietary therapy. If left untreated, adenomas can progress to severe compression, hemorrhage, and hepatocellular carcinomas.

Genglycos (pariglasgene brecaparvovec) utilizes a modified adeno-associated virus serotype 8 (AAV8) vector to deliver a functional copy of the G6Pase gene directly into the liver. Once delivered, liver cells are able to produce active G6Pase that respond to usual hormonal signals, such as insulin or cortisol. Accelerated approval was based on the Phase 3 GlucoGene Study (NCT05139316). The effectiveness of Genglycos was evaluated in a randomized, double-blind, placebo-controlled study in patients with GSDIa followed over 48 weeks after dosing. Patients treated with Genglycos demonstrated a statistically significant mean reduction from baseline in daily cornstarch intake of 31% compared to placebo, the study's primary endpoint. A mean reduction from baseline of one cornstarch dose per day was seen in the Genglycos group compared to placebo, the study's secondary endpoint. Genglycos-treated patients experienced a numerical (mean 3%) increase in the percentage of glucose values in the hypoglycemic range (< 70 mg/dL) compared to placebo.

Across two clinical studies of Genglycos including the randomized clinical study, serious adverse reactions reported in Genglycos-treated patients included anaphylaxis, adrenal insufficiency (a condition where the adrenal glands do not produce enough stress hormones), high lactate levels, and hypoglycemia. The most commonly reported adverse reactions included increased transaminases (elevation of liver enzymes), nausea, headache, constipation, and hyperglycemia. Genglycos-treated patients had a higher rate of hypertriglyceridemia (high blood triglyceride levels), a metabolic marker of GSDIa, compared to placebo-treated patients (29% vs 8%). The prescribing information contains warnings about the risks of anaphylaxis, liver toxicity, adrenal insufficiency, and risk of tumorigenicity (development of tumors). Genglycos should not be used during pregnancy.

Summary	
Effective Date of Policy:	10/1/2026
Indications	Reduce daily cornstarch intake as an adjunct to nutritional management in adult and pediatric patients 8 years of age and older with glycogen storage disease type Ia (GSDIa)
ICD10 Diagnosis Codes	E74.01
HCPCS	J3590 (non-specific)
Availability	suspension for intravenous infusion with a concentration of 3.0×10^{13} gc/mL
Duration	6 months to allow one-time administration

Required Criteria for Approval

Commercial/Essential/Exchange:

Based on a review of the available peer-reviewed evidence, pariglasgene brecaparvovec (Genglycos) is considered not medically necessary for the treatment of Glycogen Storage Disease Type 1a. (Von Gierke Disease)

In the 48 weeks, randomized, double-blind, placebo-controlled, phase 3 "GlucoGene" trial (NCT05139316), pariglasgene brecaparvovec demonstrated a statistically significant reduction in total daily cornstarch intake and frequency of cornstarch dosing. The study showed a 41.3% daily cornstarch dose reduction in the treatment group compared to 10.3% in the placebo group. It also showed a mean reduction of 1.1 cornstarch doses per day in the treatment group as compared to 0.2 in the placebo group. Secondary endpoints included a non-statistically significant reduction in the number of night-time cornstarch doses as well as the percent of patients that were able to eliminate the need for nighttime dosing. However, there is **insufficient evidence to conclude that these improvements translate into clinically meaningful patient outcomes**. As stated in the Genglycos package insert, FDA approval was based on reduction in daily cornstarch intake, not based on clinical benefit from confirmatory trials.

Additional clinical data from the phase 3 trial "GlucoGene" is limited. A secondary endpoint of maintenance of glucose control at week 48 in the treatment group (glucose values at or above 70 mg/dL) was shown to be noninferior to placebo. The phase 1/2 trial (NCT03517085) assessed clinical endpoints, including the mean time in minutes/g of carbohydrates to hypoglycemia and average monthly time in euglycemia with cornstarch dosing. The study revealed that the mean percent increase of normalized time to hypoglycemia during baseline to week 51 was 46%. This endpoint was not proven to be statistically significant and did not demonstrate clinical benefit. Average monthly time in euglycemia with cornstarch dosing was seen to have increased despite reductions in daily cornstarch intake. This datapoint was not proven to be statistically significant.

GSD-Ia is a rare and heavily burdensome disease. The frequency and quantity of cornstarch dosing, including nocturnal administration, are inhibitory to patients' quality of life. While treatment with Genglycos reduced daily cornstarch requirements, **uncertainty remains regarding whether the magnitude of this reduction translates into clinically meaningful improvements in patient outcomes beyond treatment burden itself.** Therefore, disease rarity, first-in-indication status, and unmet need were not considered sufficient to resolve the uncertainty surrounding the clinical impacts of the observed benefit.

Reconsideration of Medical Necessity

This determination will be reconsidered if new evidence addresses the uncertainty regarding the clinical and statistical significance of pariglasgene brecaparvovec (Genglycos) treatment-attributable benefit. Evidence that may support reconsideration includes:

- A prespecified, statistically controlled responder analysis demonstrating a clinically meaningful incremental benefit versus placebo or an appropriate active comparator;
- Replication or confirmation of clinically meaningful responder benefit in an additional adequately designed study;
- Demonstration of sustained benefit beyond the currently established 48-week controlled treatment period;
- Statistically and clinically meaningful between-group improvement in patient-centered outcomes such as reductions in life-threatening GSD-related events, glycemic control, metabolic control, etc.;
- Longer-term evidence that more broadly characterizes the benefit-risk profile.
- Evidence demonstrating a clinically meaningful reduction in treatment burden, including frequency of cornstarch dosing, overnight feeding requirements, or caregiver impacts
- Results from confirmatory studies verifying that reductions in cornstarch requirements translate into clinically meaningful benefits

Medicare Advantage/Medicaid/HARP:

1. Must be at least 8 years of age **AND**
2. Prescribed by or in consultation with a geneticist, metabolic disease specialist, endocrinologist, hepatologist experienced, and/or specializes in the treatment of GSD-1a **AND**
3. Must have documentation of a diagnosis of GSD-1a based on one of the following:
    a. Identification of biallelic pathogenic variants in G6PC1 (GSD-1a) **OR**
    b. Liver biopsy with enzymatic confirmation **AND**

4. Prescriber must attest that the patient is clinically stable on current disease management interventions, such as the use of uncooked cornstarch (adequate nutrition, stable glucose control, no recent hospitalizations within the last 3 months due to GSD-1a related hypoglycemia) **AND**
5. Patient must **NOT** have detectable, pre-existing AAV8 antibodies prior to therapy **AND**
6. Patient must **NOT** have any of the following:
    a. Liver cirrhosis or fibrosis of any stage **OR**
    b. Present liver adenoma measuring > 5 cm (*Medicaid ONLY*) **OR**
    c. Present liver adenoma measuring between 3-5 cm with a documented annual growth rate of ≥ 0.5 cm (*Medicaid ONLY*) **OR**
    d. History of liver transplantation (*Medicaid ONLY*) **OR**
    e. Current pregnancy (*Medicaid ONLY*) **AND**
7. Must continue dietary adjustments and/or cornstarch as deemed fit in collaboration with prescriber **AND**
8. Must have scheduled access to corticosteroid therapy beginning 2 weeks post-infusion for a minimum of 8 weeks with monitoring of hepatic enzymes and adrenal function
9. Recommended dosage for GSD-1a is a single lifetime infusion of 1.0×10^{13} gc/kg of body weight
10. Genglycos (pariglasgene brecaparvovec) is indicated for one-time single-dose intravenous use only and therefore will not be authorized for retreatment. Retreatment will be considered experimental/investigational.
11. Genglycos (pariglasgene brecaparvovec) is considered experimental/investigational when the above criteria are not met.
12. Genglycos (pariglasgene brecaparvovec) to treat other indications will be considered experimental/investigational.
13. Approval will be for 6 months to allow one-time administration

Policy Guidelines

1. Utilization Management are contract dependent. Refer to specific contract/benefit language for exclusions.
    a. Coverage criteria may be dependent on the contract renewal date.
    b. Coverage of drugs listed in this policy are contract dependent.
    c. Not all contracts/benefits allow coverage of healthcare professional administered drugs as part of their pharmacy benefit
    d. Not all contracts/benefits cover all medical infusible drugs.
2. Clinical documentation must be submitted for each request (initial and recertification [if applicable]) unless otherwise specified (e.g., provider attestation required). Supporting documentation includes, but is not limited to, progress notes documenting previous treatments and treatment history, diagnostic testing, laboratory test results, genetic testing or biomarker results, imaging and other objective or subjective measures of benefit. Requested dosing must remain consistent with FDA-approved dosing recommendations.
3. This policy does not apply to Medicare Part D and D-SNP pharmacy benefits. The drugs in this policy may apply to all other lines of business including Medicare Advantage.
4. Unless otherwise indicated within drug specific criteria, the drugs listed in this policy are administered by a healthcare professional and therefore are covered under the medical benefit.
5. All utilization management requirements outlined in this policy are compliant with applicable New York State insurance laws and regulations. Policies will be reviewed and updated as necessary to ensure ongoing compliance with all state and federally mandated coverage requirements.
6. For commercial contracts, medical necessity determinations align with the Certificate of Coverage issued by the Health Plan, which states that covered services must be clinically appropriate and not primarily for the convenience of the member, the member's family, or the provider.
7. This policy is based on available evidence as of the last review date. Coverage determinations are subject to applicable plan documents, state and federal regulations, and individual patient circumstances. This policy does not constitute medical advice.
8. This policy is subject to ongoing revision. Newly marketed drugs and existing drugs with new indications may be subject to prior authorization until formal coverage criteria are established. Inclusion of a drug in this policy does not guarantee its current availability on the market, as some agents may be discontinued, withdrawn, or otherwise unavailable. As product status changes, drugs may be removed from the policy.
9. For members with Medicare Advantage, medications with a National Coverage Determination (NCD) and/or Local Coverage Determination (LCD) will be covered pursuant to the criteria outlined by the NCD and/or LCD. NCDs/LCDs for applicable medications can be found on the CMS website at https://www.cms.gov/medicare-coverage-database/search.aspx. In the absence of a Medicare National Coverage Determination (NCD), Local Coverage Determination (LCD), or other Medicare coverage guidance, CMS permits a Medicare Advantage Organization (MAO) to establish its own coverage determinations in accordance with 42 CFR § 422.101(b)(6). Indications that have not been addressed by the applicable medication's LCD/NCD will be covered in accordance with criteria determined by the Health Plan. Step therapy requirements may be imposed in addition to LCD/NCD requirements.

10. Manufacturers may either discontinue participation in, or may not participate in, the Medicaid Drug Rebate Program (MDRP). Under New York State Medicaid requirements, physician-administered drugs must be produced by manufacturers that participate in the MDRP. Products made by manufacturers that do not participate in the MDRP will not be covered under Medicaid Managed Care/HARP lines of business. Drug coverage will not be available for any product from a non-participating manufacturer. For a complete list of New/Reinstated & Terminated Labelers please visit: https://www.medicaid.gov/medicaid/prescriptiondrugs/medicaid-drug-rebate-program/newreinstated-terminated-labeler-information/index.html
11. The requested site of care may impact approval timeframe and is subject to review.
12. The following applies to all gene and cellular therapies unless otherwise specified within the drug-specific coverage criteria:
    a. Administration, Retreatment, and Treatment with Additional or Other Gene/Cellular Therapies
        i. One-Time Administration
            1. Most gene and cellular therapies, whether autologous, allogeneic ("off-the-shelf"), or in vivo gene-transfer therapies, are designed and studied as one-time treatments.
            2. Repeat dosing, reinfusion, or sequential therapy with other gene or cellular products has not been established as safe, effective, or clinically appropriate.
        ii. Retreatment/Repeat Administration
            1. Retreatment with the same gene or cellular therapy product is considered experimental and investigational because:
                a. Clinical trials evaluated these therapies as single-administration interventions
                b. Safety, efficacy, and durability of a second administration have not been established
                c. Risks of immune activation, insertional mutagenesis, or vector immunity may be increased with repeat dosing
        iii. Treatment with an Additional or Other Gene/Cellular Therapy
            1. Treatment with an additional or different gene or cellular therapy after prior exposure to any gene or cellular therapy is also considered experimental and investigational, unless supported by evidence demonstrating (a-c):
                a. Anticipated clinical benefit beyond available standard therapies
                b. Safety of sequential administration
                c. Justification for selecting a second gene/cellular intervention after a prior one
            2. This includes, but is not limited to:
                a. Switching between CAR-T products (e.g., CD19 → CD19 or CD19 → BCMA)
                b. Switching between autologous and allogeneic cellular therapies
                c. Sequential use of CAR-T, TCR-T, NK-cell therapies, or other genetically engineered cell therapies
                d. Receiving a gene therapy after previous gene or cellular therapy exposure
                e. Receiving an in vivo gene therapy following any prior vector-based therapy
        iv. Prior Gene/Cell Therapy Exposure
            1. An individual is generally not eligible for additional gene or cellular therapy if they have previously received:
                a. Any autologous cellular therapy (e.g., CAR-T, TCR-T, TIL),
                b. Any allogeneic genetically modified cellular therapy,
                c. Any in vivo gene therapy (e.g., AAV, lentiviral vector)
                d. Any ex vivo gene-modified cell product
                e. Are being considered for any other gene or cellular therapy without documented evidence supporting safety and anticipated benefit.

Background

Geographic Atrophy (GA) is the progressive, irreversible advanced form of dry age-related macular degeneration (AMD), a leading cause of blindness. GA is caused by the gradual breakdown of light-sensitive cells in the macula, resulting in the growth of irreversible lesions in the retinal pigment epithelium (RPE) that can lead to impaired vision or blindness. Progressive GA can eventually affect the fovea, or central part of the macula, which is responsible for high-acuity vision. More than half of all patients with GA experience significant impairment of everyday vision, and about 20% of patients develop severe vision loss with visual acuity of 20/200 or worse. AMD occurs in progressive stages of severity, which are defined as early, intermediate, or advanced. GA occurs only in the intermediate or advanced stages of AMD. In the intermediate stage, GA affects the RPE, but the center of the fovea is not involved; in the advanced stage of AMD, GA also affects the foveal center. GA is progressive and irreversible, leading to central visual impairment and permanent loss of vision. The estimated prevalence of GA in the U.S. population over 40 years of age is 0.81% (in at least one eye), but this prevalence increases to 3.5% in people 75 years of age and older. Approximately 11 million people in the United States have AMD, and about 1 million of those have GA.

Pegcetacoplan was approved for geographic atrophy (GA) February 17, 2023The efficacy and safety of pegcetacoplan for GA was determined by Phase 3 DERBY and OAKS studies. DERBY and OAKS were Phase 3, multicenter, randomized, double-masked, sham-controlled studies comparing the efficacy and safety of intravitreal pegcetacoplan with sham injections in patients with GA secondary to AMD. The primary objective of the studies was to evaluate the efficacy of pegcetacoplan in patients with GA assessed by change in the total area of GA lesions from baseline as measured by fundus autofluorescence at 12 months. In the OAKS trial, pegcetacoplan reduced the rate of GA lesion growth by 22% (p=0.0003) and 16% (p=0.0052) compared with pooled sham injection in patients administered a monthly and once-every-other-month dose of the drug, respectively, after a year. Both monthly and every-other-month (EOM) intravitreal pegcetacoplan reduced the rate of GA lesion growth through 24 months compared to sham: by 22% at the monthly frequency or 18% at EOM in the OAKS study and by 18% at the monthly frequency or 17% EOM in the DERBY study. No difference was noted between pegcetacoplan and sham groups in outcomes measuring visual function at 24 months. In the DERBY study, pegcetacoplan failed to significantly cut lesion growth rate compared with sham in both cohorts, with rates of 12% (p=0.0528) and 11% (p=0.075), respectively.

When the studies were combined in a prespecified analysis combining the primary endpoints from both DERBY and OAKS trials, lesion growth at 12 months was reduced by 17% (P < .0001) with monthly pegcetacoplan treatment and by 14% (P = .0012) with every other month pegcetacoplan treatment compared with pooled sham. Therapy was well tolerated in both studies, with a pooled rate of new-onset exudations of 6% in the monthly groups and 4.1% in every other month groups. There were two confirmed cases of infectious endophthalmitis and one case of suspected infectious endophthalmitis in the injection eye across 6,331 injections. There were 13 intraocular inflammation events and no cases of retinal vasculitis or retinal vein occlusion.

Izervay (avacincaptad pegol) was the second approved agent for GA. The efficacy of Izervay was evaluated in two randomized, double-masked, sham-controlled, multicenter pivotal studies. GATHER1 was a Phase II/III 18-month study; GATHER2 was a Phase III study with 12 months of data. Patients 50 years of age or older with GA secondary to AMD and best-corrected visual acuity (BCVA) between 20/25 and 20/320 were eligible to participate in the studies.[17] In addition, patients had to have nonfoveal GA, in part within 1.5 mm from the foveal center, and total GA area had to be between 2.5 and 17.5 mm2, as determined by fundus autofluorescence (FAF) images. For multifocal GA lesions, at least one focal lesion had to be at least 1.25 mm2. GATHER1 consisted of two simultaneous parts. In Part 1, patients were randomized 1:1:1 to receive avacincaptad pegol (ACP) 1mg, ACP 2 mg, or sham. In part 2, patients were randomized 1:2:2 to receive ACP 2 mg (one 100 µl injection + 1 sham administration), ACP 4 mg (two 2 mg injections, total volume 200 µl), or sham (2 sham administrations). Investigators administered monthly intravitreal injections of ACP or sham for a duration of 18 months. The primary endpoint was the mean change from baseline in GA lesion area as measure by FAF over 12 months

(measured at baseline, Month 6 and Month 12). Secondary endpoints included the mean change in best-corrected visual acuity (BCVA) as well as low luminance best-corrected visual acuity (LL-BCVA) from baseline to month 12.

In GATHER2, patients were randomly assigned 1:1 to monthly avacincaptad pegol 2 mg or sham. At month 12, randomization was repeated for patients receiving ACP 2 mg, with these patients randomly assigned 1:1 to either continue receiving monthly ACP 2 mg or to receive ACP 2 mg every other month through to month 23. All patients receiving sham on day 1 continued to receive sham throughout the study. The primary endpoint was GA lesion size as measure by FAF for at least three timepoints (measured at baseline, Month 6 and Month 12). Secondary endpoints included the change in best-corrected visual acuity (BCVA) as well as low luminance best-corrected visual acuity (LL-BCVA) from baseline to month 12.

In both GATHER1 and GATHER2, compared with sham, Izervay significantly reduced the rate of GA growth (0.10 mm/year in GATHER1 [P<0.01] and 0.05 mm/year in GATHER2 [P<0.01] {with square root transformed data}).[12] However, secondary endpoints were not met in either of the GATHER trials. In GATHER1, ACP 2 mg or 4 mg did not have an impact on the mean change in BCVA or low luminance BCVA from baseline to month 12, compared to the corresponding sham groups. In GATHER2 at 12 months, there were no substantial differences in mean changes in BCVA or LL-BCVA between the treatment groups.

Avacincaptad pegol was generally well tolerated in both clinical trials. The most common ocular adverse effects occurring across both trials were conjunctival hemorrhage (13% in the Izervay group vs 9% in the sham), increased intraocular pressure (9% in Izervay vs 1% sham), and choroidal neovascularization (7% in the Izervay group vs 4% in the sham group). There are currently no reports of retinal vasculitis with Izervay to date.

Summary	
Effective Date of Policy:	3/26/26
Indications	Geographic atrophy (GA)
ICD10 Diagnosis Codes	Select subcodes of H35
Availability	Izervay: 20 mg/mL solution in a single-dose glass vial Syfovre: single-dose glass vial containing 0.1 mL of 150 mg/mL solution
Duration (depending on LOB)	Commercial: N/A Medicaid and Medicare: Initial: 1 year Continuation: 1 year

Required Criteria for Initial Approval		
All of the following conditions for the requested indication must be met in order to approve therapy		
Drug and Indication	**Inclusion**	**Recommended Dosing**
Izervay (avacincaptad pegol) **Geographic Atrophy Secondary to Age-Related Macular Degeneration** (FDA approved) ICD10: select subcodes of H35 HCPCS: J2782	**Commercial:** Based upon our criteria and assessment of the peer-reviewed evidence, the use of Izervay (avacincaptad pegol) has not been medically proven to be effective and, therefore, is considered not medically necessary for the treatment of geographic atrophy. The justification for Izervay (avacincaptad pegol) to be considered not medically necessary is as follows: • Based upon our assessment of the peer-reviewed medical literature, there is inconclusive evidence that the drug has a definite positive effect on health outcomes. • Based upon our assessment of the peer-reviewed medical literature, there is inconclusive evidence that the drug, over time, leads to improvement in health outcomes (e.g., the beneficial effects of the service outweigh any harmful effects). • Based upon our assessment of the peer-reviewed medical literature, there is inconclusive evidence that the drug provides improvement in health outcomes in standard conditions of medical practice, outside the clinical investigatory settings. **Medicaid and Medicare:** 1. The patient must be 50 years of age or older **AND** 2. Izervay must be prescribed by an ophthalmologist **AND** 3. The patient must have a diagnosis of geographic atrophy (GA) secondary to age-related macular degeneration (AMD) a. GA must be confirmed by an appropriate imaging test (such as fundus autofluorescence [FAF], retinal fundus photography, optical coherence tomography [OCT]) **AND** 4. The patient must have best-corrected visual acuity (BCVA) of 20/320 or better using the Snellen Eye Chart 5. **For New Starts Only**: Must have serious side effects or treatment failure to Syfovre 6. Initial and recertification approvals will be for 1 year. a. Recertifications will require provider attestation that the patient has not experienced severe vision loss (to the level of hand motion [HM] or worse range) or unacceptable toxicity to the drug. 7. Izervay will not be approved for use at intervals less than 21 days. 8. Documentation must be submitted confirming which eye (left or right), if not both, is being treated.	• 2 mg (0.1 mL of 20 mg/mL solution) administered by intravitreal injection to each affected eye once monthly (approximately 28 ± 7 days)
Syfovre (pegcetacoplan) **Geographic Atrophy Secondary to Age-Related Macular Degeneration** (FDA approved) ICD10: select subcodes of H35 HCPCS: J2781	**Commercial:** Based upon our criteria and assessment of the peer-reviewed evidence, the use of Syfovre (pegcetacoplan) has not been medically proven to be effective and, therefore, is considered not medically necessary for the treatment of geographic atrophy. The justification for Syfovre (pegcetacoplan) to be considered not medically necessary is as follows: • Based upon our assessment of the peer-reviewed medical literature, there is inconclusive evidence that the drug has a definite positive effect on health outcomes. • Based upon our assessment of the peer-reviewed medical literature, there is inconclusive evidence that the drug, over time, leads to	• 15 mg (0.1 mL of 150 mg/mL solution) administered by intravitreal injection to each affected eye once every 25 to 60 days

improvement in health outcomes (e.g., the beneficial effects of the service outweigh any harmful effects).
- Based upon our assessment of the peer-reviewed medical literature, there is inconclusive evidence that the drug provides improvement in health outcomes in standard conditions of medical practice, outside the clinical investigatory settings.

Medicaid and Medicare:
1. The patient must be 50 years of age or older **AND**
2. Syfovre must be prescribed by an ophthalmologist **AND**
3. The patient must have a diagnosis of geographic atrophy (GA) secondary to age-related macular degeneration (AMD)
    a. GA must be confirmed by an appropriate imaging test (such as fundus autofluorescence [FAF], retinal fundus photography, optical coherence tomography [OCT]) **AND**
4. The patient must have best-corrected visual acuity (BCVA) of 20/320 or better using the Snellen Eye Chart
5. Initial and recertification approvals will be for 1 year
    a. Recertifications will require provider attestation that the patient has not experienced severe vision loss (to the level of hand motion [HM] or worse range) or unacceptable toxicity to the drug
6. Documentation must be submitted confirming which eye (left or right), if not both, is being treated

Considerations

- Prior authorization is obtained through the CDPHP pharmacy department

Policy/Procedure Name: Givlaari (givosiran) **Control Number: 1350/20.0000385**

Disclaimer Notice

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgment when deciding the most appropriate care for enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

Background

Givlaari is an aminolevulinate-synthase-1-directed small interfering molecule. It is a double-stranded small interfering RNA, which causes degradation of *aminolevulinate synthase 1* (ALAS1) mRNA in hepatocytes through RNA interference, reducing elevated levels of liver *ALAS1* mRNA. This mechanism results in lowered circulating levels of neurotoxic intermediates 5-aminolevulinic acid (ALA) and porphobilinogen (PBG), factors associated with attacks and disease manifestations of acute hepatic porphyria (AHP).

Acute hepatic porphyria includes a family of rare, genetic diseases in which there is a defect, or deficiency, in one of the enzymes within the heme biosynthetic pathway in the liver, resulting in accumulation of porphyrins, a heme precursor that can be toxic to the tissues at high levels, and neurotoxic heme intermediates ALA and PBG. There are four subtypes, including acute intermittent porphyria (AIP), hereditary coproporphyria (HCP), and variegate porphyria (VP) (all autosomal dominant disorders), and lastly aminolevulinic acid dehydratase deficiency porphyria (ALAD or ADP), which is very rare.

The symptoms of AHP are due to visceral, peripheral, autonomic, and central nervous system involvement. The attacks occur intermittently and may sometimes be life-threatening due to neurologic complications (seizures, paralysis). Symptoms may become chronic, especially after many attacks. The most common presenting symptom is neuropathic abdominal pain; however, the episodic neurological attacks include a variety of symptoms that include severe abdominal and back pain, acute polyneuropathy, psychosis, and even seizures. Management for AHP includes intravenous hemin and carbohydrate (glucose) loading, which are used during the acute attacks. These therapies downregulate hepatic delta-aminolevulinic acid synthase (ALAS1), the rate-limiting enzyme for heme biosynthesis in the liver. For mild attacks, glucose (oral not preferred due to nausea/vomiting associated with attacks) may be utilized, and for more severe attacks, hemin has a more potent effect and would be an appropriate choice. Other supportive care should be administered in addition to the above noted therapies, and should aim at reducing symptoms until the attack resolves.

Givlaari was studied in the Phase 3 ENVISION trial where therapy was administered to 94 individuals with AHP. Therapy was administered in a 1:1 fashion against placebo for a duration of six months in a double-blind method. Efficacy was measured by the rate of porphyria attacks that required hospitalizations, urgent health care visits or IV hemin administration. AHP patients receiving Givlaari experienced 70% fewer porphyria attacks compared to placebo (1.9 attacks vs. 6.5 attacks in placebo [95% CI: 60% to 80%]). Similar reductions were seen in IV hemin use, with an average reduction of 77% in the annualized number of days on hemin as well as reductions in urinary ALA (91% and 83% reduction at three and six months) and urinary PBG. Additionally, results listed that 46 Givlaari patients were projected to have an average of 3.2 porphyria attacks per year after six months versus the expected average of 12.5 attacks per year for the 43 subjects in the placebo arm. Lastly, 50 percent of the Givlaari-treated patients were free from AHP attacks during the six-month treatment period, compared to 16.3 percent in the placebo arm. There are several safety concerns with this therapy, including hepatic and renal toxicity, as well as anaphylactic and injection site reactions (injection site reactions may include recall reactions).

Summary

Effective date of policy:	2/12/2026
Indications	Treatment of adults with acute hepatic porphyria E80.20, E80.21, E80.29
Availability	189 mg/mL single-dose vial HCPCS Code: J0223
Duration	Initial: Six months Continuation: Six months

Criteria for Initial Approval		
All of the following conditions for the requested indication must be met in order to approve Givlaari therapy:		
Indication	**Inclusion**	**Recommended Dosing Regimen**
Treatment of adults with acute hepatic porphyria (AHP) (FDA approval) ICD10: E80.20, E80.21, E80.29	• Enrollee is at least 18 years of age • Must be prescribed by a healthcare professional experienced in the diagnosis and management of acute hepatic porphyria such as a hepatologist, hematologist, gastroenterologist, neurologist • Must have a diagnosis of acute hepatic porphyria including one of the following 4 subtypes: Acute Intermittent Porphyria (AIP), Hereditary Coproporphyria (HCP), Variegate Porphyria (VP), ALA dehydratase-deficiency porphyria (ADP) confirmed by: o Elevated levels of the porphyria precursor porphobilinogen (PBG) or aminolaevulinic acid (ALA) in urine or plasma within the previous year **and/or** o Genetic testing confirming a mutation consistent with AIP, HCP, VP, ADP • Have active symptomatic disease with at least 2 documented porphyria attacks within the past 6 months prior to initiation, requiring hospitalization, urgent healthcare visits or intravenous Panhematin (hemin for injection) administration at home • Factors or triggers contributing to acute hepatic porphyria attacks have been identified and addressed including but not limited to evaluation of hormonal (endocrine) factors, avoidance of alcohol, quitting smoking, dietary modifications, discontinuation of medications that may precipitate attacks of acute porphyria, when possible (see considerations for link to medications deemed unsafe in those with AHP) • Current body weight and requested dose regimen must be submitted for initial review	• Subcutaneous administration by a healthcare provider only o 2.5 mg/kg administered once monthly **Dosing based on actual body weight**

Exclusion Criteria

Therapy will not be approved if any of the following exist:

- Diagnosis of porphyria that is NOT confirmed as acute hepatic porphyria (such as porphyria cutanea tarda, hereditary erythropoietic porphyria, hepatoerythropoietic porphyria, erythropoietic protoporphyria)
- Impending liver transplantation or history of prior liver transplantation. Recipients of liver transplantation previously approved for Givlaari will not be permitted additional coverage of Givlaari after successful liver transplantation
- Dose exceeding 2.5mg/kg once a month

Continuation Criteria

- Requests will be reviewed per criteria every six months
- Current body weight and requested dose regimen must be submitted for each recertification request
- Recertification after the initial 6 months of coverage requires documentation of all the following:
  - Documentation supporting a reduction in frequency of acute hepatic porphyria attacks requiring hospitalization, urgent healthcare visits or intravenous hemin administration at home (for acute treatment and/or prophylaxis) from baseline levels,
  - Enrollee has not experienced unacceptable or unmanageable toxicity such as anaphylactic reactions, hepatic toxicity, renal toxicity, or severe injection site reactions

- Enrollee has not received a liver transplant

Considerations

- Prior authorization is obtained through the CDPHP pharmacy department.
- The following two resources are recommended to reference for a list of medications deemed UNSAFE to use in those with AHP
  - American Porphyria Foundation: https://porphyriafoundation.org/drugdatabase/drug-safety-database-search/

MEDICAL POLICY

Medical Policy Title	**Heart and Heart-Lung Transplant**
Policy Number	**7.02.06**
Current Effective Date	**July 1, 2026**
Next Review Date	**July 2027**

Our medical policies are guides to evaluate technologies or services for medical necessity. Criteria are established through the assessment of evidence based, peer-reviewed scientific literature, and national professional guidelines. Federal and state law(s), regulatory mandates and the member's subscriber contract language are considered first in the determination of a covered service. (Link to Product Disclaimer)

POLICY STATEMENT(S)

Heart Transplant

I. Human heart transplantation is considered **medically appropriate** for select adults with end stage heart disease that is unresponsive to any other medical or surgical therapeutic measures and when specific recipient selection criteria have been met.

   A. Acceptable indications for cardiac transplantation include:

      1. Hemodynamically compromised individuals with heart failure must meet **one** of the following indications:

         a. Maximal oxygen consumption (Vo2) < 10 ml/kg/min with achievement of anaerobic metabolism;

         b. Refractory cardiogenic shock; **or**

         c. Documented dependence on intravenous inotropic support to maintain adequate organ perfusion;

      2. Severe ischemia consistently limiting routine activity not amenable to bypass surgery or angioplasty; **or**

      3. Recurrent symptomatic ventricular arrhythmias refractory to all accepted therapeutic modalities.

   B. Probable indications for cardiac transplantation include:

      1. Symptomatic heart failure with peak Volume of Oxygen at its maximum (VO2max) less than 14 ml/kg/min;

      2. Recurrent unstable ischemia not amenable to bypass surgery or angioplasty; **or**

      3. Instability of fluid balance or renal function that is not caused by the individual's inability to comply with regime of weight monitoring, flexible use of diuretic drugs, and salt restriction.

   C. Inadequate indications for cardiac transplantation include:

1. Ejection fraction < 20% with mild to moderate symptoms;
2. History of functional class (New York Heart Association [NYHA] Class) III or IV symptoms or transient need for inotropic support on a suboptimal medical regime (see Professional Guidelines section);
3. Previous ventricular arrhythmias that are now controlled;
4. Maximal VO2max greater than 15 ml/kg/min without other indications.

Heart and Lung Transplant

II. Heart-lung transplantation for carefully selected individuals with end-stage cardiac and pulmonary disease that is unresponsive to any other medical or surgical therapeutic measures is considered **medically appropriate** when recipient selection criteria have been met.

A. Acceptable indications for heart-lung transplantation include, but are not limited to the following:

1. Irreversible primary pulmonary hypertension with heart failure;
2. Non-specific severe pulmonary fibrosis;
3. Eisenmenger complex with irreversible pulmonary hypertension and heart failure;
4. Cystic fibrosis with severe heart failure;
5. Chronic obstructive pulmonary disease with heart failure;
6. Emphysema with severe heart failure; **or**
7. Pulmonary fibrosis with uncontrollable pulmonary hypertension or heart failure.

B. General contraindications for all solid organ transplantation include, but are not limited to the following:

1. Presence of malignancy (other than non-melanoma skin cancers) unless malignancy has been completely resected or upon medical review, it is determined that malignancy has been treated with small likelihood of recurrence and acceptable future risks;
2. Psychosocial instability (e.g., patterns of non-adherence to medical therapies to such a degree that it may jeopardize the success of a transplant);
3. History of ongoing or recent substance abuse (e.g., nicotine addiction);
4. Active peptic ulcer disease;
5. Severe peripheral vascular disease;
6. Other irreversible end-stage, life-limiting illnesses or conditions that are not attributed to heart or lung disease;
7. Neuromuscular neurological disorder that necessitates chronic placement with no anticipated likelihood of improvement;

8. Systemic disease that could be exacerbated by immunosuppression; **or**
9. Acquired immune deficiency syndrome (AIDS) unless **all** of the following criteria are met:
    a. CD4 count greater than 200 cells/mm3;
    b. HIV-1RNA undetectable;
    c. On stable anti-retroviral therapy > three (3) months; **and**
    d. Meets all other criteria for transplantation.

C. Heart transplantation is contraindicated for the following indications including, but not limited to:
1. For heart transplantation alone:
    a. Pulmonary hypertension;
    b. Severe pulmonary disease (a forced expiratory volume in 1 second [FEV1] of less than 50% predicted) despite optimal medical therapy;
    c. Irreversible hepatic dysfunction;
    d. Irreversible renal dysfunction.

RELATED POLICIES

Corporate Medical Policy

7.02.10 Lung and Lobar Lung Transplant

POLICY GUIDELINE(S)

I. Approval for all transplants, including arrangements with an approved transplant center, may be required through prior authorization.

II. Recipients considered for thoracic transplantation will be evaluated by the transplant center for potential difficulties that would complicate and diminish the success of transplantation. Consideration will be given to the individual's risk of death without transplantation, along with the presence and severity of potential contraindications to transplantation.

III. Pre-transplant evaluation documentation should include **ALL** the following clinical information. (If testing is unable to be performed, the rationale for not performing the testing must be included in the documentation):

A. Clinical Evaluation:
1. Confirmation of diagnosis;
2. Identification of comorbidities;
3. Treatment of co-morbidities;
4. Current assessment of co-morbidities;

5. Consult notes (if applicable).

B. Psycho-Social Evaluation:

1. Identification of stressors (family support, noncompliance issues, motivational issues, alcohol, or nicotine/substance abuse).

C. Performance Status:

1. Karnofsky performance score;

2. Eastern Cooperative Oncology Group (ECOG) performance status;

3. Palliative Performance Scale (PPS) score; or

4. Lansky Play-Performance scale (for age 1 to 16 years)

D. Oral Health Evaluation

E. Lab Tests:

1. Complete Blood Count (CBC), metabolic profile;

2. Serologies: Cytomegalovirus (CMV), Hepatitis B and C;

3. Human Immunodeficiency Virus (HIV) Testing.

F. Cardiac Assessment:

1. 12 Lead electrocardiogram (EKG);

2. Stress (exercise, nuclear, or dobutamine);

3. Echocardiogram (Echo) or Multigated Acquisition (MUGA) Scan.

G. Pulmonary Assessment:

1. Chest X-ray;

2. Pulmonary function tests (PFTs); for high-risk respiratory failure including but not limited to: Chronic obstructive pulmonary disease (COPD), asthma, emphysema, alpha 1-antitrypsin deficiency, hepatopulmonary syndrome, or significant smoking history;

H. Age-Appropriate Screening Tests: Please refer to the U.S Preventive Services Task Force (USPSTF) website for list of age-appropriate screening guidelines. [https://uspreventiveservicestaskforce.org/uspstf/] [accessed 2026 June 16]

IV. Transplant reauthorization is required annually while on the transplant waiting list, using the same criteria as pre-testing requirements (See Policy Guideline III). If the individual health condition remains unchanged from the previous year, some testing may be waived. If testing is not performed, a rationale must be provided, and documentation must be dated within the last 11 months, unless otherwise specified (e.g., age-related testing).

DESCRIPTION

A heart transplant involves replacing a diseased heart with a healthy donor heart. It is considered for individuals with end stage heart failure who have not responded to other treatments. Heart transplants are usually indicated for individuals suffering from severe heart disease, congenital heart defects, life threatening arrhythmias not controlled by other therapies, and intractable angina not amenable to revascularization. The combined heart-lung transplantation is intended to prolong survival and improve function in individuals with end-stage cardiopulmonary or pulmonary disease that have been unresponsive to any other therapy. These procedures are performed on selected individuals with end stage heart and pulmonary disease.

SUPPORTIVE LITERATURE

Heart and heart/lung transplantation represents the only curative approach for carefully screened individuals with end-stage or congenital heart and pulmonary disease. Transplantation is limited due to the profound shortage of donor hearts and lungs.

Sertic et al (2020) compared outcomes of adults diagnosed with Eisenmenger syndrome (ES) who had a heart-lung transplant (HLT) or bilateral lung transplant (BLT) with the repair of a cardiac defect. Information was obtained from the United Network for Organ Sharing (UNOS) database of heart-lung transplantation from 1987 to 2018. During the study period a total of 442 adults with ES had thoracic transplantation (316 HLT and 126 BLT). BLT recipients had a higher median BMI (22.4 kg/m2 vs 21.3 kg/m2), lower bilirubin level at listing (0.8 vs 1.0 mg/dL), and longer wait-list time to receive a transplant (500 vs 336.5 days). Both groups had similar in-hospital mortality following transplant (BLT 27.8% and HLT 26.6%). BLT recipients had significantly longer allograft ischemic time (5.9 vs 3.7), longer hospital stays (32 vs 23 days), and a higher rate of bronchial strictures. Overall survival was similar between patients who underwent double-lung transplantation and those who underwent heart/lung transplantation at 1-year (63.1% vs 68.0%, respectively), 5 years (38.5% vs 47.3%), and 10 years (30.2% vs 30.5%) post-transplant (p=.6). Overall survival did not differ among patients who received transplantation between 1987 to 1999 and those who received transplantation between 2000 to 2018 (p=.7).

Having HIV is no longer an absolute contraindication for transplantation. Advances in donor and recipient selection, improved surgical techniques, new immunosuppressive drugs, and better management of infections have improved long term survival of HIV positive (HIV+) recipients.

Koval et al (2019) conducted a multicenter retrospective study of heart and lung transplantation outcomes in HIV individuals. There were a total of 29 recipients from 14 states. Of the 29 recipients, there were 21 heart transplants, seven (7) lung transplants, and one heart-lung transplant reported. The median age was 48 years for heart transplants and 57 years for lung transplant recipients. The median time spent on the wait list was 82 days (range, 9−757) for heart transplant and 42 days (range, 4−200) for lung transplant. Baseline CD4+ T-cell counts were 398 cells/ml for hearts and 536 cells/ml for lungs. Two heart transplant recipients had detectable HIV RNA at time of transplantation, all others were transplanted with undetectable HIV viral load. All patients were on a 3-drug antiviral regimen at the time of transplantation. Prior opportunistic infection was present in 6 patients, 2 with multiple significant past infections (e.g., cytomegalovirus (CMV), Pneumo-cystic jirovecii pneumonia, Mycobacterium avium complex, and Mycobacterium tuberculosis infection). Acute cellular rejection

(ACR) was reported in 14 of 21 (67%) heart and 2 lung transplants at 1-year post-transplant. Six malignancies were identified during the follow up (5 heart and 1 lung). Two of these cases developed within the first-year post transplantation. Most were non-melanoma skin cancers, but they also included glioblastoma and prostate cancer. Researchers concluded that thoracic organ transplantation is an effective and feasible treatment option for patients with ES.

PROFESSIONAL GUIDELINE(S)

The New York Heart Association (NYHA) Heart Failure Classification System is a risk stratification tool for heart failure and determines clinical trial eligibility, candidate selection for drugs, devices, and transplants. The NYHA classification system categorizes heart failure severity into four classes based on physical activity limitations and symptoms.

Class I	Individual has cardiac disease but no limitation of physical activity.
Class II	Individual has slight limitation of physical activity. They are comfortable at rest but ordinary physical activity results in fatigue
Class III	Marked limitations of physical activities individuals are countable at rest but less than ordinary activity causes fatigue palpitations or shortness of breath.
Class IV	Symptoms of heart failure at rest (e.g., angina, shortness of breath) and physical activity increases discomfort.

The American College of Cardiology/American Heart Association (ACC/AHA) Guideline for the Management of Hypertrophic Cardiomyopathy (2024) provides the following recommendation for the management of individual with hypertrophic cardiomyopathy. The following are some key recommendations:

- Individuals with Class III-IV symptoms and risk factors for atrial fibrillation (AF) are considered high risk. Annual extended ambulatory rhythm monitoring is recommended in such individuals to detect subclinical AF (Class I recommendation).
- Cardiopulmonary exercise is recommended in advanced heart failure (NYHA Class III-IV) to assess transplant candidacy (Class I recommendation).
- Transplant evaluation is recommended in advanced HF or life-threatening arrhythmias refractory to guideline directed medical therapy (Class I recommendation).

The International Society for Heart and Lung transplantation (ISHLT) published updated comprehensive guidelines for the care of heart transplantation recipients building on their 2010 guidance. The 2023 update incorporates new evidence, expanded pediatric considerations, and detailed clinical recommendations across the transplant continuum. The guidelines are organized by four Task Force teams, each focusing on the keys phase or domain of the heart transplantation. The following are some Class I recommendations:

- During the pre-transplant optimization phase frailty should be assessed using the standard tool

like the modified Fried criteria.

- A multidimensional nutritional assessment tool should be used to screen for malnutrition or risk thereof.
- Long term mechanical circulatory support is recommended in patients with high-risk features such as inotrope dependency or reversible contraindication.
- In pediatric patients, extracorporeal membrane oxygenation (ECMO) should be used as a bridge to transplant in cases of refractory heart failure.
- Asymptomatic moderate to severe rejection should prompt adjustments of maintenance immunosuppressive therapy.
- Donor hearts with ischemic time greater than 4 hours should only be used under specific favorable conditions.
- All transplant patients should be screened for alcohol tobacco and illicit drug use.
- Live vaccines are contraindicated post-transplant.

REGULATORY STATUS

Solid organ transplants are considered surgical procedures and are therefore not regulated by the Food and Drug Administration (FDA). However, the FDA through its Center for Biologics Evaluation and Research does regulate human cells and tissues intended for implantation transplantation or infusion under code of Federal Regulation Title 21, parts 1270 and 1271. Available from: Regulation of Human Cells, Tissues, and Cellular and Tissue-Based Products: Small Entity Compliance Guide; Guidance for Industry [accessed 2026 Jun 16]

CODE(S)

- Codes may not be covered under all circumstances.
- Code list may not be all inclusive (AMA and CMS code updates may occur more frequently than policy updates).
- (E/I)=Experimental/Investigational
- (NMN)=Not medically necessary/appropriate

CPT Codes

Policy/Procedure Name: Hemophilia B Gene Therapy **Control Number: 1350/20.000466**

Disclaimer Notice

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgment when deciding the most appropriate care to enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

Background

Hemophilia B is an X-linked, male predominant condition of inherited deficiency of Factor IX, resulting in a disruption in the clotting cascade and an increased tendency of bleeding. The national prevalence of Hemophilia B can be estimated around 30,000-33,000.
The severity of disease can be classified as mild (Factor IX levels 5-40% of normal), moderate (Factor IX levels 1-5% of normal), or severe (Factor IX levels < 1% of normal). Those with severe disease are at risk for serious, life-threatening bleeding including bleeding into the muscles, a joint (hemarthrosis), or more rarely intracranial bleeding. These bleeding episodes lead to substantial disability due to loss of mobility and pain, as well as ongoing join inflammation and damage causing further bleeding into the affected joints.

Management of this disease is factor replacement therapy with pure FIX Clotting Factor Concentrates (CFC), administered intravenously several times per week either on an as needed or prophylaxis basis, according to The World Federation of Hemophilia. Specifically, those with severe disease it is strongly recommended that they be treated with prophylaxis, however the patient's phenotypic disease state should be individually considered (bleeding phenotype, joint status, individual pharmacokinetics, and patient self-assessment/preference). The WFH Guidelines for the Management of Hemophilia outlines prophylaxis regimens, citing that high dose/high frequency prophylaxis ensures FIX levels above 1 IU/dL and achieves the lowest annual joint bleeding rates (AJBR) and best long-term joint outcomes, achieving less than 3 AJBR per year, along with other favorable outcomes.

Hemgenix (etranacogene dezaparvovec) is an adeno-associated virus vector-based gene therapy for the treatment of adults with Hemophilia B who currently use Factor IX prophylaxis therapy or have current or historical life-threatening hemorrhage, or have repeated, serious spontaneous bleeding episodes. This single-dose therapy consists of a viral vector carrying a gene for clotting Factor IX. The gene is expressed in the liver to produce Factor IX protein which in turn increases Factor IX blood levels and limiting bleeding occurrences.

Hemgenix was evaluated in the Phase 3 HOPE-B trial, which was a prospective, open-label, single-dose, single-arm, multi-national study (N = 54). The study enrolled adult male subjects aged 19 to 75 years, with severe or moderately severe Hemophilia B, who received a single intravenous dose of Hemgenix and entered a follow-up period of five years, which is on-going. The lead-in period, before Hemgenix, intended for subjects to receive standard of care Factor IX prophylaxis replacement therapy. The subjects then received Hemgenix and followed for certain intervals, thereafter. Efficacy evaluation with data up to 18 months post-treatment was used, and included non-inferiority of annualized bleeding rate (ABR) post-Hemgenix compared to the lead-in period. *All bleeding episodes, regardless of investigator assessment, were counted.* The estimated mean ABR for months seven through 18 months after Hemgenix was 1.9 bleeds/year (95% CI 1.0, 3.4), compared to an estimated mean ABR of 4.1 (95% CI 3.2, 5.4). The ABR ratio (Month 7-18 post treatment/lead-in) was 0.46, demonstrating non-inferiority of ABR following Hemgenix, compared to before infusion. As a secondary outcome, patients produced mean FIX activity of 39% at 6 months and 36.7% at 24 months after Hemgenix infusion. Importantly, two subjects were not able to stop routine Factor IX prophylaxis following Hemgenix, and one additional subject received prophylaxis for approximately 20 weeks following therapy (days 396-534). One subject with numerous cardiovascular and urologic risk factors, aged 75 years at screening, died of urosepsis and cardiogenic shock at Month 15 post-dose (at age 77 years) unrelated to treatment. Another subject received around 10% of the intended dose of Hemgenix due to an infusion-related hypersensitivity reaction. In December 2022, additional data was released. The ABR for all bleeds was reduced by 64% during months 7-24 of the study (mean ABR 1.51 vs. 4.18 during the lead-in period; p=0.0002), sustaining the same bleed reduction that satisfied the study's primary endpoint.

ICER published the Final Evidence Report on Gene Therapies for Hemophilia A and B on December 22, 2022. This report states[8]:

Patients treated with etranacogene dezaparvovec had an 80% reduction in treated joint bleeds and similar reductions in other bleeds when compared with their bleeding rates on factor prophylaxis prior to gene therapy. No patients successfully treated with etranacogene dezaparvovec had to go back on factor prophylaxis during the first 18 months of therapy. It is not yet clear that the initial increase in factor IX levels will be maintained for decades, though the results are encouraging. Finally, the reduction in burden of therapy – no longer needing weekly or more frequent IX factor therapy is a major benefit for patients. Because of the uncontrolled study design, small numbers of patients studied and relatively short follow-up, there is still considerable uncertainty about the long-term net benefits of etranacogene dezaparvovec compared with factor IX prophylaxis. In particular, there are uncertainties about the long-term impact of the therapy on liver function and the risk for hepatocellular carcinoma. We conclude that there is moderate certainty of a small or substantial health benefit with high certainty of at least a small net health benefit (B+) for etranacogene dezaparvovec compared with factor IX prophylaxis.

Summary	
Effective Date of Policy:	2/12/2026
Indications	Treatment of adults with Hemophilia B (congenital Factor IX deficiency) who: • Currently use Factor IX prophylaxis therapy, or • Have current or historical life-threatening hemorrhage, or • Have repeated, serious spontaneous bleeding episodes.
ICD10 Diagnosis Codes	D67 Hereditary factor IX deficiency
HCPCS Code	J1411
Availability	Customized kit to meet dosing requirements for each patient with a nominal concentration of 1×10^{13} gc/mL
Duration	Approval will be for 6 months to allow one-time administration

Required Criteria for Initial Approval

All of the following conditions for the requested indication must be met in order to approve therapy:

Specific Indication	Inclusion Criteria	Recommended Dosing

Hemgenix (etranacogene dezaparvovec-drlb)
 	
Indication
Treatment of adults with Hemophilia B who currently use Factor IX prophylaxis therapy or have current or historical life-threatening hemorrhage, or have repeated, serious spontaneous bleeding episodes.
(FDA approval)
 	
ICD10: D67
	• Enrollee is at least 18 years of age
	• Therapy is being prescribed by or in consultation with a hematologist at a Hemophilia Treatment Center
	• Enrollee has a diagnosis of congenital Hemophilia B (Factor IX deficiency), with severity being defined by clotting factor levels ≤2% of normal circulating factor IX, confirmed by lab results
	• There must be documentation that the patient has current or historical life-threatening hemorrhages, or have repeated, serious spontaneous bleeding episodes into the joints or muscles (refer to Table 1 in considerations) despite continuous routine prophylaxis with factor IX replacement therapy
	  o Patients on prophylactic factor IX therapy must have had a minimum of 150 exposure days
	  o Use of Hemgenix due to convenience will not be considered medically necessary and will not be authorized
	• Documentation (i.e.. lab results) must be submitted confirming that the patient does not have active factor IX inhibitors, or a history of factor IX inhibitors
	  o Bethesda assay must have been completed within 6 months of the request is acceptable unless recent immune-tolerance induction or clinical change that suggest assessment is warranted
	• Lab results must be submitted confirming that the patient was screened for neutralizing antibodies (NAbs) against adeno-associated viral vector serotype 5 (AAV5) and was negative
	• Enrollee has current weight within the past 30 days of request
	• Enrollee has not received any previous gene therapy for the treatment of Hemophilia B within their lifetime.
	
	Retreatment with etranacogene dezaparvovec-drlb (Hemgenix) has not been proven to be safe and effective. Retreatment will be considered investigational when FDA approved gene therapy, or any other gene therapy under investigation, has been previously administered
	
	Only one administration of Hemgenix will be authorized for the lifetime of the member.
		See FDA Prescribing Information for dosing, dosing of Hemgenix not to exceed 2 x 10^{13} genome copies (gc) per kg of body weight.
		
		Administer Hemgenix as an intravenous infusion after dilution with 0.9% normal saline at a constant infusion rate of 500 ml/hour (8 mL/min)
		
		Therapy must be prescribed by a qualified treatment center to administer

Exclusion Criteria

Therapy will not be approved if any of the above noted Inclusion Criteria are NOT met OR any of the below Exclusion Criteria are met:

- Patients with any of the following will not be eligible for coverage (documentation, including laboratory results [taken within the past 3 months], is required):
  - An active Hepatitis B or C infection
  - Uncontrolled human immunodeficiency virus (HIV) (defined as a CD4+ count ≤ 200/μL)
  - Thrombocytopenia (defined as a platelet count below 50 × 109/L)
  - Advanced liver disease (suggestive of or equal to METAVIR Stage 3 disease, e.g., a FibroScan™ score of ≥9 kPa is considered equivalent)
  - A known coagulation disorder other than hemophilia B

Continuation Criteria

- Not applicable, only one administration of Hemgenix will be authorized for the lifetime of the member.

Considerations

- Prior authorization is obtained through the CDPHP pharmacy department.
- Physician acknowledges that CDPHP will request documentation, not more frequently than biannually, of follow-up patient assessments including Factor IX activity and Factor IX inhibitors, as well as documentation of relevant clinical status (bleeding events, etc.) while the patient is under the care of the physician.
- Enrollees receiving Hemgenix therapy should have liver function monitored weekly for least three months to mitigate the risk of potential hepatotoxicity, continue monitoring liver enzymes in those who develop elevations until a return to baseline.
  - Consider corticosteroid treatment should elevations occur

Table 1: Sites of bleeding in hemophilia

Serious	• Joints (hemarthrosis) • Muscles, especially deep compartments (iliopsoas, calf, forearm) • Mucous membranes of the mouth, nose, and genitourinary tract
Life-threatening	• Intracranial • Neck/throat • Gastrointestinal

Policy/Procedure Name: Hereditary Angioedema (HAE) Policy **Control Number: 1350/20.000559**

Disclaimer Notice

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgment when deciding the most appropriate care to enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

Background

Hereditary angioedema (HAE) is an autosomal dominant disease that is caused by a deficiency in functional C1 esterase inhibitor, which leads to increases in bradykinin levels. The increase in bradykinin produces an increase in vascular permeability which leads to episodes of nonpruritic, nonpitting, subcutaneous or submucosal edema. Symptoms involve the arms, legs, hands, feet, bowels, genitalia, trunk, face, tongue, or larynx and typically begin in early childhood (2-3 years of age). Attacks can be precipitated by minor trauma and stress but may occur without an apparent trigger.

The following are measured to help confirm a diagnosis of HAE:

- Serum complement factor 4 (C4)
- C1 inhibitor (C1-INH) antigenic protein
- C1 inhibitor (C1-INH) functional level

HAE can be broadly divided into 2 fundamental types: HAE-C1INH (HAE due to a deficiency of C1- INH) or HAE-nl-C1INH (HAE with normal C1-INH). HAE-C1INH is further divided into 2 subtypes: type I HAE, characterized by deficient levels of C1INH protein and function; and type II HAE, characterized by the normal level of C1INH protein that is dysfunctional, resulting in diminished C1INH functional activity. HAE-nl-C1INH (previously referred to as type III HAE), in which the C4, C1-INH protein, and C1-INH functional activity are all normal or near normal, is not as well understood as HAE-C1INH.

HAE can be treated by Andembry (garadacimab), Berinert (Human C1 Esterase Inhibitor), Cinryze (Human C1 Esterase Inhibitor), Ekterly (sebetralstat), Haegarda (Human C1 Esterase Inhibitor), Kalbitor (Ecallantide), Firazyr (Icatibant), Sajazir (Icatibant), Ruconest (Recombinant C1 Esterase Inhibitor), Takhzyro (Lanadelumab-flyo) or Orladeyo (Berotralstat), each of which is FDA approved to reduce edema symptoms. Berinert, Cinryze, Haegarda, and Ruconest treat HAE by replacing Human C1 Esterase Inhibitor deficiencies. Andembry is an activated factor XII inhibitor (monoclonal antibody) that prevents the conversion of pre-kallikrein to kallikrein. Ekterly and Kalbitor treat HAE attacks by inhibiting plasma kallikrein which cleaves high molecular weight kininogen and results in bradykinin release. Firazyr, Sajazir and generic Icatibant inhibits bradykinin from binding the B2 receptor. Takhzyro is a plasma kallikrein inhibitor (monoclonal antibody). Orladeyo is an oral kallikrein.

Summary

Effective Date of Policy:	8/13/2026

Required Criteria for Approval

To be considered for drug treatment, individuals must meet the following criteria as well as the drug specific criteria listed below.

1. Medication must be prescribed by an allergist, immunologist, hematologist, or dermatologist
2. Must have a confirmed diagnosis of HAE based on the following:
    a. HAE-C1INH (HAE due to a deficiency of C1-INH: Type 1 or II HAE)
        i. A history of recurrent angioedema in the absence of concomitant urticaria and no concomitant use of medication known to cause angioedema (i.e., ACE-inhibitors, estrogens, angiotensin II receptor blockers, DPP-IV inhibitors, and neprilysin inhibitors) **AND**
        ii. Low C1INH antigenic or functional level **AND**
        iii. Low C4 level (either at baseline or during an attack) OR
    b. HAE-nl-C1INH (HAE with normal C1-INH)
        i. A history of recurrent angioedema in the absence of concomitant urticaria and no concomitant use of medication know to cause angioedema (i.e., ACE-inhibitors, estrogens, angiotensin II receptor blockers, DPP-IV inhibitors, and neprilysin inhibitors) **AND**
        ii. Documented normal or near normal C4, C1-INH antigen, and C1-INH function AND
        iii. Demonstration of EITHER:
            1. A mutation associated with the disease (i.e., mutations of the F12 gene, ANGPT1 gene, PLG gene, or KNG1 gene) **OR**

2. A positive family history of recurrent angioedema and documented lack of efficacy of high-dose antihistamine therapy (i.e., cetirizine at 40 mg/day or the equivalent) for at least one month

Acute Treatments

Berinert (Human C1 Esterase Inhibitor) – Medical or Rx

1. Must have a diagnosis of **acute** attacks associated with hereditary angioedema (progress notes required)
2. Must be used for acute attacks--Safety and efficacy as prophylactic therapy has not been established and therefore will not be covered
3. Berinert has been proven to be both safe and effective in adult and pediatric patients
4. **For New starts only**: For patients 18 years of age and older, requests for Berinert will require documentation of therapeutic failure, severe intolerance, **OR** a contraindication to generic icatibant.
    a. Applies to Commercial, Essential Plan, Exchange, Child Health Plus, Medicare Advantage, Medicaid and HARP members when requested under the **medical benefit**
    b. Applies to Commercial, Essential Plan, Exchange, and Child Health Plus members when request under the **pharmacy benefit**
5. Berinert will be reviewed under the **medical benefit** when administered by a health care professional. If the member transitions to self-administration, then Berinert can be authorized under the **pharmacy benefit**.
6. The recommended dose is 20 units per kg by IV infusion.
7. Maximum quantity limit of 10 vials per 30 days on Rx benefit
8. Authorization on the medical benefit will be for 1 month initially then every 6 months
9. Authorization on the pharmacy benefit will be for 6 months at a time
10. Recertification will require documentation of decrease in severity or duration of attacks. Documentation including frequency of administration will also be required at time of recertification to monitor for appropriate use.

Ekterly (sebetralstat) - Rx

1. Must have a diagnosis of **acute** attacks associated with hereditary angioedema (progress notes required)
2. Must be used for acute attacks- Safety and efficacy as prophylactic therapy has not been established and therefore will not be covered
3. Safety and efficacy in children under the age of 12 has not been established and therefore will not be covered.
4. Ekterly is an oral medication and will therefore be covered under the **pharmacy benefit**
5. For patients 18 years of age and older, requests for Ekterly will require documentation of therapeutic failure, severe intolerance, **OR** a contraindication to generic icatibant
6. The recommended dose is 600 mg (2 x 300mg tablets) orally at the earliest recognition of an acute HAE attack. A second 600 mg dose may be taken 3 hours after the first dose if response is inadequate, or if symptoms worsen or recur. Maximum of 4 tablets (1,200 mg) in a 24-hour period.
7. Quantity limit of 4 tablets per 30 days.
8. Authorization will be for 6 months at a time.
    a. Recertification will require documentation of a decrease in severity or duration of attacks. Documentation including frequency of administration will also be required at the time of administration to monitor for appropriate use.

Icatibant (generic for Firazyr), Sajazir (generic for Firazyr), and brand Firazyr - Rx

1. Must have a diagnosis of **acute** attacks associated with hereditary angioedema (progress notes required)
2. Must be used for acute attacks--Safety and efficacy as prophylactic therapy has not been established and therefore will not be covered
3. Firazyr, Sajazir, and icatibant have potential to attenuate antihypertensive effects of ACE inhibitors and should not be administered to patients taking ACE inhibitors since there are no clinical trials in this population
4. Safety and Efficacy in anyone under 18 years old is not established and therefore will not be covered.
5. Firazyr, Sajazir, and icatibant can be self-administered upon recognition of an HAE attack after training under the guidance of a health care professional and therefore will be covered under the **pharmacy benefit.**
6. Step therapy applies: Both initial and recertification/continuation of therapy requests for brand Firazyr will require documentation of therapeutic failure, severe intolerance, or a contraindication to a trial with generic Icatibant.
7. The recommended dose is 30mg subcutaneously injected into abdominal area; if response is inadequate or symptoms recur additional injections of 30mg may be administered at intervals of at least 6 hours with no more than 3 doses per 24-hour period.
8. Quantity limit of #3 (3 ml each) pre-filled syringes – 9 ml/30 days.
9. Authorization will be for 6 months at a time.
    a. Recertification will require documentation of decrease in severity or duration of attacks. Documentation including frequency of administration will also be required at time of recertification to monitor for appropriate use.

Kalbitor (ecallantide) - Medical

1. Must have a diagnosis of **acute** attacks associated with hereditary angioedema (progress notes required)
2. Must be used for acute attacks--Safety and efficacy as prophylactic therapy has not been established and therefore will not be covered
3. Safety and efficacy have not been established in children under the age of 12 and therefore will not be covered
4. Anaphylaxis has been reported after administration of Kalbitor. Because of the risk of anaphylaxis, it should only be administered by a healthcare professional with appropriate medical support to manage anaphylaxis and HAE and is therefore covered under the **medical benefit**.
5. **For New starts only:** For patients 18 years of age and older, requests for Kalbitor will require documentation of therapeutic failure, severe intolerance, **OR** a contraindication to generic icatibant.
6. The recommended dose of Kalbitor is 30 mg (3 mL), administered subcutaneously in three 10 mg (1 mL) injections. If the attack persists, an additional dose of 30 mg may be administered within a 24-hour period.
7. Authorization will be for 1 month initially then every 6 months
    a. Recertification will require documentation of decrease in severity or duration of attacks. Documentation including frequency of administration will also be required at time of recertification to monitor for appropriate use.

Ruconest (C1 esterase inhibitor [recombinant]) – Medical or Rx

1. Must have a diagnosis of **acute** attacks associated with hereditary angioedema (progress notes required)
2. Ruconest will not be covered for laryngeal attacks as efficacy has not been established in patients with laryngeal HAE attacks
3. Safety and efficacy in children under the age of 13 has not been established and therefore will not be covered
4. Ruconest will be reviewed under the **medical benefit** when administered by a health care professional. If the member transitions to self-administration, then Ruconest can be authorized under the **pharmacy benefit**.
5. **For New starts only**: For patients 18 years of age and older, request for Ruconest will require documentation of therapeutic failure, severe intolerance, OR a contraindication to generic
   Icatibant
    a. Applies to Commercial, Essential Plan, Exchange, Child Health Plus, Medicare Advantage, Medicaid and HARP members when requested under the **medical benefit**
    b. Applies to Commercial, Essential Plan, Exchange, and Child Health Plus members when request under the **pharmacy benefit**
6. For patients < 84 kg, the recommended dose is 50 IU per kg by IV injection. For patients ≥ 84 kg, the recommended dose is 4200 IU (2 vials). If the attack symptoms persist, an additional (second) dose can be administered at the recommended dose level.
    a. Maximum dose is 4200 IU (2 vials) with no more than 2 doses (4 vials) within a 24-hour time-period
7. Quantity limit of 100 ml (4 vials) per 30 days.
8. Authorization on the medical benefit will be for 1 month initially then every 6 months
9. Authorization on the pharmacy benefit will be for 6 months at a time
10. Recertification will require documentation of decrease in severity or duration of attacks. Documentation including frequency of administration will also be required at time of recertification to monitor for appropriate use.

Prophylactic Treatments

Andembry (garadacimab) - Rx

1. Must have a diagnosis of hereditary angioedema (progress notes required)
2. Must be used as prophylaxis – not for acute treatment
3. For long term prophylaxis, the patient must meet the following:
    a. History of at least one laryngeal attack or at least two severe HAE attacks (i.e., debilitating cutaneious or gastrointestinal episodes) per month that resulted in loss of work/school productivity or ER/unscheduled doctor visits **OR** disability for > 5 days per month due to HAE
4. Safety and efficacy in children under the age of 12 has not been established and therefore will not be covered.
5. Andembry is intended for self-administered or administration by a caregiver and therefore will be covered under the **pharmacy benefit.**
6. Requests for Andembry will require documentation of therapeutic failure, severe intolerance, **OR** a contraindication to Haegarda **AND** Takhzyro
7. The recommended dose is an initial loading dose of 400 mg (two 200 mg injections) administered subcutaneously on the first day of treatment, followed by a maintenance dosage of 200 mg administered subcutaneously every month.
8. Quantity limit of 1.2 mL (1 injection) per 28 days.
    a. A quantity limit of 2.4 mL (2 injections) will be allowed for the initial month of therapy in order to obtain the proper loading dose.
9. Authorization will be provided for 6 months at a time

Recertification will require documentation of decrease in the severity, duration, and/or frequency of attacks.

Cinryze (Human C1 Esterase Inhibitor) – Medical or Rx

1. Must have a diagnosis of hereditary angioedema (progress notes required)
2. Must be used as a prophylaxis – not for acute treatment

3. Cinryze will be allowed for short-term prophylaxis if being requested prior to medical, surgical, or dental procedure. Approval will be for one month only.
4. For long term prophylaxis, the patient must meet the following:
    a. History of at least one laryngeal attack or at least two severe HAE attacks (i.e., debilitating cutaneous or gastrointestinal episodes) per month that resulted in loss of work/school productivity or ER/unscheduled doctor visits **OR** disability for > 5 days per month due to HAE
5. Safety and efficacy in children under the age of 6 has not been established and therefore will not be covered
6. Cinryze will be reviewed under the **medical benefit** when administered by a health care professional. If the member transitions to self-administration, then Cinryze can be authorized under the **pharmacy benefit.**
7. For New Starts only: Requests for Cinryze for long term prophylaxis will require documentation of therapeutic failure, severe intolerance, **OR** a contraindication to Haegarda **AND** Takhzyro.
    a. This step does not apply to requests for short-term prophylaxis prior to medical, surgical, or dental procedure.
8. The recommended dose for pediatric patient's ages 6-11 years old is 500 IU (1 vial) IV infusion over 5 minutes every 3-4 days. This dose may be adjusted according to individual response, up to 1000 IU (2 vials) every 3-4 days.
9. The recommended dose for adolescent and adult patients (12 years old and above) is 1000 IU (2 vials) administered IV infusion over 10 minutes every 3-4 days.
10. Quantity limit of 20 vials per 30 days.
    a. Requests for quantities in excess of the establish quantity limit for adolescent and adult patients (12 years old and above), will be considered based on Cinryze package labeling:
        i. For patients who have not responded adequately to 1000 unit every 3 or 4 days, doses up to 2000 IU (not exceeding 80 U/kg) every 3 or 4 days may be considered based on individual patient response.
    b. Requests will require documentation of a previous trial with the standard dosage (1000 IU) and outcome of the trial, to document the need for the increased dose.
    c. No more than 50 vials per 30 days will be authorized.
11. Authorization on either the medical benefit or the pharmacy benefit will be for 6 months.
    a. Recertification will require documentation of decrease in the severity, duration, and/or frequency of attacks. Documentation including frequency of administration will also be required at time of recertification to monitor for appropriate use.

Dawnzera (donidalorsen) - Rx

1. Must have a diagnosis of hereditary angioedema (progress notes required)
2. Must be used as a prophylaxis – not for acute treatment
3. For long term prophylaxis, the patient must meet the following:
    a. History of at least one laryngeal attack or at least two severe HAE attacks (i.e., debilitating cutaneous or gastrointestinal episodes) per month that resulted in loss of work/school productivity or ER/unscheduled doctor visits **OR** disability for > 5 days per month due to HAE
4. Safety and efficacy in children under the age of 12 has not been established and therefore will not be covered
5. Dawnzera is intended for self-administration or administration by a caregiver and therefore will be covered under the **pharmacy benefit.**
6. Requests for Dawnzera will require documentation of therapeutic failure, severe intolerance, **OR** a contraindication to Haegarda **AND** Takhzyro.
7. The recommended dose is 80mg administered subcutaneously every 4 weeks. A dosage of 80mg subcutaneously every 8 weeks may be considered.
8. Quantity limit of 0.8 mL (1 injection) per 28 days.
9. All recertification requests (initial and subsequent) will require documentation of the frequency and severity of attacks experienced and the frequency of administration of Dawnzera to monitor for appropriate use.
10. Initial authorization will be provided for 9 months.
    a. If 0 attacks have occurred during the prior 6 months while on the medication, a trial with an extended dosing interval of 80 mg every 8 weeks will be required.
    b. If documentation is provided that the patient is not attack free (has experienced at least 1 attack), but has had a decrease in severity, duration and/or frequency of attacks while on the medication compared to baseline, a dosing frequency of 80mg every 4 weeks can be continued.
    c. If documentation is provided that the patient has not experienced a decrease in severity, duration and/or frequency of attacks while on the medication compared to baseline (no benefit from the medication), further treatment will not be authorized.
11. Subsequent recertification requests will be for 6 months at a time and will be reviewed using the same criteria as above:
    a. If 0 attacks have occurred during the prior 6 months while on the medication, a trial with an extended dosing interval of 80 mg every 8 weeks will be required.
    b. If documentation is provided that the patient is not attack free (has experienced at least 1 attack), but has had a decrease in severity, duration and/or frequency of attacks while on the medication compared to baseline, a dosing frequency of 80mg every 4 weeks can be continued.

c. If documentation is provided that the patient has not experienced a decrease in severity, duration and/or frequency of attacks while on the medication compared to baseline (no benefit from the medication), further treatment will not be authorized.

Haegarda (Human C1 Esterase Inhibitor) - Rx

1. Must have a diagnosis of hereditary angioedema (progress notes required)
2. Must be used as a prophylaxis – not for acute treatment
3. Haegarda will be allowed for short-term prophylaxis if being requested prior to medical, surgical, or dental procedure. Approval will be for one month only.
4. For long term prophylaxis, the patient must meet the following:
   a. History of at least one laryngeal attack or at least two severe HAE attacks (i.e., debilitating cutaneous or gastrointestinal episodes) per month that resulted in loss of work/school productivity or ER/unscheduled doctor visits **OR** disability for > 5 days per month due to HAE
5. Safety and efficacy in children under the age of 6 has not been established and therefore will not be covered
6. Haegarda can be self-administered after training under the guidance of a healthcare professional and therefore will be covered under the **pharmacy benefit.**
7. The recommended dose is 60 IU per kg body weight by subcutaneous injection twice weekly.
   a. Quantity limit of 16 vials per 28 days (defined as the combined total amount of 2000 unit vials **AND** 3000-unit vials)
   b. Requests will require documentation of patient's weight to verify requested dosing is in accordance with the FDA approved dosing.
   c. Requests for dosing every three days will require documentation of a previous trial of twice weekly dosing that did not lead to a decrease in the severity, duration and/or frequency of attacks.
8. Authorization will be for 6 months at a time.
   a. Recertification will require documentation of decrease in the severity, duration, and/or frequency of attacks. Documentation including frequency of administration will also be required at time of recertification to monitor for appropriate use

Orladeyo (berotralstat) - Rx

1. Must have a diagnosis of hereditary angioedema (progress notes required)
2. Must be used as a prophylaxis – not for acute treatment
3. For long term prophylaxis, the patient must meet the following:
   a. History of at least one laryngeal attack or at least two severe HAE attacks (i.e., debilitating cutaneous or gastrointestinal episodes) per month that resulted in loss of work/school productivity or ER/unscheduled doctor visits **OR** disability for > 5 days per month due to HAE
4. Safety and efficacy in children under the age of 2 has not been established and therefore will not be covered
5. Orladeyo is an oral medication and will therefore be covered under the **pharmacy benefit**.
6. The recommended dose for ages 12 and older is 150 mg orally once daily. Dose reductions to 110 mg orally once daily are recommended for moderate-severe hepatic impairment and can be considered in patients with persistent GI reactions.
7. Oral pellets are indicated for pediatric patients age 2 to less than 12 years of age. Dosage is weight based and administered once daily.
8. Quantity limit of 28 capsules or 28 pellet packets per 28 days.
9. Authorization will be for 6 months at a time.
   a. Recertification will require documentation of decrease in the severity, duration, and/or frequency of attacks.

Takhzyro (lanadelumab-flyo) – Medical or Rx

1. Must have a diagnosis of hereditary angioedema (progress notes required)
2. Must be used as a prophylaxis – not for acute treatment
3. For long term prophylaxis, the patient must meet the following:
   a. History of at least one laryngeal attack or at least two severe HAE attacks (i.e., debilitating cutaneous or gastrointestinal episodes) per month that resulted in loss of work/school productivity or ER/unscheduled doctor visits **OR** disability for > 5 days per month due to HAE
4. The prescribing information has the following recommended dosages based on age:
   a. The recommended starting dosage in adult and pediatric patients 12 years of age and older is 300mg subcutaneously every two weeks.
   b. The recommended starting dosage in pediatric patients 6 to less than 12 years of age is 150 mg administered subcutaneously every two weeks.
   c. The recommended dosage in pediatric patients 2 to less than 6 years of age is 150 mg administered subcutaneously every four weeks.
5. The product is commercially available in the following dosage forms and has the following quantity limits:
   a. 150 mg/mL pre-filled syringe, quantity limit of 1 mL per 28 days
   b. 300 mg/2 mL pre-filled syringe, quantity limit of 2 mL per 28 days
   c. 300 mg/2 mL single-dose vial, quantity limit of 2 mL per 28 days
6. Takhzyro 150 mg/mL syringe can be considered for coverage under the **pharmacy benefit** (caregiver administered) or **medical benefit** (healthcare provider administer).

   a. Requests for Takhzyro 150mg/mL syringe under the **medical benefit** (health care provider administered) for patients < 12 years of age will require documentation of an inability to self-inject or documentation of an inability of a caregiver to administer the medication. Clinical justification may include but is not limited to history of significant tremor, dexterity limitations, cognitive impairment.
   b. Coverage under the medical benefit for patients 12 years of age and older will be excluded
   c. Once a patient turns 12 years old, they will be required to obtain treatment under the pharmacy benefit, as the 300mg/2mL syringe/vial is not covered under the medical benefit (see below).
7. Takhzyro 300 mg/2 mL pre-filled syringe and single-dose vial can be self-administered after training under the guidance of a health care professional and therefore will be covered under the **pharmacy benefit only** for all lines of business.
8. All recertification requests (initial and subsequent) will require documentation of the frequency and severity of attacks experienced and the frequency of administration of Takhzyro to monitor for appropriate use.
9. Requests for Adult and Pediatric Patients 12 years of Age and Older:
   a. Initial approval will be for 9 months.
      i. If 0 attacks have occurred during the prior 6 months while on the medication, a trial with an extended dosing interval of 300 mg every four weeks will be required based on package labeling which states that a dose of 300 mg every four weeks is also effective.
      ii. If documentation is provided that the patient is not attack free (has experienced at least 1 attack), but has had a decrease in severity, duration, and/or frequency of attacks while
      on the medication compared to baseline, a dosing frequency of 300 mg every 2 weeks can be continued.
      iii. If documentation is provided that the patient has not experienced a decrease in severity, duration, and/or frequency of attacks while on the medication compared to baseline (no benefit from the medication), further treatment will not be authorized.
   b. Subsequent recertification requests will be for 6 months at a time and will be reviewed utilizing the same criteria above:
      i. If documentation has been submitted that 0 attacks have occurred during the 6 months prior, a trial with 300 mg every four weeks will be required.
      ii. If documentation is provided that the patient is not attack free (has experienced at least 1 attack), but has had a decrease in severity, duration, and/or frequency of attacks while
      on the medication compared to baseline, a dosing frequency of 300mg every 2 weeks can be continued.
      iii. If documentation is provided that the patient has not experienced a decrease in severity, duration, and/or frequency of attacks while on the medication compared to baseline (no benefit from the medication), further treatment will not be authorized.
10. Requests for Pediatric Patients 6 to less than 12 years of age:
   a. Initial approval will be for 9 months.
      i. If 0 attacks have occurred during the prior 6 months while on the medication, a trial with an extended dosing interval of 150 mg every four weeks will be required based on package labeling which states that a dose of 150 mg every four weeks may be considered if the patient is well-controlled (e.g., attack free) for more than 6 months
      ii. If documentation is provided that the patient is not attack free (has experienced at least 1 attack), but has had a decrease in severity, duration, and/or frequency of attacks while
      on the medication compared to baseline, a dosing frequency of 150mg every 2 weeks can be continued.
      iii. If documentation is provided that the patient has not experienced a decrease in severity, duration, and/or frequency of attacks while on the medication compared to baseline (no benefit from the medication), further treatment will not be authorized.
   b. Subsequent recertification requests will be for 6 months at a time and will be reviewed utilizing the same criteria above:
      i. If documentation has been submitted that 0 attacks have occurred during the 6 months prior, a trial with 150 mg every four weeks will be required.
      ii. If documentation is provided that the patient is not attack free (has experienced at least 1 attack), but has had a decrease in severity, duration, and/or frequency of attacks while.
      on the medication compared to baseline, a dosing frequency of 150mg every 2 weeks can be continued.
      iii. If documentation is provided that the patient has not experienced a decrease in severity, duration, and/or frequency of attacks while on the medication compared to baseline (no benefit from the medication), further treatment will not be authorized.
11. Requests for Pediatric Patients 2 to less than 6 years of age:
   a. Initial approval and subsequent recertification requests will be approved for 6 months at a time.
      i. Recertification requests will require documentation that the patient has had a decrease in severity, duration, and/or frequency of attacks while on the medication compared to baseline.
      ii. If documentation is provided that the patient has not experienced a decrease in severity, duration, and/or frequency of attacks while on the medication compared to baseline (no benefit from the medication), further treatment will not be authorized.

Considerations

1. Utilization Management are contract dependent. Refer to specific contract/benefit language for exclusions.
   - Coverage criteria may be dependent on the contract renewal date.
   - Coverage of drugs listed in this policy are contract dependent.

- Not all contracts/benefits allow coverage of healthcare professional administered drugs as part of their pharmacy benefit.
- Not all contracts/benefits cover all medical infusible drugs.

2. Clinical documentation must be submitted for each request (initial and recertification [if applicable]) unless otherwise specified (e.g., provider attestation required). Supporting documentation includes, but is not limited to, progress notes documenting previous treatments and treatment history, diagnostic testing, laboratory test results, genetic testing or biomarker results, imaging and other subjective or subjective measures of clinical benefit. For recertification, continued approval requires documentation demonstrating that the requested product is providing ongoing benefit to the patient, evidenced by improvement or stability in the disease state or condition, and that continued use remains medically necessary. Ongoing use of the requested product must continue to align with the current policy's preferred formulary. Recertification reviews may result in a requirement to trial more cost-effective treatment alternatives as they become available (e.g., generics, biosimilars, or other guideline-supported treatment options). Requested dosing must remain consistent with FDA-approved or off-label/guideline-supported dosing recommendations.
3. This policy does not apply to Medicare Part D and D-SNP pharmacy benefits. The drugs in this policy may apply to all other lines of business including Medicare Advantage.
4. For members with Medicare Advantage, medications with a National Coverage Determination (NCD) and/or Local Coverage Determination (LCD) will be covered pursuant to the criteria outlined by the NCD and/or LCD. NCDs/LCDs for applicable medications can be found on the CMS website at https://www.cms.gov/medicare-coverage-database/search.aspx. Indications that have not been addressed by the applicable medication's LCD/NCD will be covered in accordance with criteria determined by the Health Plan (which may include review per the Health Plan's Off-Label Use of FDA Approved Drugs policy). Step therapy requirements may be imposed in addition to LCD/NCD requirements.
5. This policy is applicable to drugs that are included on a specific drug formulary (Pharmacy benefit only). If a drug referenced in this policy is non-formulary, please reference the Non-Formulary Medication Exception Review Policy for review guidelines.
6. Dosing and frequency should be in accordance with the FDA label or recognized compendia (for off-label uses). When services are performed in excess of established parameters, they may be subject to review for medical necessity.
7. This policy is based on available evidence as of the last review date. Coverage determinations are subject to applicable plan documents, state and federal regulations, and individual patient circumstances. This policy does not constitute medical advice.
8. A normal C4 particularly during an edema attack should make one question the diagnosis of HAE
9. Some medications may trigger or worsen angioedema events in patients with HAE and should be avoided including estrogen contraceptives, hormone replacement therapy, and ACE-Inhibitors.
10. Individuals' who are authorized for prophylactic Andembry, Cinryze, Dawnzera, Haegarda, Takhzyro or Orladeyo and have an acute attack while on therapy, should be re-evaluated to determine if there is an identifiable cause (adherence, misdiagnosis, etc.) for the breakthrough.
11. Individuals will only be authorized for **one acute** HAE medication at onetime.
12. Individuals will only be authorized for **one prophylactic** HAE medication at onetime.
13. The above quantity limits have been established in order to be sufficient to cover a patient in the event of an attack. Due to lack of evidence for more frequent administration, requests for quantities in excess of the established limits will not be approved. In the event, a patient is completely out of medication, a one-time override for early refill may be considered. One-time overrides will be approved after the submission of documentation (via provider progress notes, hospital progress notes, etc.) clarifying the patient's exacerbation details including date of exacerbation, date of medication administration, dose administered, as well asresponse.
14. All utilization management requirements outlined in this policy are compliant with applicable New York State insurance laws and regulations.
15. Manufacturers may either discontinue participation in, or may not participate in, the Medicaid Drug Rebate Program (MDRP). Under New York State Medicaid requirements, physician-administered drugs must be produced by manufacturers participating in the MDRP. Products made by manufacturers that do not participate in the MDRP will not be covered under Medicaid Managed Care/HARP lines of business. Drug coverage will not be available for any product from a non-participating manufacturer. For a complete list of New/Reinstated & Terminated Labelers please visit: https://www.medicaid.gov/medicaid/prescriptiondrugs/medicaid-drug-rebate-program/newreinstated-terminated-labeler-information/index.html
16. The requested site of care may impact approval timeframe and is subject to review.
17. This policy is subject to ongoing revision. Newly marketed drugs and existing drugs with new indications may be subject to prior authorization until formal coverage criteria are established. Inclusion of a drug in this policy does not guarantee its current availability on the market, as some agents may be discontinued, withdrawn, or otherwise unavailable. As product status changes, drugs may be removed from the policy.

GOVERNMENT PROGRAMS

CHILD HEALTH PLUS:	Subject to all terms and conditions noted in above application.
MEDICARE CHOICES:	Subject to all terms and conditions noted in above application if administered under the medical benefit Pharmacy benefit: Not applicable
SELECT/HARP PLAN:	Subject to all terms and conditions noted in above application if administered under the medical benefit Effective April 1, 2023, the pharmacy benefit for Medicaid is administered by NYRx, the Medicaid Pharmacy Program.

CDPHP Pharmacy Services 8/13/2026

Date	Notes
06/2025	New Policy
09/2025	Added Andembry (garadacimab) to policy Added Ekterly (sebetralstat) to policy
12/2025	Added language regarding concomitant use of acute attack agents Step therapy added for Berinert and Ruconest - documentation of therapeutic failure, severe intolerance, OR a contraindication to generic icatibant Added Dawnzera (donidalorsen)
2/2026	Brand Name Firazyr step therapy criteria updated • Removed Sajazir (branded generic icatibant product) from the step therapy requirement, now only requires the true generic icatibant and reworded to both initial and recertification/continuation of therapy requests for brand Firazyr will require documentation of therapeutic failure, severe intolerance, or a contraindication to a trial with generic Icatibant.
5/14/26	Applicable to pharmacy and medical benefit therapies Added therapies available through medical benefit
8/13/26	Added weight based dosing to Ruconest Updated language for consistency throughout the policy Updated policy considerations section

POLICY NAME: HIGH-RISK OBSTETRICAL NOTIFICATION

POLICY EFFECTIVE DATE: 3/1/2024
Policy Control #: 1370/20.000198
Next Annual Review: March 2027

DISCLAIMER

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgement when deciding the most appropriate care to enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

DESCRIPTION

CDPHP offers case management services for all pregnant women with high-risk criteria to achieve the goal of improving the quality of maternity care, improving birth outcomes, and providing continuity of care. This policy describes the CDPHP process to identify high-risk obstetrical patients for case management services.

RELATED POLICIES/DOCUMENTS

Payment Policies:

Notification of Inpatient Hospitalizations, 1550/20.000174

POSITION STATEMENT

CDPHP requires Obstetrical and Family Practice physicians to notify CDPHP of obstetrical patients meeting high-risk criteria as soon as they are identified. This notification effectively serves as a referral to the CDPHP case management services, so notifications should include patient records that captures the prenatal risk assessment standards or American Congress of Obstetricians and Gynecologists (ACOG) forms for the case manager's use. Additionally, CDPHP requires notification of a member's loss of pregnancy so that the appropriate resources can be provided. CDPHP also partners with a third party, Ovia Health, to offer eligible members pregnancy support through a digital app called Ovia Pregnancy. Members who log high-risk

conditions through this application will be referred for CDPHP care management services as well.

Providers should send notifications by the following means:

- Fax or email a completed CDPHP High-Risk Pregnancy Referral form (attached) with patient records or ACOG forms to (518) 641-3303 or pregnancy@cdphp.com.

The high-risk notification should include the following information:

- Enrollee name
- Enrollee identification number
- Reason for referral
- Referring physician
- Date of last menstrual period (LMP) or estimated due date (EDD)

Fax or email a completed CDPHP Loss of Pregnancy/Unsuccessful Birth Referral form (attached) to (518) 641-3303 or pregnancy@cdphp.com. The loss notification should include the following information:

- Enrollee name
- Enrollee identification number
- Reason for referral
- Referring physician
- Date of physician notification

POLICY CONSIDERATIONS

Patients meeting one or more priority risk criteria (listed below) identified by a pregnancy risk screening are the eligible target population for high-risk pregnancy case management:

- History of preterm birth (less than 37 weeks)
- Tobacco use or substance abuse
- Depression or anxiety before or during pregnancy
- Chronic conditions that may complicate pregnancy (e.g., high blood pressure, HIV/AIDS, heart problems, diabetes, asthma, obesity, seizures, lupus)
- Teen pregnancy (under age 18)
- Unsafe living environment (domestic violence or unstable housing)
- Other

CDPHP assigns a case manager to any obstetrical patient identified as high risk to assist the physician and member with treatment coordination, compliance with medical treatment, and identification of potential resources available to the patient.

High-Risk Pregnancy Referral Form

Instructions: Please provide this referral form and relevant patient records/ACOG forms using HIPAA required safeguards via fax to (518) 641-3303 or via e-mail to pregnancy@cdphp.com.

CDPHP depends on timely notification of pregnancy to provide your patients with resources and education to support them with a healthy pregnancy. Additionally, CDPHP offers case management services for high-risk pregnancies to provide continuity of care, improve the quality of maternity care, and improve birth outcomes.

MEDICAL POLICY

Medical Policy Title	**Hip Joint Procedures for Managed Medicaid (MMC), Health and Recovery Plan (HARP), Child Health Plus (CHP), and Essential Plan (EP) Members**
Policy Number	**7.01.121**
Current Effective Date	**January 1, 2027**
Next Review Date	**September 2027**

Our medical policies are guides to evaluate technologies or services for medical necessity. Criteria are established through the assessment of evidence based, peer-reviewed scientific literature, and national professional guidelines. Federal and state law(s), regulatory mandates and the member's subscriber contract language are considered first in the determination of a covered service.

Hip Arthroplasty

Partial

Total

Revision

Resurfacing

Osteotomy-Pediatrics

Hip Arthroscopy

Hip Arthroscopy

Hip Labral Repair

Not Medically Necessary Indications

POLICY STATEMENT(S)

Hip Arthroplasty

Partial Hip Arthroplasty

I. Partial hip replacement is **medically necessary** when **EITHER** of the following criteria are met:

   A. Traumatic hip injury; **or**

   B. **ANY** of the following conditions are present when the body mass index (BMI) is 40 kg/m² or less (if BMI is greater than 40 kg/m², there is a documented weight reduction of at least 10% before surgery):

      1. Comminuted femoral head or femoral neck fracture;
      2. Completely displaced femoral neck or femoral head fracture;
      3. Impacted femoral neck or femoral head fracture;

4. Partially displaced femoral neck or femoral head fracture;
5. Intracapsular fracture that is non-displaced for which fixation is not considered an appropriate treatment option.

Total Hip Arthroplasty

II. Total hip arthroplasty is **medically necessary** when **BOTH** the following are met:
   A. BMI of 40 kg/m² or less; **and**
   B. Presence of **any** of the following conditions when associated criteria are met:
      1. Developmental dysplasia of the hip;
      2. Displaced or comminuted femoral neck or femoral head;
      3. Post-traumatic arthritis;
      4. Malunion/non-union femoral head or proximal femur fracture;
      5. Prior fracture treated with open reduction internal fixation (ORIF) resulting in advanced joint disease;
      6. Osteonecrosis (Avascular Necrosis [AVN]) with subchondral fracture or crescent sign demonstrated on imaging;
      7. Symptomatic Osteonecrosis/AVN with stage IV collapse; **or**
      8. Osteoarthritis with **all** the following:
         a. Arthritis type is **any** of the following:
            i. Arthritis is Tonnis grade 2 or 3;
            ii. Rheumatoid arthritis;
            iii. Post-traumatic arthritis;
            iv. Inflammatory arthropathy; **and**
         b. Hip pain causing loss of function for 12 weeks or more that interferes with activities of daily living; **and**
         c. Conservative management includes **BOTH** of the following:
            i. Physical therapy (PT) meets **all** the following:
               a) Supervised by a licensed PT, chiropractor, or through tele-rehab PT;
               b) Participation for a minimum of 6 weeks during the previous 6 months; **and**
               c) Failure to improve symptoms or functional impairments;
            ii. Pain management includes **any** of the following:
               a) Non-pharmacologic pain management such as activity modification,

modification of activity/protective weight-bearing/use of an orthotic;

b) Intra-articular corticosteroid injection;

c) Medication management (e.g., non-steroidal anti-inflammatory drugs [NSAIDS]); **and**

d. Diagnostic imaging studies (e.g., radiographs, CT, and/or MRI as clinically indicated) demonstrate **ANY** of the following findings:

i. Bone-on-bone articulation;

ii. Severe joint-space narrowing;

iii. Advanced osteoarthritis;

iv. Tönnis Grade III deformity;

v. Symptomatic Osteonecrosis/AVN with stage IV collapse; **and**

e. Documentation demonstrates **ANY** of the following symptoms:

i. Contracture;

ii. Antalgic gait or Trendelenburg gait;

iii. Pain with hip rotation;

iv. Leg-length discrepancy;

v. Reduction in range of motion.

III. Total hip arthroplasty is **not medically necessary** for **ANY** of the following contraindications:

A. Diabetes with HbA1c greater than 8%;

B. Nicotine or tobacco use, including cigars, cigarette, e-cigarette, nicotine pouch, smokeless tobacco, or vape pen, within six (6) weeks of surgery;

C. Intra-articular corticosteroid injection within 12 weeks of surgery;

D. Clinically unstable or unmanaged comorbid conditions;

E. Active infection, in treatment or is ongoing;

F. Uncontrolled hypertension;

G. Allergy to medical treatment material;

H. Drug dependency that is not being appropriately managed.

<u>Revision Hip Arthroplasty</u>

IV. Revision hip arthroplasty is **medically necessary** when **ALL** the following are met:

A. BMI is either:

1. 40 kg/m² or less, **or**

2. If BMI is greater than 40 kg/m², documented weight reduction of at least 10% before surgery;

B. Prosthesis is painful, unstable, or causing loss of function; **and**

C. **ANY** of the following:

1. Recurrent instability, dislocation, or subluxation;
2. Intolerable leg-length discrepancy;
3. Aseptic loosening;
4. Osteolysis;
5. Implant component failure;
6. Implant recall;
7. Symptomatic synovitis or metallosis; **or**
8. Prosthetic infection or failure requiring removal.

Hip Resurfacing

V. Hip resurfacing is **medically appropriate**, when **ALL** the following are met:

A. The individual is aged 55 years or less;

B. Active lifestyle;

C. Candidate for conventional total hip arthroplasty;

D. Femoral head size of greater than or equal to 46mm;

E. Adequate femoral bone stock;

F. Presurgical x-rays within 2 to six 6 months;

G. Conservative management includes **BOTH** of the following:

1. Physical therapy (PT) meets **all** the following:
   a. Supervised by a licensed PT, chiropractor, or through tele-rehab PT;
   b. Participation for a minimum of 6 weeks during the previous 6 months; **and**
   c. Failure to improve symptoms or functional impairments;
2. Pain management includes **any** of the following:
   a. Non-pharmacologic pain management such as activity modification, modification of activity/protective weight-bearing/use of an orthotic;
   b. Non-steroidal anti-inflammatory drugs (NSAIDS) for a minimum of 4 weeks; **and**

VI. Hip resurfacing is **not medically necessary** for **ANY** of the following contraindications:

A. Developmental abnormalities affecting the acetabulum or femur;
B. Systemic infection or other active infectious process;
C. Immunocompromised status, including chronic corticosteroid therapy;
D. Clinically significant leg length inequality;
E. Known hypersensitivity or allergy to implant metal components;
F. Osteonecrosis/AVN affecting more than 50% of the femoral head;
G. Pregnancy;
H. Moderate-to-severe renal dysfunction, including an estimated glomerular filtration rate (eGFR) below 60 mL/min/1.73m²;
I. Severe reduction in bone quality or density, such as advanced osteopenia or osteoporosis;
J. History of slipped capital femoral epiphysis (SCFE);
K. Incomplete skeletal maturity.

Osteotomy- Pediatrics

VII. Pelvic or femoral osteotomy for the treatment of developmental dysplasia of the hip (DDH) in a pediatric individual is **medically necessary** when documentation supports **ALL** the following:

A. Preoperative imaging performed within the previous 4 weeks demonstrates DDH with residual or persistent acetabular dysplasia, or a subluxated/dislocated hip (a standard pelvic radiograph is the usual primary study in a child ≥6 months. Ultrasound for infants, MRI, CT, or arthrography is acceptable, but not required);
B. **ONE** of the following indications for osteotomy are present:
    1. Persistent or recurrent instability, subluxation, or dislocation of the hip;
    2. Residual acetabular dysplasia that is not anticipated to correct on its own (e.g., a persistently elevated age-specific acetabular index or a low center-edge angle); **or**
    3. Corresponding physical findings of DDH are present, including **any** of the following:
        a. Positive Barlow/Ortolani or Galeazzi sign in infants;
        b. Limited or asymmetric hip abduction, limb-length discrepancy; or limping or waddling gait in an ambulatory child; **or**
        c. Late presentation or older age at diagnosis in which primary open reduction with concomitant osteotomy would be the appropriate approach.

Hip Arthroscopy

Hip Arthroscopy- Diagnostic

VIII. Diagnostic hip arthroscopy is infrequently indicated, and therefore is only **medically**

necessary when **ALL** the following are met:

A. Hip pain for at least 6 months resulting in functional impairment that interferes with activities of daily living;

B. Conventional imaging has not established a diagnosis, including both MRI and plain radiographs; and

C. Conservative management includes **BOTH** the following:

1. Physical therapy (PT) meets **all** the following:
    a. Supervised by a licensed PT, chiropractor, or through tele-rehab PT;
    b. Participation for a minimum of 6 weeks during the previous 6 months; **and**
    c. Failure to improve symptoms or functional impairments;
2. Pain management includes **any** of the following:
    a. Non-pharmacologic pain management such as activity modification, modification of activity/protective weight-bearing/use of an orthotic;
    b. Intra-articular corticosteroid injection;
    c. Non-steroidal anti-inflammatory drugs (NSAIDS) or analgesics.

<u>Hip Arthroscopy-Biopsy, Foreign Body Removal, Synovectomy</u>

IX. Hip arthroscopy biopsy, foreign body removal, synovectomy, or a combination of these procedures is medically necessary when **ALL** the following are met:

A. Hip pain for at least 3 months;

B. **Both** the following symptoms:

1. Pain results in functional impairment that interferes with activities of daily living; **and**
2. Is associated with mechanical symptoms such as catching, clicking, grinding, locking, **or** popping;

C. Diagnostic imaging studies (e.g., radiographs, CT, and/or MRI as clinically indicated) demonstrate **any** of the following:

1. Calcification;
2. Inflammatory changes;
3. Intra-articular loose body;
4. Nodular lesion(s);
5. Pannus formation; **or**
6. Synovial proliferation;

D. Clinical exam reveals restricted range of motion of the affected hip;

E. Conservative management includes **both** of the following:
   1. Physical therapy (PT) meets **all** the following:
      a. Supervised by a licensed PT, chiropractor, or through tele-rehab PT;
      b. Participation for a minimum of 6 weeks during the previous 6 months; **and**
      c. Failure to improve symptoms or functional impairments;
   2. Pain management includes **any** of the following:
      a. Non-pharmacologic pain management such as activity modification, modification of activity/protective weight-bearing/use of an orthotic;
      b. Intra-articular corticosteroid injection; **or**
      c. Pharmacologic pain management (e.g., NSAIDS).

<u>Hip Arthroscopy- Femoroacetabular Impingement</u>

X. Arthroscopic treatment of CAM-type or Pincer-type femoroacetabular impingement is **medically necessary** when **ALL** the following criteria are met:
   A. BMI is 40kg/m² or less;
   B. Imaging confirms **both** the following:
      1. The presence of **either** of the following:
         a. CAM-type impingement, demonstrated by femoral head-neck junction abnormalities (e.g., loss of femoral head sphericity, pistol-grip deformity, or alpha angle greater than 55 degrees); **or**
         b. Pincer-type impingement, demonstrated by acetabular overcoverage findings such as acetabular retroversion, crossover sign, acetabular protrusion, posterior wall sign, prominent ischial spine sign, or center-edge angle greater than 35 degrees;

         and
      2. The absence of **either** of the following on weight-bearing radiographs:
         a. Moderate-to-severe osteoarthritis (Tönnis grade 2 or 3); or
         b. Hip dysplasia; **and**
   C. Physical exam demonstrates the following:
      1. Hip and groin pain consistent with impingement, including pain with flexion, adduction, and internal rotation; **and**
      2. Symptoms are reproducible or exacerbated by hip positioning;

         (Mechanical symptoms such as locking, catching, grinding, or popping and positive provocative maneuvers such as FABER or Fitzgerald testing may also be present);

and

D. Conservative management includes **BOTH** the following:
   1. Physical therapy (PT) meets **all** the following:
      a. Supervised by a licensed PT, chiropractor, or through tele-rehab PT;
      b. Participation for a minimum of 6 weeks during the previous 6 months; **and**
      c. Failure to improve symptoms or functional impairments;
   2. Pain management includes **any** of the following:
      a. Non-pharmacologic pain management such as activity modification, modification of activity/protective weight-bearing/use of an orthotic;
      b. Intra-articular corticosteroid injection; **or**
      c. Pharmacologic pain management (e.g., NSAIDS).

Hip Labral Repair

XI. Hip labral repair is **medically necessary** when **ALL** the following are met:
   A. Imaging findings include **both** the following:
      1. Weight-bearing radiographs do not demonstrate moderate-to-severe osteoarthritis (Tönnis grade 2 or 3) or hip dysplasia;
      2. Magnetic resonance imaging confirms an acetabular labral tear;
   B. Hip pain for **at least** 6 weeks that includes **all** the following:
      1. The pain results in functional impairment that interferes with activities of daily living;
      2. The pain is accompanied by examination findings consistent with impingement, including pain with flexion, adduction, and internal rotation;

         (Mechanical symptoms such as locking, catching, grinding, or popping may also be present)
   C. Conservative management meets **either** of the following:
      1. Conservative management is not required when **any** of the following is documented:
         a. Irreparable or substantially deficient labral tissue;
         b. A labral tear identified during another medically necessary hip arthroscopic procedure;
         c. Loose bodies, foreign bodies, or synovial pathology requiring surgical removal;
         d. Advanced structural femoroacetabular impingement with clearly associated labral pathology; **or**
         e. Suspected or confirmed septic arthritis; **or**

2. For all other indications, conservative management must include **both** of the following:
    a. Physical therapy (PT) meets **all** the following:
        i. Supervised by a licensed PT, chiropractor, or through tele-rehab PT;
        ii. Participation for a minimum of 6 weeks during the previous 6 months; **and**
        iii. Failure to improve symptoms or functional impairments;
    b. Pain management includes **any** of the following:
        i. Non-pharmacologic pain management such as activity modification, modification of activity/protective weight-bearing/use of an orthotic;
        ii. Intra-articular corticosteroid injection; **or**
        iii. Pharmacologic pain management (e.g., NSAIDS).

Not Medically Necessary Indications

XII. The following indications are **not medically necessary**:

A. Hip Arthroscopy for **ANY** of the following conditions:
    1. Bone marrow edema;
    2. Radiographic or clinical evidence of fracture;
    3. Intra-articular loose body or synovial pathology (see procedure specific criteria for arthroscopic removal of loose bodies and synovial pathology in Policy Statement XI);
    4. Tear involving the abductor, adductor, or hamstring tendon complex;

B. Diagnostic Hip Arthroscopy when **ANY** of the following are present:
    1. Advanced degenerative joint disease when documentation demonstrates significant arthritic changes of the affected hip, including **either** of the following:
        a. Joint space narrowing to 2 mm or less on radiographs; **or**
        b. Subchondral edema identified on MRI;
    2. Structural hip abnormalities with an established diagnosis and imaging confirms **ANY** of the following:
        a. Acetabular protrusion;
        b. Acetabular overcoverage involving the anterolateral rim;
        c. Femoroacetabular impingement (FAI);
        d. Alpha angle greater than 50 degrees;
        e. Crossover sign;
        f. Posterior wall sign;

g. Prominent ischial spine sign;
h. Abnormal femoral head contour resulting in loss of normal sphericity;
i. Prominent femoral head-neck junction (e.g., pistol-grip deformity); **or**
j. Acetabular retroversion with a center-edge angle greater than 35 degrees;

C. Hip dysplasia when imaging findings are consistent, including **ANY** of the following, when the proposed procedure does not include a periacetabular osteotomy:
1. Lateral center-edge angle less than 20 degrees;
2. Anterior center-edge angle less than 20 degrees;
3. Tönnis angle greater than 15 degrees; **or**
4. Femoral head extrusion index greater than 25%;

D. Alternative identifiable pathology that adequately explains symptoms, including **ANY** of the following:
1. Intra-articular loose body;
2. Pigmented villonodular synovitis (PVNS);
3. Synovial chondromatosis;
4. Ischiofemoral impingement;
5. Pubic edema or osteitis pubis; **or**
6. MRI-confirmed tear involving the labrum, adductor tendon, hamstring tendon, gluteus medius, or gluteus minimus.

E. Presence of active infection; **or**
F. Unmanaged substance use disorder/dependency.

DESCRIPTION

Total Hip Arthroplasty

Total hip replacement is a surgical technique in which the femoral head and neck are removed, and the femoral canal (marrow space) is reamed out. The damaged hip joint is replaced with an artificial prosthesis composed of two or three different components: (1) the head that replaces the original

femoral head; (2) the femoral component (a metal stem placed into the femur); and (3) the acetabular component, which is implanted into the acetabulum. The stem may be secured using bone cement or press-fit for the bone to grow into it.

The Tonnis Classification System is commonly used to describe the presence of osteoarthritis in the hips, with grading as follows:

- Grade 0: No signs of osteoarthritis.
- Grade 1: Sclerosis of the joint, with slight joint space narrowing and osteophyte formation and no or slight loss of femoral head sphericity.
- Grade 2: Small cysts in the femoral head or acetabulum, with moderate joint space narrowing and moderate loss of femoral head sphericity.
- Grade 3: Large cysts in the femoral head or acetabulum, severe joint space narrowing or obliteration of the joint space, and severe deformity and loss of sphericity of the femoral head.

Revision of hip replacement (partial or total) involves surgical reconstruction or replacement due to failure or complications of previous hip replacement.

Non-surgical management regarding the treatment of hip osteoarthritis is defined as any provider-directed, non-surgical treatment that has been demonstrated in the scientific literature to be efficacious and/or is considered reasonable care in the treatment of hip pain from osteoarthritis. The types of treatment can include but are not limited to relative rest/activity modification, weight loss, supervised physiotherapy modalities and therapeutic exercises, oral prescription and non-prescription medications, assistive devices (e.g., cane, crutches, walker, wheelchair), and/or intra-articular (i.e., steroid) injections.

Hip Resurfacing

Total hip resurfacing is an alternative to watchful waiting or total hip arthroplasty (THA) for younger, active individuals less than 65 years old with hip disease such as osteoarthritis, rheumatoid arthritis, or advanced avascular necrosis.

In total hip resurfacing, the surface of the femoral head is trimmed and covered with a hollow metal hemisphere that fits into a metal acetabular cup. It is believed to optimize stress transfer to the proximal femur, and, because of the large diameter of the articulation, to offer stability and optimal range of movement. Because total hip resurfacing preserves the proximal femoral bone stock, it may not compromise future total hip replacements.

Proposed advantages of total hip resurfacing as compared with THA include preservation of the femoral neck and femoral canal, thus allowing for revision or conversion to THA, if required. In addition, the resurfaced head is more similar in size to the normal femoral head, thus increasing the stability and decreasing the risk of dislocation compared with THA.

Non-surgical management with regard to the treatment of lower extremity joint pain is defined as any provider-directed, non-surgical treatment which has been demonstrated in scientific literature to be efficacious and/or is considered reasonable care in the treatment of lower extremity joint pain.

Types of treatment may include but are not limited to relative rest/activity modification, weight loss, supervised physiotherapy modalities and therapeutic exercises, oral prescription and non-prescription medications, assistive devices (e.g., cane, crutches, walker, wheelchair), and/or intra-articular injections (e.g., steroid).

Total hip resurfacing using polyethylene components offers a promising bone-conserving alternative to total hip replacement, particularly for individuals with metal allergies or small femoral geometries (variations in the shape and size of the upper part of the femur, particularly around the hip joint). Earlier concerns with conventional polyethylene relative to wear, thickness, osteolysis, and deformation are currently being studied with the use of cross-linked polyethylene which provides a low-friction bearing surface, mimicking the natural joint's articulation and thus promoting good outcomes.

SUPPORTIVE LITERATURE

Total Hip Arthroplasty

In a meta-analysis, Smith and colleagues (2010) compared the clinical and radiological outcomes and complication rates of hip resurfacing (HRS) and total hip arthroplasty (THA). A systematic review was undertaken of all published (Medline, CINAHL, AMED, EMBASE) and unpublished or gray literature research databases up to January 2010. Clinical and radiological outcomes, as well as complications of HRS, were compared to those of THA, using risk ratio, mean difference, and standardized mean difference statistics. Studies were critically appraised using the CASP appraisal tool. A total of 46 studies were identified from 1,124 citations. These included 3,799 HRSs and 3,282 THAs. On meta-analysis, functional outcomes for subjects following HRS were better than or the same as for subjects with a THA, but there were statistically significant increases in incidence of heterotopic ossification, aseptic loosening, and revision surgery with HRS, compared to THA. The evidence base showed a number of methodological inadequacies, such as the limited use of power calculations and poor or absent blinding of both patients and assessors, possibly giving rise to assessor bias. The authors concluded that, on the basis of the current evidence base, HRS may have better functional outcomes than THA, but the increased risks of heterotopic ossification, aseptic loosening, and revision surgery following HRS indicate that THA is superior in terms of implant survival.

In a 2019 retrospective cohort study, Inoue et al compared post-operative complications and survivorship of total hip and knee arthroplasty in dialysis and renal transplantation patients. They included a total of 107 patients undergoing primary total joint arthroplasty (TJA), including 50 who were receiving dialysis and 57 who had a prior renal transplantation. The end point was defined as revision surgery secondary to post-operative complications. Researchers found a significantly higher rate of post-operative complications in the dialysis cohort (28%, n=14 of 50 joints) compared to the renal transplant cohort (7.1%, n= 4 of 57 joints). There was a higher rate of surgical site infection (SSI) and periprosthetic joint infection (PJI) in dialysis patients, compared with renal transplantation patients (18% versus 3.5%, P=0.02). In addition, there was an increased rate of revision surgery in the dialysis cohort, compared to transplant cohort (24% versus 3.5%, P=0.002). A multi-variate analysis considering demographics and comorbidities revealed that patients with renal transplantation

were less likely to have revision surgery, compared to patients on dialysis as the time of arthroplasty (95 % CI, P=0.031), and demonstrated a strong trend for lower complications (95% CI, P=0.76), although the latter was not statistically significant. Researchers concluded that transplantation was independently associated with reduced rates of revision surgery in the setting of chronic renal failure, suggesting that those who are candidates may benefit from renal transplantation before undergoing elective TJA.

Chou et al (2021) compared outcomes of TJA, including THA and total knee arthroplasty, in individuals with end-stage renal disease who were either receiving dialysis or had undergone a kidney transplant (KT). The analysis included 22 studies encompassing 9,384 patients (n = 8,921 dialysis; n = 463 KT). The overall mortality rate after TJA was 14.9%-13.8% in dialysis patients and 15.8% in KT patients. The overall surgical site complication (SSC) rate was 3.3%, with KT patients experiencing a rate of 3.6%. SSCs included hematoma, seroma, delayed wound healing, and superficial infections. The overall PJI rate was 3.9%, with dialysis patients at 4.0% and KT patients at 3.7%. Multivariate regression analysis found no statistically significant differences in outcomes between dialysis and KT patients. Both groups demonstrated elevated risks compared to the general population, with comparable outcomes between them.

Kim et al (2022) conducted a systematic review and meta-analysis of 10 retrospective studies that included 3,631,861 patients and 14,996 solid organ transplantations (SOT). They evaluate whether patients with a history of SOT experienced different outcomes after primary hip arthroplasty compared to non- SOT patients. Medical complications included cardiac complications, pneumonia, acute kidney injury, and pulmonary thromboembolism and deep vein thrombosis. The study showed that patients with a history of SOT undergoing hip arthroplasty are at higher risk for medical complications, transfusion, readmission, and short-term mortality compared to non-transplant patients. However, surgical complication rates such as infection and revision are not significantly different.

Hip Resurfacing

Evidence from numerous case series demonstrates symptomatic and functional improvements that appear to be comparable to those obtained with the current generation of total hip replacement in individuals younger than age 65 years at similar follow-up duration. In addition, hip resurfacing leaves femoral bone stock intact and therefore revision is technically similar to primary total hip replacement. Increased concentrations of metal ions have been documented after metal-on-metal hip resurfacing in some individuals. The effect of metal ion release on a fetus is also unknown.

Za and colleagues (2024) performed a systematic review and meta-analysis of eight (8) randomized control trials that compared the outcomes of hip resurfacing (HR) and total hip arthroplasty (THA) in the treatment of hip osteoarthritis in 844 patients (n=387 hip resurfacing; n=469 THA). The mean follow-up was 7.72 years. The systematic review identified no significant differences between the groups in terms of Western Ontario and McMaster Universities Osteoarthritis Index (WOMAC) and University of California Los Angeles (UCLA) scores, revision rates, infection, aseptic loosening, or pseudotumor occurrence (all p>0.05). However, the dislocation rate was significantly lower in the hip resurfacing group (0.72% vs 4%; p=0.04). Some studies evaluated metal ion levels with slightly

higher chromium levels noted in THA patients postoperatively. The most common cause of revision in HR was aseptic loosening (48%), while adverse reactions to metal debris were the leading cause in THA (30.77%). The authors concluded that HR is a safe and effective alternative to THA.

In a 2019 retrospective cohort study, Inoue and colleagues compared post-operative complications and survivorship of total hip and knee arthroplasty in dialysis and renal transplantation patients. They included a total of 107 patients undergoing primary total joint arthroplasty, including 50 who were receiving dialysis and 57 who had a prior renal transplantation. The end point was defined as revision surgery secondary to post-operative complications. Researchers found a significantly higher rate of post-operative complications in the dialysis cohort (28%, n=14 of 50 joints), compared to the renal transplant cohort (7.1%, n= 4 of 57 joints). There was a higher rate of SSI and PJI in dialysis patients, compared with renal transplantation patients (18% versus 3.5%, P=0.02). In addition, there was an increased rate of revision surgery in the dialysis cohort, compared to transplant cohort (24% versus 3.5%, P=0.002). A multi-variate analysis considering demographics and comorbidities revealed that patients with renal transplantation were less likely to have revision surgery, compared to patients on dialysis as the time of arthroplasty (95 % CI, P=0.031) and demonstrated a strong trend for lower complications (95% CI, P=0.76), although the latter was not statistically significant. Researchers concluded that transplantation was independently associated with reduced rates of revision surgery in the setting of chronic renal failure, suggesting that those who are candidates may benefit from renal transplantation before undergoing elective total joint arthroplasty.

Ren and colleagues (2024) performed a retrospective review of 104 individuals who underwent 134 hip resurfacing arthroplasties with either the Birmingham Hip Resurfacing (BHR) (n=67) implant or the ReCap Magnum implant (n=67) at a single institution between 2006 and 2018. The primary aim of this study was to evaluate and compare early and midterm blood metal ion levels in hips implanted with BHR and ReCap devices as both contain cobalt-chromium (CoCr) metals. The study participants were matched 1:1 by sex, femoral head and acetabular cup sizes (±2 millimeters), age at surgery (±5 y), and year of surgery (±5 y). The ReCap group had lower median metal ion levels compared to the BHR group at 1-2 years (Co: 1.5 versus 1.9 parts per billion [ppb], P=0.018; Cr: 1.3 versus 2.8 ppb, P=0.008) and 3-5 years (Co: 1.1 versus 1.9 ppb, P=0.001; Cr: 1.2 versus 2.2 ppb, P=0.003) after surgery. Metal levels were identified in both study groups but potentially not clinically significant. Correlation analysis showed no significant associations between Co and Cr ion levels and pre- and postoperative patient-reported outcomes. Revisions for both study groups varied and included three (3) BHR hip revisions due to adverse reactions to metal debris as compared to two (2) ReCap hips revisions: one for instability and another for periprosthetic fracture. The authors concluded that the study identified that the BHR group had higher metal ion levels than the ReCap group at one to two (1-2) and three to five (3-5) years after surgery; however, these metal levels are still low and in line with prior studies.

Zuke and colleagues (2025) assessed the long-term outcomes of the Birmingham Hip Resurfacing (BHR) implant in a retrospective study of 224 male individuals under 60 years of age with osteoarthritis. The study followed the participants for an average of 14 years. Survivorship analysis revealed excellent long-term durability, with 96.0% of BHR implants remaining free from any revision and 97.4% free from aseptic revision at 15 years. Eight individuals required revision surgery,

primarily due to infection (n=3), pseudotumor formation with elevated metal ions (n=2), and femoral component loosening (n=2). Median serum cobalt and chromium levels were 1.4 ppb and 1.5 ppb, respectively, with only two (2) cases of late-onset elevated metal ions requiring revision. Study participant-reported outcomes were similar between the cohort of individuals who received the BHR implant and the study participant group who received total hip arthroplasty (THA), with no significant differences in the modified Harris Hip Score (92.65 vs. 93.56; p=0.44) or long-term activity levels. The authors concluded that this cohort study demonstrated that metal on metal hip resurfacing arthroplasty using BHR implants is safe and effective with outcomes comparable to THA surgery.

PROFESSIONAL GUIDELINE(S)

Total Hip Arthroplasty

In the 2023 American Academy of Orthopaedic Surgeons adopted the evidence-based Clinical Practice Guidelines for the Management of Osteoarthritis of the Hip that state:

- "They strongly recommend conservative measures such as physical therapy, corticosteroid or hyaluronic acid injections, pharmacological management (NSAIDs)."

In the 2008 International Cartilage Repair Society Guidelines for the Management of Hip and Knee Osteoarthritis (OA), Part II, stated:

- "Patients with hip or knee OA who are not obtaining adequate pain relief and functional improvement from a combination of non-pharmacological and pharmacological treatment should be considered for joint replacement surgery. Replacement arthroplasties are effective, and cost-effective interventions for patients with significant symptoms, and/or functional limitations associated with a reduced health-related quality of life, despite conservative therapy." (Zhang et al 2008)

Hip Resurfacing

Professional Society Name	Guideline/Version/Year	Summary of Content
Hip Society	2012 Algorithmic Approach to the Diagnosis and Management of Metal-on-Metal Arthroplasty	Awareness of adverse local tissue reactions to metal debris. All arthroplasty patients returning for follow-up should be queried for pain, discomfort, or compromiseof function. Description of ideal candidate for metal on metal arthroplasty.

		Listing of contraindications for metal on metal arthroplasty.
National Institute for Health and Care Excellence (NICE)	2014 Updated Guidance on THA and Total Hip Resurfacing for End-stage Arthritis of the Hip	NICE advised that both THA and total hip resurfacing were options for treating end-stage arthritis of the hip. NICE concluded that THA was more effective and less costly than total hip resurfacing in all analyses, that the revision rate was the most important key driver of costs and quality-adjusted life years, and that because the predicted revision rate of THA was less than 5% at 10 years in the population for whom both THA and total hip resurfacing were suitable, the revision rate standard for total hip resurfacing should be the same as that for THA. NICE recommended specific prostheses for THA and total hip resurfacing only if the prostheses have revision rates of 5% or less at 10 years.

REGULATORY STATUS

Surgeries of the hip are procedures and, therefore, not regulated by the United States Food and Drug Administration (FDA). However, devices and instruments used during the surgery are regulated as medical devices. All resurfacing devices including related components require FDA approval before marketing and use in the United States to ensure they are safe and effective for human use. Refer to the FDA Medical Device website. Available from: https://www.fda.gov/medical-devices [accessed 2026 May 11]

The FDA lists the most serious type of medical device recalls as well as early alert communications about corrective actions being taken by companies that the FDA believes are likely to be the most serious type of recalls. Available from: Medical Device Recalls | FDA [accessed 2026 May 11]

The Birmingham Hip Resurfacing Device (BHR), a metal-on-metal system, received FDA premarket approval in May 2006. The Cormet Hip Resurfacing system, another metal-on-metal system, received FDA premarket approval in July 2007. Two additional metal-on-metal hip resurfacing systems have received approval: the Cormet Hip Resurfacing System (Corin) in 2007 and the Conserve Plus Total Hip Resurfacing System (MicroPort Orthopedics) in 2009. Both implants were approved for skeletally mature patients with either noninflammatory degenerative arthritis (e.g., osteoarthritis and avascular necrosis) or inflammatory arthritis (e.g., rheumatoid arthritis).

CODE(S)

- Code list may not be all inclusive (AMA and CMS code updates may occur more frequently than policy updates).
- (E/I)=Experimental/Investigational
- (NMN)=Not medically necessary/appropriate

CPT Codes

Code	Description
27033	Arthrotomy, hip, including exploration or removal of loose or foreign body
27050	Arthrotomy, with biopsy; sacroiliac joint
27070	Partial excision, wing of ilium, symphysis pubis, or greater trochanter of femur, (craterization, saucerization) (e.g., osteomyelitis or bone abscess); superficial
27071	Partial excision, wing of ilium, symphysis pubis, or greater trochanter of femur, (craterization, saucerization) (e.g., osteomyelitis or bone abscess); deep (subfascial or intramuscular)
27090	Removal of hip prosthesis; (separate procedure)
27091	Removal of hip prosthesis; complicated, including total hip prosthesis, methylmethacrylate with or without insertion of spacer
27125	Hemiarthroplasty, hip, partial (e.g., femoral stem prosthesis, bipolar arthroplasty)
27130	Arthroplasty, acetabular and proximal femoral prosthetic replacement (total hip arthroplasty), with or without autograft or allograft
27132	Conversion of previous hip surgery to total hip arthroplasty, with or without autograft or allograft
27134	Revision of total hip arthroplasty; both components, with or without autograft or allograft
27137	Revision of total hip arthroplasty; acetabular component only, with or without autograft or allograft
27138	Revision of total hip arthroplasty; femoral component only, with or without allograft
27140	Osteotomy and transfer of greater trochanter of femur (separate procedure)
27146	Osteotomy, iliac, acetabular or innominate bone;
27147	Osteotomy, iliac, acetabular or innominate bone; with open reduction of hip

Code	Description
27151	Osteotomy, iliac, acetabular or innominate bone; with femoral osteotomy
27156	Osteotomy, iliac, acetabular or innominate bone; with femoral osteotomy and with open reduction of hip
27161	Osteotomy, femoral neck (separate procedure)
27165	Osteotomy, intertrochanteric or subtrochanteric including internal or external fixation and/or cast
27170	Bone graft, femoral head, neck, intertrochanteric or subtrochanteric area (includes obtaining bone graft)
27455	Osteotomy, proximal tibia, including fibular excision or osteotomy (includes correction of genu varus [bowleg] or genu valgus [knock-knee]); before epiphyseal closure
29860	Arthroscopy, hip, diagnostic with or without synovial biopsy (separate procedure)
29861	Arthroscopy, hip, surgical; with removal of loose body or foreign body
29862	Arthroscopy, hip, surgical; with debridement/shaving of articular cartilage (chondroplasty), abrasion arthroplasty, and/or resection of labrum
29863	Arthroscopy, hip, surgical; with synovectomy
29914	Arthroscopy, hip, surgical; with femoroplasty (i.e., treatment of cam lesion)
29915	Arthroscopy, hip, surgical; with acetabuloplasty (i.e., treatment of pincer lesion)
29916	Arthroscopy, hip, surgical; with labral repair

PRODUCT DISCLAIMER

- Services are contract dependent; if a product does not cover a service, medical policy criteria do not apply.
- If a commercial product (including an Essential Plan or Child Health Plus product) covers a specific service, medical policy criteria apply to the benefit.
- If a Medicaid product covers a specific service, and there are no New York State Medicaid guidelines (eMedNY) criteria, medical policy criteria apply to the benefit.
- If a Medicare product covers a specific service, and there is no national or local Medicare coverage decision for the service, medical policy criteria apply to the benefit.

RESOURCE COORDINATION POLICY

Capital District Physicians' Health Plan, Inc.
CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: HIV/AIDS CLINICAL PRACTICE GUIDELINES

POLICY EFFECTIVE DATE:	10/1/2024
Policy Control #:	1370/20.000227
Next Annual Review:	November, 2026

DISCLAIMER

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgement when deciding the most appropriate care to enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

DESCRIPTIONS

Clinical practice guidelines established to provide guidance relating to counseling and testing, ongoing clinical and behavioral health management, and monitoring of preventive health and long-term health maintenance regimens for all HIV/AIDS infected children, adolescents, and adults.

RELATED POLICIES/DOCUMENTS

Payment Policies:

Mandated Benefits for State Funded Programs, 1550/20.000188
Medical Counseling Services, 1550/20.000177
Outpatient Behavioral Health Services, 1550/20.000204
Preventive Services Guideline, 1550/20.000211

POSITION STATEMENT

CDPHP has adopted the Clinical Guidelines, established by the New York State Department of Health AIDS Institute, for the medical and behavioral health management of enrollees with HIV/AIDS that include:

- Standards of medical care for the adult, adolescent, and pediatric patient infected with

HIV
- Standards of care for individuals with mental health or substance use disorders infected with HIV
- Standards of care relating to HIV and pregnancy and prevention of mother-to-child transmission of HIV
- Diagnostic testing of individuals for HIV infection

Experienced HIV Care Provider

CDPHP has adopted the following criteria, established by the New York State Department of Health, AIDS Institute's HIV Quality of Care Program, for defining an experienced HIV care provider for the clinical management of enrollees with HIV/AIDS:

Scientific and clinical knowledge about the management of HIV infection and disease continues to evolve at a rapid pace, resulting in frequent changes in state-of-the-art practice. For this reason, the clinical care of persons with HIV/AIDS requires the participation of clinicians with specialized expertise, which is best gained from hands-on experience that includes the direct management of patients on antiretroviral therapy. The following criteria defines an experienced HIV care provider:

- A medical doctor, nurse practitioner or physician assistant providing ongoing direct clinical ambulatory care to at least 20 HIV-infected persons who are being treated with antiretroviral therapy, in the preceding twelve months; **or**
- Ten hours annually of continuing medical education including information on the use of antiretroviral therapy in the ambulatory care setting.

For some facilities, particularly in rural or small urban areas where there may be relatively few patients with HIV infection, referral to an experienced HIV care provider is impractical. In such cases, facilities may develop formal relationships with an experienced HIV care provider to co-manage patients.

Offering of HIV Testing/ Consent Requirements

In accordance with chapter 502 of the New York State Laws of 2016, CDPHP expects physicians to provide routine HIV testing to all enrollees age 13 and older (or younger than 13 if there is evidence or indication of risk activity) receiving hospital or primary care services as specified below:

- Inpatient hospitalization
- Emergency department
- Primary care services in the outpatient department of a hospital
- Freestanding diagnostic and treatment center
- Physician, physician assistant, nurse practitioner, or midwife providing primary care (e.g., family medicine, general pediatrician, internal medicine, obstetrics, and

gynecology).

Providers will not be required to offer HIV testing if an individual is being treated for a life-threatening emergency; or (b) has previously been offered or has been tested for HIV; or (c) lacks capacity to consent to a HIV related test.

Prior to the ordering an HIV related test during routine medical care, a provider must first, at a minimum, orally advise the individual, or, when the individual lacks capacity to consent, a person lawfully authorized to consent to health care for such individual, that an HIV test will be performed. The provider may not order the test over the objection of the individual, or person authorized to consent to health care for such individual, except as authorized or required by a state or federal law (i.e., court ordered testing). The advisement, and any objection to testing, is to be documented in the individual's medical record.

Prior to consent of an HIV related test, a provider must explain the following information to the individual being tested, or if such person lacks capacity to consent, to the person lawfully authorized to consent to health care for such person: causes of HIV/AIDS, available treatments, prevention/safe practices strategies, voluntary nature of testing, confidentiality protections, and the prohibition of discrimination.

HIV testing providers are not required to obtain written consent for an HIV test via a general medical consent form or an HIV specific consent form. New York State Public Health law allows for streamline consent for an HIV test. Providers must document each HIV test in the patient's medical record.

POLICY CONSIDERATIONS

Current policies, guidelines, regulations, and other relevant HIV/AIDS information are made available on the following web sites:

POLICY NAME: HIV/AIDS CLINICAL PRACTICE GUIDELINES

- CDPHP Find-A-Doc feature at www.cdphp.com

HIV-related tests, or testing is defined as any laboratory test(s) or series of tests approved for the diagnosis of HIV, including rapid HIV testing. Coverage of testing for HIV is offered through the CDPHP participating laboratory network.

CDPHP PRODUCT VARIATIONS

CHILD HEALTH PLUS: Subject to all terms and conditions noted above in the policy.

MEDICARE ADVANTAGE: Subject to all terms and conditions noted above in the policy in addition to the following specifics:

Benefits are provided for HIV screening with the appropriate Food and Drug Administration (FDA) approved laboratory tests and point of care (HIV rapid screening tests) for Medicare Choices enrollees who meet one of the following indications:

1. A maximum of one, annual, voluntary screening for all adolescents and adults between the age of 15 and 65, without regard to perceived risk (excludes pregnant enrollees addressed below).

2. A maximum of one annual voluntary HIV screening for adolescents younger than 15 and adults older than 65, who are at increased risk for HIV infection as defined below (excludes pregnant enrollees addressed below):

- Men who have sex with men
- Men and women having unprotected vaginal or anal intercourse
- Past or present injection drug users
- Men and women who exchange sex for money or drugs, or have sex partners who do
- Individuals whose past or present sex partners were HIV-infected, bisexual, or injection drug users
- Persons who have acquired or request testing for other sexually transmitted infectious diseases
- Persons with a history of blood transfusion between 1978 and 1985
- Persons who request an HIV test despite reporting no individual risk factors, since this group is likely to include

individuals not willing to disclose high-risk behaviors

- Persons with new sexual partners
- Persons who, based on individualized physician interview and examination, are deemed to be at increased risk for HIV infection

3. A maximum of three, voluntary, HIV screenings of pregnant enrollees:

- When the diagnosis of pregnancy is known; and
- During the third trimester; and

At labor, if ordered by the enrollee's physician.

4. For individuals being assessed for or using PrEP to prevent HIV, CMS covers all the following as an additional preventive service:

a) Up to eight individual counseling visits every 12 months, that include HIV risk assessment (initial or continued assessment of risk), HIV risk reduction, and medication adherence. Counseling must be furnished by a physician or other health care practitioner. Individuals must be competent and alert at the time that counseling is provided.

b) Up to eight HIV screening tests every 12 months.

c) A single screening for hepatitis B virus (HBV).

These screening tests are covered when the appropriate FDA-approved laboratory tests and point of care tests are used consistent with FDA-approved labeling and in compliance with the Clinical Laboratory Improvement Amendments of 1988 (CLIA) regulations.

SELECT PLAN/HARP: Subject to all terms and conditions noted above in the policy to include the following specifics:

- Benefits are provided for HIV screening with laboratory tests and point of care (HIV rapid screening) testing.
- Select Plan enrollees may obtain family planning and HIV testing and counseling services, including rapid HIV testing (86701), when part of a family planning visit from any provider in the CDPHP Select Plan network or from any provider that accepts Medicaid. No referral from the PCP nor authorization is required to access such services.
- HIV testing and counseling that are not part of a family planning visit are covered by Select Plan when services are

arranged by the enrollee's PCP or are obtained at an anonymous HIV testing and counseling site.

- HIV treatment after testing and counseling is covered by Select Plan when services are arranged by the enrollee's PCP and rendered by a Select Plan participating provider.

DESCRIPTION

Home and Community Based Services (HCBS) are designed to allow children and youth to participate in developmentally and culturally appropriate services. HCBS are intended to offer support and services to children/youth in non-institutionalized settings that enable them to remain at home and in the community or for children/youth being discharge from an institutional setting who require these services to safely return to their home and community. HCBS are available to Medicaid youth who meet criteria under HCBS/Level of Care Eligibility Determination, which includes those with physical health, developmental disability, and/or mental health diagnoses with related significant needs.

HCBS includes the following services:

Note: *Reference to family is broadly defined, and includes families created through birth, foster care, adoption, or self-created unit.*

Note: *While Adaptive and Assistive Equipment and Environmental and Vehicle Modifications are included in the array of HCBS services available to waiver enrolled members, the Centers of Medicare and Medicaid approved a Children's Waiver Amendment on 3/1/24 to implement Financial Management Services over these projects. Children's Health Home of Upstate New York (CHUNNY, LLC) will serve as the FMS for*

Capital District Physicians' Health Plan, Inc.
CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: HOME AND COMMUNITY BASED SERVICES FOR CHILDREN

New York State and will review and provide oversight of all EMod, VMod, and AAT project funding requests for children/youth enrolled in the Children's Waiver. This transition for children enrolled in Medicaid Managed Care occurred on 7/1/24.

***Note:** Review and oversight of all EMod, VMod, and AAT project funding requests for Child Health Plus members enrolled in the Children's Waiver will be the responsibility of CDPHP, as these services are not managed under FMS through CHHUNY.*

Adaptive and Assistive Equipment
This service provides technological aids and devices identified within the child's Plan of Care (POC) which enable him/her to accomplish daily living tasks that are necessary to support the health, welfare, and safety of the child.

***Note:** Service dogs have been removed as a service option under Adaptive and Assistive Technology.*

Caregiver/Family Advocacy and Support Services Caregiver/Family Advocacy and Support Services enhance the child's ability, regardless of disability, to function as part of a caregiver/family unit and enhance the caregiver/family's ability to care for the child in the home and/or community as well as, provides the child, family, caregivers, and collateral contacts with techniques and information not generally available so that they can better respond to the needs of the child/youth.

***Note:** This service is not the same as the Medicaid Children and Family Treatment and SupportService (CFTSS) of Family Peer Support Services, which are delivered by a certified Family Peer with lived experience.*

Community Habilitation
Community Habilitation covers face-to-face services and supports related to the child's acquisition, maintenance, and enhancement of skills necessary to perform Activities of Daily Living (ADLs), Instrumental Activities of Daily Living (IADLs), and/or Health Related Tasks delivered in the community (non-certified) settings.

Acquisition, maintenance and enhancement are defined as:

- Acquisition is described as the service available to a child who is seeking greater independence by learning to perform the task for him or herself. There should be a reasonable expectation that the individual will acquire the skills necessary to perform that task within the authorization period.
- Maintenance is described as the service available to prevent or slow regression in the child's skill level and to prevent loss of skills necessary to accomplish the identified task.
- Enhancement activities are provided to the child through training and demonstration to promote growth and independence with an already acquired skill level and to support the child's goal outside of the training environment.

Capital District Physicians' Health Plan, Inc.
CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: HOME AND COMMUNITY BASED SERVICES FOR CHILDREN

Day Habilitation
Assistance with acquisition, retention or improvement in self-help, socialization and adaptive skills including communication, and travel that regularly takes place in a non-residential setting, separate from the person's private residence or other residential arrangement. Activities and environments are designed to foster the acquisition of skills, appropriate behavior, greater independence, community inclusion, relationship building, self-advocacy and informed choice. Day Habilitation services must be provided to a child at an OPWDD certified setting typically between the daytime hours of 9 a.m.-3 p.m.

***Note: Day** Habilitation was discontinued effective 1/1/26. Participants in need of strengthening skills related to ADLs/IADLs should receive these supports through Community Habilitation, which addresses the same needs, however, does not have the added restriction to be delivered at an OPWDD certified site.*

Environmental Modifications
Provides internal and external physical adaptations to the primary residence of the enrolled child which, per the child's plan of care (POC), are identified as necessary to support the health, welfare, and safety of the child or that enable the child to function with greater independence in the home and without which the child would require an institutional and/or more restrictive living setting.

Non-Medical Transportation
Transportation to access authorized HCBS and destinations that are related to a goal included on the child/youth's plan of care.

Palliative Care
Specialized medical care focused on providing relief from the symptoms and stress of a chronic condition or life-threatening illness. Goal is to improve quality of life for both the patient and the family. Palliative care is provided by a specially trained team of doctors, nurses, social workers, and other specialists who work together with a child's doctors to provide an extra layer of support. It is appropriate at any stage of a chronic condition or life-threatening illness and can be provided along with curative treatment.

Children must meet Level of Care functional criteria and suffer from the symptoms and stress of chronic medical conditions OR illnesses that put individuals at risk for death before age 21. The Health Home Care Manager or C-YES will assist the family to obtain a doctor's written order including justification for Expressive Therapy from a Physician, Physician Assistant, Nurse Practitioner, Occupational Therapist, Physical Therapist or Psychiatrist, to be included with the child's Plan of Care and made available to the Managed care plan as needed.

Types of activities include:
- Pain and Symptom Management – relief and/or control of suffering related to illness or condition and is an important part of aiding in providing relief from pain and symptoms and/or controlling pain, symptoms, and side effects related to chronic conditions or life-threatening illness a child is enduring.

Capital District Physicians' Health Plan, Inc.
CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: HOME AND COMMUNITY BASED SERVICES FOR CHILDREN

- Counseling and Support Services (provided by HCBS providers) – help for children and their families to cope with the child's chronic medical, physical, or developmental condition or life-threatening illness and with grief/loss related to the child's passing. This service can also include Bereavement Counseling Services provided by Health Homes.
- Massage Therapy – provided to improve muscle tone, circulation, range of motion and address physical symptoms related to illness as well as provide physical and emotional comfort, pain management, and restore the idea of healthy touch for children and youth who are dealing with treatments that may involve painful interventions and ongoing and/or past trauma.
- Expressive Therapy (art, music and play) – assist child/youth to better understand and express his/her reaction through creative and kinesthetic treatment.

Prevocational Services
Designed to prepare youth (age 14 or older) to engage in paid work, volunteer work, or career exploration. Prevocational Services are not job-specific but rather are geared toward facilitating success in any work environment for youth whose disabilities do not permit them access to other prevocational services. The service will be reflected in youth's plan of care and must be directed to teaching skills rather than explicit employment objectives. In addition, PrevocationalServices assist with facilitating appropriate work habits, acceptable job behaviors, and learningjob production requirements.

Respite
Short-term assistance provided to children/youth, regardless of disability (developmental, physical and/or behavioral), because of the absence of or need for relief of the child or the child's family/caregiver. Such services can be provided in a planned mode or delivered in a crisis situation. Respite workers supervise the child/youth and engage the child/youth in activities that support his/her and/ or primary caregiver/family's constructive interests and abilities. Respite providers offer services with a level of expertise in understanding and implementing behavioral/developmental interventions required to support optimal functioning for children/youth.

Respite providers will regularly communicate the details of the child/youth's intervention plan so that there is a carryover of skill from the respite source to the caregivers and treatment providers.

Supported Employment
Designed to prepare youth with disabilities (age 14 or older) to engage in paid work. Supported Employment services provide assistance to participants with disabilities as they perform in a work setting.

Supported Employment provides ongoing supports to participants who, because of their disabilities, need intensive on-going support to obtain and maintain an individual job in competitive or customized employment, or self-employment, in an integrated work setting in the general workforce for which an individual is compensated at or above the minimum wage, but not less than the customary wage and level of benefits paid by the employer for the same or

similar work performed by individuals without disabilities. The outcome of this service is sustained paid employment at or above the minimum wage in an integrated setting in the general workforce, in a job that meets personal and career goals.

Supported Employment services are individualized and may include any combination of the following services: vocational/job-related discovery or assessment, person-centered employment planning, job placement, job development, negotiation with prospective employers, job analysis, job carving, training and systematic instruction, job coaching, benefits support, training and planning, transportation, career advancement services, and other workplace support services including services not specifically related to job skill training that enable the participant to successfully integrate into the job setting.

Supported Employment services may also include services and supports that assist the participant in achieving self-employment through the operation of a business including home-based self-employment. However, Medicaid funds are not used to defray the expenses associated with starting up or operating a business.

In addition to the need for an appropriate job match that meets the individual's skills and interests, individuals may also need long-term employment support to successfully maintain a job due to the ongoing nature of the HCBS participant's support needs, changes in life situations, or evolving and changing job responsibilities.

Vehicle Modifications
Provides physical adaptations to the primary vehicle of the enrolled child which, per the child's plan of care (POC), are identified as necessary to support the health, welfare, and safety of the child or that enable the child to function with greater independence.

The following HSBS services were added under a 4/1/26 1915(c) Children's Waiver Amendment:

Transitional Care Coordination

Transitional Care Coordination is designed to address barriers to discharge from institutional care and support safe, timely transitions to home and community settings. The service promotes continuity of care by supporting coordination across settings, timely communication among providers, and connect to appropriate follow-up services for children and families. TCC provides coordination of needed services and support to families during the transition period to maintain stability after discharge.

Transitional Care Coordination is for children and youth who:

- Are in an institutional level of care, e.g., hospital, inpatient, nursing home setting for at least one year
    - Children ages 1 up to 21 years **OR**

Capital District Physicians' Health Plan, Inc.
CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: HOME AND COMMUNITY BASED SERVICES FOR CHILDREN

- Infants 12 weeks under 1 year of age

- Can be medically cleared within 6 months, but the following condition(s) apply:
  - Non-medical barriers to discharge are present
  - Safety and/or continued care concerns exist

Eligible individuals are those who can be safely discharged from an acute or institutional setting within six (6) months of eligibility determination, with the support of transition care coordination.

Transitional Care Coordination Services can be provided up to 180 days prior to discharge from an acute or institutional setting and up to 60 days post-discharge. Transitional Care Coordinators are matched to specific institutions and determination of whether a child/youth would benefit from these services will be determined through a collaborative process between the TCC provider and the institution. The Transitional Care Coordinator will identify non-medical barriers to discharge and will develop the Transitional Service Plan which address barriers to discharge, a plan to address them, and the supports/services needed to transition to the community. The coordinator will also facilitate referral to DOH C-YES to determine HCBS eligibility, discuss Health Home options, and complete Freedom of Choice.

Service components include, but are not limited to the following:

- Communication with the participant/family, members of the treatment team. Identified support agencies, and community service providers
- Parent/caregiver and informal/formal supports. education/training regarding the participant's needs and condition to support entry/re-entry to home/community
- Identification and connection to needed community health services/resources
- Connection to needed care, services, equipment
- Facilitation of HCBS Transitional Service Requests
- Housing connection, support, and access
- Changes to the environment and submission of Environmental Modification requests
- Arrangements for medical equipment, medication, community specialists, doctors, therapies, and transportation
- Connection to caregiver supports and resources

TCC is carved out of Medicaid Managed Care and only billed Fee for Service

Transitional Services

Transitional Services are intended to assist a waiver participant in transitioning from a nursing home or institutional setting to living in the community. These services provide funds that can be utilized to help address the barriers preventing children/youth from returning home from an institutional setting. Transitional Care Coordinators will utilize Transitional Services to provide coordination of needed services and support to families during the transition period to maintain stability after discharge. Services include funding for various items, including, but not limited to the

following: the cost of moving furniture and other belongings; purchasing essential home furnishings; health and safety assurances, pest removal, allergen control, etc.

Transitional Services are administered by the Financial Management Service (FMS) and will be carved out of Managed Care and will be billed FFS for all participants.

RELATED POLICIES/DOCUMENTS

N/A

POSITION STATEMENT

CDPHP does not provide coverage for children home and community-based services identified above except for Select Plan members under 21, who have met HCBS/Level of Care Eligibility Determination criteria as determined by the Health Home, Children and Youth Evaluation Service (C-YES), or Developmental Disabilities Regional Office (DDRO), as described below.

Please note: Home and Community Based Services (HCBS) may be available to Child Health Plus members who do not qualify for Medicaid due to immigration or income status.

POLICY CONSIDERATIONS

FOR SELECT PLAN & CHILD HEALTH PLUS ONLY

Note: According to CMS, settings that do not meet the definition of being home and community based are:

- *A nursing facility;*
- *An institution for mental disease;*
- *An intermediate care facility for individuals with developmental disabilities;*
- *A hospital;*
- *OMH Licensed Congregate Treatment Sites (Community Residences);*
- *DOH Adult Homes; or*
- *Any other location that has qualities of an institutional setting.*

Home and Community Based Services (HCBS) are available for Select Plan and Child Health Plus (CHP) enrollees under 21 years of age when the eligibility assessment completed by the Health Home or C-YES, identifies eligibilityfor HCBS. Plans of Care and approval of HCBS shall be in accordance with the CMS final rule and any applicable state guidance.

Through a person-centered planning process, the Health Home Care Manager (HHCM), or

Capital District Physicians' Health Plan, Inc.
CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: HOME AND COMMUNITY BASED SERVICES FOR CHILDREN

Qualified Individual Identified by the State (QIIS) when enrollee elects not to enroll in a Health Home, develop and maintain a comprehensive plan of care (POC) inclusive of the enrollee and family's goals. If an enrollee elects not to participate in Health Home Care Management, the QIIS will be the MMCP in collaboration with OMH (for the SED Population) or DOH (for the Medically Fragile or Developmental Disability Populations). The MMCP will be responsible for monitoring and updating the Plan of Care and Coordinating HCBS care for participants. OMH/DOH will develop the initial Plan of Care, make referrals to HCBS providers for HCBS services, and be responsible for completing the annual HCBS eligibility determination.

This person-centered planning process includes convening a multi-disciplinary team meeting, completing a comprehensive assessment to determine services needed beyond HCBS (e.g., health, behavioral health, specialty services, other community and social supports, etc.), and the CANS-NY.

Throughout the person-centered planning process, the HHCM/ QIIS will update the POC. In addition to HCBS, the POC includes preventative services (e.g., annual physicals) and health education/promotion services. Enrollee/family's preferences (enrollee/family is not required to identify specific procedure code or provider to request service) and the presence of functional impairment is enough to support need.

CDPHP reviews the submitted POC, including the enrollee/family's identified goals, for clinical appropriateness of care based in the enrollee's current condition, effectiveness of previous treatment, environmental and family supports, and desired outcomes. In addition, the enrollee's CDPHP file is reviewed to identify eligibility, duplication of services, enrollee suitability for service(s) based on information that may not have been available to HHCM, evidence ofenrollee readiness, and regulatory requirements/criteria identified for the requested HCBS. CDPHP works with HHCM/QIIS.

CDPHP will conduct a quality review of the child/youth's POC, the HCBS service plan, as well as the Children's HCBS Authorization Form. When review is complete, CDPHP will notify Health Home, HCBS provider, and/or child/family of completed quality review and discuss any questions and/or provide feedback. CDPHP Care Managers will review the above referenced documents to ensure completion and assessment of frequency, scope, and duration, as well as assess the appropriateness of the anticipated utilization. Once youth begin to utilize services, CDPHP Care Managers will review utilization to ensure it aligns with the levels outlined on the HCBS Authorization Form and Plan of Care. See CDPHP Children HCBS Quality Review Process Guide for additional information.

Throughout the HCBS review process, the HHCM/QIIS continues to update the POC, as appropriate. If additional HCBS needs are identified during the process, an updated POC is submitted to CDPHP.

The completed POC is submitted to CDPHP for review within 90 days of completing theeligibility assessment. The POC is reviewed for compliance with CMS requirements.

Capital District Physicians' Health Plan, Inc.
CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: HOME AND COMMUNITY BASED SERVICES FOR CHILDREN

The final POC is shared with CDPHP case management and behavioral health teams who work collaboratively with the HHCM to monitor approved services, verifying approved are rendered appropriately with regard to the frequency, scope, and duration.

The HHCM/QIIS (OMH for SED eligibility and DOH for medically fragile eligibility) conducts eligibility re-assessment of HCBS needs on an annual basis, or after asignificant change in condition.

Continued service provision is provided when enrollee makes measurable progress toward goals, or there is evidence that the service plan has been modified to address the barriers in treatment progression, or continuation of services is necessary to maintain progress already achieved and/or prevent deterioration. Ongoing services can be outlined for quality review by submitting an updated Plan of Care (POC) and/or HCBS service plan to CDPHP.

Plan of care meetings involving the enrollee, Health Home/QIIS, and HCBS provider(s) are conducted, at a location, date and time convenient to the enrollee and the enrollee's chosen participants, to evaluate the plan of care and identify possible updates to the current plan of care. Enrollee specific requests made during these meetings, as well as requests agreed to by the team, are submitted to CDPHP for quality review.

See Department of Health Children Home and Community Based Services Workflow for an outline in roles and responsibilities and steps through the POC and HCBS process.

See NYS Children's Health and Behavioral Health Medicaid System Transformation: Children's Home and Community Based Services Manual for a complete outline of HCBS Service Components, Modality, Setting, Limitations/Exclusions, Certification/Provider Qualifications, Training Requirements, and Billing Details. CDPHP follows and complies with all guidance outlined in this document, as well as any other applicable NYS document outlining Children's HCBS.

POLICY NAME: HOME CARE SERVICES: HOME HEALTH CARE/TELE-HOMECARE/PERSONAL CARE/PERSONAL EMERGENCY RESPONSE SYSTEM

POLICY EFFECTIVE DATE:	9/1/2025
Policy Control #:	1370/20.000048
Next Annual Review:	July, 2027

DISCLAIMER

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgement when deciding the most appropriate care to enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

PROCEDURE CODES

Refer to the Policy Considerations section below for procedure codes relating to specific home health care services.

DESCRIPTIONS

Home health care is an extension of hospital care afforded patients as an alternative to hospitalization or treatment in a skilled nursing facility (SNF).

Tele-homecare is technology utilized in the home by means of an audio/video/digital telecommunication system to transmit clinical information to a skilled home care agency for the management of chronic conditions. It is used as an alternative to office-based or emergency room monitoring.

Personal care services (PCS) are services that provide assistance with activities of daily living (e.g., housekeeping, meal preparation, personal hygiene) for individuals who require such support services based on a medical need.

Personal emergency response system (PERS) is the provision and maintenance of electronic communication equipment in the home of certain high-risk individuals to secure help in the event of a physical, emotional, or environmental emergency.

POLICY NAME: HOME CARE SERVICES: HOME HEALTH CARE/TELE-HOMECARE/PERSONAL CARE/PERSONAL EMERGENCY RESPONSE SYSTEM

RELATED POLICIES/DOCUMENTS

Payment Policy:

Telehealth/Telemedicine Services, 1550/20.000221

POSITION STATEMENT

CDPHP administers benefits for home health care and/or tele-homecare when all the conditions listed below are met.

Home Health Care

- Services are ordered by a practitioner.
- Services are in lieu of a hospitalization or placement in a SNF.
- Services are provided by a licensed or certified home health agency.
- The services are required on a part-time or intermittent basis, as defined in the Medicare Benefit Policy Manual published by the Centers for Medicare & Medicaid Services (CMS).
- Services are skilled in nature.
- Services are provided by or under the supervision of a registered nurse or qualified therapist.
- Services consist primarily of caring for the patient.
- Services are considered by CDPHP to be specific, effective, and reasonable for the treatment of the patient's diagnosis and physical condition, and the most cost-effective approach to care.

In addition, CDPHP, at the network provider's request, will provide a woman a minimum of one prenatal or postnatal home health care nurse (99500, 99501) visit when the woman may derive medical or psychosocial benefits from such visits. The visit shall identify familial and environmental factors that may produce increased risk to the woman or fetus and the relevant finding shall be incorporated into the care plan.

A minimum of one home health care visit is covered for all patients who participate in early discharge from maternity care. Requests for such service may occur any time within 48 hours of the time of delivery (96 hours for caesarean section delivery) and be provided within 24 hours after discharge from the hospital or of the time of the request, whichever is later. The request for service may come from either the patient or physician. This visit is not subject to an enrollee cost-share.

Each visit by a member of the Home Health Agency is considered one (1) visit. Each visit of up to four (4) hours by a home health aide is considered one (1) visit. Any Rehabilitation or Habilitation Services received under this benefit will not reduce the amount of services available

POLICY NAME: HOME CARE SERVICES: HOME HEALTH CARE/TELE-HOMECARE/PERSONAL CARE/PERSONAL EMERGENCY RESPONSE SYSTEM

under the Rehabilitation or Habilitation Services benefits.

Home health care services may include:

- Nursing care by or under the supervision of a registered nurse.
- Physical, occupational, or speech therapy services provided by or under the supervision of a qualified therapist.
- Home health aide services that are an adjunct to a skilled service.
- Medical supplies, drugs, and medications provided by the home health agency, and prescribed by an authorized provider.
- Laboratory services by or on behalf of the home health agency.
- Home infusion therapy.

A certified doula to help manage your pregnancy, prenatal, and postnatal care may be available. (Refer to specific member contracts for benefits, if any, relating to doula services)

Tele-Homecare

CDPHP administers benefits for tele-homecare services for enrollees who have a primary or secondary diagnosis of congestive heart failure (CHF), chronic obstructive pulmonary disease (COPD), diabetes, or coronary artery disease (CAD) when **all** the following criteria is met:

- Documentation member has had two or more inpatient hospitalizations or emergency room visits in the past 12 months.
- Services are ordered by a practitioner who agrees to review the generated data and respond in a timely fashion to the home health agency (e.g., change in orders).
- Services are provided by a home health agency.
- Services are required on a part-time intermittent basis for up to six weeks and are provided seven days per week.
- Services are provided by or under the supervision of a registered nurse.
- Services are considered by CDPHP to be specific, effective, and reasonable for the treatment of the patient's diagnosis and physical condition, and the most cost-effective approach to care.

Tele-homecare services may include monitoring and reporting of the following measurements:

- Blood pressure readings
- Blood glucose levels
- Daily weights

- Vital signs

POLICY CONSIDERATIONS

Claims for the following home health care services are to be submitted utilizing the following codes:

- Home Health Aide: S5125, S5126, S9122, T1021, G0156
- Home Infusion services: 99601, 99602
- Licensed Practical Nurse (LPN): S9124, T1003, T1031, G0300, G0494, G0496
- Medical Social Services: S9127, G0155
- Nutritional Counseling: S9470, G0270
- Occupational Therapist: S9129, G0152
- Other Home Health Services/Procedures: 99500, 99501, 99502, 99503, 99504, 99505, 99506, 99507, 99511, 99512, 99600
- Physical Therapist: S9131, G0151
- Private Duty Nursing: T1000
- Registered Nurse (RN): S9123, T1002, T1030, G0162, G0299, G0493, G0495
- Respiratory Therapy: G0237, G0238
- Speech Therapist: S9128, G0153
- Tele-homecare: S9110, T1014, G0320, G0321, G0322

Services must relate directly and specifically to an active/written treatment plan, which has been approved by the ordering physician.

Services noted will be provided to the extent that such items would have been covered under the contract if the enrollee had been hospitalized or confined in an SNF.

Benefit coverage, for up to a maximum of six visits, will be provided for the establishment of an effective therapy (e.g., physical therapy, G0159, occupational therapy, G0160, and speech therapy, G0161) maintenance program in the home setting. However, no coverage will be provided for the continuation of maintenance programs (maintenance begins when the therapeutic goals of a treatment plan have been achieved and when no further functional progress is apparent or expected to occur).

In determining the appropriateness of tele-homecare, CDPHP expects consideration be given to the complexity of the enrollee's medical condition and the probability that a hospitalization or emergency room visit would occur in the absence of tele-homecare services.

To determine whether a service requires the skill of a nurse, consideration must be given to both the complexity of the service and the condition of the patient.

POLICY NAME: HOME CARE SERVICES: HOME HEALTH CARE/TELE-HOMECARE/PERSONAL CARE/PERSONAL EMERGENCY RESPONSE SYSTEM

Tele-homecare services may be initiated in conjunction with skilled nursing care.

Supplies rendered in conjunction with covered home care services are reimbursed based upon the provider agreement contracted rate.

Laboratory testing must be processed at a lab.

EXCLUSIONS

Custodial care (99509) or rest cures and services rendered for the convenience of an enrollee or provider. Care is considered custodial when it is primarily for the purpose of helping the member with daily living or meeting personal needs and could be provided safely and reasonably by people without professional skills or training. For example, custodial care includes help with walking, getting in and out of bed, bathing, dressing, and eating.

Personal care services/consumer directed personal assistance, personal emergency response systems, private duty nursing, and UAS assessment/plan of care development services are excluded for all products other than Select Plan/HARP.

CDPHP PRODUCT VARIATIONS

CHILD HEALTH PLUS	Subject to all terms and conditions noted above in the policy to include the following: • Services must be provided by a certified participating home health agency (CHHA).
MEDICARE ADVANTAGE:	Subject to all terms and conditions noted above in the policy to include the following: • Services must be provided by a Medicare participating home health care agency. • Individuals must be confined to the home as defined by Medicare. The following required criteria must be met: **Criterion One** • Enrollee must either, because of illness or injury, need the aid of supportive devices such as crutches, canes, wheelchairs, and walkers; the use of special transportation; or the assistance

	of another person in order to leave their place of residence; **OR** • Have a condition such that leaving their home is medically contraindicated. If the patient meets one of the criterion above, then the following two additional requirements defined in criterion two must be met as well: **<u>Criterion Two:</u>** • There must exist a normal inability to leave home; **AND** • Leaving the home requires a considerable and taxing effort. *Note: If the enrollee does in fact leave the home, the enrollee may be considered homebound if the absences from the home are infrequent or for periods of relatively short duration, or are attributable to the need to receive health care treatment to include, but not limited to: • Attendance at adult day centers to receive medical care; • Ongoing receipt of outpatient kidney dialysis; • The receipt of outpatient chemotherapy or radiation therapy. In accordance with guidelines from the Centers for Medicare & Medicaid (CMS), an enrollee or their designee must receive a Notice of Medicare Non-Coverage (NOMNC) no later than two days prior to termination of services. Participating agencies will provide the CDPHP NOMNC to enrollees, which includes completion of valid delivery, faxing of copy to CDPHP, and maintaining a copy in the enrollee's medical record upon completion of services.
SELECT PLAN/HARP:	Billing codes for Medicaid programs: • Personal Care Aide Level I (Homemaker/Housekeeper): S5130 (Note: Effective 9/1/25, Personal Care Aide Level I services are only billable for members granted Legacy Status, and who are therefore not subject to new Minimum Needs requirements upon reassessment. See below for additional information on the 9/1/25 Minimum Needs update) • Personal Care Aide Level II: T1019, T1020 • Consumer Directed Personal Assistant: T1019, T1020

	• Personal emergency response system: S5160, S5161 • Uniform Assessment System (UAS-NY): Service Assessment/Plan of Care Development: T2024 (Billed to Medicaid fee-for-service) • T1001: RN Supervisory Visit In accordance with New York State Public Health Law, providers must bill the universal billing codes with respective modifiers, if any, when submitting claims for payment of home care or personal care services. Subject to all terms and conditions noted above in the policy to include the following: • Home health services must be provided by a certified home health agency (CHHA), or if no CHHA available, a registered professional nurse or licensed practical nurse under the direction of the primary care physician. • Home visits for pregnant women and home visits beyond the initial visit for postpartum women are covered as medically necessary. • At least two visits to high-risk infants (newborns). • Perinatal care visits need not be in lieu of a hospitalization or placement in a SNF. • Prior authorization is required for Private Duty Nursing (PDN), Personal Care Services (PCS), Consumer Directed Personal Assistance (CDPA) & Personal Emergency Response System (PERS) as outlined below. CDPHP utilizes the New York State Medicaid Management Information System (MMIS) Home Health Manual Policy Guidelines for guidance: https://www.emedny.org/ProviderManuals/HomeHealth/index.aspx **Private Duty Nursing** Private duty nursing services, rendered by a registered professional nurse or licensed practical nurse, are covered only when determined by the attending physician to be medically necessary and prior authorized by CDPHP. Approved services are provided through a licensed home care agency or private practitioner and can be

	performed in and out of the home setting depending on the enrollee's normal life activities (e.g., for a child, full time private duty nursing would be covered in a school, an approved pre-school (both of these settings are covered by the school district of the member's residence) or a natural environment, including home and community settings). CDPHP utilizes the New York State Medicaid Management Information System (MMIS) Private Duty Nursing Manual Policy Guidelines for guidance: https://www.emedny.org/ProviderManuals/NursingServices/index.aspx **Home Telehealth Services** Benefits are provided for home telehealth services when provided by agencies approved by NYS Department of Health for enrollees who have conditions or clinical circumstances requiring frequent monitoring and when the provision of telehealth services can appropriately reduce the need for on-site or in-office visits or acute or long-term care facility admission. **Personal Care Services (PCS)/Consumer Directed Personal Assistance Program (CDPAP)** Personal care services are provided to enrollees who need additional assistance with activities of daily living (e.g., housekeeping, meal preparation, personal hygiene) to live independently at home due to the presence of a medical condition. Consumer-directed personal assistance is similar to personal care except the care is rendered by a family member or caregiver of choice, rather than a home health agency. Effective 9/1/25, members will be required to meet Minimum Needs Requirements at initial assessment and upon subsequent reassessments in order to qualify for PCS and CDPAP services. These Minimum Needs Requirements are: • Member is assessed as needing at least limited assistance with physical maneuvering with **more than two** ADL's, OR • Member has a Dementia or Alzheimer's diagnosis, and is assessed as needing at least supervision with **more than one** ADL

	○ Members with a Dementia or Alzheimer's diagnosis must provide proof of a diagnosis during the assessment process. The Alzheimer's Disease or Dementia form (DOH-5821) must be completed by the licensed health care professionals listed on the form, however, the diagnosis must be made by a physician (MD or DO) with the knowledge and expertise to confirm a diagnosis of Dementia or Alzheimer's. ○ A copy of the DOH-5821 form must be retained in the member's file. The plan must also document the date of the documentation of diagnosis in the individual's case notes and the UAS-NY "Section H: Disease Diagnoses" Prior to 9/1/25, PCS and CDPAP services were provided on two different levels depending on the needs and requirements of the individual (see outline of Level I and Level II services below). Due to the 9/1/25 Minimum Needs regulation updates, Level I will not be available on their own, and can only be received and authorized along with Level II services. • Level I are environmental and nutritional support services necessary to maintain the individual in the home when no family member or other persons are available or able to assist. Examples of such services include assistance with preparing and serving meals, making and changing beds, cleaning the kitchen, caring for laundry, and shopping for essential supplies. Benefits for level 1 (housekeeping only) services are limited to eight hours per week. • Level II includes basic personal care services, such as bathing, grooming, toileting, ambulation, turning and positioning, and assistance with taking physician-prescribed medication, in addition to household tasks. **PCS and CDPAP Legacy Status** All individuals seeking an initial assessment and authorization for PCS or CDPAS beginning on 9/1/25 must meet the Minimum Needs requirements outlined above, which will also apply to all subsequent reassessments. Both the initial assessments and reassessments to follow the information outlined below, as well as the requirements outlined above related to the Minimum Needs requirements. Individuals authorized for PCS or CDPAS before 9/1/25 will be granted

Legacy Status and will not be subject to the new Minimum Needs requirements upon subsequent reassessments.

Authorization Process

Initial assessments for adult members 18 years or older

The New York Independent Assessor – NYIA - conducts all initial assessments for adult members 18 years or older seeking PCS and/or CDPAS services.

NYIA will complete the Community Health Assessment (CHA) in UAS-NY.

The NYIA includes an Independent Practitioner Panel (IPP) to conduct the exam. During the Clinical Appointment, an IPP clinician will: review the CHA, examine the member (either in person or through a telehealth modality) and if necessary, consult with providers and others who may have insight into the member's needs; ensure that the current diagnoses and medications are documented accurately and thoroughly; attest to the member's need for assistance; indicate whether the member is self-directing, or has identified an appropriate self-directing other; indicate if the member can complete the consumer's roles and responsibilities (if they are authorized for and enroll in CDPAS); and determine if the member's medical condition is stable to receive PCS and/or CDPAS.

Once both the Initial Assessment and Clinical Appointment are completed, the member will receive a written notice from NYIA informing them of the outcome of the assessment and clinical exam.

CDPHP is responsible for developing a plan of care and authorizing services for the individual.

Reassessments for adults aged 18 and over, and initial assessments and reassessments for children aged 0-17

CDPHP conducts reassessments for adults aged 18 and over, and initial assessments and reassessment for children aged 0-17 (until further notice).

The following documentation is to be submitted for review as part of

	the initial authorization process. • A **signed physician order** certifying that the enrollee can be cared for at home. The signed order needs to identify current medical conditions, treatment regimens, medication regimen, and personal care assistance needed, and must be written within 30 calendar days of medical examination of the enrollee by the physician. Upon receipt of a completed physician order, CDPHP will arrange for a registered nurse to perform a home assessment (either in person or through a telehealth modality), which includes both nursing and social components. • A **social assessment** that documents the potential contribution of informal caregivers, such as family and friends, to the enrollee's care. • A **nursing assessment** that includes the following: a review and interpretation of the physician's order; an evaluation of the functions and tasks required by the patient and the degree of assistance required for each function and task; and the development of a plan of care recommending the appropriate amount, frequency, and duration of services. Once the process described above is complete, if documentation supports the recommended plan of care, authorization for personal care/consumer-directed personal assistance will be given. CDPHP utilizes the New York State Medicaid Management Information System (MMIS) Personal Home Care Manual Policy Guidelines for guidance: https://www.emedny.org/ProviderManuals/PersonalCare/index.aspx **Personal Emergency Response System (PERS)** A Personal Emergency Response Service (PERS) is the provision and maintenance of electronic communication equipment in the home of certain high-risk individuals to secure help in the event of a physical, emotional, or environmental emergency. A PERS has three components: a small radio transmitter, a console that is connected to a telephone, and an emergency response center that monitors the calls.

POLICY NAME: HOME CARE SERVICES: HOME HEALTH CARE/TELE-HOMECARE/PERSONAL CARE/PERSONAL EMERGENCY RESPONSE SYSTEM

	Personal Emergency Response Services are available under the following circumstances: • Only enrollees currently receiving personal care or consumer-directed personal care are eligible for personal emergency response services. • The process and procedures for the authorization of personal emergency response services are completed in accordance with and/or in coordination with the authorization process for personal care/consumer-directed personal assistance, as stated above. • Authorization for PERS services is based on a physician or nurse practitioner's order and a comprehensive assessment that must include an evaluation of the enrollee's physical disability status, the degree that they would be at risk of an emergency due to medical or functional impairments or disability and the degree of their social isolation. Qualifying for personal care services does not necessarily mean an enrollee automatically qualifies for PERS services. CDPHP utilizes the New York State Medicaid Management Information System (MMIS) Personal Emergency Response Services Manual Policy Guidelines for guidance: https://www.emedny.org/ProviderManuals/PERS/index.aspx **Recertification of Services** Requests for ongoing personal care services and/or personal emergency response services require recertification prior to the end date of the previous approved authorization period.

CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: HOME CARE SERVICES: HOME HEALTH CARE/TELE-HOMECARE/PERSONAL CARE/PERSONAL EMERGENCY RESPONSE SYSTEM

This section is intended to provide only highlights of the policy changes. The policy should always be reviewed in its entirety to ensure a comprehensive understanding of coverage.

Effective Date	Update
9/1/2025	Updated Select Plan PCS and CDPAP section to capture regulatory updates related to Minimum Needs Requirements.
8/1/2024* Effective date remains the same for this policy update	Under Home Care Section added information regarding doula services.
8/1/2024	Under Policy Considerations section added codes G0320, G0321 and G0322 to the tele-homecare section. Under Medicaid clarified information under Private Duty Nursing and Reassessments.
8/1/2023* *Effective date remains the same for this update	Clarified that T2024 should be billed to Medicaid FFS in the Select Plan/HARP section.
8/1/2023	Under Medicaid section: • Added that at least two home care visits are allowed to high-risk infants (newborns) • Removed the following services from the body of the policy and placed under the Medicaid section as these are services that are only covered under the Medicaid/HARP LOB: o Personal Care Aide Level I (Homemaker/Housekeeper): S5130 o Personal Care Aide Level II: T1019, T1020 o Consumer Directed Personal Assistant: T1019, T1020 o Personal emergency response system: S5160, S5161 o Uniform Assessment System (UAS-NY): Service Assessment/Plan of Care Development: T2024

	○ T1001: RN Supervisory Visit Removed home care limitations under CHP and Small/Individual as contracts are the source of truth for identifying contract limits.
5/16/2022	Updated PCS/CDPAP authorization process to reflect NYIA involvement in new authorizations for adult members 18 years or older in the Select Plan/HARP section. Updated Small Group/Individual section to remove information already addressed in the Position Statement.
8/1/2021	Clarified home care visit limit for small group & individual contracts. Removed the following statement as the services are no longer prior authorized: Requests for continuous home health care or tele-homecare services for a diagnosis not listed above or for continued services beyond six weeks will be reviewed on an individual case basis by a CDPHP medical director.

Medical Policy Title	**Home Non-Invasive Positive Pressure Ventilation (NIPPV) Devices for Respiratory Insufficiency and Failure**
Policy Number	**1.01.57**
Current Effective Date	**January 1, 2027**
Next Review Date	**June 2027**

Our medical policies are guides to evaluate technologies or services for medical necessity. Criteria are established through the assessment of evidence based, peer-reviewed scientific literature, and national professional guidelines. Federal and state law(s), regulatory mandates and the member's subscriber contract language are considered first in the determination of a covered service. (Link to Product Disclaimer)

POLICY STATEMENT(S)

Neuromuscular and Thoracic Disorders

I. Bilevel positive airway pressure (BPAP) device with (HCPCS: E0471) or without (HCPCS: E0470) a backup rate is considered **medically necessary** when an individual has a neuromuscular or thoracic restrictive disease diagnosis and meets **ANY** of the following criteria:

   A. Documented decrease in forced vital capacity (FVC) to less than 80% of predicted and symptomatic (e.g., dyspnea, orthopnea or fragmented sleep) **or** less than 50% of predicted without symptoms;

   B. Maximal inspiratory pressure (MIP) of < 60 cm H_2O;

   C. Oxygen desaturations ≤ 88% for at least five (5) cumulative minutes during sleep oximetry (minimum recording time of two (2) hours) while either breathing room air or prescribed FIO_2 as applicable; **or**

   D. Arterial blood gas (ABG) showing a $PaCO_2$ ≥ 45 mm Hg done while awake and breathing either room air or prescribed FIO_2 as applicable.

II. Non-invasive home mechanical ventilation (HCPCS: E0466) is considered **medically appropriate** when an individual has a neuromuscular or thoracic restrictive disease diagnosis and meets **ALL** of the following criteria:

   A. Meets criteria for a BPAP device (See Policy Statement I); **and**

   B. **One** of the following indications:

      1. Advanced BPAP with iVAPS (Intelligent Volume Assured Pressure Support) (HCPCS: E0471) does not meet the individual's respiratory needs due to **any** of the following:

         a. Need auto-expiratory positive airway pressure (EPAP);

         b. Concomitant obstructive sleep apnea (OSA);

         c. Bulbar dysfunction; **or**

         d. Concomitant chronic obstructive pulmonary disease (COPD);

2. Daytime dyspnea at rest;
3. Non-invasive ventilation is needed for greater than 10 hours per day;
4. Extreme loss in function with vital capacity less than 30%;
5. Worsening daytime hypercapnia with need for mouthpiece ventilation; **or**
6. Daytime use (battery operated unit) is required to reduce hypercapnia or dyspnea.

III. Dual (HCPCS: E0468) or multifunction (HCPCS: E0467) non-invasive home mechanical ventilators (ventilation, oxygen, cough, suction and nebulization [VOCSN, VOCSN VC, VOCSN VC Pro]) are considered **medically necessary** when **ALL** of the following are met:

A. Meets criteria for a home mechanical ventilator; **and**

B. There is documentation supporting the need for one or more functions on the device (i.e., oxygen concentrator, cough stimulator, suction pump, nebulizer) and they have not received any one of these devices individually.

Hypoventilation Syndrome

IV. BPAP without (HCPCS: E0470) a backup rate is considered **medically appropriate** for an individual with a hypoventilation syndrome diagnosis who meets **ALL** of the following criteria:

A. An initial ABG PaCO2 greater than or equal to 45 mm Hg done while awake and breathing the patient's prescribed FIO2;

B. Spirometry shows a forced expired volume in one (1) second (FEV1)/ FVC greater than or equal to 70%; **and**

C. **One** of the following:

1. An ABG PaCO2, done when the patient is asleep or has just woken up and is breathing their prescribed FIO2, shows that PaCO2 has worsened greater than or equal to 10 mm Hg compared to the original ABG; **or**
2. A facility-based Polysomnography (PSG) or home sleep test (HST) shows oxygen saturation less than or equal to 88% for greater than or equal to five (5) cumulative minutes of nocturnal recording time (minimum recording time of 2 hours) that is not caused by obstructive upper airway events.

V. BPAP with (HCPCS: E0471) a backup rate is considered **medically appropriate** for an individual with a hypoventilation syndrome diagnosis who meets **ALL** of the following criteria:

A. The individual is currently using a BPAP without backup;

B. Spirometry shows an FEV1/FVC greater than or equal to 70%; **and**

C. An ABG PaCO2, done while the patient is awake and breathing their prescribed FIO2, shows the patient's PaCO2 worsens to greater than or equal to 10 mm Hg compared to the ABG result done to qualify the patient for the E0470 device.

VI. Non-invasive home mechanical ventilations devices (HCPCS: E0466) are considered **medically appropriate** for an individual with a hypoventilation syndrome diagnosis who meets **ALL** of the following criteria:

A. Meets criteria for BPAP (see Policy Statement IV); **and**

B. **One** of the following indications:

1. Advanced BPAP with iVAPS (Intelligent volume assured pressure support) (HCPCS: E0471) does not meet the needs of the individuals and requires auto-EPAP;
2. Non-invasive ventilation is needed for greater than 10 hours per day;
3. Severe hypoxemia with an FIO_2 greater than 40% or greater than 5 L/min; **or**
4. BPAP was tried and failed (documentation of attempted daily use) with persistent hypercapnia with either of the following:
   a. Awake $PaCO_2 \geq 45$ mmHg; **or**
   b. Awake venous blood gas PCO_2, end-tidal PCO_2, or transcutaneous $PCO_2 \geq 50$ mmHg.

VII. Dual (HCPCS: E0468) or multifunction (HCPCS: E0467) non-invasive home mechanical ventilators (ventilation, oxygen, cough, suction and nebulization [VOCSN, VOCSN VC, VOCSN VC Pro]) are considered **medically necessary** for an individual when **BOTH** of the following are met:

A. Meets criteria for a home mechanical ventilator; **and**

B. There is documentation supporting the need for one or more functions on the device (i.e., oxygen concentrator, cough stimulator, suction pump, nebulizer) and they have not received any one of these devices individually.

<u>Chronic Respiratory Failure (CRF) Due to Chronic Obstructive Pulmonary Disease (COPD)</u>

VIII. BPAP without (HCPCS: E0470) backup rate is considered **medically appropriate** for an individual with CRF due to COPD who meets **ALL** of the following criteria:

A. The individual cannot tolerate high intensity NIV or back up rate is not needed;

B. The individual exhibits hypercapnia as demonstrated by PaCO2 ≥ 52 mmHg by ABG during awake hours while breathing his/her prescribed FiO2; **and**

C. Sleep apnea has been ruled out as the cause of hypercapnia.

IX. BPAP with (HCPCS: E0471) a backup rate is considered **medically appropriate** for an individual with CRF due to COPD who meets **ALL** of the following criteria:

A. Meets criteria for BPAP without a backup rate (E0470) (see Policy Statement VIII);

B. Oxygen saturations ≤ 88% for at least five (5) cumulative minutes during sleep oximetry (minimum recording time of two (2) hours) while receiving oxygen at 2 LPM or prescribed FIO2, whichever is higher; **and**

C. An ABG PaCO2, done while the individual is awake and breathing their prescribed FIO2, shows that the patient's PaCO2 worsens to greater than or equal to 10 mm Hg compared to the ABG result done to qualify the patient for the E0470 device.

X. Non-invasive home mechanical ventilation devices (HCPCS: E0466) are considered **medically appropriate** for an individual with CRF due to COPD who meets **ALL** of the following criteria:

A. Meets criteria for BPAP without a backup rate (E0470) (see Policy Statement VIII); **and**

B. **One** of the following:

1. Requires oxygen therapy at an FiO2 ≥ 36% or ≥ 4L nasally;
2. Requires ventilatory support for more than 8 hours per 24-hour period;
3. Requires the alarms and internal battery, because the patient is unable to effectively breathe on their own for more than a few hours and the unrecognized interruption of ventilatory support is likely to cause a life-threatening condition if the patient or caregiver cannot be otherwise alerted; **or**
4. Advanced BPAP with iVAPS (Intelligent volume assured pressure support) (HCPCS: E0471) does not meet the needs of the individuals and requires auto-EPAP based that the individual is unable to meet **one** of the following:
   a. Normalization (< 46 mm Hg) of PaCO2;
   b. Stabilization of a rising PaCO2;
   c. 20% reduction in PaCO2 from baseline value; **or**
   d. Improvement of at least one symptom associated with chronic hypercapnia (e.g., headache, fatigue, shortness of breath, confusion, or sleep quality).

XI. Dual (HCPCS: E0468) or multifunction (HCPCS: E0467) non-Invasive home mechanical ventilators (ventilation, oxygen, cough, suction and nebulization [VOCSN, VOCSN VC, VOCSN VC Pro]) are considered **medically necessary** when **BOTH** of the following criteria are met:

A. Meets criteria for a home mechanical ventilator; **and**

B. There is documentation supporting the need for one or more functions on the device (i.e., oxygen concentrator, cough stimulator, suction pump, nebulizer) and they have not received any one of these devices individually.

<u>Obstructive Sleep Apnea (OSA)</u>

XII. BPAP with (HCPCS: E0471) or without (HCPCS: E0470) back up rate is considered **medically appropriate** for an individual with OSA who meets **ALL** of the following indications:

A. Failed or cannot tolerate CPAP;

B. Demonstration of resolution or control of respiratory events with improved tolerance using BPAP at least two (2) weeks after an acute episode; **and**

C. The individual is stable on current treatment.

Sleep Apnea - Other

XIII. BPAP with (HCPCS: E0471) or without (HCPCS: E0470) a backup rate is considered **medically appropriate** for an individual with central sleep apnea (primary or secondary to medication or substance use, heart failure or medical condition), complex sleep apnea and treatment emergent sleep apnea who meet **ONE** of the following indications:

A. Central hypopnea/apnea > 50% of the total apnea hypopnea index rate;

B. Central hypopnea/apnea rate/index > 5 (five) events per hour;

C. Documentation supporting the effectiveness of BPAP therapy during PSG; **or**

D. Symptomatic patients with excessive sleepiness, disrupted sleep or significant desaturations despite optimized CPAP therapy.

Hospital Discharge

XIV. Hospital discharge with a home mechanical ventilator (HCPCS: E0466) or a BPAP with backup (HCPCS: E0471) rate for individuals with acute on chronic respiratory failure due to COPD and meet **BOTH** of the following indications:

A. The individual required a ventilator or a BPAP device within 24 hours prior to discharge; **and**

B. The individual is at risk of rapid symptom exacerbation or rise in PaCO2 after discharge.

Continuation of Use

XV. Continuation of use of an non-invasive home mechanical ventilation device for the diagnosis of COPD, OSA and hypoventilation syndrome are considered **medically appropriate** when compliance is demonstrated by using the device for 70% of the nights for four (4) or more hours per 24-hour period during a consecutive 30-day period.

Durable Medical Equipment (DME) Repair

XVI. Repair of a medically necessary home non-invasive positive pressure ventilation (NIPPV) devices or components not under warranty will be considered **medically appropriate** when the following criteria are met:

A. Physician documentation includes **ALL** the following:

1. Date of DME initiation;

2. Manufacturer warranty information, if applicable;

3. Attestation that the patient has been compliant with the use of the DME and will continue to benefit from the use of the DME;

B. The DME is no longer functioning adequately; and **BOTH** of the following criteria are met:

1. Inadequate function interferes with activities of daily living; and

2. Repair is expected to make the equipment fully functional (as defined by manufacturer).

XVII. Repair of equipment damaged due to patient neglect, theft, abuse, or when another available coverage source is an option (e.g., homeowners, rental, auto, liability insurance, etc.) is **ineligible for coverage**.

DME Replacement

XVIII. Replacement of a medically necessary home non-invasive positive pressure ventilation (NIPPV) devices or components not under warranty will be considered **medically appropriate** when **EITHER** of the following criteria are met:

A. The DME is no longer functioning adequately and has been determined to be non-repairable, or the cost of the repair is in excess of the replacement cost;

B. There is documentation that a change in the patient's condition makes the present unit non-functional and improvement is expected with a replacement unit.

XIX. The replacement of a properly functioning home non-invasive positive pressure ventilation (NIPPV) devices, its components or accessories is considered **not medically necessary**. This includes, but is not limited to, replacement desired due to advanced technology or to make the DME more aesthetically pleasing;

XX. The replacement of equipment damaged or lost due to patient neglect, theft, abuse, or when another available coverage source is an option (e.g., homeowners, rental, auto, liability insurance, etc.) is **ineligible for coverage**.

XXI. Accessories or components for home non-invasive positive pressure ventilation (NIPPV) devices that are considered not medically necessary or investigational by peer-reviewed literature will also be considered as **not medically necessary or investigational** by the Health Plan.

11.01.03 Experimental or Investigational Services

POLICY GUIDELINE(S)

I. Individuals who do not meet the criteria for continuation of coverage during the initial 90 day trial are eligible to re-qualify for a home ventilation devices, but must have a clinical re-evaluation by the treating physician to determine the etiology of the failure to respond to ventilation therapy (e.g., documentation of failure of symptoms to resolve or improper fit of device, and re-education of the individuals regarding proper use of the equipment or re-fitting of masks).

II. BPAP with expiratory relief are options for patients who cannot tolerate the high constant air pressure associated with CPAP but wish to continue treatment for OSA.

III. BPAP devices may or may not include a backup rate. BPAP devices with a backup rate are timed devices that supply breaths at a specific rate per minute. These devices will deliver a breath when the minimum number of breaths per minute has not been met by the user.

IV. Supplemental oxygen or humidification can be added to positive pressure devices to increase oxygen saturation and decrease vasomotor rhinitis.

V. Coverage is allowed for a one-month rental when the home ventilation device is malfunctioning and out of warranty, (and not associated with a manufacturer recall) while the device is being repaired.

VI. The monitoring feature/device, stand-alone or integrated, any type, including all accessories, components, and electronics, not otherwise classified (HCPCS: A9279) is considered inclusive to the positive airway pressure device.

VII. Devices used to clean or sanitize BPAP devices are considered a convenience item and are **ineligible for coverage** (e.g., SoClean, SoClean 2 Go).

DESCRIPTION

Bilevel Positive Airway Pressure (BPAP) (i.e. Simple BPAP)

BPAP is an airway support system, which provides two different levels of pressure delivered via a mask. There is a higher-pressure during inspiration and a lower pressure level during expiration. BPAP is an option for individuals who cannot tolerate the high constant air pressure associated with CPAP. BPAP devices with volume and/or pressure with a back-up rate feature are types of ventilators that can be used for many applications (as described below) but have not shown effectiveness for treating OSA. Bilevel positive pressure devices are used as respiratory assist devices for individuals with chronic respiratory failure in the following situations:

- At night for the management of chronic respiratory failure;
- For the long-term management of neuromuscular disorders with respiratory involvement;
- For patients with respiratory insufficiency due to severe kyphoscoliosis; or
- For the improvement of nighttime desaturation and hypoventilation in patients with chest-wall diseases.

Advanced BPAP

Advanced BPAP includes all the baseline functions of a standard BPAP but includes additional ventilation modes that automatically respond to the patient's real-time respiratory needs. The machine has adaptive volume/pressure support with backup rate. Typically, these machines are designed for:

- Complex or central sleep apnea;
- Cheyne-Stokes respiration;
- Obesity hypoventilation syndrome;
- Other irregular ventilation patterns.

Non-Invasive Positive Pressure Ventilation (NIPPV)

NIPPV involves the delivery of oxygen into the lungs via positive pressure without the need for endotracheal intubation. It is used in both acute and chronic respiratory failure but requires careful monitoring and titration to avoid complications. NIPPV is increasingly being used to treat individuals with chronic respiratory failure (e.g., neuromuscular diseases, restrictive thoracic disorders, obstructive lung diseases), and other hypoventilation conditions. NIPPV is a type of mechanical ventilation that can be used at home to assist with taking full breaths and maintaining adequate oxygen supply in the body, especially while sleeping. Intermittent positive pressure reduces the work of breathing through three different methods. By applying positive end-expiratory pressure (PEEP) through expiratory positive airway pressure (EPAP), positive pressure ventilation allows the body to overcome the dynamic intrinsic positive end expiratory pressure threshold required to initiate a breath, as well as increasing lung compliance.

Non-Invasive Dual or Multifunction Home Mechanical Ventilators (VOCSN, VOCSN VC, VOCSN VC Pro)

Non-invasive dual or multifunction home mechanical ventilators are life-support devices that combine mechanical ventilation with at least two additional respiratory functions, such as supplemental oxygen delivery, cough assistance, suction, nebulizer delivery, and oximetry in a single portable unit

Hypoventilation Syndromes

Hypoventilation syndromes are nonspecific disorders that are characterized by hypercapnia a $PaCO_2$ greater than 45 mmHg, and sometimes hypoxemia, especially during sleep with PaO_2 of less than 60 mmHg. Hypoventilation syndrome categories can be categorized as obesity hypoventilation syndrome, central sleep apnea and hypercapnic respiratory failure (not COPD).

Neuromuscular and Thoracic Restrictive Diseases

Neuromuscular disorders (muscular dystrophy, Amyotrophic Lateral Sclerosis (ALS), polio, and phrenic neuropathies) can result in weakness of the respiratory muscles, resulting in hypoventilation. Thoracic restrictive disorders can be caused by various underlying diseases that are characterized by pulmonary function testing showing patterns of restriction or respiratory muscle weakness with reductions in MIP and/or maximal expiratory pressure (MEP).

Central Apneas

Central sleep apnea is defined as the cessation of airflow through the nose and mouth for at least 10 seconds with no respiratory effort noted. The cessation in breathing can be caused by problems involving brain mechanisms, or an obstructive component. Approximately 4% of individuals undergoing PSG in a sleep laboratory are diagnosed with central sleep apnea, making this an uncommon condition.

Mixed Apneas

Mixed sleep apnea is a combination of obstructive and central sleep apnea. Not only does the patient have an obstruction in the airway, but the patient may have a neurological dysfunction or cardiopulmonary as well that contributes to the central apnea component.

Obstructive Sleep Apnea (OSA)

Obstructive sleep apnea (OSA) is a sleep-related breathing disorder caused by upper-airway obstruction, most often from relaxed throat muscles during sleep. In adults, OSA involves recurrent episodes of complete or partial upper airway blockage lasting more than 10 seconds and is commonly linked to obesity, male sex, aging, and anatomical factors. Symptoms include loud snoring, witnessed apneas, gasping, excessive daytime sleepiness, and hypertension, and diagnosis requires polysomnography or home sleep testing with evidence of clinical impairment. Untreated adult OSA increases the risk of hypertension, heart failure, atrial fibrillation, other arrhythmias, and nonalcoholic fatty liver disease.

Pediatric OSA, typically caused by enlarged tonsils and adenoids, is defined by prolonged partial obstruction or intermittent complete obstruction lasting at least two respiratory cycles and may present with snoring, breathing pauses, restless sleep, behavioral issues, or poor growth. If left untreated, children may experience growth abnormalities, neurologic problems, or cor pulmonale. Polysomnography (PSG) is the preferred diagnostic tool, although normative AHI/RDI values for children are not well established. Adenotonsillectomy is first-line therapy for pediatric OSA, while persistent cases or those with contraindications may require CPAP, observation, medications, or additional airway surgery. Obstructive hypoventilation (OH), a related condition in children, may present with normal AHI but episodes of hypercarbia indicated by elevated end-tidal CO_2.

SUPPORTIVE LITERATURE

Sarasate et al (2023) reported the results of a randomized, multicenter clinical trial evaluating whether initiating non-invasive ventilation (NIV) earlier in patients with ALS, at a FVC threshold of 75%, improves outcomes compared with standard initiation at 50%. Forty-two patients were randomized to early or standard NIV, and survival time to death or tracheostomy was the primary outcome. Although early NIV was associated with longer median survival and lower mortality incidence, these differences did not reach statistical significance. Nevertheless, early NIV demonstrated benefits in slowing respiratory muscle decline, reducing adverse events, and showing good tolerance and adherence without impairing sleep quality. Overall, while the primary survival endpoint was not met, all findings favored early NIV, supporting earlier respiratory assessment and NIV initiation around an FVC of 75% in ALS patients.

Wang et al (2019) conducted a systematic review to assess the effectiveness of home noninvasive NIPPV (home mechanical ventilation (HMV), BPAP, or CPAP devices) in adults with chronic respiratory failure. 68 studies evaluating 53,733 patients were included. In patients with COPD, home BPAP (compared to no device) was associated with lower mortality, decreased need for intubations and hospital admissions, but no change in quality of life. In patients with COPD, HMV (compared individually with BPAP, CPAP, or no device) was associated with fewer hospital admissions. In patients with thoracic restrictive diseases, HMV (compared to no device) was associated with lower mortality. In patients with neuromuscular diseases, home BPAP (compared to no device) was associated with lower mortality and better quality of life. In patients with obesity hypoventilation syndrome, home HMV/BPAP (compared to no device) was associated with lower mortality. Current evidence was not available to assess the comparative effectiveness of many device capabilities on patient outcomes. Criteria to initiate home NIPPV and home respiratory services varied and were not validated in comparative studies.

Patil et al (2019) conducted a systematic review and meta-analysis of 184 studies to evaluate the effectiveness of PAP therapy for adults with OSA. CPAP significantly reduced AHI by 23 events/hour versus no treatment—an 86% reduction from 32.7 to 4.1 events/hour. CPAP also improved daytime sleepiness by 2.4 points in symptomatic patients and showed clinically meaningful benefits for sleep-related quality of life, blood pressure, and motor vehicle crash risk. Observational evidence suggested reductions in cardiovascular events and mortality, though RCTs did not confirm these outcomes. No major differences were found among CPAP, APAP, and BPAP for individual clinical outcomes, supporting CPAP as first-line therapy unless not tolerated. Home-based versus in-lab APAP initiation showed comparable results. Education, behavioral interventions, and telemonitoring improved adherence. Nasal masks enhanced adherence and reduced AHI more effectively than oronasal masks. Humidification reduced side effects without improving adherence or outcomes. Overall, CPAP reliably reduces OSA severity, improves sleepiness, and lowers blood pressure, particularly in symptomatic or hypertensive adults. Benefits for asymptomatic individuals and long-term cardiovascular outcomes remain uncertain.

Khamankar et al (2018) reported the results of this retrospective cohort study evaluating whether earlier initiation and optimized use of NIV improves survival in patients with ALS. Among 474 patients, those who used BPAP had significantly longer survival than non-users. With survival increasing progressively when BPAP was initiated at higher FVC thresholds (< 50% (20.3 months); ≥ 50% (23.60 months); ≥ 80% (25.36 months). Longer daily BPAP use (> 8 hours/day), and combined daily use of Bi-PAP with cough assist were each associated with significant survival benefits, whereas cough assist alone had minimal impact. Higher functional status at initiation correlated with better outcomes, and time since symptom onset was not a reliable indicator for starting NIV. Overall, an optimized NIV strategy—early BPAP initiation, sustained daily use, and concurrent cough assist—was associated with markedly prolonged survival compared with standard, later initiation protocols, supporting earlier access to and combined use of NIV interventions in ALS care.

PROFESSIONAL GUIDELINE(S)

The 2025 American Academy of Sleep (AASM) reported guidelines for the treatment of central sleep

apnea (CSA) in adults, stating:

- "Suggests using continuous positive airway pressure over no continuous positive airway pressure in adults with CSA due to the following etiologies: primary CSA, CSA due to heart failure, CSA due to medication or substance use, treatment-emergent CSA, and CSA due to a medical condition or disorder." (Conditional recommendation, low certainty of evidence)
- "Suggests using bilevel positive airway pressure with a backup rate over no bilevel positive airway pressure with a backup rate in adults with CSA due to the following etiologies: primary CSA, CSA due to medication or substance use, treatment-emergent CSA, and CSA due to a medical condition or disorder." (Conditional recommendation, very low certainty of evidence)
- "Suggests against the use of bilevel positive airway pressure without a backup rate in adults with CSA due to the following etiologies: primary CSA, CSA due to heart failure, CSA due to medication or substance use, treatment-emergent CSA, and CSA due to a medical condition or disorder." (Conditional recommendation, very low certainty of evidence)
- "Suggests using adaptive servo-ventilation over no adaptive servo-ventilation in adults with CSA due to the following etiologies: primary CSA, CSA due to heart failure, CSA due to medication or substance use, treatment-emergent CSA, and CSA due to a medical condition or disorder." (Conditional recommendation, low certainty of evidence)

The 2023 American College of Chest Physicians Clinical Practice Guidelines and Expert Panel Report for the respiratory management of patients with neuromuscular weakness state:

- "Patients with neuromuscular disease (NMD) and chronic respiratory failure- they recommend using NIV for treatment with any of the following indications (indications can vary depending on age, NMD, and rate of the disease progression):
    - Any fall in FVC to < 80% of predicted with symptoms;
    - FVC to < 50% of predicted without symptoms;
    - Maximum inspiratory pressure (MIP) to < –60 cm H2O;
    - Maximum expiratory pressure (MEP) of < 40 cm H2O;
    - Based on the polysomnography results if polysomnography was indicated or the presence of hypercapnia (awake PaCO2 > 45 mm Hg)."

The American Thoracic Society released their 2020 guidelines for long-term noninvasive ventilation in chronic stable hypercapnic COPD defined as, FEV1/FVC less than 0.70; resting PaCO2 greater than 45 mm Hg; not during exacerbation. The guidelines state:

- "Suggests the use of nocturnal noninvasive ventilation (NIV) in addition to usual care for patients with chronic stable hypercapnic COPD." (conditional recommendation, moderate certainty).
- "Suggests that patients with chronic stable hypercapnic COPD undergo screening for obstructive sleep apnea before initiation of long-term NIV." (conditional recommendation, very low certainty).

- "Suggests not initiating long-term NIV during an admission for acute on-chronic hypercapnic respiratory failure, favoring instead reassessment for NIV at 2–4 weeks after resolution." (conditional recommendation, low certainty).
- "Suggests not using an in-laboratory overnight PSG to titrate NIV in patients with chronic stable hypercapnic COPD who are initiating NIV." (conditional recommendation, very low certainty).
- "Suggest NIV with targeted normalization of PaCO2 in patients with hypercapnic COPD on long-term NIV." (conditional recommendation, low certainty).

The European Respiratory Society (ERS) and the American Thoracic Society (ATS) Clinical Recommendation for Non-Invasive Ventilation (NIV) in Adults with Acute Respiratory Failure (Rochwerg 2017) state:

- "Bilevel NIV for individuals with acute respiratory failure (ARF) leading to acute or acute-on-chronic respiratory acidosis (pH < 7.35) due to COPD exacerbation." (Strong recommendation, high certainty of evidence.)
- "Either bilevel NIV or CPAP for individuals with ARF due to cardiogenic pulmonary oedema." (Strong recommendation, moderate certainty of evidence.
- "Early NIV for immunocompromised individuals ARF." (Conditional recommendation, moderate certainty of evidence.)
- "Due to the uncertainty of evidence ERS/ATS is unable to offer a recommendation on the use of NIV for de novo ARF."
- "NIV for individuals with post-operative ARF." (Conditional recommendation, moderate certainty of evidence.)
- "NIV to dyspneic individuals for palliation in the setting of terminal cancer or other terminal conditions." (Conditional recommendation, moderate certainty of evidence.)
- "NIV should not be used in the treatment of patients with established post-extubation respiratory failure." (Conditional recommendation, low certainty of evidence.

American Academy of Sleep Medicine (ASSM 2008) Clinical Guidelines for the Manual Titration of Positive Airway Pressure in Patient with OSA state:

- "Pre-Titration Preparation: All candidates should receive PAP education, hands-on demonstration, careful mask fitting, and acclimatization." (Standard)
- "Transition to BPAP: If a patient is uncomfortable or intolerant of high CPAP pressures, or obstructive respiratory events continue at 15 cm H2O, switch the patient to BPAP." (Consensus)
- "Repeat Titration Study: Consider repeating a titration if the initial titration was not optimal/good and, for split-night studies, fails to meet AASM criteria." (Consensus)

REGULATORY STATUS

The United States Food and Drug Administration (FDA) regulates BPAP and home ventilators as

medical devices. All BPAP and home ventilators including related components require FDA approval before marketing and use in the United States to ensure they are safe and effective for human use. Refer to the FDA Medical Device website. Available from: https://www.fda.gov/medical-devices [accessed 2026 May 26]

The FDA lists the most serious type of medical device recalls as well as early alert communications about corrective actions being taken by companies that the FDA believes are likely to be the most serious type of recalls on our website by the date that the FDA posts the information on our website. Available from: Medical Device Recalls | FDA [accessed 2026 May 26]

MEDICAL POLICY

Medical Policy Title	**Hyperbaric Oxygen Therapy (HBOT)**
Policy Number	**2.01.07**
Current Effective Date	**January 1, 2026**
Next Review Date	**July 2027**

Our medical policies are guides to evaluate technologies or services for medical necessity. Criteria are established through the assessment of evidence based, peer-reviewed scientific literature, and national professional guidelines. Federal and state law(s), regulatory mandates and the member's subscriber contract language are considered first in the determination of a covered service. (Link to Product Disclaimer)

POLICY STATEMENT(S)

Topical Hyperbaric Oxygen Therapy

I. Topical hyperbaric oxygen therapy (HBOT) is considered **investigational**.

Systemic Hyperbaric Oxygen Therapy

II. Systemic HBOT in a pressurized chamber is considered **medically appropriate** for the following indications (refer to Policy Guidelines for condition-specific recommendations):

- A. Acute traumatic peripheral ischemia/insufficiency (e.g., crush injury, compartment syndrome, reperfusion injury, and suturing of severed limbs);
- B. Air or gas embolism, acute;
- C. Arterial inefficiencies: enhancement of healing in selected wounds of patients who have non-healing wounds of the lower extremities and who have **ALL** the following:
  1. A lower extremity wound due to diabetes;
  2. A wound classified as Wagner grade 3 or higher (Grade 2: ulcer penetrates to tendon, bone or joint; Grade 3: lesion has penetrated deeper than Grade 2 and there is abscess, osteomyelitis, pyarthrosis, plantar space abscess, or infection of the tendon and tendon sheaths; Grade 4: gangrene of the forefoot);
  3. No measurable signs of healing after 30 days of an adequate course of standard wound therapy; which may include **ANY** of the following:
     - a. Assessment of vascular status and correction of any vascular problems in the affected limb if possible;
     - b. Optimization of nutritional status;
     - c. Optimization of glucose control;
     - d. Debridement by any means to remove devitalized tissue;
     - e. Maintenance of clean, moist bed of granulation tissue with appropriate moist dressings;

f. Appropriate off-loading; or

g. Necessary treatment to resolve any infection that might be present.

D. Carbon monoxide poisoning, acute;

E. Central retinal artery occlusion (CRAO)

F. Cerebral edema, acute;

G. Compromised grafts and flaps (not for primary management of these wounds);

H. Cyanide poisoning, acute;

I. Decompression sickness;

J. Gas/wet gangrene (e.g., clostridial myonecrosis);

K. Idiopathic sudden sensorineural hearing loss (ISSHL)

L. Necrotizing soft tissue infections, based on location and/or organism type and/or particular host immunologic and vascular risk factors causing hypoxia resulting in necrosis;

M. Osteomyelitis, acute, refractory (has not responded to standard medical and surgical management techniques);

N. Osteomyelitis, chronic, refractory (has persisted for at least six (6) weeks or has recurred after appropriate interventions, i.e., surgical debridement and at least one appropriate course of parenteral antibiotics, have been performed);

O. Pre- and post-treatment for patients undergoing dental surgery (non-implant related) of an irradiated jaw;

P. Profound anemia with exceptional blood loss, but only when blood transfusion is impossible or must be delayed;

Q. Radiation necrosis osteoradionecrosis (ORN)/bony necrosis and soft tissue radiation necrosis, (e.g., radiation enteritis, cystitis, proctitis);

R. Refractory mycosis (mucormycosis, actinomycosis, or canidiobolus coronato).

III. Systemic HBOT in a pressurized chamber is considered **investigational** for **ALL** other indications, including, but **not limited to**, the following:

A. Acute ischemic stroke;

B. Amyotrophic Lateral Sclerosis;

C. Arterial peripheral insufficiency, acute; (outside of the other listed medically necessary indications involving arterial insufficiency)

D. Autism spectrum disorders;

E. Bell's palsy;

F. Bone grafts;

G. Breast cancer, locally advanced, as pretreatment for patients undergoing chemotherapy;
H. Brown recluse spider bites;
I. Carbon tetrachloride poisoning, acute;
J. Cardiopulmonary bypass, as pretreatment;
K. Cerebral palsy;
L. Cerebrovascular disease, acute (thrombotic or embolic) or chronic;
M. Chronic, non-healing wounds;
N. Complex regional pain syndrome;
O. COVID-19
P. Uncompromised skin grafts or flaps;
Q. Fibromyalgia syndrome;
R. Fracture healing;
S. Frostbite;
T. Head injury, traumatic (including traumatic brain injury);
U. Tinnitus;
V. Hydrogen sulfide poisoning;
W. Inflammatory bowel disease (Crohn's disease, ulcerative colitis);
X. Interstitial cystitis;
Y. Intra-abdominal and intracranial abscesses;
Z. In vitro fertilization;
AA. Lepromatous leprosy;
BB. Malignant otitis externa;
CC. Meningitis;
DD. Migraine;
EE. Myocardial infarction and acute coronary syndrome (acute myocardial infarction and unstable angina);
FF. Multiple sclerosis;
GG. Muscle soreness, delayed onset;
HH. Prevention of coronary restenosis;
II. Pseudomembranous colitis (antimicrobial agent-induced colitis);

JJ. Pyoderma gangrenosum;

KK. Radiation myelitis;

LL. Radiation therapy, for the purpose of tumor sensitization;

MM. Retinal detachment;

NN. Retinopathy, adjunct to scleral buckling procedures in patients with sickle cell peripheral retinopathy;

OO. Sickle cell crisis and/or hematuria;

PP. Soft tissue injury;

QQ. Spinal cord injury;

RR. Thermal burns, acute.

POLICY GUIDELINE(S)

I. HBOT should not be a replacement for successful standard therapeutic measures. Documentation in the medical record should support the specific condition being treated with HBOT and the medical necessity of such treatment. The following information must be documented, as applicable to the specific medical condition:

   A. Initial assessment and medical history detailing the condition requiring HBOT, and a physical exam. The history should list prior treatments, including antibiotic therapy and surgical interventions.

   B. Current adjunctive treatment that includes type of treatment and its effectiveness.

   C. Established HBOT goals.

   D. HBOT session records describing physical findings and treatment rendered (including ascent time, descent time, total compression time, oxygen dose, pressurization level, documentation of attendance, and a recording of events).

   E. Effect of treatment upon established HBOT goals.

   F. When applicable, advanced diabetic foot ulcers may require photos to avoid overuse of HBOT when the foot is not salvageable. For a Wagner 5 (or Grade D) with complete gangrene of foot, once the heel is necrotic, the patient will likely not respond to HBOT treatments.

II. HBOT treatments of diabetic wounds of the lower extremities should be discontinued when the patient heals, is unable to tolerate treatment, or fails to improve. Documentation must include an

assessment of wound healing progress; changes in the wound condition, including the precise wound length, width, and depth measurements; presence of granulation and necrotic tissue; and concurrent measures being addressed relative to wound therapy. Weekly wound measurements should be performed to document progress in wound healing. A steady decrease in wound volume should be noted from week to week.

III. Continued treatment with HBOT is **not covered** if measurable signs of healing have not been demonstrated within any 30-day period of treatment. Most patients should **NOT** require more than 40 treatments. Patients who do not respond to 40 treatments will likely not respond to 60 or 80 or 120 treatments.

IV. Below are specific recommendations on the utilization of HBOT, based upon published, peer-reviewed literature.

Condition	**Pressure (ATA*)**	**Patient Selection Criteria**	**Duration, Frequency, and/or Number of Treatments**	**Utilization review**
Air or Gas embolism, acute	High to low pressure mixed gases	Gases in the vasculature sufficient enough to interfere with the function of an organ and results in ischemia to the affected areas.	Treatment is typically one to two treatments but occasionally may be as many as five to 10; treatment continues until no additional improvement is seen.	After 10 treatments
Anemia, severe	2.0-3.0 ATA	When blood transfusion is impossible or must be delayed.	Treatments of up to three or four hours, three to four times a day. Treatment can continue with taper of time and frequency until red blood cells have been satisfactorily replaced by patient regeneration or the patient can undergo transfusion.	Daily
Arterial Inefficiencies: non-healing *diabetic wounds* of the lower	2.0-3.0 ATA	Wagner grade 3 or higher and failure of standard wound therapy for at least 30 consecutive days.	90-minute treatments, five days per week, are performed in conjunction with continuing standard wound care; may last for 30-40 treatments.	After 40 treatments

Condition	Pressure (ATA*)	Patient Selection Criteria	Duration, Frequency, and/or Number of Treatments	Utilization review
extremities				
Carbon monoxide poisoning, acute	2.5-3.0 ATA	Within six hours of patient removal from the carbon monoxide-contaminated environment.	One treatment; if patient has persistent neurologic dysfunction after the initial treatment further treatment can occur within six to eight hours and can be continued once or twice daily until there is no additional improvement in cognitive function.	After 5 treatments
Central Retinal Artery Occlusion	2-2.8 ATA	Factors which influence outcome include the length of time of occlusion, the anatomical site of the occlusion, and the presence of a patent cilioretinal artery. The diagnosis of CRAO is typically and reliably made with a fundoscopic exam.	Treat twice daily until clinical plateau plus three days (usually up to 10 days).	After 20 treatments
Compromised Grafts and Flaps	2.0-2.5 ATA	In tissue compromised by irradiation or in other cases where there is decreased perfusion (vascular compromise) or hypoxia, HBOT has been shown to be extremely useful in flap salvage. This indication is not for primary management of wounds for normal, uncompromised skin	90-120 minute treatments. It is not unusual to receive treatments twice a day. When the graft or flap appears stable, treatments are reduced to once daily. Should a graft or flap fail, HBOT may be used to prepare the already-compromised recipient site for a new graft or flap. It does not apply to the initial preparation of the body site	After 40 treatments

Condition	Pressure (ATA*)	Patient Selection Criteria	Duration, Frequency, and/or Number of Treatments	Utilization review
		grafts or flaps.	for a graft.	
Crush injury	2.0-2.4 ATA	In conjunction with standard therapeutic measures, when loss of function, limb or life is threatened, and tissue oxygen tension is below 30 mmHg.	Three 1.5-hour treatments per day for two - three days, then twice a day for two days, and then once daily for two days	After 20 treatments
Cyanide poisoning, acute	2.5-3.0 ATA	As an adjunct to infusion of sodium nitrite.	One treatment of 120 minutes.	
Decompression sickness	2.0-5.0 ATA	Gas bubbles in the tissue or blood in volumes sufficient enough to interfere with the function of an organ or cause alteration in sensation.	One treatment of 1.5 to 14 hours; patients who have residual defects after the initial treatment should receive additional treatments until clinical stability is achieved; generally, no more than five to 10 treatments.	After 10 treatments
Gas gangrene (e.g., clostridial myonecrosis)	3.0 ATA	Positive gram-stained smear or culture from tissue fluids, tissue gas visualization on X-ray, severe and sudden pain, skin changes, and edema.	Three 90-minute treatments during the first 24 hours, and then two treatments per day for the next two to five days.	After 10 treatments
Idiopathic Sudden Sensorineural Hearing Loss	2-2.5 ATA	The degree of hearing loss is typically defined as a loss of 30 decibels or more across 3 contiguous frequencies on audiogram. Treatment is	Recommend 10-20 sessions.	After 20 treatments

Condition	Pressure (ATA*)	Patient Selection Criteria	Duration, Frequency, and/or Number of Treatments	Utilization review
		recommended either: • combined with steroid therapy within 2 weeks of onset; or • combined with steroid therapy as salvage within 1 month of onset		
Necrotizing Soft Tissue Infections:	2.0-2.5 ATA	Adjunctive therapy only in patients where morbidity and mortality are expected to be high despite aggressive standard treatment.	Twice daily for 90 to 120 minutes until condition is stabilized, then once daily.	After 30 treatments
Osteomyelitis, chronic, refractory	2.0-2.5 ATA	HBOT should not be used as a primary treatment for osteomyelitis. HBOT should be considered only after surgical debridement and at least one six-week appropriate course of parenteral antibiotics have been performed.	Daily treatment for 90-120 minutes; can be continued for four to six weeks for patients who respond to initial treatment with antibiotics, surgical debridement, and HBOT.	After 30-40 sessions
Osteoradio-necrosis	2.0-2.5 ATA	As adjunctive treatment in the preoperative and postoperative management of the patient.	30 treatments, followed by only minor bony debridement. If response is adequate, an additional 10 treatments can be given. Patients who are not responding are considered stage II; they receive more extensive surgical	After 10-30 treatments

Condition	Pressure (ATA*)	Patient Selection Criteria	Duration, Frequency, and/or Number of Treatments	Utilization review
			debridement, then 10 additional treatments. Stage III patients receive 30 treatments, followed by mandibular segmental resection, and then 10 additional treatments.	
Osteoradio-necrosis, mandibular (i.e., Marx Protocol for ORN and Tooth Extraction)	2.0-2.5 ATA	Evidence of overt fracture or bony resorption. Marx Protocol: Pre-and post-treatment for patients undergoing dental surgery (non-implant-related) of an irradiated jaw.	Initial treatment for stage I patients is 30 treatments. If response is adequate, 10 additional treatments can be provided. Non-responders are considered stage II and receive more extensive surgical debridement, followed by 10 additional treatments. Patients with stage III disease can receive up to 30 treatments, followed by mandibular segmental resection, and then an additional 10 treatments.	After 10-30 treatments
Refractory mycosis (e.g., actinomycosis, mucormycosis)	2.0-2.5 ATA	In conjunction with standard treatment when the disease process is refractory to antibiotics and surgical treatment.	One to two times daily for 90-120 minutes; treatment can continue for up to 40-80 treatments.	After 10-30 treatments

*1 ATA (atmospheres absolute) = pressure of 760 mmHg, 14.7 psi, 760 torr, or 33 ft of seawater.

V. It is recommended that the Centers for Medicare and Medicaid Services (CMS) criteria for coverage be utilized in determining appropriate practitioners to render HBOT. The CMS criteria state:

   A. Qualified non-physician practitioners (NPPs) may supervise HBOT services, if such services are included within their state's scope of practice, if their required supervision or

collaborative agreement is with a physician qualified to provide HBOT services, and if the NPP meets the educational requirements identified within the coverage article.

B. Physicians supervising HBOT should be certified in Undersea and Hyperbaric Medicine by the American Board of Emergency Medicine (ABEM), the American Board of Preventive Medicine (APBM), or the American Osteopathic Conjoint Committee of Undersea and Hyperbaric Medicine (AOCUHM); or must have completed a minimum 40-hour training experience in a program such as one approved by the American College of Hyperbaric Medicine or the Undersea and Hyperbaric Medical Society.

C. Advanced Cardiac Life Support (ACLS) training and certification of supervising physicians (and NPPs) is required, for provision of HBOT services in physician offices and off-campus hospital sites; and in on-campus, provider-based departments for which provider-response time to the chamber can be expected to exceed five minutes.

D. HBOT services rendered within a hospital outpatient department are considered "incident to" a physician's or qualified NPP's services and require physician supervision. The physician supervision requirement is presumed to be met when services are performed on hospital premises (i.e., certified as part of the hospital and part of the hospital campus); however, in all instances, it is required that the physician be present during the ascent and descent portions of each treatment.

E. In order to satisfy the immediately available criterion, for HBOT performed in an on-campus outpatient hospital or in an off-campus provider-based department, the physician (or qualified NPP) must be present in the office suite or at a location with a maximum of a five-minute response time to the chamber. For HBOT services performed in a physician office, the physician (or qualified NPP) must be present in the office suite.

DESCRIPTION

HBOT is a technique of delivering highly pressurized oxygen to the tissues. Two methods of administration are available.

In systemic, or large chamber, HBOT, the patient is entirely enclosed in a pressure chamber and breathes nearly 100% oxygen intermittently at a pressure greater than one atmosphere (the pressure of O_2 at sea level). This technique relies on the systemic circulation to deliver highly oxygenated blood to the target site, typically a wound. In addition, systemic HBOT can be used to treat systemic illness such as air or gas embolism, carbon monoxide poisoning, clostridial gas gangrene, etc. Treatment may be carried out either in a mono (single person) chamber pressurized with nearly 100% O_2 or in a larger, multi-place (multi-person) chamber pressurized with compressed air, in which case the patient receives pure oxygen by mask, head hood, or endotracheal tube.

Topical HBOT describes a technique of delivering 100% oxygen directly to a wound site at a pressure slightly higher than atmospheric pressure. It is hypothesized that the high concentration of oxygen diffuses directly into the wound to increase the local cellular oxygen tension, which, in turn, promotes wound healing. Topical HBOT devices consist of an appliance to enclose the wound area and a

source of O_2; conventional O_2 tanks may be used. The appliances may be disposable and may be used without supervision in the home by well-trained patients. Topical HBOT has been investigated as a treatment for skin ulcerations due to diabetes, venous stasis, post-surgical infection, gangrenous lesion, decubitus ulcers, amputations, skin graft, and frostbite.

SUPPORTIVE LITERATURE

Topical Hyperbaric Oxygen Therapy

de Smet et al (2017) conducted a systematic review of various oxygen therapies (oxygen dressing therapy, topical oxygen therapy, HBOT, inspired oxygen therapy). Three RCTs evaluating topical oxygen therapy for chronic wound healing were identified. A total of 315 participants with stage II-IV sacral or ischial pressure ulcers (1 RCT) or refractory venous ulcers (2 RCTs) were included in the systematic review. One RCT (n=100) administered treatment for 20 minutes 3 times per day for 12 days to the treatment group and standard care to the control group. The number of patients experiencing complete wound healing, defined as complete epithelialization of the wound without drainage, was 16 in the experimental group and 1 in the control group ($p<.001$). Two of the RCTs, which had overlapping populations with refractory venous ulcers (n=83 in one and n=132 in the other) administered treatment for 180 minutes 2 times per day for 12 weeks to the treatment group and conventional compression dressing to the control group. In all trials, patients in the treatment group experienced significantly higher proportions of healed ulcers and significantly faster healing times. This systematic review is limited in two of the trials had overlapping populations, so there were not 315 unique patients. There was heterogeneity in the trial populations and treatment regimes. The data are insufficient to draw conclusions about the effect on the net health outcome.

Hu et al (2025) published a meta-analysis comparing the efficacy of 12 interventions in the treatment of diabetic foot ulcers. They included a total of 99 RCTs, involving 7,356 patients overall. Nine included studies compared topical oxygen therapy (TOT) (n=458) with standard of care (SOC) (n=421). TOT was significantly outperformed by other interventions regarding healing outcomes. Concerning percentage area reduction, TOT (18.3%) ranked lowest among the interventions.

Systemic Hyperbaric Oxygen Therapy

Sharma et al (2021) conducted a systematic review and meta-analysis of 14 studies (N=768) comparing the effect of HBOT with standard care on diabetic foot ulcers (Table 2). Study authors noted that various modalities can be considered standard care including, but not limited to, debridement, antibiotics, and blood sugar control. However, the specific standard care modality in each included study was not reported. HBOT duration ranged from 45 to 120 minutes (median, 90 minutes). All included studies had methodological limitations, including selection, performance, detection, attrition, and reporting bias. The review found those treated with standard care were less likely to have complete ulcer healing versus HBOT, based on pooled analysis of 11 studies (odds ratio [OR], 0.29; 95% confidence interval [CI], 0.14 to 0.61; I^2=62%). Results were consistent when stratified according to duration of follow up of less than 1 year (7 studies; OR, 0.63; 95% CI, 0.39 to 1.02; I^2=1%) and at 1 year (4 studies; OR, 0.16; 95% CI, 0.03 to 0.82; I^2=83%), although the risk estimate wasn't statistically significant for studies with less than one year follow up. A funnel plot

analysis for this outcome was asymmetrical, suggesting publication bias. Risk of major amputation was also significantly lower with HBOT compared to standard care based on pooled analysis of 7 studies (OR, 0.60; 95% CI, 0.39 to 0.92; I^2=24%). There were no clear differences between groups in minor amputation (9 studies; OR, 0.89; 95% CI, 0.71 to1.12) or mortality (3 studies; OR, 0.55; 95% CI, 0.25 to 1.24). Standard care was associated with an increased risk of adverse events compared with HBOT (7 studies; OR, 1.68; 95% CI, 1.07 to 2.65).

A systematic review (Hedetoft 2021) included 31 retrospective cohort studies assessing the effect of adjunctive HBOT for treating necrotizing soft-tissue infections (necrotizing fasciitis, Fournier's gangrene, and gas gangrene). Ten studies assessed to have critical (very high) risk of bias were excluded from meta-analyses. Pooled results from the remaining 21studies found HBOT associated with a reduced risk of in-hospital mortality (OR, 0.44; 95% CI, 0.33 to 0.58; I^2=8%), but the duration of follow-up for mortality was not reported. Results were consistent when studies were stratified according to moderate (5 studies; OR, 0.39; 95% CI, 0.28 to 0.55; I^2=0%) and serious (high) risk of bias (16 studies; OR, 0.51; 95% CI, 0.33 to 0.80; I^2=17%). Publication bias favoring HBOT was present for this outcome based on funnel plot analysis. For other outcomes, including major amputation and length of hospital stay, there were no statistically significant differences between HBOT use and non-use. Evidence on adjunctive HBOT and the need for surgical debridement was mixed. One study with a low/moderate risk of bias reported a higher number of debridement's with HBOT use versus non-use (mean difference, 1.8; 95% CI,1.15 to 2.45), but the mean difference between HBOT use and non-use in a pooled analysis of 5 studies with methodological flaws was not statistically significant (mean difference, 0.63; 95% CI, -0.49 to 1.75).

Cavaliere et al (2022) conducted an RCT to compare the effect of HBOT, oral steroids (OS) and a combination of both therapies (HBOT+OS) for treating sudden sensorineural hearing loss (SSNHL). One hundred and seventy-one patients with SSNHL were randomized and included in the study. Participants were evaluated by pure tone audiometry test (PTA) at baseline and 20 days after treatment. After baseline PTA, patients were randomly assigned to each group, HBOT group A, OS-group B, and HBOT+OS-group C. Patients in the HBOT+OS, and HBOT groups improved their auditory function ($p < 0.05$). HBOT was the best choice for treatment when started by seven days from SSNHL onset, while HBOT+OS in case of late treatment. Profound SNHL recovered equally by HBOT, and HBOT+OS ($p < 0.05$). Upsloping SNHL obtained better auditory results by HBOT compared to HBOT+OS ($p < 0.05$). Down sloping and flat SSNHL had the most improvement with HBOT+OS compared to HBOT only ($p < 0.05$). The authors concluded that in both early and late treatment, a combination of HBOT and OS is a valid treatment for SSNHL and had the best results. Limitations include lack of a control group.

Joshua et al (2022) conducted a systematic review and meta-analysis of RCTs to evaluate the use of HBOT with hearing outcomes in patients with SSNHL and determine if HBOT should be utilized as a single treatment or part of the combination regimen. The study included 3 RCTs, 88 patients who received HBOT in intervention groups and 62 patients who had routine treatment in the control group. The intergroup difference in mean absolute hearing gain (mean difference, 10.3 dB; 95% CI, 6.5-14.1 dB; I2 = 0%) and the odds ratio of hearing recovery (4.3; 95% CI, 1.6-11.7; I2 = 0%) favored HBOT over the control therapy. The authors suggest that HBOT as part of a combination

treatment regimen should be considered for patients with SSNHL. Limitations include small sample sizes of studies, and the secondary outcome (adverse effect of treatment) could not be assessed. The authors recommend further studies to assess the adverse effects of treatment and to determine the optimal HBOT protocol.

Rhee et al (2018) performed a systematic review and meta-analysis through February 2018 for patients comparing HBOT plus medical therapy (MT) with MT alone for ISSNHL treatment. Randomized clinical trials and nonrandomized studies were included. The main outcomes considered were complete hearing recovery, any hearing recovery, and absolute hearing gain. Nineteen studies (3 randomized and 16 nonrandomized) with a total of 2401 patients (mean age, 45.4 years; 55.3% female) were included. In the HBOT+MT group, rates of complete hearing recovery and any hearing recovery were 264/897 (29.4%) and 621/919 (67.6%), respectively, and in the MT alone group were 241/1167 (20.7%) and 585/1194 (49.0%), respectively. Pooled HBOT+MT also showed favorable pooled results from random-effects models for both complete hearing recovery (OR, 1.61; 95% CI, 1.05 to 2.44) and any hearing recovery (OR, 1.43; 95% CI, 1.20 to 1.67). The study was limited by the following: (1) differences in clinical and methodological characteristics of selected studies, (2) considerable heterogeneity, (3) the possibility of measured or unmeasured confounder effects, and (4) difficulty in evaluating the benefit of treatment due to a substantial proportion of patients experiencing spontaneous recovery.

Včeva et al (2022) published a retrospective study that included a total of 59 patients (31 males and 28 females, median age 56 years) treated for ISSNHL with HBOT in the period from January 2015 to the end of December 2019. Patients were offered various treatments, and the patients with sudden sensorineural hearing loss of idiopathic cause included in this study were those who refused corticosteroid therapy. The median time from the onset of symptoms to treatment was three days. A pure-tone audiogram was recorded in all patients during the first visit to the otorhinolaryngologist and after completion of the HBOT course. Following HBOT (90 min at 203 kPa daily for 20 days), hearing loss was significantly reduced with the median loss across all frequencies falling from 81.2 dB (IQR 70.0−95.0) to 58.1 dB (IQR 47.5−77.5) ($P < 0.001$). The difference in the median value of hearing loss before and after HBOT across all patients was 22.5 dB (IQR 12.5–33.75). Significantly lower hearing thresholds were observed at 500, 1,000, 2,000 and 4,000 Hz after treatment, with the largest difference at 1,000 Hz. There were four patients who started HBOT greater than 14 days from the onset of symptoms. The median value of hearing recovery (difference in hearing thresholds before and after HBOT) was 17.5 dB (IQR 4.1–38.4), and the median hearing threshold after HBOT was 54.3 dB (IQR 51.8–68.1) for these 'delayed' patients. There was no significant difference in recovery (difference in hearing threshold before and after HBOT) between patients who started therapy within seven days, 7–14 days, or > 14 days from the onset of symptoms ($P = 0.39$). There was no association between treatment initiation time and recovery. The principal limitation of this study is the lack of a comparator group primarily treated with corticosteroids that would allow comparison of outcomes with those obtained using HBOT. The study is also small and retrospective in design. The authors concluded the study showed HBOT is a legitimate choice as the primary treatment for ISSNHL, especially if it is readily accessible, and if there are contraindications for corticosteroid therapy.

Wu et al (2018) conducted a meta-analysis to determine the effectiveness of oxygen therapy in retinal artery occlusion patients. The primary endpoint was visual acuity (VA). Seven RCTs met inclusion criteria. Patients who received oxygen therapy exhibited probability of visual improvement about 5.61 times compared with the control group who did not receive oxygen therapy. No statistically significant difference was observed between oxygen inhalation methods, combined therapy, or RAO type. Conversely, 100% oxygen and hyperbaric oxygen significantly improved VA in RAO patients. Better effect was showed in period within three months and the most effective treatment length was over nine hours. The authors concluded that oxygen therapy had beneficial effects in improving VA in RAO patients, especially when treated with 100% hyperbaric oxygen for over nine hours.

Boyoung M et al (2025) published a retrospective clinical cohort study to describe the outcomes of HBOT for patients with central retinal artery occlusion (CRAO) at a single tertiary care center. Medical records of all patients diagnosed with CRAO who received HBOT at Mayo Clinic in Rochester, Minnesota from January 1, 2009 to December 31, 2020 were reviewed to confirm diagnosis, time from onset to presentation, exam findings, treatments, and follow-up data. Main outcome measures included final visual acuity (VA) and number of lines of improvement. There were 41 patients diagnosed with CRAO who received HBOT during the 12-year study period. Median time from symptom onset to HBOT treatment was 9.5 h (interquartile range [IQR] 6.5, 14.0 h), and patients received a median of 4 HBOT sessions (IQR 2.5, 6.0 sessions). There were 20 patients who received HBOT within 9 h, 14 (70%) of which had clinically meaningful improvement in VA of ≥ 0.3 logMAR. In comparison, of the 21 patients treated after 9 h, 6 (28.6%) had VA improvement of ≥ 0.3 logMAR ($P = .008$). For all patients, the median logMAR VA at presentation was 2.00 (IQR 1.70, 2.30) and the median logMAR VA at follow-up was 1.94 (IQR 1.00, 2.00) ($P < .001$), with median lines of improvement of 3.0 (IQR 0.0, 7.0). For patients treated within 9 h, the median logMAR VA at presentation was 2.00 (IQR 1.93, 2.30) and the median logMAR VA at follow-up was 1.70 (IQR 0.54, 2.00). Patients treated within 9 h had statistically significant greater median lines of VA improvement than cases that were treated after > 9 h from symptom onset at 5.9 (IQR 3.0, 10.0) and 0.0 (IQR 0.0, 3.0), respectively ($P < .001$). There was no difference in VA recovery associated with specific retinal exam findings such as cherry-red spot ($P = .22$) and cilioretinal artery perfusion ($P = .36$) compared to patients without those findings. Limitations of the study include the retrospective design and the small cohort of patients. There was a statistically significant improvement in VA after HBOT treatment in CRAO patients among patients that received early HBOT, with patients receiving the most benefit when receiving treatment within 9 h.

Maldonado et al (2024) published a retrospective study to report the visual acuity outcomes in all patients with CRAO and symptoms lasting for less than 24 hours who were prescribed HBOT in the Hyperbaric Medicine Unit of a Portuguese hospital from March 2009 to February 2023. All patients were subjected to 90-minute HBOT sessions with 100% oxygen at 2.4 ATA. The primary outcome was VA change (dif-logMAR) before and after treatment. A clinically significant visual improvement was defined as a dif-logMAR≥0.3. A total of 114 patients were included in this study; 68% (n=77) were male, with a mean age of 69 years, and were subjected to a median number of seven HBOT sessions. No serious adverse effects from HBOT were reported. The mean time delay from symptoms

to treatment was 12 hours, and best-corrected visual acuity (BCVA) at baseline was counting fingers or worse in 84% (n=96) of the patients. A dif-logMAR≥0.3 occurred in 46% (n=52) of the patients, and 58% (n=66) reported subjective VA improvement after the treatment. A significant improvement between BCVA before HBOT (2.12±0.74) and after HBOT (1.67±0.74) was observed. The VA outcome was found to be related to the total number of sessions, age, obesity, supplementary treatments, and cherry-red spot (CRS) at presentation. There were no significant effects of the time delay from symptoms to treatment in the explanation of the VA outcome. Limitations of the study included the retrospective design and absence of a control group for ethical reasons. The authors concluded HBOT appears to be safe and has a beneficial effect on VA outcomes in patients with non-arteritic CRAO, particularly depending on the number of sessions. Patient factors such as age, obesity, and the presence of CRSs also appear to influence the VA outcome.

Bagli BS et al (2018) aimed to investigate efficacy of HBO2 treatment in CRAO patients that were referred to their Hyperbaric Oxygen Treatment Unit. Patient demographics, their systemic diseases, best-corrected visual acuity (BCVA) and the time of visual loss were recorded. Oral acetazolamide and topical beta blocker treatments as well as HBO2 treatments were administered to patients as soon as possible. Patients received 20 treatments as standard. Visual acuity was examined and recorded following each HBO2 treatment administration. 10 eyes (five right, five left) of 10 patients) were included in the study. While average visual acuity was LogMAR 3 before the treatment, it was measured as LogMAR 1.8 on average after treatment (P ⟨ 0.05). None of the patients were observed to have neovascular glaucoma. The authors concluded their study showed HBO2 treatment is an efficacious method with few side effects and can be used in the treatment of CRAO patients. During acute and subacute periods, a certain number of HBO2 treatment sessions may be beneficial. Stopping treatments before eight completed HBO2 sessions for a patient who did not show improvement until that time may miss a patient who would have benefited from HBO2 treatment.

Kim YS et al (2020) published a registry-based observational study which included adult patients who presented to the emergency department or ophthalmology outpatient department within 24 hours of the onset of CRAO symptoms. Data of patients from October 2016 to February 2019 were analyzed. The patients were categorized into two groups according to the use of adjunctive HBO2: no HBO2 and HBO2. During the study period, 34 consecutive patients were enrolled, of which 19 were included in the study. In the total cohort, 10 patients (52.6%) were treated with adjunctive HBO2. There were no statistically significant differences in terms of age, sex, comorbidities, duration from symptoms onset to hospital visit, presence of the cilioretinal artery, and use of anterior chamber paracentesis between the two groups. The HBO2 group showed significantly higher change in best-corrected visual acuity than the no HBO2 group (p=0.043). The authors concluded the study showed patients with CRAO in the HBO2 group showed significantly greater visual improvement than those in the no-HBO2 group.

A 2016 Cochrane review identified one randomized, controlled trial (RCT) evaluating systemic HBOT for people with autism spectrum disorder who met reviewers' eligibility criteria, and that trial did not find significantly improved outcomes with HBOT versus sham (Xiong 2016). The authors concluded that there is no evidence that HBOT improves core symptoms and associated symptoms of ASD, adding that it is important to note that adverse effects (minor-grade ear barotrauma events) can

occur. Given the absence of evidence of effectiveness, the limited biological plausibility, and possible adverse effects, the need for future RCTs of HBOT must be carefully considered.

Published clinical trials have not provided evidence to support the efficacy and safety of HBOT over current treatment options for the indications listed as investigational in this policy.

PROFESSIONAL GUIDELINE(S)

The Undersea and Hyperbaric Medical Society (UHMS) (2023) published recommended indications for systemic hyperbaric oxygen therapy which include the following:

- Air or gas embolism
- Arterial insufficiencies
    - Central retinal artery occlusions
    - Selected problem wounds-diabetic ulcers (microvascular insufficiency)
- Carbon monoxide poisoning/ carbon monoxide poisoning complicated by cyanide poisoning
- Clostridial myositis and myonecrosis (gas gangrene)
- Crush injury, compartment syndrome, and other acute traumatic ischemias
- Decompression sickness
- Severe anemia
- Intracranial abscesses
- Necrotizing infections
- Osteomyelitis (refractory)
- Delayed radiation injury (soft tissue and bony necrosis)
- Compromised skin grafts and flaps
- Acute thermal burn injury
- Idiopathic sudden sensorineural hearing loss
- Avascular necrosis (aseptic osteonecrosis)

In 2015, the Undersea and Hyperbaric Medical Society (UHMS) published guidelines on the use of HBOT for treating diabetic foot ulcers (Huang 2015). Recommendations in the current version include:

- Suggest against using HBOT in patients with "Wagner Grade 2 or lower diabetic foot ulcers..."
- Suggest adding HBOT in patients with "Wagner Grade 3 or higher diabetic foot ulcers that have not shown significant improvement after 30 days of [standard of care] therapy..."
- Suggest "adding acute post-operative hyperbaric oxygen therapy to the standard of care" in patients with "Wagner Grade 3 or higher diabetic foot ulcers" who have just had foot surgery

related to their diabetic ulcers.

In December 2009, the Undersea and Hyperbaric Medical Society issued a position paper stating that the society does not recommend routine treatment of autism with HBOT, as there is very little evidence to support an effect of pressure alone or that oxygen has differing effects whether given by increasing ambient pressure or increasing the inspired fraction.

In 2019, the American Academy of Otolaryngology-Head and Neck Surgery updated clinical guidelines on the treatment of sudden sensorineural hearing loss (SSNHL) (Chandrasekhar 2019). They give the following options regarding HBOT:

- Clinicians may offer, or refer to a physician who can offer, hyperbaric oxygen therapy (HBOT) combined with steroid therapy within 2 weeks of onset of SSNHL.
- Clinicians may offer, or refer to a physician who can offer, hyperbaric oxygen therapy (HBOT) combined with steroid therapy as salvage within 1 months of onset of SSNHL."

The guideline provided a comprehensive list of evidence gaps and future research needs on the use of HBOT for SSNHL. These included, among others, the need for a standardized, evidence-based definition of SSNHL, the assessment of the prevalence of SSNHL, and the need for the development of standardized HBOT treatment protocols and standardized outcome assessments.

In 2025, The American Academy of Ophthalmology (AAO) published a Preferred Practice Pattern for Retinal and Ophthalmic Artery Occlusions (Kovach 2025). They state the use of hyperbaric oxygen therapy (100% oxygen over 9 hours) has demonstrated efficacy over observation alone in several small retrospective studies (Wu 2018, Chiabo 2024). However, a Cochrane review concluded that evidence is uncertain regarding interventions and well-designed randomized controlled trials are needed (Lin 2023).

In 2024, the American College of Cardiology/American Heart Association Joint Committee on Clinical Practice Guidelines published a Guideline for the Management of Lower Extremity PAD. The Guideline was developed in collaboration with and endorsed by the American Association of Cardiovascular and Pulmonary Rehabilitation, American Podiatric Medical Association, Association of Black Cardiologists, Society for Cardiovascular Angiography and Interventions, Society for Vascular Medicine, Society for Vascular Nursing, Society for Vascular Surgery, Society of Interventional Radiology, and Vascular & Endovascular Surgery Society. The Guideline included the following statements relevant to this evidence review:

- Beyond wound care, hyperbaric oxygen therapy has been studied in the context of wound healing for CLTI as an adjunctive therapy to revascularization and may have a limited role in this population.
- Hyperbaric oxygen therapy may be considered as an adjunctive therapy to revascularization for wound healing in the context of CLTI (chronic limb threatening ischemia) and diabetic foot ulcers.

In 2019 the American Heart Association and American Stroke Association updated the guidelines for early management of acute ischemic stroke (Powers 2019). The guidelines were endorsed by the

Society for Academic Emergency Medicine, the Neurocritical Care Society, the American Association of Neurological Surgeons, and the Congress of Neurological Surgeons. The Guideline included the following statements relevant to this evidence review:

"The limited data available on the utility of HBO therapy for acute ischemic stroke (not related to cerebral air embolism) show no benefit. HBO therapy is associated with claustrophobia and middle ear barotrauma, as well as an increased risk of seizures. Given the confines of HBO chambers, the ability to closely/adequately monitor patients may also be compromised. HBO thus should be offered only in the context of a clinical trial or to individuals with cerebral air embolism."

In 2016, the Society of Vascular Surgery in collaboration with the American Podiatric Medical Association and the Society for Vascular Medicine published guidelines on the management of the diabetic foot (Hingorani 2016). According to the guidelines, for diabetic foot ulcers that fail to demonstrate improvement (> 50% wound area reduction) after a minimum of 4 weeks of standard wound therapy, adjunctive therapy such as HBOT is recommended (grade 1B). Also, for diabetic foot ulcers with adequate perfusion that fail to respond to 4 to 6 weeks of conservative management, HBOT is suggested (grade 2B).

REGULATORY STATUS

Since 1979, the U.S. Food and Drug Administration (FDA) has cleared multiple topical and systemic hyperbaric oxygen administration devices through the 510(k) pathway. Last updated in 2021, the FDA has cleared hyperbaric chambers for the following disorders:

- Air and gas bubbles in blood vessels
- Anemia (severe anemia when blood transfusions cannot be used)
- Burns (severe and large burns treated at a specialized burn center)
- Carbon monoxide poisoning
- Crush injury
- Decompression sickness (diving risk)
- Gas gangrene
- Hearing loss (complete hearing loss that occurs suddenly and without any known cause)
- Infection of the skin and bone (severe)
- Radiation injury
- Skin graft flap at risk of tissue death
- Vision loss (when sudden and painless in one eye due to blockage of blood flow)
- Wounds (non-healing, diabetic foot ulcers)

HBOT is being studied for other conditions, including COVID-19. However, at this time, the FDA has not cleared or authorized the use of any HBOT device to treat COVID-19 or any conditions beyond

those listed above.

In 2013, the FDA published a statement warning that non-FDA approved uses of HBOT may endanger the health of patients. If patients mistakenly believe that HBOT devices have been proven safe for uses not cleared by the FDA, they may delay or forgo proven medical therapies. Patients receiving HBOT are at risk of suffering an injury that can be mild (such as sinus pain, ear pressure, painful joints) or serious (such as paralysis, air embolism). Since hyper baric chambers are oxygen rich environments, there is also a risk of fire.

The FDA states the safety and effectiveness of HBOT has not been established for these diseases and conditions, including:

- AIDS/HIV
- Alzheimer's Disease
- Asthma
- Bell's Palsy
- Brain Injury
- Cerebral Palsy
- Depression
- Heart Disease
- Hepatitis
- Migraine
- Multiple Sclerosis
- Parkinson's Disease
- Spinal Cord Injury
- Sport's Injury
- Stroke

CODE(S)

- Codes may not be covered under all circumstances.
- Code list may not be all inclusive (AMA and CMS code updates may occur more frequently than policy updates).
- (E/I)=Experimental/Investigational
- (NMN)=Not medically necessary/appropriate

CPT Codes

Code	Description
99183	Physician or other qualified health care professional attendance and supervision of hyperbaric oxygen therapy, per session

Copyright © 2026 American Medical Association, Chicago, IL

HCPCS Codes

Code	Description
A4575 (E/I)	Topical hyperbaric oxygen chamber, disposable
E0446 (E/I)	Topical oxygen delivery system, not otherwise specified, includes all supplies and accessories
G0277	Hyperbaric oxygen under pressure, full body chamber, per 30-minute interval

ICD10 Codes

Code	Description
A18.01	Tuberculosis of spine
A18.03	Tuberculosis of other bones
A42.0-A42.2	Actinomycosis (code range)
A42.81-A42.89	Other forms of actinomycosis (code range)
A42.9	Actinomycosis, unspecified
A43.0-A43.9	Nocardiosis (code range)
A48.0	Gas gangrene
A50.01-A50.09	Early congenital syphilis, symptomatic (code range)
A52.77	Syphilis of bone and joint
B36.0-B36.9	Other superficial mycoses (code range)
B47.1	Actinomycetoma
B47.9	Mycetoma, unspecified
B48.3	Geotrichosis
B48.8	Other specified mycoses

Code	Description
B49	Unspecified mycosis
D62	Acute posthemorrhagic anemia
E08.52	Diabetes mellitus due to underlying condition with diabetic peripheral angiopathy with gangrene
E09.52	Drug or chemical induced diabetes mellitus with diabetic peripheral angiopathy with gangrene
E10.52	Type 1 diabetes mellitus with diabetic peripheral angiopathy with gangrene
E10.618-E10.69	Type 1 diabetes mellitus with other specified complications (code range)
E11.52	Type 2 diabetes mellitus with diabetic peripheral angiopathy with gangrene
E11.618-E11.69	Type 2 diabetes mellitus with other specified complication
E13.52-E13.69	Other specified diabetes mellitus (code range)
G93.6	Cerebral edema
H05.021-H05.029	Osteomyelitis of orbit (code range)
H90.3	Sensorineural hearing loss, bilateral
H90.5	Unspecified sensorineural hearing loss
H90.A2-H90.A22	Sensorineural hearing loss, unilateral, with restricted hearing on the contralateral side (code range)
H91.2-H91.23	Sudden idiopathic hearing loss (code range)
H34.1-H34.13	Central retinal artery occlusion (code range)
I70.361-I70.369	Atherosclerosis of bypass graft(s) of the extremities with gangrene (code range)
I70.461-I70.469	Atherosclerosis of autologous vein bypass graft(s) of the extremities with gangrene (code range)
I73.01	Raynaud's syndrome with gangrene

Code	Description
I96	Gangrene, not elsewhere classified
K12.2	Cellulitis and abscess of mouth
L02.01-L02.93	Cutaneous abscess, furuncle, and carbuncle (code range)
L03.111-L03.119	Cellulitis of other parts of limb (code range)
L03.121-L03.129	Acute lymphangitis (code range)
L03.211-L03.91	Cellulitis and acute lymphangitis (code range)
L08.1	Erythrasma
L59.9	Disorder of the skin and subcutaneous tissue related to radiation, unspecified
L98.3	Eosinophilic cellulitis (Wells)
M27.2	Inflammatory conditions of jaws
M27.8	Other specified diseases of jaws
M46.20-M46.28	Osteomyelitis of vertebra (code range)
M46.30-M46.39	Infection of intervertebral disc (pyogenic) (code range)
M86.00-M86.09	Acute hematogenous osteomyelitis (code range)
M86.10-M86.19	Other acute osteomyelitis (code range)
M86.20-M86.29	Subacute osteomyelitis (code range)
M86.30-M86.69	Chronic osteomyelitis (code range)
M86.8x0-M86.9	Other and unspecified osteomyelitis (code range)
M90.80-M90.89	Osteopathy in diseases classified elsewhere (code range)

Code	Description
P11.0	Cerebral edema due to birth injury
S06.1x0A-S06.1x9A	Traumatic cerebral edema (code range)
S07.0xxA, S17.9xxA,	Crushing injury (code range)
T57.3x1A-T57.3x4A	Toxic effect of hydrogen cyanide (code range)
T58.01xA-T58.94xA	Toxic effect of carbon monoxide (code range)
T65.0x1A-T65.0x4A	Toxic effect of cyanides (code range)
T66.xxxA-T66.xxxS	Radiation sickness, unspecified (code range)
T70.3xxA-T70.3xxS	Caisson disease (decompression sickness) (code range)
T79.0xxA-T79.0xxS	Air embolism (traumatic) (code range)
T86.820-T86.822	Complications of skin graft (allograft) (autograft) (code range)
T86.828-T86.829	Other and unspecified complications of skin graft (allograft) (autograft) (code range)

PRODUCT DISCLAIMER

- Services are contract dependent; if a product does not cover a service, medical policy criteria do not apply.
- If a commercial product (including an Essential Plan or Child Health Plus product) covers a specific service, medical policy criteria apply to the benefit.
- If a Medicaid product covers a specific service, and there are no New York State Medicaid guidelines (eMedNY) criteria, medical policy criteria apply to the benefit.
- If a Medicare product covers a specific service, and there is no national or local Medicare coverage decision for the service, medical policy criteria apply to the benefit.

POLICY HISTORY/REVISION

Committee Approval Dates

New:02/99

Revised:10/99, 12/00, 09/03, 12/04, 09/05, 11/06, 09/08, 07/09, 09/11, 09/14, 01/15, 09/15, 09/17, 09/20, 9/21, 11/23, 5/24, 11/25

Reviewed:01/01, 12/02, 07/04, 10/07, 09/10, 09/12, 09/13, 09/16, 09/18, 09/19, 9/22, 9/23, 9/24, 9/25, 9/26

Date	Summary of Changes
1/1/2026	• Transitioned Hyperbaric Oxygen Therapy policy, 1370/20.000203 to Lifetime Healthcare Companies policy template.
6/1/2024	• Added examples of soft tissue radionecrosis.

12/1/2023	• Added the following additional covered indications: • Central retinal artery occlusion (CRAO) • Idiopathic sudden sensorineural hearing loss (SSHL)
1/1/2022	• Removed indication for HBOT as an adjunct treatment for burns and added skin burns (thermal) to the exclusions. • Under Medicaid: To clarify criteria, added verbiage from the MMIS DME Manual for topical oxygen wound therapy. Also removed code E0446 as this code is no longer on the MMIS DME Manual.
1/1/2021	• Added Lyme disease to the Exclusions section.

Policy/Procedure Name: Immune Thrombocytopenia (ITP) Policy **Control Number: 1350/20.000329**

Disclaimer Notice

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgment when deciding the most appropriate care for enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

Background

Immune thrombocytopenia (ITP) is a rare autoimmune bleeding disorder defined as thrombocytopenia (platelet count < 100,000 x 10^9/L) without anemia or leukocytopenia and without another apparent cause of thrombocytopenia. Patients may appear asymptomatic, in which thrombocytopenia is detected through CBC, or symptomatic with signs of bleeding, such as petechiae, purpura, epistaxis, and rarely, major or clinical hemorrhages. ITP can be further categorized based on duration: newly diagnosed (within 3 months), persistent (3-12 months), and chronic ITP (> 12 months).

ITP can affect both children and adults. First line treatment is corticosteroids. For adults with persistent ITP, who are dependent on or unresponsive to corticosteroids, it is recommended to initiate thrombopoietin (TPO) receptor agonists: Nplate (romiplostim), Promacta (eltrombopag olamine), Alvaiz (eltrombopag choline), and Doptelet (avatrombopag). For adults with chronic ITP, who are dependent on or unresponsive to corticosteroids, recommended treatment options include TPO receptor agonists or splenectomy.

For children with persistent ITP, who are unresponsive to corticosteroids or intravenous immune globulin (IVIG), recommended treatment options include TPO receptor agonists and splenectomy.

Intravenous immune globulin (IVIG) is a potent immunomodulating agent that consists of concentrated human immunoglobulin, prepared from pooled plasma collected from human donors. IVIG is indicated for providing antibodies to patients who are susceptible to diseases where there is no immunization available and to treat certain immunodeficiencies. IVIG is recommended for patients who require a rapid increase in platelet count in those unresponsive to corticosteroid. In ITP, IVIG increases platelet count by blocking the Fc receptors on macrophages in the spleen and liver, preventing the uptake of autoantibody-coated platelets.

This policy contains coverage requirements for the following drugs: Nplate (romiplostim), Promacta (eltrombopag olamine), Alvaiz (eltrombopag choline), Doptelet (avatrombopag), Tavalisse (fostamatinib), and Wayrilz (rilzabrutinib). IVIG is addressed in a separate policy (Intravenous Immune Globulin (IVIG) & Subcutaneous Immune Globulin (SCIG) Therapy, 1350/20.000143).

TPO receptor agonists for the treatment of ITP include **Nplate (romiplostim)**, **Promacta (eltrombopag olamine)**, **Alvaiz (eltrombopag choline)**, and **Doptelet (avatrombopag)** which are all indicated after insufficient response to corticosteroids, immunoglobulin, or splenectomy. Nplate is also indicated for increasing the survival in adults and pediatric patients (including term neonates) with hematopoietic syndrome of acute radiation syndrome. Promacta and Alvaiz are also indicated for thrombocytopenia due to chronic hepatitis C and severe aplastic anemia. Doptelet is also indicated for chronic liver disease who are scheduled to undergo a procedure.

Tavalisse (fostamatinib) is a spleen tyrosine kinase (SYK) inhibitor that is only indicated for the treatment of chronic ITP after insufficient response to previous therapies.

Wayrilz (rilzabrutinib) is a Bruton's tyrosine kinase (BTK) inhibitor that is only indicated for the treatment of adults with persistent or chronic ITP who have had insufficient response to previous treatments.

Summary

Effective date of policy:	2/12/2026
Indications	Per product
ICD10 diagnosis codes	D69.5, D69.3, T66
Availability	*See individual formulary for covered product(s)*
HCPCS Code	Nplate – J2802
Duration	Thrombocytopenia in adults with chronic liver disease: 14 days Chronic immune thrombocytopenia: • Initial: 6 months • Continuation: 12 months

Required Criteria for Approval

Alvaiz (eltrombopag) - Rx	
Indication	**Criteria**
Immune thrombocytopenia (FDA approval) ICD10: D69.3	• Must be prescribed by or in consultation with a hematologist • Must have a diagnosis of immune thrombocytopenia/idiopathic thrombocytopenia purpura • Must have a current (within 30 days) platelet count of either: o less than 30 x 10^9/L o less than 50 x 10^9 with significant bleeding symptoms • Must have had an insufficient response (defined as a platelet count of < 30 x 109/L, or ≥ 30 x 109/L but with bleeding symptoms) to corticosteroids OR immunoglobulins (IVIG) • Initial approval will be provided for 6 months. • Recertification for 12 months at a time will require the following: o First recertification (after initial approval) will require documentation of the following: ▪ Positive response to treatment as documented by one of the following: • Platelet count ≥ 50 x 10^9/L OR • Platelet count ≥ 30 x 10^9/L without evidence of bleeding o Subsequent recertifications (after first recertification) will require documentation of the following: ▪ Maintenance of increased platelet count from baseline (platelet count ≥ 50 x 109/L OR platelet count ≥ 30 x 10^9/L without evidence of bleeding) AND ▪ Provider attests continuation of treatment is required to maintain a platelet count sufficient to avoid clinically important bleeding and will not be used to normalize platelet counts • Quantity limit is 30 tablets per 30 days o Approved requests for FDA approved indications that require 108 mg dosing will be approved with a quantity authorization to allow two 54 mg tablets per day o Requests above the quantity limit will be reviewed for medical necessity **AND** reviewed to require the most cost-efficient dose available for the quantity requested
Chronic Hepatitis C-Associated Thrombocytopenia (FDA approval) ICD 10: D69.59	• Must have a diagnosis of hepatitis C-associated thrombocytopenia • Must be prescribed by or in consultation with a prescriber specializing in infectious disease, gastroenterology, hepatology or hematology • Must have a platelet level < 75 x 10^9 within previous 4 weeks • Eltrombopag is being prescribed to increase platelet count sufficiently to allow the initiation (or maintenance) of interferon-based therapy • Initial approval will be provided for 6 months. • Recertification for 6 months at a time will require documentation of the following: o Documentation of platelet count ≥ 90 x 10^9/L OR platelet count has increased sufficiently to initiate or maintain interferon therapy **AND** o Patient is continuing to receive interferon-based therapy. Eltrombopag should be discontinued when interferon therapy is discontinued • Quantity limit is 30 tablets per 30 days o Approved requests for FDA approved indications that require 108 mg dosing will be approved with a quantity authorization to allow two 54 mg tablets per day o Requests above the quantity limit will be reviewed for medical necessity **AND** reviewed to require the most cost-efficient dose available for the quantity requested
Severe Aplastic Anemia (FDA approval) ICD 10: D61.2	• Must have a diagnosis of severe aplastic anemia • Must be prescribed by or in consultation with a hematologist • Diagnosis of severe aplastic anemia must be documented by BOTH: o One of the following: ▪ A marrow biopsy showing < 25% of normal cellularity ▪ A marrow biopsy showing < 50% normal cellularity in which < 30% of cells are hematopoietic

	○ At least 2 of the following are present at the time of diagnosis ▪ Absolute reticulocyte count < 60,000microL ▪ Absolute neutrophil count < 500/microL ▪ Platelet count < 20,000/microL • Baseline hemoglobin and documentation of RBC transfusion status must be submitted • Must have had an insufficient response to immunosuppressive therapy • Alvaiz should not be used to normalize platelet counts. • Initial approval will be provided for 6 months. • Recertification for 12 months at a time requires the following: ○ First recertification (after initial approval) will require documentation of positive hematologic response as evidenced by any of the following: ▪ Platelet count ≥ 50 x 109/L ▪ Platelet count increases to 20 x 109/L above baseline ▪ Stable platelet counts with transfusion independence for a minimum of 8 weeks ▪ Hemoglobin increase by greater than 1.5 g/dL ▪ Reduction in greater than or equal to 4 units of RBC transfusions for 8 consecutive weeks ▪ An ANC increase of 100% ▪ An ANC increase greater than 0.5 x 10^9/L ○ Subsequent recertifications (after first recertification) will require documentation of maintenance of positive hematologic response. • Quantity limit is 30 tablets per 30 days ○ Approved requests for FDA approved indications that require 108 mg dosing will be approved with a quantity authorization to allow two 54 mg tablets per day ○ Requests above the quantity limit will be reviewed for medical necessity **AND** reviewed to require the most cost-efficient dose available for the quantity requested
Doptelet and Doptelet Sprinkle (avatrombopag) - Rx	
Thrombocytopenia in adults with chronic liver disease (FDA approval) ICD10: D69.5	• Member must have a diagnosis of chronic liver disease and be scheduled to undergo a procedure with date of the procedure provided **AND** ○ Must be 18 years of age or older ○ Must also have a diagnosis of thrombocytopenia defined as a platelet count of less than 50 x 10^9/L within 30 days prior to procedure ○ Must be prescribed by or in consultation with a hepatologist, gastroenterologist, or hematologist ○ Must be prescribed for the appropriate dose based on platelet count prior to the scheduled procedure: ▪ For patients with a platelet count between 40 and 50 x 10^9/L, Doptelet can be approved at a dose of 40 mg (2 tablets) per day for 5 days ▪ For patients with a platelet count less than 40 x 10^9/L, Doptelet can be approved at a dose of 60 mg (3 tablets) per day for 5 days ○ Patients should begin dosing 10-13 days prior to their procedure and undergo their procedure within 5-8 days after their last dose ○ Approval will be for 14 days ○ Reauthorizations for future peri-procedural treatment must meet initial authorization criteria. ○ Documentation of prior response to therapy is required. Patients will not be eligible for retreatment if considered a non-responder to the initial course of therapy (non-responder defined as requiring a platelet transfusion following avatrombopag therapy) ○ Quantity limit: Tablets: 15 tablets per 30 days.
Chronic immune thrombocytopenia (ITP) (FDA approval) ICD10: D69.3	• Member must have a diagnosis of Immune Thrombocytopenia/Idiopathic Thrombocytopenia Purpura (ITP) **AND** ○ An adult patient with thrombocytopenia lasting more than 12 months (chronic ITP) **OR** ○ Pediatric patient 1 year of age or older with thrombocytopenia lasting 6 months or greater (persistent or chronic ITP) **AND** ○ Must be prescribed by or in consultation with a hematologist **AND** ○ Member has one of the following within the previous 30 days:

	▪ Platelet count < 30 x 10^9/L **OR** ▪ Platelet count < 50 x 10^9/L with significant bleeding symptoms o Must have had an insufficient response (defined as a platelet count of < 30 x 10^9/L, or ≥ 30 x 10^9/L but with bleeding symptoms) to corticosteroids **OR** immunoglobulins (IVIG) o Initial approval will be provided for 6 months. o Recertification for 12 months at a time will require the following: ▪ First recertification (after initial approval) will require documentation of the following: • Positive clinical response to treatment as documented by one of the following: ▪ Platelet count ≥ 50 x 10^9/L OR ▪ Platelet count ≥ 30 x 10^9/L without evidence of bleeding • Subsequent recertifications (after first recertification) will require documentation of the following: ▪ Maintenance of increased platelet count from baseline (platelet count ≥ 50 x 10^9/L or platelet count ≥ 30 x 10^9/L without evidence of bleeding) **AND** ▪ Provider attests continuation of treatment is required to maintain a platelet count sufficient to avoid clinically important bleeding and will not be used to normalize platelet counts • Doptelet should not be used to normalize platelet counts • Quantity limit: o **Tablets:** 15 tablets per 30 days. ▪ For adult and pediatric patients with a diagnosis of ITP, a quantity of 60 tablets per 30 days will be allowed o **Sprinkle capsules** are only approved for children aged 1 to less than 6 years old with a quantity limit of 60 capsules per 30-day supply for a maximum of 20 mg/day.
Mulpleta (lusutrombopag) - Rx	
Thrombocytopenia in adults with chronic liver disease (FDA approval) ICD10: D69.5	• Must be at least 18 years old • Must be prescribed by or in consultation with a hepatologist, gastroenterologist, or hematologist • Must have a diagnosis of chronic liver disease and be scheduled to undergo an invasive procedure that has a high risk of bleeding associated, as described in Table 1 (below)[3], OR is undergoing a low-bleeding-risk procedure with a personal history of clinically relevant bleeding requiring intervention o Date of procedure must be provided • Must have a platelet count below 50 x 10^9/L obtained within four weeks prior to procedure • Doptelet is started 10 to 13 days prior to scheduled procedure, and members should undergo procedure five to eight days after last dose • Quantity limit is 15 tablets per 30 days • Reauthorizations for future peri-procedural treatment must meet initial authorization criteria. Documentation of prior response to therapy is required. Patients will not be eligible for retreatment if considered a non-responder to the initial course of therapy (non-responder defined as requiring a platelet transfusion following avatrombopag therapy) • Mulpleta therapy is initiated 8 to 14 days prior to scheduled procedure, and member should undergo procedure 2-8 days after last dose of drug o Quantity limit is 7 tablets per 30 days • Reauthorizations for future peri-procedural treatment must meet initial authorization criteria. Documentation of prior response to therapy is required. Patients will not be eligible for retreatment if considered a non-responder to the initial course of therapy (non-responder defined as requiring a platelet transfusion following lusutrombopag therapy)

Nplate (romiplostim) - Medical	
Immune thrombocytopenia (ITP) (FDA approval) ICD10: D69.3	• Must be prescribed by or in consultation with a hematologist • Must have a diagnosis of immune thrombocytopenia/idiopathic thrombocytopenia purpura • Must have a current (within 30 days) platelet count of either: o less than 30 x 10^9/L o less than 50 x 10^9 with significant bleeding symptoms • Must have had an insufficient response (defined as a platelet count of <30 x 109/L, or ≥ 30 x 109/L but with bleeding symptoms) to corticosteroids OR immunoglobulins (IVIG) • Initial approval will be provided for 6 months. • Recertification for 12 months at a time will require the following: o First recertification (after initial approval) will require documentation of the following: ▪ 1. Positive response to treatment as documented by one of the following (A OR B): • A. Platelet count ≥ 50 x 10^9/L OR • B. Platelet count ≥ 30 x 10^9/L without evidence of bleeding o Subsequent recertifications (after first recertification) will require documentation of the following: ▪ Maintenance of increased platelet count from baseline (platelet count ≥ 50 x 10^9/L or platelet count ≥ 30 x 10^9/L without evidence of bleeding) AND ▪ Provider attests continuation of treatment is required to maintain platelet count sufficient to avoid clinically important bleeding and will not be used to normalize platelet counts. • Nplate may be used in combination with other medical ITP therapies such as, corticosteroids, danazol, azathioprine, intravenous immunoglobulin (IVIG), and anti-D immunoglobulin. • The approved dose is 1 mcg/kg once weekly (subcutaneously). The dose may be adjusted in increments of 1 mcg/kg to achieve platelet counts of ≥ 50 x 10^9/L. Max weekly dose of 10 mcg/kg.
Hematopoietic subsyndrome of acute radiation syndrome (HSARS) (FDA approval) ICD10: T66	• The medication must be used to treat hematopoietic subsyndrome of acute radiation syndrome to increase survival in adults and in pediatric patients (including term neonates) acutely exposed to myelosuppressive doses of radiation o The medication must be given as a single dose of 10 mcg/kg o Approval will be provided for 1 month and may not be renewed
Promacta and eltrombopag tablet and powder for suspension - Rx	
Immune Thrombocytopenia (ITP) (FDA approval) ICD10: D69.3	• Must be at least 18 years of age • Must be prescribed by or in consultation with a hematologist • Must have a diagnosis of immune thrombocytopenia/idiopathic thrombocytopenia purpura • Must have a current (within 30 days) platelet count of either: o less than 30 x 10^9/L o less than 50 x 10^9 with significant bleeding symptoms • Must have had an insufficient response (defined as a platelet count of less than 30 x 10^9/L, or ≥ 30 x 10^9/L but with bleeding symptoms) to corticosteroids OR immunoglobulins (IVIG) • Initial approval will be for 6 months. • Recertification for 12 months at a time will require the following: o First recertification (after initial approval) will require documentation of the following: ▪ Positive response to treatment as documented by one of the following: • Platelet count ≥ 50 x 10^9/L **OR** • Platelet count ≥ 30 x 10^9/L without evidence of bleeding o Subsequent recertifications (after first recertification) will require documentation of the following: ▪ Maintenance of increased platelet count from baseline (platelet count ≥ 50 x 109/L or platelet count ≥ 30 x 10^9/L without evidence of bleeding) AND ▪ Provider attests continuation of treatment is required to maintain a platelet count sufficient to avoid clinically important bleeding and will not be used to normalize platelet counts • Quantity limit is 30 tablets or packets per 30 days

	○ Approved requests for FDA approved indications that require 150 mg dosing will be approved with a quantity authorization to allow two 75 mg tablets per day ○ Requests above the quantity limit will be reviewed for medical necessity AND reviewed to require the most cost-efficient dose available for the quantity requested
Chronic Hepatitis C-Associated Thrombocytopenia (FDA approval) ICD 10: D69.59	• Must have a diagnosis of hepatitis C-associated thrombocytopenia • Must be prescribed by or in consultation with a prescriber specializing in infectious disease, gastroenterology, hepatology or hematology • Must have a platelet level < 75 x 10^9 within previous 4 weeks • Eltrombopag is being prescribed to increase platelet count sufficiently to allow the initiation (or maintenance) of interferon-based therapy • Recertification for 6 months at a time will require documentation of the following: ○ Documentation of platelet count ≥ 90 x 10^9/L OR platelet count has increased sufficiently to initiate or maintain interferon therapy **AND** • Patient is continuing to receive interferon-based therapy. Eltrombopag should be discontinued when interferon therapy is discontinued • Quantity limit is 30 tablets or packets per 30 days ○ Approved requests for FDA approved indications that require 150 mg dosing will be approved with a quantity authorization to allow two 75 mg tablets per day ○ Requests above the quantity limit will be reviewed for medical necessity AND reviewed to require the most cost-efficient dose available for the quantity requested
Severe Aplastic Anemia (FDA approval) ICD 10: D61.2	• Must have a diagnosis of severe aplastic anemia • Must be prescribed by or in consultation with a hematologist • Diagnosis of severe aplastic anemia must be documented by BOTH: ○ One of the following: ▪ A marrow biopsy showing < 25% of normal cellularity ▪ A marrow biopsy showing < 50% normal cellularity in which < 30% of cells are hematopoietic ○ At least 2 of the following are present at the time of diagnosis ▪ Absolute reticulocyte count < 60,000microL ▪ Absolute neutrophil count < 500/microL ▪ Platelet count < 20,000/microL • Baseline hemoglobin and documentation of RBC transfusion status must be submitted • Promacta will be prescribed for one of the following: ○ As first-line therapy in combination with standard immunosuppressive therapy ○ For refractory or second-line treatment as a single agenet following insufficient response to immunosuppressive therapy • Eltrombopag should not be used to normalize platelet counts • Initial response will be provided for 6 months • Recertification for 12 months requires the following: ○ First recertification (after initial approval) will require documentation of positive hematologic response as evidenced by any of the following: ▪ Platelet count ≥ 50 x 109/L ▪ Platelet count increases to 20 x 109/L above baseline or ▪ Stable platelet counts with transfusion independence for a minimum of 8 weeks or ▪ Hemoglobin increase by greater than 1.5 g/dL or ▪ Reduction in greater than or equal to 4 units of RBC transfusions for 8 consecutive weeks or ▪ An ANC increase of 100 % or ▪ An ANC increase greater than 0.5 x 109/L • Subsequent recertifications will require documentation of maintenance of positive hematologic response

	• Quantity limit is 30 tablets or packets per 30 days o Approved requests for FDA approved indications that require 150 mg dosing will be approved with a quantity authorization to allow two 75 mg tablets per day o Requests above the quantity limit will be reviewed for medical necessity AND reviewed to require the most cost-efficient dose available for the quantity requested
Tavalisse (fostamatinib) - Rx	
Immune thrombocytopenia (ITP) (FDA approval) ICD10: D69.3	• Must be at least 18 years of age • Must be prescribed by or in consultation with a hematologist • Must have a diagnosis of chronic immune thrombocytopenia/idiopathic thrombocytopenia purpura (thrombocytopenia lasting more than 12 months) • Must have a current (within 30 days) platelet count of either: o less than 30 x 10^9/L o less than 50 x 10^9 with significant bleeding symptoms • Must have had an insufficient response (defined as a platelet count of less than 30 x 109/L, or ≥ 30 x 10^9/L but with bleeding symptoms) to corticosteroids OR immunoglobulins (IVIG) • Tavalisse should not be used to normalize platelet counts • Initial approval will be provided for 6 months. • Recertification for 12 months at a time requires the following: o First recertification (after initial approval) will require documentation of positive response as evidenced by one of the following: ▪ Platelet count ≥ 50 x 10^9/L OR ▪ Platelet count ≥ 30 x 10^9/L without evidence of bleeding o Subsequent recertifications (after first recertification) will require documentation of the following: ▪ Maintenance of increased platelet count from baseline (platelet count ≥ 50 x 109/L or platelet count ≥ 30 x 10^9/L without evidence of bleeding) AND ▪ Prescriber attests continuation of treatment is required to maintain a platelet count sufficient to avoid clinically important bleeding and will not be used to normalize platelet counts. • The starting dose of Tavalisse is 100 mg twice daily. After 4 weeks, the dose can be increased to 150 mg twice daily to achieve a platelet count of at least 50 x 10^9/L to reduce the risk of bleeding. • Quantity limit of 60 per 30 days
Wayrilz (rilzabrutinib) - Rx	
Immune thrombocytopenia (ITP) who have had an insufficient response to a previous treatment (FDA approval) ICD10: D69.3	• Must be prescribed by or in consultation with a hematologist AND • Must be 18 years of age or older AND • Member must have a diagnosis of persistent or chronic Immune Thrombocytopenia/Idiopathic Thrombocytopenia Purpura (ITP) AND • Member has one of the following within the previous 30 days: o Platelet count <30 x 10^9/L OR o Platelet count < 50 x 10^9/L with significant bleeding symptoms • Must have had an insufficient response (defined as a platelet count of less than 30 x 10^9/L, or ≥ 30 x 10^9/L but with bleeding symptoms) to corticosteroids OR immunoglobulins (IVIG) AND • Must have had serious side effects or drug failure with eltrombopag • Initial approval will be provided for 6 months. • Recertification for 12 months at a time will require the following: o First recertification (after initial approval) will require documentation of positive response as evidenced by one of the following: ▪ Platelet count ≥ 50 x 10^9/L OR ▪ Platelet count ≥ 30 x 10^9/L without evidence of bleeding o Subsequent recertifications (after first recertification) will require documentation of the following:

	▪ Maintenance of increased platelet count from baseline (platelet count ≥ 50 x 109/L or platelet count ≥ 30 x 10^9/L without evidence of bleeding) AND ▪ Provider attests continuation of treatment is required to maintain a platelet count sufficient to avoid clinically important bleeding • Recommended dosage of Wayrilz is 400 mg twice daily. • Quantity limit is 60 tablets per 30-day supply

Exclusion Criteria

Exclusion Criteria for therapy in the treatment of Thrombocytopenia in adults with chronic liver disease (CLD):

- Members undergoing procedures that have a low risk of bleeding associated, including paracentesis, thoracentesis, gastrointestinal endoscopy with or without plans for biopsy, colonoscopy, polypectomy, or variceal banding. See Table 2 below for other procedures that are considered to have a low risk of bleeding, and will not be covered.
- Members undergoing procedures including laparotomy, thoracotomy, open-heart surgery, craniotomy, or organ resection.
- Mulpleta has been investigated only when used in a single seven-day once-daily dosing regimen in those with CLD undergoing a procedure, and should not be given to those with CLD in an attempt to normalize platelet count.
- Doptelet had been approved for use for five days only, and should not be given to those with CLD in an attempt to normalize platelet count.
- Doptelet use in members with thrombotic or thromboembolic complications (arterial or venous).
- Members will not be eligible for future re-treatment if considered a non-responder to the initial course of therapy (non-responder defined as requiring platelet transfusion following TPO receptor agonist therapy).
- Members with history of splenectomy, partial splenic embolization, or thrombosis; and those with Child-Pugh class C liver disease, absence of hepatopetal blood flow, or a prothrombotic condition other than CLD.

Considerations

- Patient must have prescription drug coverage administered by CDPHP.
- Prior authorization is obtained through the CDPHP pharmacy department.
- Members who have received therapy for thrombocytopenia with chronic liver disease (undergoing a procedure) should have repeat platelet count obtained no more than two days prior to procedure.
- Guideline suggested treatment regimens –
    - Corticosteroids - prednisone 0.5-2 mg/kg/per day for 2-3 weeks (tapered by 6-8 weeks) OR dexamethasone 40 mg per day for four days
    - IVIG - 1 g/kg/day for 1–2 days (high-dose) or 0.4 g/kg/day for up to five days (low-dose)

Table 1[3]

Risk of bleeding associated with procedure	Procedure
Low risk	Catheter exchanges (gastrostomy, biliary, nephrostomy, abscess, including gastrostomy/gastrojejunostomy conversions)
	Diagnostic arteriography and arterial interventions: peripheral, sheath < 6 F, embolotherapy
	Diagnostic venography and select venous interventions: pelvis and extremities
	Dialysis access interventions
	Facet joint injections and medial branch nerve blocks (thoracic and lumbar spine)
	IVC filter placement and removal
	Lumbar puncture
	Non tunneled chest tube placement for pleural effusion
	Non tunneled venous access and removal (including PICC placement)
	Paracentesis
	Peripheral nerve blocks, joint, and musculoskeletal injections
	Sacroiliac joint injection and sacral lateral branch blocks
	Superficial abscess drainage or biopsy (palpable lesion, lymph node, soft tissue, breast, thyroid, superficial bone, e.g., extremities and bone marrow aspiration)
	Thoracentesis
	Transjugular liver biopsy
	Trigger point injections including piriformis

	Tunneled drainage catheter placement
	Tunneled venous catheter placement/removal (including ports)
	Gastrointestinal endoscopy with or without plans for biopsy, colonoscopy, polypectomy, or variceal banding
High risk	Ablations: solid organs, bone, soft tissue, lung
	Arterial interventions: > 7-F sheath, aortic, pelvic, mesenteric, CNS
	Biliary interventions (including cholecystostomy tube placement)
	Catheter directed thrombolysis (DVT, PE, portal vein)
	Deep abscess drainage (e.g., lung parenchyma, abdominal, pelvic, retroperitoneal)
	Deep nonorgan biopsies (e.g., spine, soft tissue in intraabdominal, retroperitoneal, pelvic compartments)
	Gastrostomy/gastrojejunostomy placement
	IVC filter removal complex
	Portal vein interventions
	Solid organ biopsies
	Spine procedures with risk of spinal or epidural hematoma (e.g., kyphoplasty, vertebroplasty, epidural injections, facet blocks cervical spine)
	Transjugular intrahepatic portosystemic shunt
	Urinary tract interventions (including nephrostomy tube placement, ureteral dilation, stone removal)
	Venous interventions: intrathoracic and CNS interventions

MEDICAL POLICY

Medical Policy Title	**Implantable and Invasive Neuromodulation Systems**
Policy Number	**1.01.60**
Current Effective Date	**August 1, 2026**
Next Review Date	**May 2027**

Our medical policies are guides to evaluate technologies or services for medical necessity. Criteria are established through the assessment of evidence based, peer-reviewed scientific literature, and national professional guidelines. Federal and state law(s), regulatory mandates and the member's subscriber contract language are considered first in the determination of a covered service.
(Link to Product Disclaimer)

This policy does not address Sacral, Spinal Cord/Dorsal Column Stimulation or Tibial Nerve Stimulation.

POLICY STATEMENT(S)

I. The following implantable and invasive neuromodulation systems are **investigational**:
   A. Peripheral Nerve Stimulation (PNS)- Permanent Systems;
   B. Peripheral Nerve Stimulation (PNS)-Temporary Systems (e.g., SPRINT);
   C. Restorative Neurostimulation (e.g., ReActiv8);
   D. Percutaneous Electrical Nerve Stimulation/Percutaneous Neuromodulation Therapy.

DESCRIPTION

Peripheral Nerve Stimulation (PNS)- Permanent Systems

PNS is a similar concept to transcutaneous electrical nerve stimulation (TENS) but different in that

electrodes are implanted around or adjacent to the nerve serving the painful stimuli and then stimulated using a pulse generator and remote control. A trial of treatment is typically required prior to permanent implant of the generator and/or electrodes. Success of the trial is defined as > 50% reduction in pain response. PNS is generally reserved for patients who fail to get pain relief from TENS, medications, physical therapy or injection therapy.

The Moventis PNS (Micron Medical Corporation) received U.S. Food and Drug Administration (FDA) approval based upon substantial equivalence to The Freedom Spinal Cord Stimulator (SCS) System (Curonix) and an implanted peripheral nerve stimulator (StimQ PNS, Stimwave Technologies) for pain management. All of the devices are intended to treat adults who have severe intractable chronic pain of peripheral origin, as the sole mitigating agent, or as an adjunct to other modes of therapy used in a multidisciplinary approach and are not intended to treat pain in the craniofacial region of the body.

The Nalu neurostimulation (Nalu Medical, Inc.) system involves a 3-step process: wear experience, therapy trial, and permanent implantation. The treatment involves the initial use of adhesive clips and nonfunctioning Therapy Discs to determine future stimulation location and comfort level, followed by a temporary trial of the implanted leads, prior to permanent implantation. It is used for the management of chronic pain.

Peripheral Nerve Stimulation- Temporary Systems

The SPRINT peripheral nerve stimulation system (SPR Therapeutics, Inc.) is considered a temporary device, SPRINT uses a percutaneous electrode placed via an introducer needle near target peripheral motor or sensory nerves. The insertion of the implant does not require incisions or anesthesia, and the indwelling leads are left in place for up to 60 days. The device utilizes 300-micron diameter leads (one quarter the size of conventional neurostimulation leads) to provide safe lead withdrawal at the completion of the treatment. The device is intended to provide symptomatic relief of chronic, intractable pain, post-surgical and post-traumatic acute pain. It is not intended to treat pain in the craniofacial region of the body.

Restorative Neurostimulation Therapy

The ReActiv8 (Mainstay Medical) device is a permanent implant indicated for adults with intractable chronic low back pain associated with multifidus dysfunction who have failed pain medications and physical therapy and are not candidates for spine surgery. The device components consist of an implantable pulse generator, stimulation leads, software and programmer wand, activator, and magnet. ReActiv8 is marketed as the first and only restorative neurostimulation therapy to treat mechanical chronic low back pain and is full body MRI conditional.

Percutaneous Electrical Nerve Stimulation (PENS)/Percutaneous Neuromodulation Therapy (PNT)

PENS and PNT are terms often used interchangeably in the literature. This form of stimulation utilizes very fine needle-like electrode arrays placed near the painful area to stimulate peripheral sensory nerves in the soft tissue. PENS and PNT are also not to be confused with acupuncture using electrical stimulation. In electrical acupuncture, needle electrodes are inserted below the skin, but not necessarily at the site of pain. They are placed according to acupuncture meridians, which are a concept of Chinese medicine.

SUPPORTIVE LITERATURE

Peripheral Nerve Stimulation- Permanent Systems

Lin et al (2024) conducted a systematic review and meta-analysis of randomized controlled trials. The authors investigated the effectiveness of peripheral nerve stimulation (PNS) has on pain and improvement in function on post operative lower-limb orthopedic patients. Data was used from eight randomized controlled trials involving 633 patients. While PNS did not significantly reduce pain intensity or improve functional outcomes such as range of motion and length of hospitalization, it did lead to a marginally significant reduction in analgesic consumption. These findings suggest that although PNS may offer some benefit in reducing the need for pain medication, its overall clinical efficacy remains uncertain. The authors recommend future research with larger sample sizes, longer follow-up periods, and varied stimulation parameters to better assess its potential.

Peripheral Nerve Stimulation- Temporary Systems

Gilmore et al (2021) performed a prospective multi-center study aimed at characterizing the responses of percutaneous medial branch peripheral nerve stimulation (PNS) to see if results from earlier, smaller single-center studies and reports were generalizable when performed on a larger number of patients refractory to nonsurgical treatments. Participants (n=89) with chronic lower axial backpain, a pain score greater than or equal to four, had failed at least two different categories of treatments and had at least four weeks of stable analgesic medication usage were enrolled, eight of which were later to be found ineligible because they did not meet the predefined criteria at the baseline. Authors report enrollment stopped short due to COVID-19. Exclusions included history of lumbar surgery, however, 10 of the patients with a history of lumbar surgery were included as part of a prospectively designed sub study with revised exclusion criteria. Participants were implanted with percutaneous PNS leads from the SPRINT PNS System under ultrasound and/or fluoroscopic guidance and were left in place for up to 60-days, when leads were removed. Follow up was planned for 12 months after the two-month PNS treatment. The study was not completed, and follow-up beyond 8 months is on-going. Clinically and statistically significant reductions in pain intensity, disability, and pain interference were reported by a majority of participants. 73% of participants were successful for the primary end point, reporting clinically significant (≥ 30%) reductions in back pain intensity after the 2-month percutaneous PNS treatment (n = 54/74). Whereas prospective follow-up is ongoing, among those who had already completed the long-term follow-up visits (n = 51), reductions in pain intensity, disability, and pain interference were sustained in a majority of participants through 14 months after the start of treatment. Limitations of the study include lack of randomization and control group.

Restorative Neurostimulation Therapy

ReActiv8 system FDA approval was based on a 2020 randomized control trial by Gilligan and colleagues (ReActiv8-B, NCT02577354). The authors have since published two-year and three-year durability studies on the same participants (Gilligan et al 2021, 2023). The pivotal trial was a multicenter sham controlled RCT enrolling 204 individuals with chronic, refractory low back pain. All participants were permanently implanted with the system. Therapeutic group participants (n=102)

received active treatment of the medial branch of the dorsal ramus nerve for 30-minutes twice daily. The control group (n=102) received low level sham stimulation. The primary endpoint was the difference in proportions of responders in the treatment and control groups. Response was defined as having a 30% or greater reduction in visual analog scale (VAS) and no increase in pain medications, assessed at 120 days. Following the 120-day randomized phase, participants in the control group were given the option to cross over to the intervention group and were followed along with the participants from the intervention group for up to three years. At 120 days, there was no difference between groups on the primary endpoint of treatment response (57.1% intervention vs 46.6% sham; p =.1377) or the individual components of the primary endpoint.

The study investigators conducted prespecified secondary analyses of the primary outcome data, including the between-group difference in VAS at 120 days, a review of participants with increased pain medications, and a cumulative-proportion-of-responders analysis, which graphically displays the proportion of responders across the range of all possible cutoffs and is described as having greater statistical power than the comparison of proportions of the dichotomized primary outcome. The VAS mean change from baseline to 120 days favored the intervention group (-3.3 vs -2.4; p =.032), but it is unclear if the difference between groups (0.9 points) was clinically meaningful. The cumulative proportion-of-responders analysis similarly favored the intervention group (p =.0499). Nine participants in both the intervention and control groups had an increase in pain medication at 120 days, but the increase was unrelated to low back pain in 6 of 9 participants in the treatment group versus 0 of 9 in the control group. Most importantly, the controlled phase was only 120 days. In the longer-term, uncontrolled follow-up phase of the trial, there was continued improvement in VAS scores over time in those who were assessed. Data was available for 176 of 204 participants at 1 year (86.3%), 156 of 204 participants (79%) at two years, and 130 of 204 (63.7%) at three years. The limitations of the studies, including a lack of a control group and high attrition limits drawing conclusions from these results. Additional evidence from longer-term sham controlled RCTs is needed.

Percutaneous Electrical Nerve Stimulation (PENS)/Percutaneous Neuromodulation Therapy (PNT)

PENS has been investigated for the treatment of headache, diabetic neuropathy, chronic neck pain, chronic low back pain, chronic surface hyperalgesia, and musculoskeletal pain. A systematic review conducted by Plaza-Manzano and colleagues (2020) concluded that PENS could decrease the level of pain intensity, but not related disability, in musculoskeletal pain disorders. The overall level of evidence, however, was low and there was heterogeneity in the application methods.

Beltran-Alacreu et al (2022) evaluated the effectiveness of PENS compared to TENS on the reduction of musculoskeletal pain. This systematic review and meta-analysis included a total of nine RCTs in the qualitative analysis, with seven in the quantitative analysis. Overall, there was low-quality evidence for increased pain intensity reduction with PENS over TENS, but the difference found was not deemed to be clinically significant. When only studies with low risk of bias were meta-analyzed, there was a moderate quality of evidence that there is no difference between TENS and PENS for pain intensity. Six out of the nine studies presented high risk for the blinding of participants, and seven out of nine were high risk for blinding of personnel. Beyond these two items, the risk of bias in the included trials was either low or unclear. Protocols and parameters for the application of PENS

and TENS were heterogenous across all trials, leading to the conclusion that there is still high uncertainty regarding the effectiveness of PENS for musculoskeletal pain.

There are no well-designed randomized controlled studies in the medical literature comparing PNS to established treatment options or a sham procedure; and studies on larger populations with longer follow-up are needed to permit scientific conclusions regarding the benefit and improved health outcomes for the use of PNS.

PROFESSIONAL GUIDELINE(S)

The American Society of Pain and Neuroscience 2022 Clinical Guidelines for the Use of Implantable Peripheral Nerve Stimulation in the Treatment of Chronic Pain stated:

Facial Pain

- "Stimulation of occipital nerves may be offered to patients with chronic migraine headache when conservative treatments have failed. The average effect size for relief of migraine symptoms is modest to moderate." (Level I, Grade B)
- "There is insufficient evidence to recommend stimulation of supraorbital and infraorbital nerves for neuropathic craniofacial pain." (Level II-3, Grade C)

Upper Extremities

- "PNS may offer modest and short-term pain relief, improved physical function, and better quality of life for chronic hemiplegic shoulder pain." (Level I, Grade B)
- "PNS for mononeuropathies of the upper extremity may be offered following a positive diagnostic ultrasound-guided nerve block of the targeted nerve and is associated with modest to moderate pain relief." (Level II-2, Grade B)

Lower Back and Trunk

- "Subcutaneous peripheral field stimulation combined with optimal medication management may offer moderate improvement in pain intensity for failed back surgery syndrome compared to optimal medication management alone." (Level I, Grade B)
- "There is evidence that PNS of medial branch nerves may improve pain intensity, physical function, and pain interference in patients with axial, mechanical low back pain." (Level II-2, Grade B)
- "There is limited evidence that PNS alleviates pain in neuropathic pain syndrome involving the trunk and back, including radiculopathy and post-herpetic neuralgia." (Level III, Grade C)

Lower Extremities

- "PNS may be considered for lower extremity neuropathic pain following failure of conservative treatment options and is associated with modest pain relief." (Level I, Grade B)

- "PNS may be considered for lower extremity post-amputation pain following failure of conservative treatment options and is associated with modest to moderate pain relief." (Level I, Grade B) (Strand 2022)

REGULATORY STATUS

The United States Food and Drug Administration (FDA) regulates electrical stimulation devices as medical devices. All electrical stimulation devices including related components require FDA approval before marketing and use in the United States to ensure they are safe and effective for human use. Refer to the FDA Medical Device website. Available from: https://www.fda.gov/medical-devices [accessed 2026 Mar 13]

The FDA lists the most serious type of medical device recalls as well as early alert communications about corrective actions being taken by companies that the FDA believes are likely to be the most serious type of recalls. Available from: Medical Device Recalls | FDA [accessed 2026 Mar 13]

CODE(S)

- Codes may not be covered under all circumstances.
- Code list may not be all inclusive (AMA and CMS code updates may occur more frequently than policy updates).
- (E/I)=Experimental/Investigational
- (NMN)=Not medically necessary/appropriate

CPT Codes

Code	Description
64555 (E/I)	Percutaneous implantation of neurostimulator electrode-electrode array; peripheral nerve (excludes sacral nerve)
64575 (E/)	Open implantation of neurostimulator electrode array; peripheral nerve (excludes sacral nerve)
64585 (E/I)	Revision or removal of peripheral neurostimulator electrode array
64590 (*E/I)	Insertion or replacement of peripheral, sacral, or gastric neurostimulator pulse generator or receiver, requiring pocket creation and connection between electrode array and pulse generator or receiver (*E/I when services include the use of systems addressed within this policy.)
64596 (E/I)	Insertion or replacement of percutaneous electrode array, peripheral nerve, with integrated neurostimulator, including imaging guidance, when performed; initial electrode array
64999 (E/I)	Unlisted procedure, nervous system (PNS or PNT using needle[s] or needle electrode[s])

Copyright © 2026 American Medical Association, Chicago, IL

HCPCS Codes

Code	Description
C9807	Nerve stimulator, percutaneous, peripheral (e.g., sprint peripheral nerve stimulation system), including electrode and all disposable system components, nonopioid medical device (must be a qualifying Medicare nonopioid medical device for postsurgical pain relief in accordance with Section 4135 of the CAA, 2023)

ICD10 Codes

Code	Description
G89.2-G89.4	Chronic pain (code range)
G62.89	Other specified polyneuropathies
M53.86	Other specified dorsopathies, lumbar region
M53.87	Other specified dorsopathies, lumbosacral region
M54.51	Vertebrogenic low back pain
M62.85	Dysfunction of the multifidus muscles, lumbar region
M79.10	Myalgia, unspecified site

MEDICAL POLICY

Medical Policy Title	**Implantable Bone Conduction Hearing Aids**
Policy Number	**7.01.77**
Current Effective Date	**January 1, 2026**
Next Review Date	**April 2027**

Our medical policies are guides to evaluate technologies or services for medical necessity. Criteria are established through the assessment of evidence based, peer-reviewed scientific literature, and national professional guidelines. Federal and state law(s), regulatory mandates and the member's subscriber contract language are considered first in the determination of a covered service. (Link to Product Disclaimer)

This policy addresses implantable bone conduction hearing aids only. It does not address middle ear implants (partial or full) (e.g., Maxum System, Vibrant Soundbridge, or Esteem Implanted Hearing System) or nonsurgical bone-conduction hearing aids (e.g., Baha Headband, Baha Softband).

POLICY STATEMENT(S)

I. When used according to U.S. Food and Drug Administration (FDA) labeled indications, unilateral or bilateral implantable bone conduction (bone-anchored) hearing aid(s) are **medically appropriate** as an alternative to an air-conduction hearing aid when **ALL** of the following criteria are met:

   A. Individual is five (5) years of age or older;

   B. Individual has conductive or mixed-hearing loss;

   C. Speech discrimination scores are at least 60% at elevated sound pressure levels during standardized tests;

   D. A pure-tone average (PTA) bone-conduction threshold (measured at 0.5, 1, 2, and 3 kilohertz [kHz]) up to 70 decibels (dB) in the affected ear; **and**

   E. **ONE** of the following conditions are present:

      1. Congenital or surgically induced malformations (e.g., atresia) of the external ear canal or middle ear;

      2. Chronic external otitis or otitis media (e.g., recurring, or persistent infection or inflammation that precludes the wearing of a conventional air conduction hearing aid); **or**

      3. Other acquired malformations of the middle or external ear canals that preclude the wearing of a conventional air conduction hearing aid (e.g., tumor of the external canal or tympanic cavity, dermatitis of the external canal).

II. When used according to FDA labeled indications, implantable bone conduction (bone-anchored) hearing aids are **medically appropriate** as an alternative to an air-conduction contralateral routing of signal (CROS) hearing aid when **BOTH** of the following criteria are met:

A. Individual is five (5) years of age or older; **and**

B. Individual has single-sided sensorineural deafness in one ear and normal hearing in the contralateral ear.

III. Implantable bone conduction (bone-anchored) hearing aids are **not medically necessary** for individuals with **ANY** of the following contraindications:

A. Individual is under five (5) years of age;

B. Individual has insufficient bone volume and bone quality to support successful implant placement;

C. Individuals who are unable, and have no caregiver who is able, to perform the hygienic activities necessary to maintain the abutment/skin interface of the bone conduction hearing aid.

IV. All other uses of bone conduction (bone-anchored) hearing aids (e.g., use in patients with bilateral sensorineural hearing loss) are **investigational**.

Device Repair

V. Repair of a medically necessary bone conduction hearing aid or components not under warranty will be considered **medically appropriate** when the following criteria are met:

A. Physician documentation includes **ALL** of the following:

1. date of device implantation/initiation;
2. manufacturer warranty information, if applicable;
3. attestation that the patient has been compliant with the use of device and will continue to benefit from the use of device;

B. The device is no longer functioning adequately; and **BOTH** of the following criteria are met:

1. inadequate function interferes with activities of daily living; **and**
2. repair is expected to make the equipment fully functional (as defined by manufacturer).

C. Repair of equipment damaged due to patient neglect, theft, abuse, or when another available coverage source is an option (e.g., homeowners, rental, auto, liability insurance, etc.) is **ineligible for coverage**.

Device Replacement

VI. Replacement of a medically necessary bone conduction hearing aid or components not under warranty will be considered **medically appropriate** when **EITHER** of the following criteria are met:

A. The device is no longer functioning adequately and has been determined to be non-repairable or the cost of the repair is in excess of the replacement cost;

B. There is documentation that a change in the patient's condition makes the present unit non-functional and improvement is expected with a replacement unit.

VII. The replacement of a properly functioning bone conduction hearing aid, its components or accessories is considered **not medically necessary**. This includes, but is not limited to, replacement desired due to advanced technology or in order to make the device more aesthetically pleasing;

VIII. The replacement of equipment damaged or lost due to patient neglect, theft, abuse, or when another available coverage source is an option (e.g., homeowners, rental, auto, liability insurance, etc.) is **ineligible for coverage**.

IX. Accessories or components for bone conduction hearing aids that are considered not medically necessary or investigational by peer-reviewed literature will also be considered as **not medically necessary or investigational** by the Health Plan.

POLICY GUIDELINE(S)

I. Coverage for implantable bone conduction (bone-anchored) hearing aids, is provided under the member's prosthetic benefit.

DESCRIPTION

The American Speech-Language-Hearing Association (ASHA, n.d.) defines hearing loss (HL) within its practice portal available from: Hearing Loss in Adults [accessed 2026 Mar 02].

HL refers to an audiologic diagnosis of hearing thresholds outside the range of typical hearing, and can be described by variation in type, degree, and configuration. The three basic types of HL are:

- Sensorineural hearing loss (SNHL): cochlear (sensory) or vestibulocochlear nerve/CN VIII (neural) auditory dysfunction.
- Conductive hearing loss: a problem conducting sound waves through the outer ear canal, tympanic membrane, or middle ear (ossicles).
- Mixed hearing loss is the result of damage to conductive pathways of the outer or middle ear and to the nerves or sensory hair cells of the inner ear.

HL can be bilateral or unilateral, symmetrical (degree and configuration of HL are the same in each ear) or asymmetrical, progressive, or sudden in onset, fluctuating or stable, and present at birth or acquired. The degree of HL refers to level of severity, and is measured in decibels in hearing level, or dB HL. The degree of HL can have significant implications for an individual (e.g., limiting the ability to

understand speech in background noise, decreasing the enjoyment of music, impacting overall quality of life).

The most widely accepted degree of hearing loss system in the audiology field (ASHA, n.d.) defines HL severity levels as the following:

- Normal: -10 to 15 dB HL
- Slight: 16 to 25 dB HL
- Mild: 26 to 40 dB HL
- Moderate: 41 to 55 dB HL
- Moderately severe: 56 to 70 dB HL
- Severe: 71 to 90 dB HL
- Profound: ≥ 91 dB HL

The World Health Organization (2024) identifies several causes of HL that span across the lifespan, and often occur during critical periods of life, including the following:

Prenatal Period

- Genetic factors including hereditary and non-hereditary HL
- Intrauterine infections, such as rubella and cytomegalovirus infection

Perinatal Period

- Birth asphyxia
- Hyperbilirubinemia
- Low-birth weight
- Other perinatal morbidities and their management

Childhood and Adolescence

- Chronic suppurative otitis media
- Chronic nonsuppurative otitis media
- Meningitis and other infections

Adulthood and Older Age

- Chronic diseases
- Smoking
- Otosclerosis
- Age-related sensorineural degeneration
- Sudden SNHL

Factors Across the Life Span

- Cerumen impaction

- Trauma to the ear or head
- Loud noise/loud sounds
- Ototoxic medicines
- Work related ototoxic chemicals
- Nutritional deficiencies
- Viral infections and other ear conditions
- Delayed onset or progressive genetic HL

Technologies for the treatment of HL are dependent on the cause and severity and include hearing aids (external or implanted), cochlear implants, and middle ear implants.

Conventional external hearing aids are subdivided into air conduction hearing aids and bone conduction hearing aids. Air conduction hearing aids require the use of ear molds, which may be problematic in patients with chronic middle ear and ear canal infections, atresia of the external canal, or an ear canal that cannot accommodate an ear mold. In these patients, bone conduction hearing aids may be an alternative.

Bone conduction devices for hearing were first utilized in the early 1900's with the invention of the carbon microphone. The devices were made to convert sound into a mechanical signal that vibrated the mastoid bone. They were held in place with a headband or eyeglasses, were cumbersome, inefficient for sound transmission, however, were found to be beneficial. Modern bone-anchored hearing aids (BAHA) are osseointegrated bone conduction prostheses, meaning they are surgically implanted into the temporal bone.

A BAHA combines a sound processor with a small titanium fixture implanted into the bone behind the ear. The sound processor is connected to the implant and abutment by means of coupling. The device is placed on the deaf side behind the ear and transmits sound through bone conduction, stimulating the cochlea from the normal hearing ear. Bahas are classified as percutaneous and transcutaneous devices dependent on whether or not the abutment penetrates the skin.

Several implantable BAHAs have been developed and are available to treat patients with conductive or mixed hearing loss, including the following:

A percutaneous or direct-drive is a device coupled to the skull bone by a skin-penetrating abutment (e.g., Baha device and Ponto system).

A transcutaneous or transcutaneous passive or skin-driven BAHA device is coupled with an implanted subcutaneous magnet (Sophono device and Baha Attract).

An active transcutaneous device is a system with an implanted actuator, which communicates wirelessly with the external sound processor over the skin by an inductive link using radiofrequency transmission (e.g., Bonebridge or Osia device) (Maier 2022).

According to the American Speech-Language-Hearing Association (ASHA), a pure tone average (PTA) air conduction hearing threshold (measured at 0.5, 1, 2, and 3 kHz) of 71 - 90 dbHL (dB HL) is considered a severe hearing loss, and above 90 is considered a profound hearing loss. A normal

hearing range is up to 15 dB HL (ASHA, n.d.).

SUPPORTIVE LITERATURE

Published data have suggested that the BAHA device is associated with improved hearing outcomes compared to external bone conduction hearing aids, and equivalent outcomes compared to a conventional air conduction hearing aid.

Gawecki et al (2022) performed a small, randomized study that compared patients who received the Osia system (n=4) or the Baha Attract system (n=4) for bilateral mixed hearing loss. After implantation, the mean gain in PTA was 42.8 ± 4.9 dB in the Osia group and 38.8 ± 8.5 dB in the BAHA group. Patient ratings of hearing quality were better in the Osia group based on subjective Likert scores of sound loudness, sound distinctness, and hearing of own voice. Patient reported voice quality scores for reverberation were similar in the Osia and BAHA groups. Both groups reported improved quality of life based on global Abbreviated Profile of Hearing Aid Benefit scores but there was a numerically larger improvement in the Osia group. Results for the Speech, Spatial and Qualities of Hearing Scale improved in both groups and were slightly better in the BAHA group. The authors concluded that larger studies with longer follow-up are needed to evaluate differences in outcomes between these 2 systems.

Kim et al (2022) compared the effects of the Osia system with the Baha Attract and Bonebridge systems in 67 patients with conductive hearing loss (CHL) or mixed hearing loss (MHL) or single-sided deafness (SSD). Patients who received the Osia system (n=17) were prospectively recruited and retrospectively compared with patients who received the Baha Attract or Bonebridge systems (n=50). Effective gains in bone conduction threshold at 2 kHz were 11.1 ± 14.9 dB in the Osia group compared to -2.7 ± 12.6 dB in the Baha Attract and Bonebridge group (combined) among patients with CHL or mixed hearing loss (p=.01). Among patients with SSD, average functional gains at 4 kHz were 37.5 ± 8.9 dB in the Osia group, 21.7 ± 15.7 dB in the BAHA Attract group, and 29.0 ± 13.0 dB in the Bonebridge group.

Schwab et al (2020) completed a systematic review of adverse events associated with bone-conduction and middle-ear implants. The ten most frequently reported adverse events for bone conduction hearing implants included skin reactions (Holgers grade 1 to 3), skin revision surgery due to overgrowth or cellulitis, minor soft tissue/skin overgrowth, skin infection, surgical revision, preimplantation, failure to osseointegrate, and minor skin complications.

Verheij et al (2016) published a systematic review on complications of tissue preservation surgical techniques with percutaneous BAHA devices, including 18 studies with 381 devices. The implantation techniques reported in the studies were as follows: punch method, four studies (81 implants); linear incision technique without soft tissue reduction, 13 studies (288 implants); and Weber technique, one study (12 implants). Indications for surgery were SSD (n=68), sensorineural hearing loss (n=4), mixed hearing loss (n=65), or CHL (n=66). The Holgers classification was used to grade soft tissue reactions (grade 0, no reaction; grade 2, red and moist tissue; grade 3, granulation tissue; grade 4, removal of skin-penetrating implant necessary due to infection). The incidence of Holgers 3 was 2.5% with the punch technique, 5.9% with the linear incision technique, and 0% with the Weber

technique. Holgers 4 was reported in one patient implanted with the linear incision technique.

Dimitriadis et al (2016) reported a systematic review of observational studies of the BAHA Attract device, including 10 studies (total N=89 patients; range, 1-27 patients). Seventeen (19%) of the patients were children, of whom five had unilateral sensorineural hearing loss and four had CHL. Of the 27 (45%) adults, 22 had unilateral sensorineural hearing loss and 11 (18%) had bilateral mixed hearing loss. Audiologic and functional outcome measures and the timing of testing varied greatly in the studies. Summary measures were not reported. In general, audiologic and functional outcomes measured pre- and post-implantation showed improvement, although statistical comparisons were lacking in some studies.

Use of bilateral devices has been evaluated in patients with conductive or mixed hearing losses. A number of studies, published over several years, have demonstrated a consistent improvement in speech recognition in noise and in sound localization with bilateral devices.

PROFESSIONAL GUIDELINE(S)

In 2021, the American Academy of Otolaryngology - Head and Neck Surgery revised the position statement on bone conduction hearing devices (BCHD), indicating the devices are appropriate, and in some cases preferred for the treatment of conductive and mixed hearing loss. BCHD may also be indicated in select patients with single-sided deafness. BCHDs include semi-implantable bone conduction devices utilizing either a percutaneous or transcutaneous attachment, as well as bone conduction oral appliances and scalp-worn devices. The recommendation for BCHD should be determined by a qualified otolaryngology-head and neck surgeon. These devices are approved by the Food and Drug Administration (FDA) for these indications, and their use should adhere to the restrictions and guidelines specified by the appropriate governing agency, such as the FDA in the United States and the respective regulatory agencies in countries other than the United States.

REGULATORY STATUS

BAHAs have received U.S. Food and Drug Administration (FDA) clearance as Class II devices. The following table is provided for convenience and may not be all inclusive. Visit Devices@fda.gov for updates and device specific indications regarding age and degree of HL. Additionally, the FDA maintains a list of recent device recalls. [accessed 2026 Feb 16] Available from: Medical Device Safety | FDA.

CENTERS FOR MEDICARE AND MEDICAID SERVICES (CMS)

Implantable bone conduction hearing aids are not addressed in National or Regional Medicare coverage determinations or policies.

However, osseointegrated hearing aids are addressed under Chapter 16, Section 100 of the Medicare Benefit Policy Manual. Please refer to the following website for Medicare Members [updated 2014 Nov 06; accessed 2026 Feb 16]. Available from: Medicare Benefit Policy Manual- Chapter 16: General Exclusions from Coverage

PRODUCT DISCLAIMER

- Services are contract dependent; if a product does not cover a service, medical policy criteria do not apply.
- If a commercial product (including an Essential Plan or Child Health Plus product) covers a specific service, medical policy criteria apply to the benefit.

- If a Medicaid product covers a specific service, and there are no New York State Medicaid guidelines (eMedNY) criteria, medical policy criteria apply to the benefit.
- If a Medicare product covers a specific service, and there is no national or local Medicare coverage decision for the service, medical policy criteria apply to the benefit.

POLICY HISTORY/REVISION	
Committee Approval Dates	
New:03/10 **Revised**:03/11, 09/11, 9/13, 03/14, 9/16, 03/17, 01/18, 03/19, 11/19, 3/21, 3/22, 1/23, 3/25, 11/25 **Reviewed:** 03/12, 03/13, 03/15, 03/16, 03/18, 3/20, 3/23, 3/24, 7/26	
Date	**Summary of Changes**
7/1/2026	Annual review; policy intent unchanged.
1/1/2026	Transitioned Bone Anchored Hearing Aid (BAHA)/Auditory Osseointegrated Device policy, 1370/20.000466 to Lifetime Healthcare Companies policy template.
3/1/2025	No changes to criteria. Removed examples of the types of models available as some are no longer available and listed models are not all inclusive.
1/1/2023	Added the following to the procedure codes section: 69716, 69717, 69719, 69726, 69727, 69728, 69729, and 69730.
3/1/2022	Removed deleted code 69715 (deleted code effective 1/1/2022).
7/1/2021	Removed Small Group Individual Plans from the Product Variations section.
1/1/2020	Added coverage criteria for Small Group Individual Plans to CDPHP Product Variations section.

Disclaimer Notice

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to healthcare practitioners how to provide appropriate healthcare to their patients. Healthcare practitioners shall exercise their own medical judgment when deciding the most appropriate care to enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing healthcare services. CDPHP reserves the right to review this policy at any time and change it without notice.

Policy Guidelines

Clinical documentation must be submitted for each request (initial and recertification) unless otherwise specified (e.g., provider attestation required). Supporting documentation includes, but is not limited to, progress notes documenting previous treatments/treatment history, diagnostic testing, laboratory test results, genetic testing/biomarker results, and imaging.

Continued approval at time of recertification will require documentation that the drug is providing ongoing benefit to the patient in terms of improvement or stability in disease state or condition.

Dose and frequency should be in accordance with the FDA label or recognized compendia (for off label uses). When services are performed in excess of established parameters, they may be subject to review for medical necessity.

Supportive documentation of previous drug use must be submitted for any criterion that requires the trial of a preferred agent if the preferred drug is not found in claims history.

Dose and frequency should be in accordance with the FDA label or recognized compendia (for off label uses). When services are performed in excess of established parameters, they may be subject to review for medical necessity.

Summary

Inborn errors of metabolism (IEMs) comprise a wide array of genetic diseases including disorders of protein, carbohydrate, and fat metabolism, lysosomal storage disorders, fatty acid oxidation defects, and mitochondrial and peroxisomal disorders. Although errors of metabolism are more common in infancy and childhood, presentation can occur at any time, even in adulthood. In many of the disorders, problems arise secondary to the accumulation of substances which are toxic or interfere with normal functions of the body. Or patients are unable to synthesize essential compounds necessary for adequate growth and maintenance of health. Enzyme replacement has become a beneficial treatment strategy for many of these previously untreatable disorders. IEMs are often treated with FDA approved replacement enzymes that may be designated as orphan drugs or investigational agents. Prompt institution of therapy is important because delay in the recognition and treatment of IEMs may result in long-term neurologic impairment or even death. Drug therapies to treat various rare diseases due to genetic mutations are also included within this policy.

Effective Date of Policy:	10/8/2026

Required Criteria for Initial Approval

All of the following conditions for the requested indication must be met in order to approve therapy

Indication	Inclusion Criteria	Recommended Dosing Regimen
Avlayah (tividenofusp alfa-eknm) **Medical Benefit** Treatment of neurologic manifestations of Hunter syndrome (Mucopolysaccharidosis type II, MPS II) when initiated in presymptomatic or symptomatic pediatric patients weighing at	**Initial: 6 month approval** 1. Patient must be followed by a physician experienced in metabolic disorders, AND 2. Must have a diagnosis of neuronopathic (severe) Hunter Syndrome (mucopolysaccharidosis [MPS] II) confirmed by: a. Enzyme and molecular testing i. Biochemical enzyme analysis for iduronate sulfatase deficiency in white blood cells or cultured skin fibroblasts AND ii. Documented pathogenic or likely pathogenic mutation in the iduronate 2-sulfatase (IDS) gene 1. For patients with clinical suspicion of MPS II and at least one IDS variant of uncertain	Week 1 to 4: 3 mg/kg once weekly Week 5 to 8: 7.5 mg/kg once weekly Week 9 and beyond: 15 mg/kg once weekly (maintenance dosage)

least 5 kg prior to advanced neurologic impairment ICD10: E76.1 HCPCS: No specific code yet	significance (VUS) documentation the following must be submitted: a. Biochemical enzyme analysis for iduronate sulfatase deficiency in white blood cells or cultured skin fibroblasts b. Documentation that alternative diagnoses have been excluded, such as other MPS types, based on biochemical enzyme analysis b. Documentation of severe disease, confirmed by meeting at least ONE of the following age-stratified criteria i. Cognitive standard score or developmental quotient (DQ) ≤ 85 on a validated instrument appropriate for the patient's age ii. Documented decline of ≥ 7.5 points in cognitive standard score or DQ on serial testing with the same instrument within the preceding 6-18 months iii. Complete IDS gene deletion, large gene rearrangement, or IDS-IDS2 recombination, which are invariably associated with neuronopathic phenotype iv. Documentation of a sibling's concordant IDS variant AND documented cognitive standard score or DQ ≤ 85 or documented cognitive regression in the sibling v. Elevated CSF heparan sulfate ≥ 4,000 ng/mL by validated LC-MS/MS assay, obtained via lumbar puncture vi. Documentation of a neurodevelopmental assessment by a pediatric neurologist or developmental specialist documenting at least 3 of the following behavioral markers of CNS involvement: sleep disturbance, hyperactivity/impulsivity, aggressive behavior, perseverative chewing, inability to achieve bowel training, inability to achieve bladder training, seizure-like episodes. 3. Must be ≥ 3 months of age and weigh ≥ 5 kg 4. Must have documentation of the following baseline values within the past 30 days: a. Hemoglobin b. Serum creatinine c. Urine or blood glycosaminoglycans (GAG) d. Cognitive ability standard score appropriate for enrollee age: i. Bayley Scales of Infant and Toddler Development (BSID) II or III ii. Nonverbal Index (NVI) of the Kaufman Assessment Battery for Children (KABC)-II iii. Differential Ability Scales (DAS)-II 5. Exclusion criteria: a. Has received gene therapy or stem cell therapy for MPS II b. Documented loss of activity of sulfatases other than IDS, indicating multiple sulfatase deficiency	

	6. If switching from Elaprase (idursulfase): Must have documentation of neuronopathic MPS II with progressive neurological symptoms 7. Avlayah will not be used in combination with other enzyme replacement therapies for MPS II 8. Initial approval will be for 6 months to assess response to treatment and adverse events **Continuation: 6 month approval** **1.** Recertification will require documentation of a reduction of urine or blood glycosaminoglycans (GAG) from baseline AND provider attestation of stable or improved clinical symptoms, such as stable or improved cognitive function Current body weight and requested dose regimen must be submitted for initial review and each recertification request	
Brineura (cerliponase alfa) **Medical Benefit** Slow the loss of ambulation in pediatric patients with neuronal ceroid lipofuscinosis type 2 (CLN2 disease), also known as tripeptidyl peptidase 1 (TPP1) deficiency ICD10: E75.4 HCPCS: J0567	**Initial: 6 month approval** • Enrollee is ≥ 3 years of age • Therapy is prescribed by or in consultation with a provider that specializes in the treatment of neuromuscular disorders and/or late infantile neuronal ceroid lipofuscinosis type 2 (CLN2) disease, also known as tripeptidyl peptidase 1 (TPP1) deficiency and is knowledgeable in intraventricular administration • Enrollee has a diagnosis of late infantile CLN2 disease confirmed by deficient TPP1 enzyme activity (in leukocytes, fibroblasts, or dried blood spots); or detection of two pathogenic mutations in trans in the TPP1/CLN2 gene • Enrollee has a score of ≥ 1 and < 6 on the CLN2 clinical rating scale for motor and language function (see below for CLN2 rating scale) **Continuation: 2 year approval** • Documentation of positive response to therapy defined as no decline or decline of one category decline and a score > 0 o Decline was defined as having an unreversed (sustained) 2 category decline or an unreversed score of 0 in the motor domain of the CLN2 Clinical Rating Scale Brineura is contraindicated in patients with ventriculoperitoneal shunts (used to drain extra fluid around the brain) and those with acute intraventricular access device-related complications (e.g., leakage, device failure, device-related infection). CLN2 Clinical Rating Scale Score | Motor Function 3 | Walks normally 2 | Intermittent falls, clumsiness, obvious instability 1 | No unaided walking OR crawling only 0 | Immobile, mostly bedridden	Recommended Dosing: • Birth to < 6 months: 100 mg every other week • 5 months to < 1 year: 150 mg every other week • 1 year to < 2 years: 200 mg (first 4 doses) every other week followed by 300 mg every other week • 2 years and older: 300 mg every other week
Carbaglu and generic carglumic acid **Rx Benefit** Adjunctive therapy to	**Initial: 1 year approval** • Enrollee must be followed by a physician experienced in metabolic disorders • Enrollee must have a diagnosis of acute or chronic hyperammonemia due to the deficiency of the hepatic enzyme, N-acetylglutamate synthase	Recommended Dosing: • Dosage for acute hyperammonemia is 100-250mg/kg/day. Dose should be divided to 2-4 times per

standard of care for the treatment of acute hyperammonemia due to N-acetylglutamate synthase (NAGS) deficiency Maintenance therapy for the treatment of chronic hyperammonemia due to NAGS deficiency Adjunctive therapy to standard of care for the treatment of acute hyperammonemia due to propionic acidemia (PA) or methylmalonic acidemia (MMA) ICD10: E72.2	(NAGs) confirmed via genetic testing or enzyme analysis alone or in combination with laboratory tests specific for this diagnosis including measurement of ammonia, plasma citrulline, plasma arginine, orotic acid • For acute hyperammonemia due to the deficiency of the hepatic enzyme, N-acetylglutamate synthase (NAGs), enrollee must be receiving concomitant ammonia lowering therapies such as alternate pathway medications, hemodialysis, and dietary protein restriction • For acute hyperammonemia due to propionic acidemia or methylmalonic acidemia, enrollee must be receiving standard therapies including a combination of protein restriction, intravenous (IV) glucose, insulin, and/or L-carnitine **Continuation: 2 year approval** • Documentation of normalization of plasma ammonia levels, improvement in any clinical symptoms and stability on the requested therapy • Current body weight and requested dose regimen must be submitted for initial review and each recertification request • All requests for brand Carbaglu (initial and recertification) will require documentation of severe intolerance to generic carglumic acid	day and rounded to the nearest 100 mg (1/2 tablet) • Dosage for maintenance should be targeted for normal plasma ammonia level for age (usually less than 100 mg/kg/day) • Dosage in patients with acute hyperammonemia due to propionic acidemia or methylmalonic acidemia is 150 mg/kg/day for patients ≤ 15 kg and 3.3 g/m^2/day for patients > 15 kg. Divide the daily dosage into two equal doses, round up to the next multiple of 50 mg (i.e., one-quarter of a Carbaglu tablet), and administer doses 12 hours apart
Cerdelga (eliglustat) **Rx Benefit** Long-term treatment of adult patients with Gaucher disease type 1 who are CYP2D6 extensive metabolizers (EMs), intermediate metabolizers (IMs), or poor metabolizers (PMs) as detected by an FDA-cleared test ICD10: E75.22	**Initial: 1 year approval** • Enrollee is ≥ 18 years of age • Prescribed by or in consultation with a physician knowledgeable in the management of Gaucher disease • Must have a confirmed diagnosis of Type 1 Gaucher disease (see Diagnosis section below for requirements) o Adults: Type 1 (nonneuronopathic) Gaucher disease confirmed by: ▪ Biochemical assay of glucocerebrosidase activity in white blood cells (WBCs) or skin fibroblasts less than or equal to 30% OR ▪ Genotype mutation of two mutant alleles of the glucocerebrosidase gene AND ▪ Symptomatic manifestations of the disease • Skeletal disease as demonstrated by radiological evidence of joint deterioration, pathological fracture, osteopenia, avascular necrosis, osteosclerosis, marrow infiltration, lytic lesions, or Erlenmeyer flask deformity) OR • Hemoglobin ≤ 11.5 for females and ≤ 12.5 g/dl for males (or 1.0 g/dL below the lower limit of normal for age and sex), platelet count <= 60,000 mm3, spleen > 15 times normal size, liver > 2.5 times normal size o Children: Type 1 (nonneuronopathic): less than 18 years of age with Type 1 Gaucher disease confirmed by: ▪ Biochemical assay of glucocerebrosidase activity in WBC's or skin fibroblasts is less than or equal to 30%. OR	Recommended Dosing: • CYP2D6 EMs or IMs: approved dose is 84 mg orally twice daily • CYP2D6 PMs: approved dose is 84 mg orally once daily • CYP2D6 ultra-rapid metabolizers (URM) and CYP2D6 indeterminate metabolizers are excluded from coverage. o CYP2D6 URMs may not achieve adequate concentrations of CERDELGA to achieve a therapeutic effect o A specific dosage cannot be recommended for those patients whose CYP2D6 indeterminate • The following drug interactions result in contraindication to Cerdelga and will not be covered: o CYP2D6 EMs or IMs taking a strong or

	▪ Genotype mutation of two mutant alleles of the glucocerebrosidase gene AND ▪ Symptomatic manifestations of the disease o Abdominal or bone pain, delayed growth, impaired psychomotor development, fatigue, exertional limitations, marrow infiltration, organomegaly, weakness and cachexia. • Not covered in patients with pre-existing cardiac disease, long QT syndrome, and concomitant use of Class IA and Class III antiarrhythmics, AND • Cerdelga will not be approved in combination with enzyme replacement therapy (taliglucerase alfa, imiglucerase, or velaglucerase alfa) as this is considered investigational, AND • Must be designated as a CYP2D6 extensive metabolizer (EM), intermediate metabolizer (IM), or poor metabolizer (PM) as detected by an FDA-cleared test to determine appropriate dosing **Continuation: 2 year approval** • Enrollee is not on strong or moderate CYP2D6/3A inhibitors which results in contraindications to Cerdelga • Documentation of improvement in any clinical symptoms and stability on the requested therapy	moderate CYP2D6 inhibitor concomitantly with a strong or moderate CYP3A inhibitor. o CYP2D6 IMs or PMs taking a strong CYP3A inhibitor. • Specific dosing information is listed in the Cerdelga package insert.
Cerezyme (imiglucerase) **Medical Benefit** Treatment of adults and pediatric patients 2 years of age and older with Type 1 Gaucher disease that results in one or more of the following conditions: anemia, thrombocytopenia, bone disease, hepatomegaly, or splenomegaly ICD10: E75.22 HCPCS: J1786	**Initial: 2 year approval** • Enrollee is ≥ 2 years of age • Prescribed by or in consultation with a physician knowledgeable in the management of Gaucher disease, AND • Enrollee must have a confirmed diagnosis of Gaucher disease (see Diagnosis section below for requirements), AND o Adults: Type 1 (nonneuronopathic) Gaucher disease confirmed by: ▪ Biochemical assay of glucocerebrosidase activity in white blood cells (WBCs) or skin fibroblasts less than or equal to 30% OR ▪ Genotype mutation of two mutant alleles of the glucocerebrosidase gene AND ▪ Symptomatic manifestations of the disease • Skeletal disease as demonstrated by radiological evidence of joint deterioration, pathological fracture, osteopenia, avascular necrosis, osteosclerosis, marrow infiltration, lytic lesions, or Erlenmeyer flask deformity) OR • Hemoglobin ≤ 11.5 for females and ≤ 12.5 g/dl for males (or 1.0 g/dL below the lower limit of normal for age and sex), platelet count <= 60,000 mm3, spleen > 15 times normal size, liver > 2.5 times normal size o Children Type 1 (nonneuronopathic): less than 18 years of age with Type 1 Gaucher disease confirmed by:	• Recommended Dosing: Based upon disease severity ranges from 2.5 units/kg three times a week to 60 units/kg once every two weeks

	▪ Biochemical assay of glucocerebrosidase activity in WBC's or skin fibroblasts is less than or equal to 30%. OR ▪ Genotype mutation of two mutant alleles of the glucocerebrosidase gene AND ▪ Symptomatic manifestations of the disease: • Abdominal or bone pain, delayed growth, impaired psychomotor development, fatigue, exertional limitations, marrow infiltration, organomegaly, weakness and cachexia o Adults and Children Type III (neuronopathic): Enzyme replacement therapy is considered off label for this diagnosis; however, consideration will be given for the following scenarios in which ERT has been shown to be beneficial for hematological and visceral disease ▪ Individuals with chronic (not acute) neuronopathic Gaucher disease type 3 ▪ Siblings of individuals with chronic neuronopathic Gaucher disease who have proven diagnosis ▪ Individuals with high-risk genotypes: L444P/L444P (c.1448T>C homozygote), D409H/D409H (c.1342G>C homozygote), L444P/D409H (c.1448T>C/c.1342G>C heterozygote) • Cerezyme is administered by intravenous infusion by a healthcare professional and is covered under the medical benefit, AND • All requests for Cerezyme will be required to use Elelyso (taliglucerase alfa) except in the following situation: o Cerezyme (imiglucerase) will be approved for children between age 2 and less than 4 years of age. Requests for Cerezyme as continued therapy for children at 4 years of age or older will be required to use Elelyso or document serious side effects or drug failure to Elelyso, AND • Cerezyme will not be approved in combination with any other enzyme replacement therapy for Gaucher disease • Current body weight and requested dose regimen must be submitted for initial review and each recertification request **Continuation: 2 year approval** • Documentation that the drug is providing ongoing benefit to the patient in terms of improvement or stability in disease state or condition	
Cholbam (cholic acid) **Rx Benefit** Treatment of bile acid synthesis disorders due to single enzyme defects (SEDs) Adjunctive treatment of peroxisomal disorders	**Initial: 3 months approval** • Enrollee is ≥ 2 years of age • Must have a diagnosis of bile acid synthesis disorder due to single enzyme defect (SED) OR • Must be used as an adjunctive treatment of peroxisomal disorder (PD) including Zellweger spectrum disorders, in patients who show signs and symptoms of liver disease, steatorrhea (fatty stools), or complications from decreased fat-soluble vitamins absorption (A, D, E, K) AND	Recommended Dosing: • Recommended initial dosage is 10 to 15 mg/kg/day (given in 1 or 2 divided doses) using available 50 mg and 250 mg capsules and rounded to the nearest whole capsule strength. • For patients with concomitant familial

(PDs) including Zellweger spectrum disorders in patients who exhibit manifestations of liver disease, steatorrhea, or complications from decreased fat-soluble vitamin absorption ICD10: E78.70. E78.79, E71.510	• Diagnosis must be confirmed via gas chromatography-mass spectrometry analysis of the urine, which positively identifies elevated bile acids AND • Must have elevated serum aminotransferases with normal serum gamma glutamyl transferase, AND • Member must be seen by a hepatologist, or gastroenterologist • Current body weight and requested dose regimen must be submitted for initial review and each recertification request • Discontinue Cholbam if liver function does not improve within 3 months of starting treatment, if complete biliary obstruction develops, or if there are persistent clinical or laboratory indicators of worsening liver function or cholestasis; continue to monitor liver function and consider restarting a lower dose when parameters return to baseline **Continuation: 2 year approval** • Continued approval beyond 3 months and recertification every 2 years will require documentation of improved liver function via aminotransferase lowering as well as improvement in any clinical symptoms and stability on the requested therapy	hypertriglyceridemia, the recommended dosage is 11 to 17 mg/kg (given in 1 or 2 divided doses).
Ctexli (chenodiol) **Rx Benefit** Treatment of cerebrotendinous xanthomatosis (CTX) in adults ICD10: E75.5	**Initial: 6 months approval** • Must be 18 years of age or older AND • Must be prescribed by, or in consultation with, a hepatologist, metabolic specialist, or gastroenterologist AND • Must have a diagnosis of cerebrotendinous xanthomatosis (CTX) with genetic testing confirming biallelic pathogenic variants in the CYP27A1 gene AND • Must have documentation of at least ONE of the following parameters (baseline value must be provided and will be used to assess response to therapy): o Elevated blood cholestanol OR o Elevated blood or urine bile alcohol (e.g., 23S-pentol) • Ctexli will not be authorized for treatment of gallstones 6. Ctexli will not be authorized for use in combination with Cholbam, cholestyramine, or colestipol **Continuation: 12 month approval** • Documentation of improvement from baseline (upon initial recertification) and/or maintenance of improvement of either: o Blood cholestanol OR o Blood or urine bile alcohol (e.g., 23S-pentol) Quantity limit: 90 tablets per 30 days	Recommended Dosing: • 250 mg administered orally three times daily
Dojolvi (tripheptanoin oral liquid) **Rx Benefit** Source of calories and fatty acids for the treatment of adult and	**Initial: 6 months approval** • Must be prescribed by, or in consultation with, a metabolic disease specialist knowledgeable in the management of long-chain fatty acid oxidation disorders and their dietary management, AND • Must have a molecularly confirmed long-chain fatty acid oxidation disorder based on at least two of the following (i, ii, and/or iii). Of note, infants with positive newborn screening on dried blood spot analysis are required to have confirmatory testing	Recommended Dosing: • Target daily dose of Dojolvi is up to 35% of the patient's total prescribed daily caloric intake (DCI) divided into at least four doses and administered orally diluted with semi-solid foods,

pediatric patients with molecularly confirmed long-chain fatty acid oxidation disorders (LC-FAOD) ICD10: E71.31	○ i. Molecular genetic testing identifying biallelic pathogenic variants confirming a long-chain fatty acid oxidation disorder (such as in CPT1A, CPT2, ACADVL, HADHA, or HADHB), AND/OR ○ ii. Abnormal acylcarnitine analysis on biochemical testing of plasma, AND/OR ○ iii. Biochemical analysis confirming diminished enzyme activity (such as in cultured skin fibroblasts, muscle, liver, leukocytes), AND • Must have evidence of clinical signs and/or symptoms associated with LC-FAOD such as hypoglycemia, hepatopathy, cardiomyopathy, skeletal myopathy, rhabdomyolysis, exercise intolerance, for example, despite current management such as a low-fat, high-carbohydrate diet; avoidance of fasting and/or the use of a medium-chain triglyceride (MCT) oil, or as noted below in i AND/OR ii: ○ i. Patients who are infants or early childhood (3-5 years old) at the time of the request who were diagnosed via a Newborn Screening program with confirmatory testing will not be required to be symptomatic ○ ii. Plan will consider coverage for asymptomatic children who have a confirmed diagnosis with a positive family history of severe disease, or positive genotype indicating severe form of the disease, AND • Provider must attest/confirm that medium-chain triglyceride (MCT) oil products will be discontinued prior to the start of Dojolv **Initial continuation: 6 month approval** **Subsequent continuation: 1 year approval** • Dojolvi continues to be used as monotherapy [i.e., not in combination with any other medium chain triglyceride (MCT) products] Quantity limit of 500ml per 30 days. Requests for quantities above this limit will be evaluated based on the dosing documentation provided. Documentation of the patient's total prescribed Daily Caloric Intake (DCI) and Target percentage of daily caloric intake prescribed and Target Total Daily Dosage (mL) to be administered must be provided with each review	liquids, or formula or enterally via a silicone or polyurethane feeding tube. • The total daily dosage is determined using the following calculation: ○ Caloric value of DOJOLVI = 8.3 kcal/mL ○ Round the total daily dosage to the nearest whole number Total Daily Dosage (__ mL) = $\frac{DCI(__\ kcal)\ x\ __\%\ Target from\ Dojolvi}{8.3\ \frac{kcal}{mL}\ of\ Dojolvi}$
Elaprase (idursulfase) **Medical Benefit** Patients with Hunter syndrome (Mucopolysaccharidosis II, MPS II) ICD10: E76.1, E76.3 HCPCS: J1743	**Initial: 2 year approval** • Enrollee is ≥ 16 months of age AND • Patient must be followed by a physician experienced in metabolic disorders, AND • Must have a diagnosis of Hunter Syndrome (mucopolysaccharidosis II) confirmed by biochemical enzyme analysis for iduronate sulfatase deficiency in white blood cells or cultured skin fibroblasts AND • Must have an affected 1st degree relative OR • Must have clinical symptoms of the disease such as: progressive coarsening of facial features, short stature, joint stiffness, hepatosplenomegaly, hernias, ivory colored papular skin lesions located on the upper back and/or lateral upper arms and thighs, mental retardation, deafness, cerebral ventricular dilation, mild dysostosis multiplex of bone, hypertrichosis, thickened skin, or Mongolian spots.	Recommended Dosing: 0.5 mg/kg IV infusion once a week

	Continuation: 2 year approval • Documentation that the drug is providing ongoing benefit to the patient in terms of improvement or stability in disease state or condition Current body weight and requested dose regimen must be submitted for initial review and each recertification request.	
Elelyso (taliglucerase alfa) **Medical Benefit** Treatment of patients 4 years and older with a confirmed diagnosis of Type 1 Gaucher disease ICD10: E75.22 HCPCS: J3060	**Initial: 2 year approval** • Enrollee is ≥ 4 years of age AND • Prescribed by or in consultation with a physician knowledgeable in the management of Gaucher disease, AND • Must have a confirmed diagnosis of Gaucher disease (see Diagnosis section below for requirements), AND o Adults: Type 1 (nonneuronopathic) Gaucher disease confirmed by: ▪ Biochemical assay of glucocerebrosidase activity in white blood cells (WBCs) or skin fibroblasts less than or equal to 30% OR ▪ Genotype mutation of two mutant alleles of the glucocerebrosidase gene AND ▪ Symptomatic manifestations of the disease • Skeletal disease as demonstrated by radiological evidence of joint deterioration, pathological fracture, osteopenia, avascular necrosis, osteosclerosis, marrow infiltration, lytic lesions, or Erlenmeyer flask deformity) OR • Hemoglobin ≤ 11.5 for females and ≤ 12.5 g/dl for males (or 1.0 g/dL below the lower limit of normal for age and sex), platelet count <= 60,000 mm3, spleen > 15 times normal size, liver > 2.5 times normal size o Children Type 1 (nonneuronopathic): less than 18 years of age with Type 1 Gaucher disease confirmed by: ▪ Biochemical assay of glucocerebrosidase activity in WBC's or skin fibroblasts is less than or equal to 30%. OR ▪ Genotype mutation of two mutant alleles of the glucocerebrosidase gene AND ▪ Symptomatic manifestations of the disease • Abdominal or bone pain, delayed growth, impaired psychomotor development, fatigue, exertional limitations, marrow infiltration, organomegaly, weakness and cachexia o Adults and Children Type III (neuronopathic): Enzyme replacement therapy is considered off label for this diagnosis; however, consideration will be given for the following scenarios in which ERT has been shown to be beneficial for hematological and visceral disease ▪ Individuals with chronic (not acute) neuronopathic Gaucher disease type 3	Recommended Dosing: Treatment-naïve Patients 4 Years of Age and Older: 60 units/kg (based on actual body weight) administered every other week

	▪ Siblings of individuals with chronic neuronopathic Gaucher disease who have proven diagnosis ▪ Individuals with high-risk genotypes: L444P/L444P (c.1448T>C homozygote), D409H/D409H (c.1342G>C homozygote), L444P/D409H (c.1448T>C/c.1342G>C heterozygote) ▪ Onset of severe systemic disease at age ≤ 2 years of age • Elelyso is administered by intravenous infusion by a healthcare professional and is covered under the medical benefit, AND • Elelyso will not be approved in combination with any other enzyme replacement therapy for Gaucher disease **Continuation: 2 year approval** • Documentation that the drug is providing ongoing benefit to the patient in terms of improvement or stability in disease state or condition Current body weight and requested dose regimen must be submitted for initial review and each recertification request.	
Galafold (migalastat) **Rx Benefit** Treatment of adults with a confirmed diagnosis of Fabry disease and an amenable galactosidase alpha gene (GLA) variant based on in vitro assay data ICD10: E75.21	**Initial: 1 year approval** • Enrollee is ≥ 18 years of age • Therapy is prescribed by or in consultation with an expert in genetics and management of Fabry disease • Must have a diagnosis of Fabry Disease confirmed as follows: o Male patients: ▪ Enzyme assay test in leukocytes, plasma, fibroblasts, or dried blood spots demonstrating complete deficiency or less than 3% of normal of alpha-galactosidase A (alpha-Gal A) activity (classically affected, hemizygous males) OR ▪ Documented GLA gene mutation by gene sequencing o Female patients: ▪ Documented GLA gene mutation by gene sequencing is required for diagnosis, AND • Must have an amenable GLA gene mutation based on in vitro assay data (see manufacturer prescribing information for amenable GLA variants), AND • Must have clinical symptoms of disease as noted below (except for classically affected males) o Males: Classically affected of any age with complete deficiency or less than 3% of normal alphaGal A) activity treatment should begin treatment at time of diagnosis o Atypically affected Males with residual alpha-Gal A activity (3-35% of normal mean): initiate treatment if significant symptoms (see below) or evidence of progression of organ involvement o Females (all ages): Monitor; institute treatment if significant symptoms (see below) or evidence of progression of organ involvement o Symptoms or physical findings of Fabry disease:	Recommended Dosing: 120 mg orally once every other day at the same time of day on an empty stomach

	▪ Angiokeratomas: characteristic lysosomal disease skin rashes ▪ Hypohidrosis: decreased sweating ▪ Acroparesthesia: neuropathic pain in the hands and feet ▪ Cornea verticillata and characteristic corneal and lenticular opacities ▪ Diarrhea, abdominal pain, nausea, vomiting, flank pain, heat and cold intolerance, vertigo, tinnitus, diplopia, fatigue. ▪ Long term consequences include cardiac disease (including hypertrophic cardiomyopathy), arrhythmias, progressing renal disease (proteinuria to end stage renal disease) and stroke, AND • Must have an estimated glomerular filtration rate (eGFR) of at least 30 mL/min/1.73 m2 **Continuation: 2 year approval** • Documentation of adequate renal function [(eGFR) of at least 30 mL/min/1.73 m2] AND • Enrollee has had positive response to therapy for symptomatic individuals (via lab reports, progress notes documenting improvement in clinical symptoms) AND • Enrollee is stable on the requested regimen Galafold must be used as monotherapy and will NOT be covered in combination with Fabrazyme or Elfabrio. Prior approval for any other Fabry disease specific treatment will be terminated upon approval of Galafold. Quantity limit of 14 capsules per 28 days	
Kanuma (sebelipase alfa) **Medical Benefit** Treatment of patients with a diagnosis of Lysosomal Acid Lipase (LAL) deficiency ICD10: E75.5 HCPCS: J2840	**Initial: 2 year approval** • Patient must be followed by a physician experienced in metabolic disorders, AND • Must have a diagnosis of LAL deficiency confirmed by any combination of the following means: laboratory tests, imaging studies, genetic testing, and highly specific dried blood spot and either a or b: o a. The clinical presentation should display an LDL-C concentration of 4.7 mmol/L or greater (or above the 95th percentile for age and sex). Based on review of family history, if disease is confirmed to be autosomal dominant no further testing is required, OR o b. For individuals with unknown family history or recessive pattern, further evaluation should take place to see if any of the following exist. Individuals with at least 3 of these criteria should be tested by dry blood spot test for LAL activity (CPT code 82657). ▪ ALT levels greater than 1.5 of the upper limits of normal (ULN) ▪ HDL-C levels less than 1.3 mml/L or Body mass index of 30 kg/m^2 or more	Recommended Dosing: • For pediatric and adult patients with LAL deficiency, the recommended starting dose is 1 mg/kg administered intravenously every other week. • For patients with rapidly progressive LAL deficiency presenting within the first 6 months of life, the recommended starting dose is 1 mg/kg administered intravenously once weekly. The dose may be increased up to 3 mg/kg once weekly for patients who do not achieve clinical response with the lower dose.

	▪ Liver biopsy suggestive of microvesicular steatosis o Hepatomegaly **Continuation: 2 year approval** • Documentation that the drug is providing ongoing benefit to the patient in terms of improvement or stability in disease state or condition Current body weight and requested dose regimen must be submitted for initial review and each recertification request	
Kuvan, Javygtor and generic sapropterin **Rx Benefit** Reduce blood phenylalanine (Phe) levels in adult and pediatric patients one month of age and older with hyperphenylalaninemia (HPA) due to tetrahydrobiopterin-(BH4-) responsive Phenylketonuria (PKU) ICD10: E70.0, E70.1	**Initial: 2 months** • Must be prescribed by a healthcare provider experienced in the management of phenylketonuria (PKU), AND • Must have a diagnosis of PKU with hyperphenylalaninemia (HPA) AND • Must adhere to a phenylalanine (Phe) restricted diet • Current body weight and requested dose regimen must be submitted for initial review • Phe levels should be checked one week after initiation of therapy. If Phe levels do not decrease from baseline on a 10 mg/kg/day dose, the dose may be increased to 20 mg/kg/day. If Phe levels do not decrease by at least 30% from baseline after 2 months, the patient is considered a non-responder and further therapy with sapropterin will not be authorized. • Kuvan/Javygtor/generic sapropterin must be used as monotherapy and will not be approved for use in combination with Palynziq **Continuation: Up to 2 years** • Continuation will require documentation of current body weight, requested dose regimen, continued adherence to Phe restricted diet and stability on requested therapy. • Current body weight and requested dose regimen must be submitted for each request for continuation	Recommended Dosing: FDA approved for adults and children 1 (one) month of age and older. Maximum recommended dose is 20 mg/kg/day
Kygevvi (doxecitine and doxribtimine) **Rx Benefit** Treatment of thymidine kinase 2 deficiency (TK2d) in adult and pediatric patients with symptom onset at ≤ 12 years of age ICD10: E88.40, E88.49, G71.3	**Initial: 6 months** • Must be prescribed by or in consultation with a neurologist or specialist experienced in managing mitochondrial myopathies AND • Must have a diagnosis of thymidine kinase 2 deficiency (TK2d) confirmed by genetic testing that detects variants (biallelic pathogenic or likely pathogenic) in the TK2 gene o For patients with clinical suspicion of TK2d and at least one TK2 variant of uncertain significance (VUS) documentation the following must be submitted: ▪ Muscle biopsy mandatory, demonstrating at least one of: • Mitochondrial DNA (mtDNA) depletion (30% of age-matched controls for infantile/childhood onset; quantitative analysis required) • Multiple mtDNA deletions (for late-onset phenotype) • Ragged red fibers and/or cytochrome c oxidase (COX)-deficient fibers	Recommended Dosing: Refer to prescribing information for weight based dosing depending on stage in titration

- Documentation that alternative diagnoses have been excluded (e.g., other mtDNA maintenance defects: POLG, DGUOK, RRM2B, TYMP) AND
- Must have clinical documentation of initial symptom onset at ≤ 12 years of age, consistent with infantile- or childhood-onset TK2d AND
- Must have documentation of a baseline functional assessment
  - Forced vital capacity (FVC) % predicted
    - An age-appropriate respiratory assessment for infants/young children unable to perform spirometry is acceptable
  - Ventilatory support status (none, non-invasive, invasive; hours per day)
  - Nutritional/feeding status (oral intake, dietary modification, enteral feeding)
  - Body weight and growth parameters (percentiles for pediatric patients)
  - Motor function assessment
    - Ambulatory patients
      - North Star Ambulatory Assessment (NSAA) score (0–34) OR
      - 6-Minute Walk Test (6MWT) distance in meters OR
      - Motor Function Measure (MFM-32 or MFM-20) total score
    - Non-ambulatory patients
      - Hammersmith Functional Motor Scale Expanded (HFMSE) score OR
      - Children's Hospital of Philadelphia Infant Test of Neuromuscular Disorders (CHOP INTEND) for infants OR
      - Motor Function Measure (MFM-20) total score
- Baseline liver function tests (ALT, AST, bilirubin) are ≤ 2x upper limit of normal prior to treatment initiation AND
- Exclusion Criteria
  - Predominant encephalopathy as primary clinical manifestation
  - Treatment may be considered if myopathy is the predominant feature with secondary/mild neurological involvement
  - Severe hepatic impairment (Child-Pugh C)

Continuation: 6 month approval

- Recertification will require provider attestation of stable or improved motor, respiratory, or other clinical symptoms

Quantity limits:

- 30 packets/30 days
  - Upon each review and dose escalation request, the allowed quantity will be reviewed in accordance with FDA-approved weight-based dosing, and as such, will be limited to the minimum number of packets to obtain the appropriate daily dose. For pediatric patients, a higher quantity may be allowed based on the patients' predicted growth, on a case-by-case basis.

Loargys (pegzilarginase nbln)
 	
Medical Benefit
 	
Treatment of hyperargininemia in adult and pediatric patients 2 years of age and older with Arginase 1 Deficiency (ARG1-D), in conjunction with dietary protein restriction
 	
ICD10: E72.21
 	
HCPCS: no specific code yet
	Initial: 6 month approval
	• Must be prescribed by or in consultation with a metabolic disease specialist, geneticist, or neurologist experienced in managing urea cycle disorders or inborn errors of metabolism
	• The patient must be ≥ 2 years of age
	• The patient must have a confirmed diagnosis of Arginase 1 Deficiency (ARG1-D) as evidenced by ONE of the following:
	  o Genetic testing identifying biallelic pathogenic or likely pathogenic variants in the ARG1 gene OR
	  o For patients with clinical suspicion of ARG1-D and at least one ARG1 variant of uncertain significance (VUS), documentation of the following must be submitted:
	  ▪ Deficient red blood cell (RBC) arginase 1 enzyme activity
	  ▪ Plasma arginine persistently elevated (≥ 3× upper limit of normal) on at least two separate occasions
	  ▪ Documentation that alternative diagnoses have been excluded (e.g., other urea cycle disorders, HHH syndrome, hereditary spastic paraplegia, cerebral palsy)
	• Must have documentation of concurrent dietary protein restriction with or without arginine-free essential amino acid supplementation
	• Must have plasma arginine > 200 µmol/L documented on at least two separate occasions separated by a minimum of 4 weeks, with prescriber attestation that the patient is adherent to dietary protein restriction.
	  o Values may be obtained at any time prior to the authorization request.
	  o Historical values from the patient's medical record are acceptable
	• Must have documentation of clinical manifestations consistent with ARG1-D on at least one of the following: motor impairment, spasticity, developmental delay, cognitive impairment, or seizures
	  o For patients with genetically confirmed ARG1-D who are pre-symptomatic (e.g., identified through newborn screening), coverage may be considered on a case-by-case basis.
	• Must have documentation of a baseline assessment including all of the following:
	  o Plasma arginine concentration obtained within 30 days prior to the first dose
	  o Spasticity assessment obtained within 60 days prior to the first dose: Modified Ashworth Scale (MAS) score with documentation of affected muscle groups, OR clinical documentation of spasticity severity and distribution
	  o Motor function/mobility assessment obtained within 60 days prior to the first dose:
	  ▪ Ambulatory patients: GMFM-D and/or GMFM-E domain scores, OR 6-Minute Walk Test (6MWT) distance, OR 2-Minute Walk Test (2MWT) distance
	  ▪ Non-ambulatory or limited-mobility patients: GMFCS level AND GMFM total score or applicable domain scores
		See Prescribing Information for Approved Dosage

- Pediatric patients (ages 2-5): Age-appropriate developmental motor assessment (e.g., Bayley Scales) is acceptable if standardized walk tests cannot be performed

Continuation: 12 month approval
Recertification will require all of the following:

1. Documentation of plasma arginine level ≤ 200 µmol/L, obtained within 60 days of recertification request
    a) For patients with plasma arginine > 200 µmol/L but current dose is below maximum (0.2 mg/kg/week), coverage will be continued if both of the following are met:
        - Dose escalation is being pursued per the FDA-approved titration algorithm
        - Plasma arginine has decreased ≥ 30% from pre-treatment baseline
    b) For patients with plasma arginine > 200 µmol/L at maximum dose (0.2 mg/kg/week for ≥ 8 consecutive weeks) AND plasma arginine has decreased ≥ 30% from pre-treatment baseline, coverage will be continued if all of the following are met:
        - Adherence to dosing schedule (infusion/injection administration records)
        - Adherence to dietary protein restriction
        - The provider submits a letter of medical necessity (LOMN) that documents clinical justification for continued treatment
    c) For patients with plasma arginine > 200 µmol/L at maximum dose (0.2 mg/kg/week for ≥ 8 consecutive weeks) AND plasma arginine has not decreased ≥ 30% from pre-treatment baseline AND there is no documented clinical improvement in motor function or spasticity from baseline assessments, continued coverage will not be granted
2. There must be documentation of stable or improved status in at least ONE of the following: motor function (GMFM, 6MWT, 2MWT, or clinical documentation) OR spasticity (MAS score or clinical assessment)
3. Confirmation of continued dietary protein restriction
4. Continued approval (includes recertification) will be for 12 months at a time
    a) Exception: continued approval will be for 6 months if plasma arginine level is > 200 µmol/L and the patient meets for 1a or 1b

Must have documentation of current weight for initial review and each recertification request.

Upon each review and dose escalation request, the allowed quantity will be reviewed in accordance with FDA-approved weight-based dosing, and as such, will be limited to the minimum number of vials to obtain the appropriate weekly dose. For pediatric patients, a higher quantity may be allowed based on the patient's predicted growth, on a case-by-case basis.

Mepsevii (vestronidase alfa-vjbk) **Medical Benefit** Pediatric and adult patients for the treatment of Mucopolysaccharidosis VII (MPS VII, Sly syndrome) ICD10: E76.29 HCPCS: J3397	**Initial: 2 year approval** • Patient must be followed by a physician experienced in metabolic disorders, AND • Must have a diagnosis of MPS VII, Sly Syndrome (mucopolysaccharidosis VII) confirmed by at least one of the following methods (i OR ii): o i. Biochemical enzyme analysis for glucuronidase enzyme deficiency in white blood cells or cultured skin fibroblasts OR o ii. Genetic testing • Must have urinary GAG excretion at least three-fold over the mean normal for age AND • Must have clinical signs of lysosomal storage disease including at least one of the following: enlarged liver and spleen, joint limitations, airway obstruction or pulmonary problems, heart valve abnormalities, and limitation of mobility while still ambulatory **Continuation: 2 year approval** • Documentation that the drug is providing ongoing benefit to the patient in terms of improvement or stability in disease state or condition Current body weight and requested dose regimen must be submitted for initial review and each recertification request.	Recommended Dosing: 4 mg/kg administered every 2 weeks by intravenous (IV) infusion
Naglazyme (galsulfase) **Medical Benefit** Patients with Mucopolysaccharidosis VI (MPS VI; Maroteaux-Lamy syndrome) ICD10: E76.29 HCPCS: J1458	**Initial: 2 year approval** • Patient must be followed by a physician experienced in metabolic disorders, AND • Must have a diagnosis of Mucopolysaccharidosis IV confirmed by biochemical enzyme analysis for aryl sulfatase B enzyme deficiency or accumulation of dermatan sulfate lysosomal enzyme in cultured fibroblasts or isolated leukocytes, AND • Must have at least one of the following documented symptoms: coarse facial features, enlarged tongue, hepatosplenomegaly, hirsutism, prominent forehead, reduced stature, and/or corneal clouding AND • Documentation of at least one of the following baseline tests: o a. 6-minute walk test (6MWT) OR o b. 3-minute stair-climb test **Continuation: 2 year approval** • Documentation of response to therapy, as evidenced by an improvement or stabilization in one of the above baseline tests Current body weight and requested dose regimen must be submitted for initial review and each recertification request.	Recommended Dosing: 1 mg per kg given intravenously once weekly.
nitisinone capsule, Nityr (nitisinone), Orfadin (nitisinone), and Harliku (nitisinone) **Rx Benefit** Treatment of adult and pediatric patients with hereditary tyrosinemia	**Initial: 1 year approval** A. Request for **nitisinone capsule, Nityr (nitisinone) and Orfadin (nitisinone):** 1. Patient must be followed by a physician experienced in metabolic disorders, **AND** 2. Diagnosis confirmed by presence of succinylacetone in blood, urine, or dried blood spots (DBS), **AND** 3. Clinical features of disease such as: failure to thrive, fever, emesis, diarrhea, epistaxis, melena, developmental delay, hepatosplenomegaly, jaundice, ascites, purpura, clotting abnormalities, rickets, cirrhosis, renal disease/Fanconi syndrome,	Recommended Dosing: Nitisinone capsule, Nityr (nitisinone) and Orfadin (nitisinone): • Initial dose should be 0.5 mg/kg dosed twice daily. Dosage can be increased to 0.75 mg/kg twice daily if succinylacetone is

type 1 (HT-1) in combination with dietary restriction of tyrosine and phenylalanine ICD10: E70.21	neurological crisis. Of note, clinical symptoms may be limited in newborns diagnosed during newborn screening, **AND** 4. Documentation of dietary restriction of tyrosine and phenylalanine is required, **AND** 5. Requests for Orfadin capsules will require documentation of serious side effects or drug failure of the equivalent generic product – nitisinone capsules. 6. Requests for Nityr tablets or Orfadin suspension will require documentation of severe intolerance or drug failure of the *preferred* product generic nitisinone capsules. 7. Current body weight and requested dose regimen must be submitted for initial review B. Request for **Harliku (nitisinone)**: 1. Patient must be at least 18 years of age 2. Must be prescribe by or in consultation with a physician experienced in metabolic disorders 3. Diagnosis of elevated urine homogentisic acid (HGA) with alkaptonuria (AKU) must be confirmed by urinary HGA excretion of at least 4.60 g per day and HGC plasma concentration of at least 3.15 ug/mL at baseline 4. Baseline Schober's test of spinal flexion, functional reach, timed get up and go, and 6MW (ft) and range of motion in the worse hip must be submitted 5. Quantity limit is 30 per 30 days 6. Harliku is only approved to reduce the urine homogentisic acid (HGA) in adult patients with confirmed alkaptonuria (AKU); it will not be approved for any other non-FDA approved diagnoses. Harliku is not interchangeable with other nitisinone products **Continuation: 2 year approval** **Nitisinone capsule, Nityr (nitisinone) and Orfadin (nitisinone):** • Documentation that the drug is providing ongoing benefit to the patient in terms of improvement or stability in disease state or condition • Current body weight and requested dose regimen must be submitted for each recertification request **Harliku (nitisinone)** • Recertification requires documentation of improvement from baseline(s) described in criterion 4, OR sustained clinical benefits	detectable 1 month after initiation • Maximum dose should not exceed 1mg/kg twice daily Harliku (nitisinone): • one 2 mg tablet once daily
Nulibry (fosdenopterin) **Medical Benefit** Reduce the risk of mortality in patients with molybdenum cofactor deficiency (MoCD) Type A ICD10: E61.5 HCPCS: no specific code	**Initial: 6 month approval** • Prescribed by or in consultation with a provider knowledgeable in the management of molybdenum cofactor deficiency (MoCD) Type A AND • Must have a diagnosis of molybdenum cofactor deficiency Type A confirmed by genetic testing that shows a mutation in the MOCS1 gene **Continuation: 2 year approval** • Recertification will require documentation of a positive clinical response to Nulibry (A positive response to therapy could be measured by urine and blood biomarkers (concentrations of s-sulfocysteine [SSC]), improvements in neurological function, gross motor function, developmental milestones, BMI, etc.)	Recommended Dosing: • 0.9 mg/kg via IV infusion once daily for age ≥ 1 year. • < 1 year: dose based on gestational age and body weight with patients < 37 weeks old given initial dose of 0.4 mg/kg once daily, 0.7 mg/kg once daily at month one and 0.9 mg/kg once daily at month three. • 37 weeks or older the initial dose is 0.55 mg/kg once daily, 0.75 mg/kg once daily

		at month one and 0.9 mg/kg once daily at month three.
Olpruva (sodium phenylbutyrate) **Rx Benefit** Adjunctive therapy to standard of care, which includes dietary management, for the chronic management of adult and pediatric patients weighing 20 kg or greater and with a body surface area (BSA) of 1.2 m2 or greater, with urea cycle disorders (UCDs) involving deficiencies of carbamylphosphate synthetase (CPS), ornithine transcarbamylase (OTC), or argininosuccinic acid synthetase (AS) ICD10: E72.2	**Initial: 1 year approval** • Must have a diagnosis of a urea cycle disorder diagnosed through newborn screening, DNA mutation analysis, enzyme analysis or other specialized testing, AND • Olpruva must be prescribed by physician experienced in the management of Urea Cycle Disorders (UCDs) and seen by a geneticist/metabolic specialist AND a nutritionist, AND • Must be used for a diagnosis of urea cycle disorder involving deficiencies of carbamylphosphate synthetase (CPS), ornithine transcarbamylase (OTC), or argininosuccinic acid synthetase (AS) AND • Olpruva must be used with dietary protein restriction, AND **Continuation: 2 year approval** • Documentation of continued dietary protein restriction, improvement in any clinical symptoms and stability on the requested therapy Current body weight and height (or body surface area) and requested dose regimen must be submitted for initial review and each recertification request Olpruva will NOT be approved for the treatment of acute hyperammonemia in patients with Urea Cycle Disorders All requests for Olpruva (initial/recertification) will require documentation of severe intolerance to generic sodium phenylbutyrate AND Pheburane. Quantity limit: • 2G and 3G: 180 packets/30 days (1 kit) • 4G, 5G ,6G, and 6.7G: 270 packets/30 days (1 kit)	Recommended Dosing: • 9.9 –13 g/m2/day orally. Divide the calculated total daily dose into three to six doses. Administer as three to six divided doses and take with food. • Round each individual dose of Olpruva to the nearest available dosage strength. The maximum dosage is 20 grams per day
Palynziq (pegvaliase-pqpz) **Rx Benefit** Reduce blood phenylalanine concentrations in adult and pediatric patients 12 years of age and older with phenylketonuria (PKU) who have uncontrolled blood phenylalanine concentrations greater than 600 micromol/L on existing management ICD10: E70.0, E70.1	**Initial: 1 year approval** • Enrollee is ≥ 12 years of age • Therapy is prescribed by a healthcare provider experienced in the management of PKU • Enrollee has diagnosis of phenylketonuria (PKU) with hyperphenylalanemia (HPA) • Documentation of elevated blood phenylalanine level (> 600 µmol/L) within the past 30 days prior to treatment despite existing management with Kuvan/sapropterin (must be used in combination with dietary restrictions) o For those with an inability to tolerate Kuvan/sapropterin OR those who are non-responders to Kuvan/sapropterin (defined as a decrease in phenylalanine levels of less than 30% from baseline after at least a 2-month trial with maximum dose for patient age), documentation of elevated blood phenylalanine level (> 600 µmol/L) will not be required • Palynziq must be used as monotherapy and will not be approved for use in combination with Kuvan/Javygtor/sapropterin • Quantity limits apply: 2.5 mg = 30/30; 10mg = 30/30; 20 mg = 30/30 **Continuation: 2 year approval**	• Induction: 2.5 mg subcutaneously (SC) once a week for 4 weeks then titrated, based on tolerability and blood phenylalanine concentrations, to maintenance dose of 20 mg SC once a day over at least a 5-week period and continued for at least 24 weeks (refer to FDA approved package literature for dose titration schedule). • After 24 weeks dose may be increased to max of 40 mg SC once a day in patients who have not achieved a response (20% reduction in blood phenylalanine concentration from

	• Documentation of achievement and maintenance of at least a 20% reduction in blood phenylalanine concentration from pre-treatment baseline or a blood phenylalanine concentration less than or equal to 600 µmol/L once maintenance dose is achieved ○ Coverage will not be continued for patients who have not achieved a response (at least a 20% reduction in blood phenylalanine concentration from pre-treatment baseline or a blood phenylalanine concentration less than or equal to 600 µmol/L) after at least 16 weeks of continuous treatment with the maximum dosage of 60 mg once daily.	pretreatment baseline or a blood phenylalanine concentration ≤ 600 µmol/L). • May increase to 60 mg once daily if blood phenylalanine control has not been achieved after 16 weeks on the 40-mg/day dosage. Discontinue therapy if adequate response is not achieved after 16 weeks of 60 mg once daily: MAX, 60 mg/day

Ravicti (glycerol phenylbutyrate)
 	
Rx Benefit
 	
Chronic management of patients with urea cycle disorders (UCDs) who cannot be managed by dietary protein restriction and/or amino acid supplementation alone.
 	
Ravicti must be used with dietary protein restriction and, in some cases, dietary supplements
 	
ICD10: E72.2
	Initial: 1 year approval
	• Must have a diagnosis of a urea cycle disorder diagnosed through newborn screening, DNA mutation analysis, enzyme analysis or other specialized testing, AND
	• Ravicti must be prescribed by physician experienced in the management of Urea Cycle Disorders (UCDs) and seen by a geneticist/metabolic specialist AND a nutritionist, AND
	• Must be used for a diagnosis of urea cycle disorder that cannot be managed by dietary protein restriction and/or amino acid supplementation alone, AND
	• Ravicti must be used with dietary protein restriction, AND
	• Documentation of severe intolerance to generic sodium phenylbutyrate AND Pheburane
	
	Continuation: 2 year approval
	• Documentation of continued dietary protein restriction, improvement in any clinical symptoms and stability on the requested therapy.
	
	Ravicti will NOT be approved for the treatment of acute hyperammonemia in patients with Urea Cycle Disorders or for treatment of N-acetylglutamate synthase (NAGS) deficiency
	
	Current body weight and height (or body surface area / BSA) and requested dose regimen must be submitted for initial review and each recertification request.
	
	Quantity limit is 525 ml per 30 days
		Recommended Dosing:
		• Recommended initial dosage in Phenylbutyrate-naïve patients is 4.5-11.2 mL/m^2/day (5 to 12.4 g/m2 /day) given in 3 divided dosages via oral syringe or dosing cup, rounded up to the nearest 0.5mL, with a maximum of 17.5 mL/day. Should be taken with food.
		• For patients switching from sodium phenylbutyrate to Ravicti, Patients should receive the same amount of phenylbutyric acid from the sodium phenylbutyrate dose. Calculate the dosage of Ravicti (mL) using the following equation
		  ○ Total daily dosage of Ravicti (mL) = total daily dosage of sodium phenylbutyrate tablets (g) x 0.86
		  ○ Total daily dosage of Ravicti (mL) = total daily dosage of sodium phenylbutyrate powder (g) x 0.81
		• Neurotoxicity: (phenylacetate [PAA], the active moiety of Ravicti, may be toxic). Reduce dosage for symptoms of neurotoxicity

		such as: vomiting, nausea, headache, lightheadedness, somnolence, confusion, sleepiness or worsening of numbness, tingling, or burning in hands or feet are present in the absence of high ammonia or other intercurrent illnesses
Sephience (sepiapterin) **Rx Benefit** Treatment of hyperphenylalaninemia (HPA) in adult and pediatric patients 1 month of age and older with sepiapterin-responsive phenylketonuria (PKU). SEPHIENCE is to be used in conjunction with a phenylalanine (Phe)- restricted diet. ICD10: E70.0, E70.1	**Initial: 2 months** 1. Must be prescribed by a healthcare provider experienced in the management of PKU AND 2. Patient must have a diagnosis of phenylketonuria (PKU) with hyperphenylalaninemia (HPA) AND 3. Patient must adhere to a phenylalanine (Phe) restricted diet AND 4. For the initiation of pharmacologic therapy for PKU, there must be documentation of persistent uncontrolled Phe level ≥ 360 µmol/L on two separate occasions, at least one week apart within a 4-week period, while the patient is clinical stable (e.g., no acute illness or dietary lapse) AND 5. Must have an inadequate response to generic sapropterin (brand Kuvan or Javygtor) prior to initiation of Sephience a. Non-responders defined as a decrease in phenylalanine levels of less than 30% from baseline after at least 2-month trial of sapropterin at the maximum dose for patient age **Continuation: 2 years** • Documentation of current body weight, requested dose regimen, continued adherence to Phe restricted diet and stability on requested therapy • Sephience must be used as monotherapy and will not be approved for use in combination with Kuvan/sapropeptrin or Paylnziq AND • Current body weight and requested dose regimen must be submitted for initial review and each recertification request • Quantity limit of 30 packets per 30 days. o Upon each drug review and dose escalation request, the allowed quantity will be reviewed in accordance with FDA-approved age- and weight-based dosing (see table 1, 2, and 3), and, as such, will be limited to minimum number of packets of each strength to obtain the appropriate daily dose. o 60 mg/kg is the maximum daily dose for all patients. • Phe levels should be checked one week after initiation of therapy. If Phe levels do not decrease by at least 30% from baseline after 2 months, the patient is considered a non-responder and further therapy with Sephience will not be authorized.	Recommended starting dosage of Sephience in pediatric and adult patients: • < 6 months: 7.5 mg/kg/day • 6 months to < 1 year: 15 mg/kg/day • 1 year to < 2 years: 30 mg/kg/day • 2 years and older: 60 mg/kg/day For number of packets and volume to prepare mixtures for specific dosing, refer to the prescribing information
Strensiq (asfotase alfa) **Rx Benefit** treatment of patients with perinatal/ infantile- and juvenile-onset	**Initial: 6 month approval** • Patient must be followed by a physician experienced in metabolic disorders, AND • Must have a diagnosis of perinatal/infantile- or juvenile-onset hypophosphatasia (HPP) with symptom onset at ≤ 12 years of age confirmed by both of the following (i and ii): o i. Total serum ALP below the lower limit of normal for age (based upon laboratory-specific reference ranges).	Recommended Dosing: The recommended initial dose is 2 mg/kg of body weight administered subcutaneously 3 times per week, or 1 mg/kg of body weight administered subcutaneously 6 times per week. The dose may be increased to 3 mg/kg administered

hypophosphatasia (HPP) ICD10: E83.3	▪ If laboratory-specific reference ranges are not available, please refer to Table 1 (below) for ALP reference intervals, AND o ii. The presence of elevated ALP substrate levels [increased serum pyridoxal 5'-phosphate (PLP) or urinary phosphoethanolamine (PEA)] AND 3. • Must have evidence of clinical/radiographic symptoms including: o Skeletal manifestations of HPP by radiographic evidence OR o Presence of systemic complications (e.g., neurological, renal, respiratory, muscular, rheumatologic) OR o Dental manifestations of HPP OR o Family history of siblings or parents with HPP AND • Current body weight and requested dose regimen must be submitted for initial review and each recertification request **Continuation: 6 month approval** • Recertification will require documentation of a positive response to therapy and stability on requested regimen (via lab reports and progress notes documenting improvement in any clinical/radiographic symptoms) Clinical documentation must be submitted with each request and be within the previous 6 months Quantity limit: 1 vial per 28 days for all strength vials (18 mg/0.45 mL, 28 mg/0.7 mL, 40 mg/mL and 80 mg/0.8 mL) Upon each review and dose escalation request, the allowed quantity will be reviewed in accordance with FDA-approved weight-based dosing and, as such, will be limited to the minimum number of vials to obtain the appropriate weekly dose.	subcutaneously 3 times per week for insufficient efficacy in perinatal/infantile-onset HPP.
Sucraid (sacrosidase) **Rx Benefit** Congenital sucrase-isomaltase deficiency	**Initial: 1 year approval** • Patient must be followed by a physician experienced in the treatment of CSID, AND • Must have a diagnosis of congenital sucrase-isomaltose deficiency (CSID) confirmed by Small Bowel Biopsy with Disaccharidase Enzyme Testing (definitive test for diagnosing CSID). o For individuals where invasive procedure is contraindicated, diagnosis can be confirmed by a positive sucrose breath test [carbon-13 (13C) sucrose breath test]. Documentation of this contraindication is required. o A sucrose hydrogen breath test alone is not enough to confirm the diagnosis. The sucrose hydrogen breath test is not specific for identifying CSID since other gastrointestinal conditions can also produce a positive hydrogen breath test. • Treatment will not be authorized as part of a therapeutic trial to confirm diagnosis **Recertification: 2 year approval** • Recertification will require documentation of response to therapy, as evidenced by an improvement or stabilization in one of the above baseline tests	Recommended Dosing: • Sucraid is FDA-approved for patients ≥ 5 months of age • Adult dosage: 17,000 units with each meal or snack • Children weighing > 15 kg: 17,000 taken with each meal or snack • Children weighing 15 kg or less: 8,500 units taken with each meal or snack

Vimizim (elosulfase alfa) **Medical Benefit** Mucopolysaccharidosis type IVA (MPS IVA; Morquio A syndrome) ICD10: E76.210 HCPCS: J1322	**Initial: 1 year approval** • Enrollee is ≥ 5 years of age AND • Patient must be followed by a physician experienced in metabolic disorders, AND • Must have a diagnosis of Morquio A Syndrome (Mucopolysaccharidosis IVA) confirmed by biochemical enzyme analysis for N-acetylgalactosamine-6-sulfate sulfatase (GALNS) activity using fibroblasts or leukocytes AND • Must have at least one of the following documented symptoms: short stature, abnormal gait, genu valgum, spinal abnormalities, chest abnormalities, joint abnormalities, respiratory compromise, cardiac valve abnormalities, muscular weakness, visual impairment, hearing loss, or dental abnormalities and oral health challenges AND • Documentation of at least one of the following baseline tests: o a. 6-minute walk test (6MWT) OR o b. 3-minute stair-climb test **Continuation: 2 year approval** • Recertification will require documentation of response to therapy, as evidenced by an improvement or stabilization in one of the above baseline tests. Current body weight and requested dose regimen must be submitted for initial review and each recertification request	Recommended Dosing: 2 mg/kg given intravenously over a minimum range of 3.5 to 4.5 hours, based on infusion volume, once every week
VPRIV (velaglucerase alfa) **Medical Benefit** Long-term enzyme replacement therapy (ERT) for patients with type 1 Gaucher disease ICD10: E75.22 HCPCS: J3385	**Initial: 1 year approval** • Enrollee is ≥ 4 years of age AND • Prescribed by or in consultation with a physician knowledgeable in the management of Gaucher disease, AND • Must have a confirmed diagnosis of Gaucher disease (see Diagnosis section below for requirements), AND o Adults: Type 1 (nonneuronopathic) Gaucher disease confirmed by: ▪ Biochemical assay of glucocerebrosidase activity in white blood cells (WBCs) or skin fibroblasts less than or equal to 30% OR ▪ Genotype mutation of two mutant alleles of the glucocerebrosidase gene AND ▪ Symptomatic manifestations of the disease • Skeletal disease as demonstrated by radiological evidence of joint deterioration, pathological fracture, osteopenia, avascular necrosis, osteosclerosis, marrow infiltration, lytic lesions, or Erlenmeyer flask deformity) OR • Hemoglobin ≤ 11.5 for females and ≤ 12.5 g/dl for males (or 1.0 g/dL below the lower limit of normal for age and sex), platelet count <= 60,000 mm3, spleen > 15 times normal size, liver > 2.5 times normal size.	Recommended Dosing: • The recommended starting VPRIV dosage in naïve adults and naïve pediatric patients 4 years of age and older is 60 Units/kg administered every other week as a 60-minute intravenous infusion

	○ Children Type 1 (nonneuronopathic): less than 18 years of age with Type 1 Gaucher disease confirmed by: ▪ Biochemical assay of glucocerebrosidase activity in WBC's or skin fibroblasts is less than or equal to 30%. OR ▪ Genotype mutation of two mutant alleles of the glucocerebrosidase gene AND ▪ Symptomatic manifestations of the disease • Abdominal or bone pain, delayed growth, impaired psychomotor development, fatigue, exertional limitations, marrow infiltration, organomegaly, weakness and cachexia. ○ Adults and Children Type III (neuronopathic): Enzyme replacement therapy is considered off label for this diagnosis; however, consideration will be given for the following scenarios in which ERT has been shown to be beneficial for hematological and visceral disease ▪ Individuals with chronic (not acute) neuronopathic Gaucher disease type 3 ▪ Siblings of individuals with chronic neuronopathic Gaucher disease who have proven diagnosis ▪ Individuals with high-risk genotypes: L444P/L444P (c.1448T>C homozygote), D409H/D409H (c.1342G>C homozygote), L444P/D409H (c.1448T>C/c.1342G>C heterozygote) ▪ Onset of severe systemic disease at age ≤ 2 years of age **Continuation: 2 year approval** • Documentation of continued dietary protein restriction, improvement in any clinical symptoms and stability on the requested therapy. Current body weight and requested dose regimen must be submitted for initial review and each recertification request Commercial: Requests for VPRIV, for NEW STARTS, AND EXISTING USERS at the time of recertification, will require documentation of serious side effects or drug failure with Elelyso (taliglucerase alfa)	
Xuriden (uridine triacetate) **Rx Benefit** Adult and pediatric patients for the treatment of hereditary orotic aciduria ICD10: E79.89	**Initial: 6 month approval** • Patient must be followed by a physician experienced in metabolic disorders AND • Diagnosis must be confirmed by: ○ Genetic testing of the UMPS gene OR ○ Urine test that reveals very high amounts of orotic acid, with milder elevations of orotidine. • Must have at least one of the following documented symptoms (prior to treatment with uridine or Xuriden) attributed to the disease: Urinary orotic acid level significantly above the normal range, blood abnormalities (anemia, decreased white blood cell and neutrophil	Recommended Dosing: • Recommended dose for children and adults is 60 mg/kg once a day • Increase to 12 0mg/kg (maximum 8 grams) for insufficient efficacy (e.g., urine orotic acid levels remaining above normal or increasing above the usual/expected range for the patient; lab values

	counts, etc.), urinary tract obstruction, developmental delays, failure to thrive, congenital malformations, and/or immune deficiencies AND • Must have trial and failure to the preferred product: over the counter (OTC) uridine **Continuation: 2 year approval** • Documentation of a positive response to therapy and stability on requested regimen (via lab reports and progress notes) Current body weight and requested dose regimen must be submitted for initial review and each recertification request, AND Maximum daily dose is 8 grams per day according to the FDA approved labeling Quantity limit of 120 packets per 30 days	affected by orotic acid [red or white blood cell indices] worsening; worsening disease signs/symptoms) See FDA approved labeling for 60 mg/kg and 120 mg/kg weight-based dosing tables
Yargesa/ Zavesca / miglustat **Rx Benefit** Treatment of adult patients with mild to moderate type 1 Gaucher disease for whom enzyme replacement therapy is not a therapeutic option (e.g., due to allergy, hypersensitivity, or poor venous access) ICD10: E75.22	**Initial: 1 year approval** • Must meet for ONE of the following diagnoses (A OR B): o a. For a diagnosis of Gaucher disease ▪ i. Must be prescribed by or in consultation with a physician knowledgeable in the management of Gaucher disease, AND ▪ ii. Must have a confirmed diagnosis of Type 1 Gaucher disease (see Diagnosis section below for requirements) • a. Adults Type 1 (nonneuronopathic): greater than 18 years of age with Type 1 Gaucher disease confirmed by i (a OR b) AND ii: o i. One of the following: ▪ Biochemical assay of glucocerebrosidase activity in white blood cells (WBCs) or skin fibroblasts less than or equal to 30% OR ▪ Genotype mutation of two mutant alleles of the glucocerebrosidase gene o ii. Symptomatic manifestations of the disease ▪ 1. Skeletal disease as demonstrated by radiological evidence of joint deterioration, pathological fracture, osteopenia, avascular necrosis, osteosclerosis, marrow infiltration, lytic lesions, or Erlenmeyer flask deformity) OR ▪ 2. Hemoglobin ≤ 11.5 for females and ≤ 12.5 g/dl for males (or 1.0 g/dL below the	Recommended dose: 100 mg three times a day

	lower limit of normal for age and sex), platelet count <= 60,000 mm3, spleen > 15 times normal size, liver > 2.5 times normal size. • Children Type 1 (nonneuronopathic): less than 18 years of age with Type 1 Gaucher disease confirmed by i (a OR b) AND ii: o i. One of the following: ▪ Biochemical assay of glucocerebrosidase activity in WBC's or skin fibroblasts is less than or equal to 30%. OR ▪ Genotype mutation of two mutant alleles of the glucocerebrosidase gene o ii. Symptomatic manifestations of the disease ▪ Abdominal or bone pain, delayed growth, impaired psychomotor development, fatigue, exertional limitations, marrow infiltration, organomegaly, weakness and cachexia o For a diagnosis of Niemann-Pick disease type C (NPC) the following criteria must be met: ▪ i. Must be prescribed by or in consultation with a geneticist, neurologist, or metabolic disorder specialist, or a physician who specializes specializing in the treatment of Niemann-Pick disease type C (NPC) AND ▪ ii. Must have a diagnosis of NPC confirmed with documentation biallelic pathogenic variants in either NPC1 or NPC2 identified by molecular genetic testing AND ▪ iii. Must have neurological, psychiatric, and/or cognitive symptoms related to NPC AND ▪ iv. Must provide documentation of disease severity status using an objective measurement scale at baseline (prior to initiating a miglustat product) which will be used to assess clinical response to therapy. (e.g., Niemann-Pick disease type C Clinical Severity Scale (NPCCSS)- 17, rescored 4-domain NPC Clinical Severity Scale (R4DNPCCSS), fSARA) AND **Continuation: 2 year approval** • For a diagnosis of Niemann-Pick disease type C: Enrollee has demonstrated stabilization or improvement based on objective measurement scale provided upon initial approval (criterion iv) Yargesa and Zavesca will not be authorized without documentation of serious	

	side effects or drug failure to the AB rated generic equivalent miglustat AND Yargesa, Zavesca/miglustat is approved for whom enzyme replacement therapy (taliglucerase alfa, imiglucerase, or velaglucerase alfa) is not a therapeutic option due to one or more of the following: allergy, hypersensitivity, or poor venous access AND Yargesa, Zavesca/miglustat will not be approved for use in combination with enzyme replacement therapy (taliglucerase alfa, imiglucerase, or velaglucerase alfa) as this is considered investigational, Quantity limit of 90 capsules per 30 days • For a diagnosis of Gaucher disease, the maximum dose is 100 mg (1 capsule) three times a day • For a diagnosis of NPC, a quantity limit exception may be granted for up to 180 capsules per 30 days, to allow for maximum dose of 200 mg (2 capsules) three times a day	
Zanvastro (zilganersen) **Medical benefit** Treatment of Alexander disease in pediatric and adult patients ICD10: G31.86 HCPCS: J3590 (unclassified)	**Zanvastro for Commercial/Exchange/Essential Plan/Child Health Plus (CHP):** Based on a review of the available peer-reviewed evidence, Zanvastro (zilganersen) is considered not medically necessary for the treatment of Alexander Disease. In the Phase 1-3 study (NCT04849741), zilganersen 50 mg demonstrated a statistically significant stabilization of gait speed on the 10-Meter Walk Test at Week 61, with a least square mean difference of approximately 33.3% vs control (P = .041). Of note, the zilganersen group had a higher mean baseline gait speed of 1.201 vs. 1.053 in the pooled control. The participant population enrolled in the main study had a broad age range, with a mean (SD) age of 12.3 (10.6) and a range of 2.0 to 53.7 years. On the Most Bothersome Symptom (MBS) scale at week 61, 11/19 patients reported no change or worse on zilganersen vs. 14/16 patients in the pooled control. 68.4% of patients reported improvement or no change in the zilganersen group vs. 43.8% in the placebo group. The MBS evaluated the impact of zilganersen on the symptom that each participant considered to be most bothersome at baseline as reported by the participant or caregiver in an interview. On the Patient Global Impression of Change (PGIC) scale that captured change in patient's global health status at week 61 relative to day 1, 66.7% of patients reported no change or worse on zilganersen vs. 94.1% on placebo, demonstrating the majority of patients did not feel a little to much better on therapy. On the Clinician Global Impression of Change scale at week 61 relative to day 1, 79.2% of clinicians reported no change to worse for patients on zilganersen vs. 76.5% on placebo. 54.2% reported no change and 25% a little worse in the zilganersen group vs 23.5% no change, 41.2% a little worse, and 11.8% much worse in the placebo group. Similar to the PGIC, the majority of clinicians did not find patients on therapy to be a little or much better on therapy. Despite observed stabilization in gait, and potential stabilization to modest improvement in symptoms and impression of change, uncertainty regarding clinical benefit remains. Due to the heterogeneous nature of the disease, as a disease-modifying therapy, additional evidence is needed to demonstrate	See Prescribing Information for approved dosing

benefit outside of gait alone.

Alexander disease is an extremely rare, usually progressive and fatal, neurological disorder that affects not only gait and mobility, but also intellectual development, gastrointestinal functioning, autonomic functioning amongst others. Therefore, disease rarity, first-in-indication status, and unmet needs were not considered sufficient to resolve the uncertainty regarding the clinical meaningfulness of the demonstrated incremental benefit.

Reconsiderations of Medical Necessity
This determination will be reevaluated when new evidence materially addresses the uncertainty regarding the clinical meaningfulness of zilganersen's treatment-attributable benefit. Evidence that may support reconsideration includes:

- Replication or confirmation of clinically meaningful responder benefit in an additional adequately designed study
- Demonstration of sustained benefit beyond the currently established 61-week controlled treatment period
- Demonstration of improvement in survival
- Comparative or add-on evidence demonstrating clinically meaningful incremental benefit of comorbid conditions (ex. respiratory and seizure conditions) relative to established therapies

Zanvastro for Medicare Advantage/Medicaid Managed Care (MMC)/Health and Recovery Plans (HARP):

1. Must be prescribed by or in consultation with a neurologist, medical geneticist, or other provider with expertise in the diagnosis and management of Alexander disease or leukodystrophies
2. Must have a diagnosis of Alexander disease confirmed by:
    a. Documented gene heterozygous pathogenic or likely pathogenic variant in GFAP identified by molecular genetic testing, AND
    b. Neuro imaging consistent with a diagnosis of Alexander disease:
        i. Extensive cerebral white matter abnormalities with a frontal preponderance
        ii. Periventricular rim of decreased signal intensity on T2-weighted images and elevated signal intensity on T1-weighted images
        iii. Abnormalities of the basal ganglia and thalami that may include one or both of the following:
            1. Swelling and increased signal intensity on T_2-weighted images
            2. Atrophy and increased/decreased signal intensity on T_2-weighted images
        iv. Brainstem abnormalities, particularly involving the medulla and midbrain
        v. Contrast enhancement of one or more of the following (ventricular lining, periventricular rim, frontal white matter, optic chiasm, basal ganglia, thalamus, fornix, dentate nucleus, and brainstem)
3. Must have one or more clinical manifestations consistent with Alexander disease, including but not limited to developmental delay or regression, seizures, megalencephaly/macrocephaly, motor impairment, pyramidal tract signs or spasticity, gait impairment, ataxia or other cerebellar manifestations, bulbar or pseudobulbar dysfunction (e.g., dysphagia, dysarthria, or dysphonia), feeding difficulties or failure to thrive, recurrent/intractable vomiting, autonomic dysfunction, sleep-disordered breathing, or ocular motor abnormalities

	4. Must not have permanent ventilator dependence 5. Must have documentation of baseline: a. For ambulatory individuals able to complete the assessment: 10-Meter Walk Test (10MWT) b. For individuals for whom the 10MWT is not developmentally or functionally appropriate: Gross Motor Function Measure-88 (GMFM-88) c. Another objective, clinically appropriate measure of the patient's predominant disease manifestation when neither the 10MWT nor GMFM-88 is appropriate. 6. Zanvastro must be administered in accordance with the current FDA-approved prescribing information. 7. Zanvastro will not be authorized for any non-FDA approved indication 8. Initial approval will be for 12 months to assess response to treatment and adverse events a. Continued approval will be for 12 months b. Recertification will require provider attestation that the patient has experienced clinical benefit from treatment, as demonstrated by stability or improvement in an appropriate disease-specific clinical or functional measure (e.g., 10MWT, GMFM-88, or another objective measure appropriate to the patient's predominant manifestations), and that the patient does not have unacceptable treatment-related toxicity.	
Zycubo (copper histidinate) **Medical benefit** Treatment of Menkes disease in pediatric patients. ICD10: E83.09 HCPCS: No specific code yet	• Must be prescribed by, or in consultation with, a pediatric geneticist, pediatric neurologist, or metabolic disease specialist with experience in copper metabolism disorders • Must have a diagnosis of classic Menkes disease as evidenced by BOTH of the following: o Molecular genetic testing report demonstrating pathogenic or likely pathogenic ATP7A variant o A plasma catecholamine analysis (dopamine:norepinephrine ratio and/or DHPAA:DHPG ratio) confirming functional copper deficiency • Must have documentation of biochemically confirmed low serum copper (< 75 mcg/dL) AND low ceruloplasmin (< 20 mg/dL) • Must meet one of the following: o If treatment is initiated within 4 weeks of birth (corrected for prematurity), documentation must be submitted confirming the patient is presymptomatic or minimally symptomatic at the time of treatment initiation OR o If treatment is initiated after 4 weeks but within 6 months of birth (corrected for prematurity), documentation shared decision-making with family acknowledging limited neurodevelopmental benefit expected must be submitted OR o If treatment is initiated after 6 months of birth (corrected for prematurity), there must be attestation that family understands treatment is unlikely to improve neurodevelopment but may extend survival with palliative intent documented. • Baseline requirements o Serum copper and ceruloplasmin o Serum electrolytes (sodium, potassium, phosphorus, bicarbonate) o Kidney function (BUN, creatinine)	See Prescribing Information for approved dosing

	o Liver function (AST, ALT, bilirubin) o Complete blood count o Urinary β2-microglobulin (if available) o Neurodevelopmental assessment (Denver II or equivalent) • Documentation of molecular generic testing report showing the specific ATP7A pathogenic variant, including: o Variant nomenclature (HGVS format, e.g., c.2555C>T, p.Pro852Leu) o Variant classification (pathogenic, likely pathogenic, VUS) o Mutation type (missense, nonsense, frameshift, splice site, deletion, duplication) o Exon/intron location o Inheritance status (inherited vs. de novo) o Laboratory performing the test (CLIA-certified) Reauthorization/Continuation criteria • Absence of treatment-limiting toxicity (or documentation of dose modification) • Laboratory monitoring results demonstrating compliance with FDA schedule o Baseline requirements must be monitored on the following cadence based on age ▪ Age 1 month to ≤ 7 months: Every 6 weeks ▪ Age 7 months to ≤ 24 months: Every 3 months ▪ Age 25 months and up: Every 6 months • Discontinuation o Severe renal tubular toxicity unresponsive to dose reduction ▪ Persistent non-anion gap metabolic acidosis, severe electrolyte wasting requiring hospitalization, progressive renal insufficiency o Severe hepatotoxicity ▪ ALT/AST > 10× ULN, evidence of hepatic synthetic dysfunction, clinical hepatitis o Severe hematologic toxicity ▪ Transfusion-dependent anemia, pancytopenia o No biochemical response ▪ Serum copper remains < 50 mcg/dL despite compliant dosing o Progressive neurological decline despite treatment ▪ Loss of previously acquired milestones, intractable seizures, vegetative state Quantity Limit: 30 vials/30 days	

Appendix

Functional Scale for the Assessment and Rating of Ataxia (fSARA)

SARA Domain	Item	Modified Domain Score*
Domain 1: Gait	Normal, no difficulties in walking, turning, and walking tandem (up to one misstep allowed)	0
	Slight difficulties, only visible when walking 10 consecutive steps in tandem	1
	Clearly abnormal, tandem walking > 10 steps not possible	1
	Considerable staggering, difficulties in half-turn, but without support	2
	Marked staggering, intermittent support of the wall required	2
	Severe staggering, permanent support of one stick or light support by one arm required	2

	Walking > 10 m only with strong support (two special sticks or stroller or accompanying person)	3
	Walking < 10 m only with strong support (two special sticks or stroller or accompanying person)	3
	Unable to walk, even supported	4
Domain 2: Stance	Normal, able to stand in tandem > 10 s	0
	Able to stand with feet together without sway, but not in tandem for > 10 s	1
	Able to stand with feet together for >10 s, but only with sway	1
	Able to stand for > 10 s without support in natural position, but not with feet together	2
	Able to stand for > 10 s in natural position only with intermittent support	3
	Able to stand > 10 s in natural position only with constant support of one arm	3
	Unable to stand for > 10 s even with constant support of one arm	4
Domain 3: Sitting	Normal, no difficulties sitting > 10 s	0
	Slight difficulties, intermittent sway	1
	Constant sway, but able to sit > 10 s without support	2
	Able to sit for > 10 s only with intermittent support	3
	Unable to sit for > 10 s without continuous support	4
Domain 4: Speech Disturbance	Normal	0
	Suggestion of speech disturbance	1
	Impaired speech, but easy to understand	1
	Occasional words difficult to understand	2
	Many words are difficult to understand	3
	Only single words understandable	4
	Speech unintelligible, anarthria	4

*Represents modified domain scores recommended by the Food and Drug Administration

Rescored 4-domain Niemann-Pick type C Clinical Severity Score (R4DNPCCSS)

<table>
<tr><th>Domain</th><th>Scoring Criteria</th><th>Score Range*</th></tr>
<tr><td>Ambulation</td><td>0 = Normal
1 = Clumsy
2 = Ataxic unassisted gait or not walking by 18 months
4 = Assisted ambulation or not walking by 24 months
5 = Wheelchair dependent</td><td>0-5</td></tr>
<tr><td>Fine Motor Skills</td><td>0 = Normal
1 = Slight dysmetria/dystonia (independent manipulation)
2 = Mild dysmetria/dystonia (requires little to no assistance, able to feed self without difficulty)
4 = Moderate dysmetria/dystonia (limited fine motor skills, difficulty feeding self)
5 = Severe dysmetria/dystonia (gross motor limitation, requires assistance for selfcare activities)</td><td>0-5</td></tr>

GOVERNMENT PROGRAMS

CHILD HEALTH PLUS:	Subject to all terms and conditions noted in above application.
MEDICARE ADVANTAGE:	Subject to all terms and conditions noted in above application if administered under the medical benefit. Pharmacy benefit: Not applicable.
SELECT/HARP PLAN:	Effective April 1, 2023, the pharmacy benefit for Medicaid is administered by NYRx, the Medicaid Pharmacy Program.

CDPHP Pharmacy Services 10/8/2026

New: 6/2025

Revised	Reviewed
12/2025, 2/2026, 5/2026, 10/2026	

Revision Date	Changes Made
12/2025	Added Harliku (nitisinone) criteria Moved Kuvan, Javygtor and generic sapropterin from the Clinical Review Prior Authorization (CRPA) Rx policy to the Inborn Errors of Metabolism Policy Added Ctexli (chenodiol) Updated approval timeframes Added newly approved Sephience (sepiapterin) to policy
2/2026	Removed statement from Palynziq renewal about Requests will be reviewed per criteria every 12 months
3/2026	Updated Palynziq age range based on updated FDA approval for those ages 12+
5/2026	Made policy applicable to Medicare for drugs administered under the medical benefit Added Kygevvi (doxecitine and doxribtimine) Moved Sucraid from standalone policy
5/2026	Added Avlayah, Loargys, and Zycubo
10/2026	Added Zanvastro

This Pharmacy Policy is the exclusive property of Capital District Physicians' Health Plan, Inc. (CDPHP®) and its affiliated companies, CDPHP Universal Benefits,® Inc. (CDPHP UBI), and Capital District Physicians' Health Care Network, Inc. (CDPHN). The contents and form of this policy are proprietary to CDPHP. Any reproduction or replication of this policy without the express written permission of CDPHP, CDPHP UBI, and CDPHN is strictly prohibited. This policy is subject to contractual limitations and/or parameters established in any Employer sponsored Summary Plan Description (SPD) and/or Benefit Design Document (BDD).

Disclaimer Notice

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgment when deciding the most appropriate care to enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

Background

The Inflammatory Conditions Clinical Review Prior Authorization- Medical Benefit policy contains criteria for medications that have significant concerns about potential efficacy, quality, toxicity, or utilization, but do not warrant a stand-alone policy. The Pharmacy Management clinical team and members of the Pharmacy and Therapeutics (P&T) committee review the drugs falling into this policy.

CDPHP administers benefits to members for drugs contained in this policy only if the member has a medical benefit with CDPHP. Prior authorization is obtained thought the CDPHP pharmacy department.

Summary

Effective Date of Policy:	9/24/2026
Indications	Varies by drug
ICD10 Diagnosis Codes	HCPCS: Actemra (tocilizumab) Intravenous Infusion (J3262). Cimzia (certolizumab pegol) (J0717), Cosentyx (secukinumab) Intravenous Infusion (J3247), Entyvio (vedolizumab) Intravenous Infusion (J3380) Ilumya (tildrakzumab) (J3245), Skyrizi (riskankizumab) Intravenous Infusion (J2327), Spevigo (spesolimab-sbzo) (J1747), Stelara (Ustekinumab)/ Selarsdi (ustekinumab-aekn)/Yesintek (ustekinumab-kfce) (J3357), J3358, Q9998, Q5100), Tremfya (J1628)
Availability	Varies by drug
Duration	1 year unless otherwise noted

This policy is only applicable if medication is administered under the medical benefit

Required Criteria for Approval

Actemra (tocilizumab) Intravenous Infusion

1. The enrollee must have a diagnosis of moderately to severely active **Rheumatoid Arthritis**
    a. The medication must be prescribed by or in consultation with a Rheumatologist
    b. The enrollee must be 18 years of age or older
    c. The enrollee must have tried or is intolerant to at least one conventional disease-modifying antirheumatic drug (DMARD) such as methotrexate, leflunomide, sulfasalazine or hydroxychloroquine either alone or in combination for at least 3 months
    d. The recommended starting dose is 4 mg/kg every 4 weeks
        i. Depending on clinical response, the dose can be increased to 8 mg/kg (up to 800 mg per dose) every 4 weeks
2. The enrollee must have a diagnosis of **Giant Cell Arteritis**
    a. The medication must be prescribed by or in consultation with a Rheumatologist, Neurologist, or Ophthalmologist
    b. The enrollee must be 18 years of age or older
    c. The enrollee must have trialed at least one systemic corticosteroid
    d. The recommended dose is 6 mg/kg every 4 weeks (maximum dose 600 mg) in combination with a tapering dose of corticosteroids
3. The enrollee must have a diagnosis of **Polyarticular Juvenile Idiopathic Arthritis**
    a. The medication must be prescribed by or in consultation with a Rheumatologist
    b. The enrollee must be 2 years of age or older
    c. The enrollee has tried at least one other systemic therapy for this condition OR patient has an absolute contraindication to methotrexate, sulfasalazine or leflunomide OR patient has aggressive disease, as determined by the prescriber
    d. The recommended dose for patients weighing less than 30 kg is 10 mg/kg every 4 weeks
    e. The recommended dose for patients weighing more than 30 kg is 8 mg/kg every 4 weeks

4. The enrollee must have a diagnosis of **Systemic Juvenile Idiopathic Arthritis**
    a. The medication must be prescribed by or in consultation with a Rheumatologist
    b. The enrollee must be 2 years of age or older
    c. The enrollee has tried at least one other systemic therapy for this condition OR patient has an absolute contraindication to methotrexate, sulfasalazine or leflunomide OR patient has aggressive disease, as determined by the prescriber
    d. The recommended dose for patients weighing less than 30 kg is 12 mg/kg every 2 weeks
    e. The recommended dose for patients weighing more than 30 kg is 8 mg/kg every 2 weeks
5. Actemra is being used for the treatment of **cytokine release syndrome associated with Chimeric Antigen Receptor (CAR) T-Cell Therapy**
    a. Enrollee has been or will be treated with a CAR T-cell therapy
    b. The recommended dosing is as follows:
        i. For patients < 30 kg: up to 12 mg/kg (maximum of 800 mg per dose)
        ii. For patients ≥ 30 kg: up to 8 mg/kg (maximum of 800 mg per dose)
6. IV tocilizumab has been FDA approved for the treatment of hospitalized adult patients, and Actemra with additional indication for pediatric patients (2 years of age or older), with COVID-19 who are receiving systemic corticosteroids and require supplemental oxygen, non-invasive or invasive mechanical ventilation, or extracorporeal membrane oxygenation (ECMO) for inpatient use only; therefore, coverage in the outpatient setting will not be authorized.

HCPCS: J3262

Cimzia (certolizumab pegol)

1. The enrollee must have a diagnosis of **Ankylosing Spondylitis**
    a. The medication must be prescribed by or in consultation with a Rheumatologist
    b. The enrollee must be 18 years of age
    c. The recommended dosing is as follows:
        i. Initial dosing: subcutaneous injection of 400 mg (given as two injections of 200 mg) at weeks 0, 2, and 4
        ii. Maintenance dosing: 400 mg subcutaneously every 4 weeks OR 200 mg subcutaneously every other week
2. The enrollee must have a diagnosis of **Crohn's disease**
    a. The medication must be prescribed by or in consultation with a gastroenterologist
    b. The enrollee must be at least 18 years of age
    c. The enrollee meets at least one of the following criteria:
        i. Has tried or is currently taking a systemic corticosteroid or a systemic corticosteroid is contraindicated
        ii. Has tried at least one other conventional systemic therapy for Crohn's disease
        iii. Has enterocutaneous (perianal or abdominal) or rectovaginal fistulas
        iv. Has a history of ileocolonic resection
    d. The recommended dosing is as follows:
        i. Initial dosing: subcutaneous injection of 400 mg (given as two injections of 200 mg) at weeks 0, 2, and 4
        ii. Maintenance dosing: 400 mg subcutaneously every 4 weeks
3. The enrollee must have a diagnosis of **Non-Radiographic Axial Spondyloarthritis**
    a. The medication must be prescribed by or in consultation with a rheumatologist
    b. The enrollee must be at least 18 years of age
    c. The enrollee has objective signs of inflammation, defined as at least one of the following:
        i. C-reactive protein (CRP) above the upper limit of normal
        ii. Sacroiliitis reported on magnetic resonance imaging (MRI)
    d. The recommended dosing is as follows:
        i. Initial dosing: subcutaneous injection of 400 mg (given as two injections of 200 mg) at weeks 0, 2, and 4
        ii. Maintenance dosing: 400 mg subcutaneously every 4 weeks OR 200 mg subcutaneously every other week
4. The enrollee must have a diagnosis of **Plaque Psoriasis**
    a. The medication must be prescribed by or in consultation with a dermatologist
    b. The enrollee must be at least 18 years of age
    c. The enrollee must meet at least one of the following criteria:
        i. Has tried at least one traditional systemic agent for psoriasis for at least 3 months unless intolerant
        ii. Has a contraindication to methotrexate, as determined by the prescriber

d. The recommended dosing is as follows:
    i. Subcutaneous injection of 400 mg every other week
    ii. For some patients with a body weight ≤ 90 kg, a dose of 400 mg at weeks 0, 2, and 4 followed by 200 mg every other week may be considered

5. The enrollee must have a diagnosis of **Polyarticular Juvenile Idiopathic Arthritis**
    a. The medication must be prescribed by or in consultation with a rheumatologist
    b. The enrollee must be at least 2 years of age
    c. The enrollee must meet one of the following criteria:
        i. Has tried at least one other agent for this condition
        ii. Will be starting on therapy concurrently with methotrexate, sulfasalazine, or leflunomide
        iii. Has an absolute contraindication to methotrexate, sulfasalazine or leflunomide
        iv. Has aggressive disease, as determined by the prescriber
    d. The recommended dosing is weight-based as follows:
        i. 10 kg to less than 20 kg: 100 mg at weeks 0, 2, and 4 followed by 50 mg every other week
        ii. 20 kg to less than 40 kg: 200 mg at weeks 0, 2, and 4 followed by 100 mg every other week
        iii. Greater than or equal to 40 kg: 400 mg at weeks 0, 2, and 4 followed by 200 mg every other week
6. The enrollee must have a diagnosis of **Psoriatic Arthritis**
    a. The medication must be prescribed by or in consultation with a dermatologist or rheumatologist
    b. The enrollee must be at least 18 years of age
    c. The recommended dosing is as follows:
        i. Initial dosing: subcutaneous injection of 400 mg (given as two injections of 200 mg) at weeks 0, 2, and 4
        ii. Maintenance dosing: 400 mg subcutaneously every 4 weeks OR 200 mg subcutaneously every other week
7. The enrollee must have a diagnosis of **Rheumatoid Arthritis**
    a. The medication must be prescribed by or in consultation with a rheumatologist
    b. The enrollee must be at least 18 years of age
    c. The enrollee must have tried or is intolerant to at least one conventional disease-modifying antirheumatic drug (DMARD) such as methotrexate, leflunomide, sulfasalazine, or hydroxychloroquine either alone or in combination for at least 3 months
    d. The recommended dosing is as follows:
        i. Initial dosing: subcutaneous injection of 400 mg (given as two injections of 200 mg) at weeks 0, 2, and 4
        ii. Maintenance dosing: 400 mg subcutaneously every 4 weeks OR 200 mg subcutaneously every other week

HCPCS: J0717

Cosentyx (secukinumab) Intravenous Infusion

1. The enrollee must have a diagnosis of **Ankylosing Spondylitis**
    a. The medication must be prescribed by or in consultation with a rheumatologist
    b. The enrollee must be at least 12 years of age
    c. Must have refractory disease defined by failure of or intolerance to at least TWO different NSAIDS at maximum strength for at least 1 month each
    d. The recommended dosing is as follows:
        i. With a loading dose: A single 6 mg/kg loading dose followed by 1.75 mg/kg (up to a maximum of 300 mg per dose) every 4 weeks
        ii. Without a loading dose: 1.75 mg/kg (up to a maximum of 300 mg) every 4 weeks
2. The enrollee must have a diagnosis of **Non-Radiographic Axial Sponyloarthritis**
    a. The medication must be prescribed by or in consultation with a rheumatologist
    b. The enrollee must be at least 18 years of age
    c. Must have refractory disease defined by failure of or intolerance to at least TWO different NSAIDS at maximum strength for at least 1 month each
    d. The recommended dosing is as follows:
        i. With a loading dose: A single 6 mg/kg loading dose followed by 1.75 mg/kg (up to a maximum of 300 mg per dose) every 4 weeks
        ii. Without a loading dose: 1.75 mg/kg (up to a maximum of 300 mg) every 4 weeks

3. The enrollee must have a diagnosis of **Psoriatic Arthritis**
    a. The medication must be prescribed by or in consultation with a Rheumatologist or dermatologist
    b. The enrollee must be at least 18 years of age
    c. The recommended dosing is as follows:
        i. With a loading dose: A single 6 mg/kg loading dose followed by 1.75 mg/kg (up to a maximum of 300 mg per dose) every 4 weeks
        ii. Without a loading dose: 1.75 mg/kg (up to a maximum of 300 mg) every 4 weeks

HCPCS: J3247

Entyvio (vedolizumab) Intravenous Infusion

1. The enrollee must have a diagnosis of **Crohn's disease**
    a. The medication must be prescribed by or in consultation with a gastroenterologist
    b. The enrollee must be at least 18 years of age
    c. The enrollee meets at least one of the following criteria:
        i. Documentation that azathioprine, 6-mercaptopurine, or methotrexate is not effective, contraindicated, or not tolerated
        ii. Treatment with a biologic medication as first-line therapy will be assessed on a case-by-case basis through a letter of medical necessity and clinical progress notes based on severity of the disease (such as but not limited to enterocutaneous [perianal or abdominal] fistulas, rectovaginal fistulas, ileocolonic resection
    d. The recommended dose is 300 mg at weeks 0, 2, and 6, followed by 300 mg every 8 weeks
2. The enrollee must have a diagnosis of **Ulcerative Colitis**
    a. The medication must be prescribed by or in consultation with a gastroenterologist
    b. The enrollee must be at least 18 years of age
    c. Enrollee must meet ONE of the following:
        i. Must have tried and failed or has documented intolerance to at least ONE of the following conventional therapies for at least 3 months:
            1. I. Thiopurines: Azathioprine/6-mercaptopurine (6-MP)
            2. 5-Aminosalicylates: Sulfasalazine, Mesalamine, Olsalazine
            3. IV or oral steroids - note, a 3-month trial of systemic steroid therapy will not be required
        ii. The patient has been diagnosed with pouchitis and has tried an antibiotic, corticosteroid enema, or mesalamine enema
    d. The recommended dose is 300 mg at weeks 0, 2, and 6, followed by 300 mg every 8 weeks

HCPCS: J3380

Ilumya (tildrakzumab)

1. The enrollee must have a diagnosis of moderate to severe chronic **Plaque Psoriasis** that involves at least 10% of their body surface area. Consideration will be given to those who have less than 10% body surface area involvement but have severe disease of sensitive areas or areas causing significant disruption in normal activities (such as the hands, feet, face, genitalia)
    a. The medication must be prescribed by or in consultation with a dermatologist or rheumatologist
    b. The enrollee must be at least 18 years of age
    c. The patient must be a candidate for systemic therapy or phototherapy and meet for ONE of the following:
        i. The patient must have had a 3-month trial of systemic therapy (i.e., acitretin, methotrexate, or cyclosporine) that resulted in an inadequate response (failure). A 3-month trial will not be required if the member experienced serious side effects during a trial of one of the aforementioned agents OR
        ii. The patient must have had a 3-month trial of Ultraviolet B (UVB) Phototherapy or Psoralen Ultraviolet A (PUVA) Phototherapy that resulted in an inadequate response (failure)
    d. The recommended dosing is 100 mg by subcutaneous injection at weeks 0, 4, and then every 12 weeks thereafter
2. Coverage for Ilumya will only be authorized under the medical benefit

HCPCS: J3245

Skyrizi (riskankizumab) Intravenous Infusion

1. The enrollee must have a diagnosis of **Crohn's disease**
    a. The medication must be prescribed by or in consultation with a gastroenterologist
    b. The enrollee must be at least 18 years of age
    c. The enrollee meets at least one of the following criteria:
        i. has tried or is currently taking a systemic corticosteroid or a systemic corticosteroid is contraindicated
        ii. has tried at least one other conventional systemic therapy for Crohn's disease
        iii. has enterocutaneous (perianal or abdominal) or rectovaginal fistulas
        iv. has a history of ileocolonic resection
    d. Skyrizi IV infusion will be used as induction therapy only
    e. The recommended dose is 600 mg at weeks 0, 4, and 8
2. The enrollee must have a diagnosis of **Ulcerative Colitis**
    a. The medication must be prescribed by or in consultation with a gastroenterologist
    b. The enrollee must be at least 18 years of age
    c. The enrollee meets at least one of the following criteria:
        i. has tried or is currently taking a systemic corticosteroid or a systemic corticosteroid is contraindicated
        ii. has tried at least either a thiopurine or 5-aminosalicylate for at least 3 months
        iii. has a diagnosis of pouchitis AND has tried an antibiotic, corticosteroid enema, or mesalamine enema
    d. Skyrizi IV infusion will be used as induction therapy only
    e. The recommended dose is 1200 mg at weeks 0, 4, and 8

HCPCS: J2327

Spevigo (spesolimab-sbzo)

1. The patient must be at least 12 years of age **AND**
2. The patient must weigh at least 40 kilograms (kg) **AND**
3. Must be prescribed by a dermatologist or a physician specializing in the treatment of autoinflammatory conditions **AND**
4. The patient must have a confirmed diagnosis of generalized pustular psoriasis (GPP) defined as the presence of primary, sterile, macroscopically visible pustules on non-acral skin (excluding cases where pustulation is restricted to psoriatic plaques) **AND**
5. Must be used for the treatment of a generalized pustular psoriasis (GPP) moderate to severe flare in patients with a history of at least 2 moderate to severe GPP flares defined as:
    a. A Generalized Pustular Psoriasis Physician Global Assessment (GPPGA) score of ≥ 3 **AND**
    b. New appearance or worsening of existing pustules **AND**
    c. A GPPGA pustulation sub score of ≥ 2 **AND**
    d. ≥ 5% body surface covered with erythema and the presence of pustules **OR**
6. Requests for **an additional dose** used to treat the **same flare** will be covered if the patient meets the following criteria:
    a. The additional dose will be used no sooner than 1 week after the initial dose **AND**
    b. The patient has a Generalized Pustular Psoriasis Physician Global Assessment (GPPGA) total score of 2 or higher at the end of week 1 (range, 0 [clear skin] to 4 [severe disease]) **AND**
    c. The patient has a GPPGA pustulation subscore of 2 or higher at the end of week 1 (range, 0 [no visible pustules] to 4 [severe pustulation])
7. Requests for Recertification
    a. Individuals that have previously received at least 1 dose of Spevigo for the treatment of a prior GPP flare will be covered for a recurrent flare if the patient achieved a Generalized Pustular Psoriasis Physician Global Assessment (GPPGA) score of 0 or 1 after previous treatment AND had an increase of at least 2 points in both GPPGA total score and pustulation subscore after previous treatment
8. Spevigo IV will not be covered for the ongoing treatment of GPP (as a one-time loading dose or as maintenance treatment)
9. Approval timeframe: Treatment of a flare with intravenous (IV) Spevigo: 1 week per request (new, additional, and recertification)
10. Approved Dosing:
    a. Experiencing a flare: 900 mg dose by intravenous (IV) infusion over 90 minutes
    b. If GPP flare symptoms persist, an additional intravenous (IV) 900 mg dose (over 90 minutes) may be administered one week after the initial dose (the criteria listed in 6 must be met for coverage for an additional dose)

HCPCS: J1747

Stelara (Ustekinumab)/ Selarsdi (ustekinumab-aekn)/Yesintek (ustekinumab-kfce)

1. The enrollee must have a diagnosis of **Crohn's disease**
- a. The medication must be prescribed by or in consultation with a gastroenterologist
- b. The enrollee must be at least 2 years of age
- c. The enrollee meets at least one of the following criteria:
  - i. has tried or is currently taking a systemic corticosteroid or a systemic corticosteroid is contraindicated
  - ii. has tried at least one other conventional systemic therapy for Crohn's disease
  - iii. has enterocutaneous (perianal or abdominal) or rectovaginal fistulas
  - iv. has a history of ileocolonic resection
- d. Approved dosing:
  - i. Adult patients:
    1. Induction dose - At week 0, a one-time weight-based IV loading dose given by a healthcare professional. This will be covered under the medical benefit.
       - a. 55 kg or less: 260 mg
       - b. Greater than 55 kg to 85 kg: 390 mg
       - c. Greater than 85 kg: 520 mg
    2. Maintenance dosing:
       - a. Starting at week 8, ustekinumab 90mg is given subcutaneously every 8 weeks.
       - b. This can be self-injected under the Rx benefit or given subcutaneously by a healthcare professional under the medical benefit.
  - ii. Pediatric patients:
    1. For pediatric patients weighing 10 kg or more: A single intravenous infusion using weight-based dosing given by a healthcare professional. This will be covered under the medical benefit.
       - a. 10 kg-25 kg: 10 mg/kg
       - b. Greater than 25 kg to 55 kg: 260 mg
       - c. Greater than 55 kg to 85 kg: 390 mg
       - d. Greater than 85 kg: 520 mg
    2. Maintenance weight-based dosing:
       - a. 10 kg to 35 kg: a subcutaneous 2.5 mg/kg dose administered 8 weeks after the initial intravenous dose, then every 8 weeks thereafter.
       - b. Greater than 35 kg: a subcutaneous 90 mg dose administered 8 weeks after the initial intravenous dose, then every 8 weeks thereafter.
       - c. This can be self-injected or given by caregivers under the Rx benefit or given subcutaneously by a health care professional under the medical benefit

2. The enrollee must have a diagnosis of **Ulcerative Colitis**
- a. The medication must be prescribed by or in consultation with a gastroenterologist
- b. The enrollee must be at least 2 years of age
- c. The enrollee meets at least one of the following criteria:
  - i. Has tried or is currently taking a systemic corticosteroid or a systemic corticosteroid is contraindicated
  - ii. Has tried at least either a thiopurine or 5-aminosalicylate for at least 3 months
  - iii. Has a diagnosis of pouchitis AND has tried an antibiotic, corticosteroid enema, or mesalamine enema
- d. Approved dosing
  - i. Adult patients:
    1. Induction dose - At week 0, a one-time weight-based IV loading dose given by a healthcare professional. This will be covered under the medical benefit.
       - a. 55 kg or less: 260 mg
       - b. Greater than 55 kg to 85 kg: 390 mg
       - c. Greater than 85 kg: 520 mg
    2. Maintenance dosing:
       - a. Starting at week 8, ustekinumab 90mg is given subcutaneously every 8 weeks.
       - b. This can be self-injected under the Rx benefit or given subcutaneously by a healthcare professional under the medical benefit.

ii. Pediatric patients:
    1. Induction dose- for pediatric patients weighing 10 kg or more: A single intravenous infusion using weight-based dosing given by a healthcare professional. This will be covered under the medical benefit.
        a. 10 kg-25 kg: 10 mg/kg
        b. Greater than 25 kg to 55 kg: 260 mg
        c. Greater than 55 kg to 85 kg: 390 mg
        d. Greater than 85 kg: 520 mg
    2. Maintenance weight-based dosing:
        a. 10 kg to 35 kg: a subcutaneous 2.5 mg/kg dose administered 8 weeks after the initial intravenous dose, then every 8 weeks thereafter.
        b. Greater than 35 kg: a subcutaneous 90 mg dose administered 8 weeks after the initial intravenous dose, then every 8 weeks thereafter.
        c. This can be self-injected or given by caregivers under the Rx benefit or given subcutaneously by a healthcare professional under the medical benefit

3. The enrollee must have a diagnosis of **Plaque Psoriasis**
    a. The medication must be prescribed by or in consultation with a dermatologist
    b. The enrollee must be at least 6 years of age
    c. The enrollee must meet one of the following criteria:
        i. Has tried at least one traditional systemic agent for psoriasis for at least 3 months, unless intolerant or if traditional agent therapy is contraindicated
    d. The recommended dose is as follows:
        i. Pediatric dosing:
            1. For those weighing < 60 kg: 0.75 mg/kg at weeks 0, 4, and then every 12 weeks thereafter
            2. For those weighing 60–100 kg: 45 mg at weeks 0, 4, and then every 12 weeks thereafter
            3. For those weighing > 100 kg: 90 mg at weeks 0, 4, and then every 12 weeks thereafter
        ii. Adult dosing:
            1. For those weighing ≤ 100 kg: 45 mg at weeks 0, 4, and then every 12 weeks thereafter
            2. For those weighing > 100 kg: 90 mg at weeks 0, 4, and every 12 weeks thereafter
4. The enrollee must have a diagnosis of **Psoriatic Arthritis**
    a. The medication must be prescribed by or in consultation with a dermatologist or rheumatologist
    b. The enrollee must be at least 6 years of age
    c. The recommended dosing is as follows:
        i. Pediatric dosing:
            1. For those weighing < 60 kg: 0.75 mg/kg at weeks 0, 4, and then every 12 weeks thereafter
            2. For those weighing 60–100 kg: 45 mg at weeks 0, 4, and then every 12 weeks thereafter
            3. For those weighing > 100 kg with co-existent moderate-to-severe plaque psoriasis: 90 mg at weeks 0, 4, and then every 12 weeks thereafter
        ii. Adult dosing:
            1. For those weighing ≤ 100 kg: 45 mg at weeks 0, 4, and then every 12 weeks thereafter
            2. For those weighing > 100 kg with co-existent moderate-to-severe plaque psoriasis: 90 mg at weeks 0, 4, and every 12 weeks thereafter

HCPCS: J3357, J3358, Q9998, Q5100

Tremfya (guselkumab)

Note: Tremfya (guselkumab) will be approved under the medical for induction dosing only if the following criteria are met:

Moderately to severely active Ulcerative Colitis

1. Must be prescribed by or in consultation with a gastroenterologist
2. Must be at least 18 years of age
3. Must meet **ONE** of the following:
    a. Must have tried and had an inadequate response or documented intolerance to at least ONE of the following conventional therapies for at least 3 months:

i. Thiopurines: azathioprine/6-mercaptopurine (6-MP)
ii. 5-Aminosalicylates: sulfasalazine, mesalamine, olsalazine
iii. IV or oral steroids – note, a 3-month trial of systemic steroid therapy will not be required

b. The patient has been diagnosed with pouchitis and has tried an antibiotic, corticosteroid enema, or mesalamine enema

4. Coverage of Tremfya for Ulcerative Colitis will be limited to the following:
   a. **Induction**: One of the following
      i. 200 mg IV at week 0, 4, and 8. Approval is for 3 induction doses in 12 weeks as a medical benefit **OR**
      ii. 400 mg (Induction Pack for UC or CD: 2 x 200 mg/2 mL single-dose prefilled pens) administered by subcutaneous injection at week 0, 4, and 8. Approval is for 3 induction doses in 12 weeks *(refer to Inflammatory Conditions Clinical Review Prior Authorization (CRPA) Policy – PHARMACY BENEFIT ONLY, 1350/20.000558)*

Moderately to severely active Crohn's Disease

1. Must be prescribed by or in consultation with a gastroenterologist
2. Must be at least 18 years of age
3. Must have had an inadequate response, intolerance or contraindication to azathioprine, 6-mercaptopurine, or methotrexate
   a. Treatment with a biologic medication as first-line therapy will be assessed on a case-by-case basic through documentation of medical necessity and clinical progress notes based on severity of disease (such as but not limited to enterocutaneous [perianal or abdominal] fistulas, rectovaginal fistulas, ileocolonic resection)
4. Coverage for Crohn's Disease will be limited to the following:
   a. **Induction:** One of the following
      i. 200 mg administered by intravenous infusion at week 0, 4, and 8. Approval is for 3 induction doses in 12 weeks as a medical benefit **OR**
      ii. 400 mg (Induction Pack for UC or CD: 2 x 200 mg/2 mL single-dose prefilled pens) administered by subcutaneous injection at week 0, 4, and 8. Approval is for 3 induction doses in 12 weeks *(refer to Inflammatory Conditions Clinical Review Prior Authorization (CRPA) Policy – PHARMACY BENEFIT ONLY, 1350/20.000558)*

HCPCS: J1628

Exclusion Criteria

- Drugs listed in this policy as well as other immunomodulating therapies or Targeted Synthetic Disease-Modifying Antirheumatic Drugs (DMARDs) not listed in this policy should not be administered in combination with another biologic or targeted synthetic DMARD used for an inflammatory condition. Combination therapy is generally not recommended due to the added risk of immunosuppression, potential for a higher rate of adverse effects, and lack of evidence for additive therapy.
  - NOTE: This does NOT exclude the use of conventional synthetic DMARDs (e.g., MTX, leflunomide, hydroxychloroquine)
- Requests for non-FDA approved uses are not covered per this policy; review as per Off-Label Uses of FDA-Approved Drugs Policy Control Number: 1350/20.000048

Continuation Criteria

- Continued approval at time of recertification will require documentation that the drug is providing ongoing benefit to the patient in terms of improvement or stability in disease state or condition.
- Clinical documentation must be submitted for each request (initial and recertification) unless otherwise specified (e.g., provider attestation required). Supporting documentation includes, but is not limited to, progress notes documenting previous treatments/treatment history, diagnostic testing, laboratory test results, genetic testing/biomarker results, imaging and other objective or subjective measures of benefit which support continued use of the requested product is medically necessary.

Considerations

- Patient must have medical coverage administered by CDPHP.
- Prior authorization is obtained through the CDPHP pharmacy department.
- An exception can be made to the requirement of a trial of at least one conventional agent if the member has already had a 3-month trial or previous intolerance to at least one biologic other than the requested drug. A biosimilar of the requested biologic does not count.

- Dose and frequency should be in accordance with the FDA label or recognized compendia (for off-label uses). When services are performed in excess of established parameters, they may be subject to review for medical necessity.

GOVERNMENT PROGRAMS

CHILD HEALTH PLUS: Subject to all terms and conditions noted in above application.

MEDICARE CHOICES: Not applicable

SELECT/HARP PLAN: Subject to all terms and conditions noted in above application.

CDPHP Pharmacy Services 9/24/2026

New: 6/25

Policy History

Revised	Reviewed
9/2025, 12/2025, 1/2026, 2.2026, 6/2026, 9/2026	7/2026

Revision Date	Changes Made
9/2025	Added Spevigo (spesolimab-sbzo) for generalized pustular psoriasis flares
12/2025	Added statement to Actemra not being covered outpatient for COVID-19 Removed Simponi Aria from policy as changed to no PA required
1/2026	Added Selarsdi and Yesintek as Stelara biosimilars
2/2026	Updated Entyvio criteria wording Updated Cosentyx: Added NSAID requirement for diagnosis of ankylosing spondylitis and non-radiographic axial spondylitis. And removed CRP and MRI requirement for non-radiographic axial spondylitis Updated Ilumya: Added rheumatologist as provider, specified severity and BSA, updated to trial of systemic therapy or phototherapy, clarified Ilumya will only be authorized under the medical benefit
2/2026	Added Tremfya to make clearer IV vs. SQ induction
6/2026	Updated Cosentyx age for AS down to 12 years of age
9/2026	Updated with dosing for Stelara pediatric Crohn's and UC

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: INPATIENT PHYSICAL REHABILITATION: ACUTE, SUBACUTE & SKILLED

POLICY EFFECTIVE DATE:	8/1/2023
Policy Control #:	1370/20.000204
Next Annual Review:	July 2027

DISCLAIMER

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgement when deciding the most appropriate care to enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

DESCRIPTION

Inpatient physical rehabilitation is designed to provide rehabilitation therapy in a resource-intensive environment for patients who, due to the complexity of their nursing, medical management, and rehabilitation needs, require and can reasonably be expected to benefit from an inpatient stay and an interdisciplinary team approach to the delivery of rehabilitation care. Rehabilitation is the ongoing process of therapy and education that assists the member with attaining maximum functional status.

POSITION STATEMENT

CDPHP administers benefits for inpatient physical rehabilitation provided in an approved rehabilitation unit or facility when determined to be medically necessary and in accordance with the criteria stated below.

Requests for all levels of inpatient rehabilitation services must be reasonable and necessary (in terms of efficacy, duration, frequency, and amount) for the treatment of the member's condition in accordance with the criteria outlined below and cannot be provided in a less intensive clinical setting (e.g., outpatient services or home care).

Inpatient rehabilitation services may be habilitative or rehabilitative in nature.

- **Rehabilitation services are** health care services that help a person keep, get back, or

improve skills and functioning for daily living that have been lost or impaired because a person was sick, hurt, or disabled.

- **Habilitation Services** are health care services that help a person keep, learn, or improve skills and functioning for daily living. They include the management of limitations and disabilities, including services or programs that help maintain or prevent deterioration in physical, cognitive, or behavioral function.
  - Refer to specific member contracts for availability of benefits, if any, relating to habilitative services.

The following are **general requirements** for all levels of inpatient physical rehabilitation:

- Transfer to an inpatient rehabilitation facility is ordered by a physician.
- The inpatient rehabilitation facility is a CDPHP provider.
- There is a plan of care, defined at the time of admission, which includes identification of specific patient needs and clear measurable goals that can be achieved in a reasonable and predictable period of time, and that result in significant clinical improvement leading to increased independence. At the discretion of the Plan's medical director, the facility may be given the initial 48 hours of the stay to define or further clarify the plan.
- The patient's physical and mental condition makes it possible to actively participate in, and significantly benefit from, the inpatient rehabilitation program.
- The expectation exists for restoring function within the individual's mental/physical limitations with the goal of continuing rehabilitation at a less intensive setting as soon as the patient's condition allows.

Inpatient Acute Rehabilitation

*In an **acute** rehabilitation setting, CDPHP expects the program will offer at least three hours of combined services daily, six days a week, that are comprehensive and skilled, including, but not limited to: physical, occupational, and speech therapies, along with cognitive and/or recreational therapies, as needed. There is to be daily documentation of the patient's progress.*

In addition, the following criteria is to be met:

- The complexity of the individual's nursing, medical management, and rehabilitation needs (e.g., physical, occupational, speech therapy) require an inpatient interdisciplinary team approach for delivery of care, under the direction of a physiatrist or other physician with rehabilitation experience.

The following special patient circumstances will be reviewed on an individual case basis by a CDPHP medical director for approval of inpatient acute rehabilitation:

- When the patient's medical condition indicates a higher level of care than may be required by the rehabilitation needs alone either due to services required to treat the

medical condition or due to the impact of the condition on the rehabilitation; **or**

- When a patient who was active prior to an acute hospitalization becomes deconditioned and will not meet acute inpatient rehabilitation criteria immediately upon admission but appears to be able to achieve that level of rehabilitation within a short time.

Inpatient Subacute Rehabilitation

*In a **subacute** rehabilitation setting, CDPHP expects the program will offer from 1½ to up to three hours of combined services daily, five days a week, that are comprehensive and skilled, including, but not limited to: physical, occupational, and speech therapies, along with cognitive and/or recreational therapies, as needed. There is to be documentation of the patient's progress at least every other day.*

Inpatient Skilled Nursing Facility Rehabilitation

*In a **skilled nursing facility** rehabilitation setting**,** CDPHP expects the program will offer from 20 minutes up to 1½-hours of skilled rehabilitation services at least five days per week that are comprehensive and skilled, including, but not limited to: physical, occupational, and speech therapies, along with cognitive and/or recreational therapies, as needed. There is to be documentation of the patient's progress at least two times a week*.

Additional Services

CDPHP provides reimbursement for the following services, in addition to all levels of inpatient physical rehabilitation, when the criteria outlined below is met:

Active Weaning of Ventilator-Dependent Individual

Medical record documentation to support all of the following:

- Pulmonary or critical care physician documents medical opinion that member is able to be weaned and/or weaning barrier assessment.
- Documentation of wean should consist of ventilator modes, PEEP, oxygenation, airway resistance/ling compliance, and medical stability with wean attempts.

Services are provided for attempts to wean from ventilator and not for chronic long-term ventilator support.

- If no documented progression in one month, physician documentation of re-assessment and/or weaning barriers to attempts with goals is required.
- Weekly assessment of documented weaning progression will occur thereafter by a CDPHP medical director for continued additional reimbursement.

POLICY NAME: INPATIENT PHYSICAL REHABILITATION: ACUTE, SUBACUTE & SKILLED

Dialysis Management

Includes coverage of cost for the following services only:

- When the skilled nursing facility is paying for transportation of the member to and from dialysis.
- When the skilled nursing facility provides staff to accompany the member to and from dialysis.
- When the member is receiving dialysis within the skilled nursing facility such as peritoneal dialysis.

Six-Day Rehabilitation Program

Coverage is provided for an additional therapy day, either Saturday or Sunday, as supported in medical record documentation.

Skilled Nursing Level Criteria:

Level 1:

- Basic skilled services – may include IV hydration, IV antibiotics, Lovenox, daily skilled wound care
- Combined Restorative rehab services up to 0.5 hours/day, five times/week
- Care of chronic tracheostomy/suctioning
- Tube feedings management
- New Oxygen use, nebs, respiratory treatments
- Insulin dependent Diabetics on daily insulin scale (for Medicare Choice members. Commercial members should require Medical Director Review for coverage determination.)

Level 2:

- Basic Skilled Services – may include IV hydration, IV antibiotics
- Combined restorative rehab services up to 1.75 hours/day five times/week
- Wound management including skilled wound care – daily dressing changes
- Members with tracheostomy that requires frequent suctioning (q2-4 hours and prn)
- Wound vac management if there is a separate auth for the wound vac.

Level 3:

- Basic skilled services – may include IV hydration, IV antibiotics AND combined rehab services up to 1.75 hours/day up to six days/week

OR

- Extensive wound management AND combined rehab services up to 1.75 hours/day up to five days/week. Extensive wound management defined:
    - Complicated wound care needs, wound vac procedures and/or wound packing that is required more than once per day. May also include the management of Stage 3 or Stage 4 decubiti and venous/arterial insufficiency ulcers that require extensive wound management.
    - Application of ointments, dry dressings, wet soaks, and use of protective dressings does not correlate with extensive wound management.

Level 4

- Vent dependent with active weaning program. RT notes and weaning info required for review.
- If no documented progression in one month, physician documentation of re-assessment and/or weaning barriers to attempts with goals is required.

Level 5

- Vent weaning AND hemodialysis being done on-site at the skilled nursing facility.

POLICY CONSIDERATIONS

CDPHP utilizes nationally published guidelines *(InterQual®)* to assist with all medical necessity determinations relating to admission and appropriateness of continued acute and subacute inpatient rehabilitation, and skilled nursing facility stay.

The patient requires active and ongoing therapeutic intervention of multiple therapy disciplines (physical therapy, occupational therapy, speech-language pathology, or prosthetics/orthotics), one of which must be physical or occupational therapy.

Deficits are present in areas of functional mobility, self-care skills, cognitive status, or neurosensory areas, and not limited to cognitive therapy only.

Patient is willing to participate in therapies and can follow commands with sufficient cognitive ability and motivation.

Discharge planning is expected to begin upon admission, and must be proactive in nature, with early social work intervention for anticipated socioeconomic issues.

Skilled therapies are available during weekends and holidays for acute and subacute levels of rehabilitation.

Other teaching needs are concurrently addressed, such as diabetic and colostomy care, and self-catheterization.

Services are subject to all applicable limitations and/or cost-share as stated in the enrollee's contract.

Discharge Indicators

The patient will be considered eligible for discharge when one or more of the following are met:

- The patient's rehabilitative needs can be met more appropriately in a less intensive clinical setting; **or**
- The patient has attained maximum independence in functioning within the limitations imposed by disease or injury; **or**
- The patient demonstrates successful adaptation to the outpatient setting on home visit when appropriate; **or**
- The treatment team documents the refusal of the patient to actively participate in rehabilitation program; **or**
- Medical complications occur that preclude participation in the rehabilitation documented; **or**
- There is no documented measurable improvement in functional status for one week; **or**
- The patient's function returns to their pre-morbid status

CDPHP PRODUCT VARIATIONS

CHILD HEALTH PLUS	Subject to all terms and conditions noted above in the policy. • Services in a skilled nursing facility or rehabilitation facility are excluded from coverage.
MEDICARE ADVANTAGE	Subject to all terms and conditions noted above in the policy. In accordance with guidelines from the Centers for Medicare & Medicaid Services (CMS), an enrollee or their designee must receive a *Notice of Medicare Non-coverage (NOMNC)* no later than two days prior to termination of inpatient subacute and inpatient skilled nursing facility rehabilitation services. Participating providers will provide the CDPHP NOMNC to enrollees, which includes completion of valid delivery, faxing a copy to CDPHP, and maintaining a copy in the enrollee's medical record upon

	completion of services. In accordance with guidelines from the Centers for Medicare & Medicaid Services (CMS), an enrollee or their designee must receive an *Important Message (IM)* no later than two days prior to termination of inpatient acute rehabilitation services. Participating providers will provide the CDPHP IM to enrollees, which includes completion of valid delivery, faxing a copy to CDPHP, and maintaining a copy in the enrollee's medical record upon completion of services.
SELECT PLAN/HARP	Subject to all terms and conditions noted above in the policy.

MEDICAL POLICY

Medical Policy Title	**Interfacility Transfer of a Registered Inpatient**
Policy Number	**11.01.18**
Current Effective Date	**November 1, 2026**
Next Review Date	**March 2027**

Our medical policies are guides to evaluate technologies or services for medical necessity. Criteria are established through the assessment of evidence based, peer-reviewed scientific literature, and national professional guidelines. Federal and state law(s), regulatory mandates and the member's subscriber contract language are considered first in the determination of a covered service. (Link to Product Disclaimer)

This medical policy does not address the coverage of transportation of a registered inpatient but rather addresses the transferred admission of the patient from one acute care facility to another acute care facility.

POLICY STATEMENT(S)

I. Interfacility transfer of a registered inpatient from one acute care facility to another acute care facility, to obtain necessary, specialized diagnostic and/or therapeutic services is considered **medically appropriate** and, therefore, both hospital stays are eligible for coverage when **BOTH** criteria are met:

   A. The necessary diagnostic and/or therapeutic services are not available in the facility in which the patient is registered; **and**

   B. The provider of the necessary service(s) is the participating facility nearest to the facility in which the patient is currently admitted that has the required capabilities for providing the necessary services.

II. Interfacility transfers for any other reasons are considered **not medically necessary** and, therefore, admission to the receiving facility is **not eligible for coverage**.

III. If a newborn is transferred to a second facility for a higher level of care, then the transfer of the mother will be considered **medically necessary** unless the mother's medical status is such that her medical discharge is anticipated within 24 hours. (Refer to Policy Guideline I for additional information.)

11.01.06 Ambulance: Air

POLICY GUIDELINE(S)

Proprietary Information of Capital District Physicians' Health Plan, Inc. | CDPHP Universal Benefits,® Inc. | Capital District Physicians' Healthcare Network, Inc.

I. If a newborn has been transferred to a second facility for medically necessary tertiary care that the birth facility is unable to provide, then the interfacility transfer of the newborn to return to the birth hospital will be **eligible for coverage** when:

   A. The newborn has completed tertiary care according to the InterQual® Level of Care Criteria Acute Pediatric for Level III or Level IV NICU care; and the criteria of 1 **AND** 2 **OR** 3 are met:

      1. The birth hospital is greater than 50 miles/one (1) hour driving time from the tertiary care facility;

         AND

      2. It is anticipated that the newborn will remain in the receiving facility for at least three (3) days for convalescent care;

         OR

      3. Bed space is needed in the tertiary care facility, and the newborn can be safely cared for in the receiving acute hospital.

   Note: Please contact your local Customer (Member/Provider) Service Department to determine specific regional interfacility newborn transfer requirements.

II. Coverage is not available for elective or convenience interfacility transfers (e.g., transferring a patient back to the originating facility when not medically necessary).

III. The receiving facility in an interfacility transfer should be the nearest participating facility that can provide the necessary care, unless there are extenuating circumstances. In the case of inability, lack of capacity, or refusal of the nearest participating facility to accept the patient, the patient should then be transferred to the next nearest participating facility that can provide the necessary care. Review by a Health Plan Medical Director is required in these circumstances.

IV. Prior authorization for interfacility transfer is contract-dependent, and, where a member's subscriber contract requires, authorization must be obtained prior to transfer of the patient. Some members' subscriber contracts exclude coverage for the transfer of a member between health care facilities.

V. Accepting the transfer of a registered inpatient from another facility through the emergency room, when the patient is not in need of emergent services, does not negate the requirement for prior authorization of the transfer if the member contract requires prior authorization for inpatient admissions.

VI. The transfer of a registered inpatient to another facility for a diagnostic procedure that is designated by the Health Plan as an outpatient procedure, is not considered an interfacility transfer if it does not meet the InterQual® Acute Inpatient Level of Care Criteria.

VII. Hospital contracts with some health care systems provide for only one diagnostic related group (DRG) payment, irrespective of the number of facilities in which the patient becomes registered. Intra-system transfers with one DRG payment do not require prior authorization.

Proprietary Information of Capital District Physicians' Health Plan, Inc. | CDPHP Universal Benefits,® Inc. | Capital District Physicians' Healthcare Network, Inc.

VIII. A medically necessary determination for the interfacility transfer service of a registered inpatient to another facility does not automatically translate to an approval for transportation. A clinical review of the mode of ambulance transport service (air or land/ground) to the specified facility should also be performed in accordance with the applicable Corporate Medical Policy.

DESCRIPTION

Interfacility, or interhospital, transfer of a registered inpatient involves the transfer of a registered hospital inpatient to another acute care facility, to obtain medically necessary, specialized diagnostic or therapeutic services.

For an interfacility transfer to occur, the transferring physician should ensure that all required documentation relating to the transfer of patients is completed.

POLICY STATEMENT(S)

Initial Epidural Steroid Injection (ESI)

I. An initial ESI (caudal, interlaminar, or transforaminal) is considered **medically appropriate** when documentation meets **ALL** the following:

   A. The individual is diagnosed with **ANY** of the following:

      1. Degenerative lumbar spondylolisthesis with neurological findings and/or deficits (e.g., back pain, leg pain, motor weakness);

2. Failed back surgery syndrome (FBSS) or epidural fibrosis; **or**
3. Spinal stenosis (foraminal, central, or disc disease);

B. Pain-related symptoms meet **all** the following:

1. Radicular pain, acute or chronic, with or without motor weakness;
2. Pain causes a functional impairment;
3. A minimum of 6 weeks of conservative management during the previous 6 months failed, or was not tolerated, and includes **BOTH** of the following:
   a. Non-pharmacologic management with **either**:
      i. Chiropractic care; **or**
      ii. Supervised physical therapy (PT); **and**
   b. Pharmacological management with **either**:
      i. Medication directed at the underlying disease process; **or**
      ii. Oral analgesics;

II. An initial ESI is considered **not medically necessary** for **ANY** of the following contraindications:

A. Allergy or hypersensitivity to any component of the injectate;
B. Local infection at the planned injection;
C. Systemic infection;
D. Infectious spondylosis;
E. Uncontrolled bleeding or clotting disorder;
F. Malignancy involving the planned injection site;
G. Pregnancy; **or**
H. Refusal of the procedure by the individual or legally authorized representative;
I. ESI will be performed under computed tomography (CT) or fluoroscopic guidance.

<u>Repeat ESI</u>

III. A repeat ESI (caudal, interlaminar, or transforaminal) is considered **medically appropriate** when documentation meets **ALL** the following:

A. Active engagement in non-surgical conservative management with chiropractic care or supervised PT, unless intolerance due to pain is documented;
B. Pain and/or functional impairment persist;
C. Performed for **either** of the following scenarios:

1. For diagnostic injections(s), with/without steroids, when **both** of the following are met:
    a. No more than two (2) injections in total have been performed; **and**
    b. It has been at least 2 weeks between injections; **or**
2. For therapeutic injections, when **all** the following are met:
    a. No more than four (4) injections have been performed per year, per spinal region;
    b. It has been at least 10 weeks between injections;
    c. A minimum of 50% reduction in pain was a result of the previous injection; **and**
    d. Pain relief lasted for a minimum of 10 weeks.

IV. A repeat ESI is considered **not medically necessary** for **ANY** of the following contraindications:

A. Allergy or hypersensitivity to any component of the injectate;
B. Local infection at the planned injection site;
C. Systemic infection;
D. Infectious spondylosis;
E. Uncontrolled bleeding or clotting disorder;
F. Malignancy involving the planned injection site;
G. Pregnancy; **or**
H. Refusal of the procedure by the individual or legally authorized representative.

<u>Selective Nerve Root Block (SNRB)</u>

V. A diagnostic selective nerve root block (SNRB) is considered **medically appropriate** when documentation meets **ALL** the following:

A. Performed at one (1) or more spinal levels;
B. Anesthetic injectate only is used;
C. Performed to assist in establishing a diagnosis of radicular pain (e.g., radiculitis, radiculopathy) when there is no known pain diagnosis;
D. Completed diagnostic evaluation includes **one (1) or more** of the following:
    1. Neurological examination;
    2. Electrodiagnostic testing; **or**
    3. Relevant imaging studies;
E. Documentation of **either** of the following:
    1. Clinical findings are suggestive of nerve root pathology; **or**

2. Performed for preoperative planning.

VI. SNRB is considered **not medically necessary** for **ANY** of the following contraindications:

A. Allergy or hypersensitivity to any component of the injectate;

B. Local infection at the planned injection;

C. Systemic infection;

D. Infectious spondylosis;

E. Uncontrolled bleeding or clotting disorder;

F. Malignancy involving the planned injection site;

G. Pregnancy; **or**

H. Refusal of the procedure by the individual or legally authorized representative.

Initial Facet Joint Injections (FJI) and/or Medial Branch Blocks (MBB)

VII. An initial FJI (cervical, thoracic or lumbar) or MBB are considered **medically appropriate** when the documentation meets **ALL** the following:

A. Pain-related symptoms meet **all** the following:

1. Persistent for a minimum of 12 weeks;
2. Pain causes a functional impairment;
3. Non-radicular (cervical, thoracic or lumbar);

B. A minimum of 6 weeks of conservative management, unless contraindicated, during the previous 6 months failed or was not tolerated, including **both** of the following:

1. Non-pharmacologic management with **either**:
   a. chiropractic care; **or**
   b. supervised physical therapy (PT); **and**
2. Pharmacological management with **either**:
   a. Medication directed at the underlying disease process; **or**
   b. Oral analgesics;

C. The procedure will be performed under computed tomography (CT) or fluoroscopic guidance.

VIII. An initial FJI or MBB is considered **not medically necessary** for **ANY** of the following contraindications:

A. Allergy to any component of the injectate;

B. Uncontrolled bleeding or clotting disorder;

C. Active infection;

D. Pregnancy when ultrasound guidance is not available; **or**

E. History of spinal fusion at the same level.

Repeat FJI/MBB

IX. A repeat FJI or MBB are considered **medically appropriate** when the documentation meets **ALL** the following:

A. Performed at the same level as the initial block;

B. Performed for **either** of the following scenarios:

1. For diagnostic injections(s) when **all** the following are met:

a. No more than two (2) injections per region;

b. A minimum of 70% reduction in pain was a result of the initial injection;

c. A minimum of 6 weeks of conservative management during the previous 6 months failed or was not tolerated, including **BOTH** the following:

i. Non-pharmacologic management with **either**:

a) chiropractic care; **or**

b) supervised physical therapy (PT); **and**

ii. Pharmacological management with **either**:

c) Medication directed at the underlying disease process; **or**

d) Oral analgesics;

2. For therapeutic injections, when **all** the following are met:

a. No more than three (3) injections per region performed in a 12-month period;

b. A minimum of 50% pain relief from the prior injection;

c. Pain relief lasted for a minimum of 3 months; and

d. Active engagement in non-surgical conservative management with chiropractic care or supervised PT, unless intolerance due to pain is documented;

X. A repeat FJI or MBB is considered **not medically necessary** for **ANY** of the following contraindications:

A. Allergy to any component of the injectate;

B. Uncontrolled bleeding or clotting disorder;

C. Active infection;

D. Pregnancy when ultrasound guidance is not available; **or**

E. History of spinal fusion at the same level.

FIJ/MSS as an Alternative to Radiofrequency Ablation/Neurotomy

XI. FJI/MBB as an alternative to radiofrequency ablation/neurotomy is considered **medically appropriate** when documentation meets **ALL** of the following:

A. Significant pain relief (e.g., greater than 50%) was a result of the initial FJI/MBB;

B. Pain relief lasted a minimum of 12 weeks;

C. Radiofrequency denervation/ablation is not appropriate due to **ANY** of the following:

1. Implanted cardiac device (e.g., pacemaker, defibrillator);
2. Prior diagnostic injection positive outcomes support continued injection-based therapy;
3. Continued anticoagulation therapy is required; **or**
4. Young athletes for whom alternative treatment options are preferred based on long-term considerations;

XII. FJI/MBB as an alternative to radiofrequency ablation/neurotomy is considered **not medically necessary** for **ANY** of the following contraindications:

A. Allergy to any component of the injectate;

B. Uncontrolled bleeding or clotting disorder;

C. Active infection;

D. Pregnancy when ultrasound guidance is not available; **or**

E. History of spinal fusion at the same level.

Initial Radiofrequency Neurolysis, Paravertebral Facet Joint/Medial Branch Transection

XIII. Initial radiofrequency neurolysis (denervation/ablation) of a paravertebral facet joint or medial branch transection is considered **medically appropriate** when the documentation meets **ALL** the following:

A. There is no evidence from the clinical assessment, diagnostic evaluation, or imaging studies of an alternative pain generator (e.g., central spinal stenosis, foraminal stenosis, disc herniation, fracture, infection, spinal instrumentation, pseudoarthrosis, or neoplastic disease);

B. Pain-related symptoms meet **all** the following:

1. Persistent for a minimum of 3 months;
2. Pain causes a functional impairment;
3. A minimum of 6 weeks of conservative management during the previous 6 months failed or was not tolerated, including **ALL** of the following:

a. Non-pharmacologic management with **either**:
    i. chiropractic care; **or**
    ii. supervised physical therapy (PT); **and**
b. Pharmacological management with **either**:
    i. Medication directed at the underlying disease process; **or**
    ii. Oral analgesics;

C. No more than two (2) diagnostic facet joint injections/medial branch blocks have been performed;

D. Previous diagnostic facet joint injections/medial branch blocks provided significant reduction in pain or functional improvement for at least the expected duration of the anesthetic utilized; The procedure will be performed under computed tomography (CT), fluoroscopic, or ultrasound guidance.

XIV. Initial radiofrequency neurolysis (denervation/ablation) of a paravertebral facet joint or medial branch transection is considered **not medically necessary** for **ANY** of the following contraindications:

A. Active infection;

B. Coagulopathy;

C. Myopathy, acquired or congenital;

D. Neuromuscular disease, including but not limited to amyotrophic lateral sclerosis (ALS);

E. Pregnancy; **or**

F. Previous spinal fusion at the same level.

<u>Repeat Radiofrequency Neurolysis, Paravertebral Facet Joint/Medial Branch Transection</u>

XV. Repeat radiofrequency joint neurolysis/medial branch transection (denervation/ablations) is considered **medically appropriate** when documentation meets **ALL** the following:

A. No more than two (2) procedures per spinal region during a 12-month period;

B. At least 6 months since the previous denervation/ablation at the same level;

C. Recurrence of pain after previously successful denervation/ablation;

D. Active engagement in non-surgical conservative management with chiropractic care or supervised physical therapy, unless intolerance due to pain is documented.

XVI. Repeat radiofrequency joint neurolysis/medial branch transection (denervation/ablations) is considered **not medically necessary** for **ANY** of the following contraindications:

A. Active infection;

B. Coagulopathy;

C. Myopathy, acquired or congenital;

D. Neuromuscular disease, including but not limited to amyotrophic lateral sclerosis (ALS);

E. Pregnancy; **or**

F. Previous spinal fusion at the same level.

Sacroiliac Joint Injection - Diagnostic

XVII. A diagnostic sacroiliac joint injection is considered **medically appropriate** when documentation meets **ALL** of the following:

A. At least one (1) sacroiliac provocative test is positive;

B. Pain-related symptoms meet **ALL** the following:

1. Unilateral non-radicular pain localized over the sacroiliac joint below the L5 level;
2. Persistent for a minimum of 3 months;
3. A minimum of 6 weeks of conservative management, unless contraindicated, during the previous 6 months failed, including **both** of the following:
    a. Non-pharmacologic management with **either**:
        i. chiropractic care; **or**
        ii. supervised physical therapy (PT); **and**
    b. Pharmacological management includes **either**:
        i. Medication directed at the underlying disease process; or
        ii. Oral analgesics;

C. Injection will be performed under computed tomography (CT) or fluoroscopic guidance.

XVIII. A diagnostic sacroiliac joint injection is considered **not medically necessary** for **ANY** of the following contraindications:

A. Allergy to any component of the injectate;

B. Uncontrolled bleeding or clotting disorder;

C. Active infection; **or**

D. Pregnancy.

Sacroiliac Joint Injection - Therapeutic

XIX. A therapeutic sacroiliac injection for sacroiliac joint pain is considered **medically appropriate** when documentation meets **ALL** the following:

A. A minimum of 50% reduction in pain was a result of the diagnostic injection;

B. Active engagement in non-surgical conservative management with chiropractic care or supervised PT, unless intolerance due to pain is documented;

C. Pain causes a functional impairment.

XX. A therapeutic sacroiliac injection for sacroiliac joint pain is considered **not medically necessary** for **ANY** of the following contraindications:

A. Allergy to any component of the injectate;

B. Uncontrolled bleeding or clotting disorder;

C. Active infection; **or**

D. Pregnancy.

Sacroiliac Joint Injection - Repeat

XXI. Repeat sacroiliac injection(s) are considered **medically appropriate** when documentation meets **ALL** of the following:

A. Active engagement in non-surgical conservative management with chiropractic care or supervised PT, unless intolerance due to pain is documented;

B. Injection(s) will be performed under computed tomography (CT) or fluoroscopic guidance;

C. Performed for **either** of the following scenarios:

1. For diagnostic injections(s) when **both** the following are met:
    a. No more than two (2) injections per region; **and**
    b. The result of the initial injection was less than 75% reduction in pain; **or**
2. For therapeutic injections, when **all** the following are met:
    a. No more than four (4) injections per region performed in a 12-month period;
    b. A minimum of 50% pain relief from the initial injection;
    c. Pain relief lasted for a minimum of two (2) months; **and**
    d. Active engagement in non-surgical conservative management with chiropractic care or supervised PT, unless intolerance due to pain is documented.

XXII. Repeat sacroiliac injection(s) are considered **not medically necessary** for **ANY** of the following contraindications:

A. Allergy to any component of the injectate;

B. Uncontrolled bleeding or clotting disorder;

C. Active infection; **or**

D. Pregnancy.

POLICY GUIDELINE(S)

I. If an individual demonstrates improvement during the initial 6 weeks of PT, an additional 6 weeks of PT should be attempted prior to interventional pain management.

II. Relative contraindications to ESI (caudal, interlaminar, transforminal) include **any** of the following:

   A. Acute spinal cord compression;

   B. Cauda equina syndrome or myelopathy;

   C. Chronic immunosuppression;

   D. Uncontrolled medical comorbidity(ies);

   E. Clinical improvement to conservative management; **or**

   F. For interlaminar ESI only: severe spinal stenosis.

DESCRIPTION

Definitions to support interventional pain management criteria:

- Activities of daily living (ADLs) refer to routine self-care activities required for independent daily functioning, including bathing, dressing, eating, toileting, and transferring between surfaces such as a bed and chair.
- Cauda equina syndrome is a neurologic emergency caused by compression of the lumbosacral nerve roots and may present with bowel or bladder dysfunction, saddle sensory changes, and motor or sensory deficits involving the lower extremities.
- Caudal epidural steroid injection (CESI) is a procedure in which contrast material (when not contraindicated), corticosteroid, and optionally a local anesthetic are introduced into the epidural space through the sacral hiatus under fluoroscopic guidance.
- Compression test is a sacroiliac joint provocation maneuver performed with the individual lying on their side, in which the examiner applies downward (vertical) pressure over the uppermost iliac crest/hip to compress the pelvis and stress the sacroiliac joints, assessing for reproduction of sacroiliac joint pain.
- Conservative management refers to non-surgical treatment strategies used to manage spinal pain and related conditions and may include physical therapy, medication therapy, chiropractic care, and other non-operative interventions.

- Distraction test is a sacroiliac joint provocation maneuver in which outward pressure is applied across the pelvis to place stress on the sacroiliac joints and assess for symptom reproduction.
- Electrodiagnostic testing refers to neurophysiologic studies used to evaluate the function of peripheral nerves, muscles, and related neuromuscular structures.
- Epidural fibrosis refers to scar tissue formation adjacent to a spinal nerve root, most commonly occurring following spinal surgery.
- Epidural steroid injection (ESI) involves administration of a corticosteroid into the epidural space surrounding a spinal nerve root as a diagnostic and/or therapeutic intervention for radicular pain. Epidural injections may be performed using interlaminar, transforaminal, or caudal approaches.
- Flexion, abduction, and external rotation (FABER) Test, also known as Patrick's Test, is a provocative examination maneuver used in the assessment of pathology involving the hip, lumbar spine, or sacroiliac joint.
- Facet joint injections/medial branch blocks refer to the injection of local anesthetic, with or without corticosteroid, into a facet joint or along the medial branch nerves supplying the joint for the evaluation and treatment of facet-mediated pain.
- Failed back surgery syndrome (FBSS) describes persistent or recurrent pain following spinal surgery despite completion of the surgical procedure.
- Fluoroscopy is a real-time X-ray imaging modality that allows visualization of internal structures and procedural instruments during diagnostic and therapeutic interventions.
- Foraminal stenosis refers to narrowing of the neural foramen that may lead to irritation or compression of an exiting spinal nerve root.
- Gaenslen's test is a sacroiliac joint provocation maneuver that places stress across the pelvis and sacroiliac joint to assist in identifying pain arising from that region.
- Glucocorticosteroid refers to a class of medications commonly used for their anti-inflammatory and immunosuppressive properties.
- Immunosuppression refers to reduced immune system function resulting from disease, medication, or therapeutic intervention.
- Interlaminar epidural steroid injection (ILESI) is a procedure in which contrast material (when not contraindicated), corticosteroid, and optionally a local anesthetic are delivered into the epidural space through an interlaminar approach under imaging guidance.
- Log roll test is a physical examination maneuver used primarily to evaluate for pathology arising from the hip joint.
- Medial branch transection, also known as endoscopic rhizotomy, is a surgical or endoscopic division of the medial branch nerves supplying the facet joints for the treatment of facet-mediated pain.
- Myasthenia Gravis is an autoimmune neuromuscular disorder characterized by fluctuating

skeletal muscle weakness resulting from impaired transmission at the neuromuscular junction.

- Myopathy refers to a disorder of muscle tissue characterized primarily by muscle weakness and, in some cases, cramping, stiffness, or pain.
- Nerve root disease, also referred to as radiculopathy, involves irritation or compression of a spinal nerve root that may result in pain, sensory disturbance, and/or motor dysfunction within the affected distribution.
- Neurotomy refers to the intentional interruption or division of a nerve for therapeutic purposes.
- Non-radicular pain refers to pain that is not caused by irritation or compression of a spinal nerve root and generally occurs without objective neurologic findings suggestive of radiculopathy.
- Paravertebral facet joints, also known as zygapophyseal joints or Z-joints, are articulations between adjacent vertebrae that may serve as a source of chronic spinal pain.
- Provocative test refers to a diagnostic maneuver designed to reproduce or exacerbate symptoms associated with a suspected condition.
- Pseudoarthrosis refers to failure of bony fusion following an attempted spinal fusion procedure.
- Radicular means relating to, involving, or arising from a spinal nerve root.
- Radiculitis refers to inflammation or irritation of a spinal nerve root that may result in pain and sensory symptoms.
- Radiculopathy refers to signs and symptoms caused by compression or irritation of a spinal nerve root, including pain, numbness, tingling, and/or weakness.
- Radiofrequency joint denervation/ablation refers to a minimally invasive procedure that uses thermal energy delivered through a radiofrequency probe to disrupt sensory nerve supply to a painful facet joint with the goal of reducing pain.
- Sacral thrust test is a sacroiliac joint provocation maneuver in which pressure is applied over the sacrum to reproduce symptoms arising from the sacroiliac joint.
- Sacroiliac (SI) joint injections involve administration of local anesthetic, with or without corticosteroid, into the sacroiliac joint for diagnostic evaluation and/or treatment of sacroiliac joint-mediated pain.
- Selective nerve root block (SNRB) is a diagnostic procedure in which anesthetic is injected around a specific spinal nerve root under imaging guidance to assist in identifying the symptomatic nerve root and/or for surgical planning.
- Spinal cord compression occurs when pressure on the spinal cord impairs normal neurologic function.
- Spinal instrumentation refers to surgically implanted devices, such as rods, screws, hooks, or wires, used to stabilize and support the spine.
- Spinal stenosis is a condition characterized by narrowing of the spinal canal and/or neural

foramina that may result in compression of neural structures.

- Spondylitis refers to inflammation involving the vertebrae or spinal joints.
- Spondylolisthesis refers to forward displacement of one vertebral body relative to the vertebra below it.
- Thigh thrust test is a sacroiliac joint provocation maneuver in which force is transmitted through the femur to stress the sacroiliac joint and reproduce symptoms.
- Transforaminal epidural steroid injection (TFESI) is a procedure in which contrast material (when not contraindicated), corticosteroid, and optionally a local anesthetic are introduced into the epidural space through the neural foramen under imaging guidance.

SUPPORTIVE LITERATURE

Epidural spinal injection (ESI) is one of several therapies available for people who fail conservative treatment, and is a common modality used for radicular pain and lumbar referred pain with several potentially painful conditions (e.g., neurogenic claudication) associated with degenerative or isthmic spinal stenosis.

Buenaventura et al (2009) conducted a systematic review to evaluate the effectiveness of lumbar TFESIs in managing chronic radicular pain. Of the four randomized, controlled trials evaluating TFESIs, all showed positive results for short-term relief. Two studies were positive for long-term relief; the results for long-term relief were not available for the third study, and the fourth study had negative long-term relief results.

Novak et al (2008) conducted a systematic review to evaluate the evidence in support of guidelines on frequency and timing of epidural steroid injections, to help determine what sort of response should occur to repeat an injection. The review included 11 randomized, controlled trials, one prospective controlled trial, and two prospective cohort studies. The authors concluded that there is limited evidence to suggest guidelines for frequency and timing of epidural steroid injections or to help define an appropriate partial response that would trigger a repeat injection. Research suggests that repeat injections may improve outcomes, but conclusions cannot be made due to methodological limitations of the available evidence. The authors further concluded that there does not appear to be any evidence to support the common practice of a series of injections.

Parr et al (2012) conducted a systematic review evaluating the effect of caudal epidural injections with or without steroids in managing various types of chronic low back and lower extremity pain, produced good evidence for short- and long-term relief of chronic pain secondary to disc herniation or radiculitis with local anesthetic and steroids, and fair relief with local anesthetic only. Further, this systematic review also provided only fair evidence for caudal epidural injections in managing chronic axial or discogenic pain, spinal stenosis, and post-surgery syndrome.

<u>Lumbar Radiculopathy</u>

In a Cochrane review, Oliveira et al (2020) published a systematic review and meta-analysis of 25 placebo-controlled randomized trials (n=2,470) evaluating the efficacy and safety of epidural

corticosteroid injections for lumbosacral radicular pain. Moderate-quality evidence indicated that epidural corticosteroid injections were slightly more effective than placebo in reducing short-term leg pain and short-term disability (95% CI). However, the treatment effects were small and may not be considered clinically important (i.e., mean difference lower than 10%). Epidural corticosteroid injections were not more effective than placebo for reducing leg pain at intermediate or long-term follow-up. Adverse events were mostly minor (e.g., headache, accidental dural puncture, worsening pain), with no significant difference between groups. The authors concluded that the available evidence provides only limited support for the use of epidural corticosteroid injections in lumbosacral radicular pain, as benefits are small and largely confined to the short term.

Verheijen et al (2021) conducted a meta-analysis of 17 RCTs comparing ESI to epidural or nonepidural placebo in patients with sciatica. Studies were eligible for inclusion in the meta-analysis if they provided data on sciatica patients (any level of pain, any duration of symptoms, and any prior therapy). For back pain, ESI was not significantly more effective than epidural placebo at 6 weeks (p=.14), 3 months (p=.95), or 6 months (p=.53). GRADE quality of evidence was moderate at 6 weeks, very low at 3 months, and low at 6 months. When compared to nonepidural placebo, ESI resulted in greater relief of back pain at 3 months (p=.02) but not at 6 weeks or 6 months (quality of evidence: moderate). Based on low-quality evidence, leg pain was significantly improved with ESI compared to epidural placebo at 6 weeks (p<.01) and 3 months (p=.04), but not at 6 months (p=.31). In a sensitivity analysis adjusting for heterogeneity, leg pain was significantly improved with ESI compared to epidural placebo at all time points. Compared to nonepidural placebo, ESI did not significantly improve leg pain at any time point (quality of evidence: low to moderate). Functional status was significantly improved with ESI versus epidural placebo at 6 weeks (p<.01), but between-group differences were not significant at 3 months or 6 months (quality of evidence: moderate at 6 weeks, low at 3 months, and very low at 6 months). Compared to nonepidural placebo, ESI did not significantly improve functional status at any time point (quality of evidence: moderate). The patient population included in this review was not well-defined; therefore, it is unclear whether certain subpopulations may obtain greater benefit from ESI. Other limitations of the review include the relatively small number of studies available (particularly for the back pain outcome analyses and all comparisons between ESI and nonepidural placebo), the unclear clinical importance of the outcomes, and the variation in treatment success definitions across studies.

Cervical Radiculopathy

Cohen et al (2014) reported the results of an RCT that compared ESI, conservative treatment, and a combination of both for patients with cervical radiculopathy. A total of 169 patients were randomized to conservative care (physical therapy plus medications), ESIs, or a combination of both treatments. The primary outcomes were neck and arm pain measured at 1- and 3- months posttreatment. There were no differences noted between ESI and conservative care on any of the outcome measures. The group receiving combination therapy had a greater reduction in arm pain at 1 month compared with the two individual treatments and had a greater success rate at 3 months (56.9% vs. 26.8%, p=.006).

Borton et al (2022) performed a systematic review of cervical transforaminal ESIs for cervical

radiculopathy. The review included six studies (3 RCTs and 3 observational studies; n=443). None of the included studies directly compared cervical transforaminal ESIs with other treatment options or placebo. Short-term (4 to 8 weeks) decreases in pain scores following injection varied greatly both within and between the six studies, and mean reduction in pain scores ranged from 18% to 70%. Four studies reported on longer-term pain relief (> 8 weeks), and mean reduction in pain scores ranged from 33% to 73%; however, there was a significant number of patients lost to follow-up in these studies.

Spinal Stenosis

Schneider et al (2019) published the results of a 3-arm RCT comparing the clinical effectiveness of medical care (n=88), group exercise (n=84), and manual therapy/individualized exercise (n=87) in patients with lumbar spinal stenosis. Treatment in the medical care group consisted of medications and/or ESI provided by a physiatrist. Study limitations include failure to disclose the proportion of patients in the medical care group that received ESI during the course of the study, excluding patients <60 years of age, and no direct reporting of pain outcomes. The primary outcomes were symptoms and physical function as measured by the patient-reported Swiss Spinal Stenosis (SSS) score. The SSS score ranges from 12 to 55 points, with higher scores indicating higher levels of self-reported disability. Analyses at 2 months indicated that manual therapy/individualized exercise demonstrated greater reduction in SSS score compared to medical care or group exercise. The magnitude of the difference in the reduction of SSS score between groups did not reach the level of a minimal clinically important difference of 3.02 points.

Failed Back Surgery Syndrome

The evidence is insufficient to determine that ESI results in an improvement in the net health outcome for individuals with failed back surgery syndrome (FBSS), also known as persistent spinal pain syndrome (PSPS) or post-laminectomy syndrome.

Celenlioglu et al (2022) investigated the efficacy of caudal epidural steroid injection (CESI) versus transforaminal epidural steroid injection (TFESI) in patients with post lumbar surgery syndrome (PLSS). In a prospective, randomized, assessor-blind study, a total of 56 patients (n = 26 CESI group; n = 30 TFESI group) were randomized and assessed at baseline, 1-hour, 3-weeks, and 3-months after the procedure. Treatment success was defined as a ≥ 50% decrease in the Numeric Rating Scale (NRS-11) scores compared to baseline. NRS-11 and modified Oswestry Disability Index (mODI) scores showed a significant decline in both groups at all follow-ups ($p < 0.001$). At 3 weeks, the improvement in the mODI scores was significantly higher in the TFESI group ($p = 0.020$). In all follow-ups, the NRS-11 scores were similar between the groups. At 3 weeks, the rates of patients with a ≥ 50% decrease in NRS-11 scores were 53.8% and 60% in the CESI group and TFESI group, respectively, while these rates were 30% and 26.7%, respectively, at 3 months. Although both CESI and TFESI were effective and safe methods in the treatment of PLSS caused by EF following lumbar discectomy, the study was limited by the lack of a placebo-controlled group and a short follow-up period.

Herpes Zoster Associated Pain (Active and Postherpetic Neuralgia)

A single case report described complete resolution of thoracic postherpetic neuralgia symptoms at 2- and 12-week follow-up after a transforaminal ESI (Mehta 2015); however, case-level evidence is insufficient to draw conclusions about efficacy.

Fujiwara et al (2018) conducted a randomized prospective trial comparing transforaminal (TF) and interlaminar (IL) epidural steroid injection approaches in patients (n=40) with acute-phase shingles. Patients were evaluated at baseline, 1 month, and 3 months using VAS and SF-36 scores. VAS scores at 1- and 3-month follow-up were significantly lower than baseline in both groups, with no significant difference between approaches. SF-36 scores and PHN incidence (defined as VAS >40 at 3 months) were also not significantly different between groups. The study was limited by a small sample size that did not meet power analysis requirements and a short follow-up period. The authors concluded that both IL and TF approaches improved pain scores, but neither demonstrated superiority.

Ghanavatian et al (2019) conducted a retrospective review of 42 patients with PHN managed by ESI at Mayo Clinic campuses from 1997 through 2018. A total of 97% of patients were treated with interlaminar ESI. Patients who reported poor ESI efficacy at 2 weeks had a 94% chance of continued pain at 12 weeks. Conversely, of the 24 patients who reported moderate-to-good pain relief at 2 weeks, 79% had persistent relief at 12 weeks. PHN duration <11 months was predictive of moderate-to-good pain relief at 12 weeks (positive predictive value 55.2%). However, no patient characteristics, concurrent medications, or type of intervention were significantly associated with ESI efficacy. The study was limited by its retrospective design and small sample size.

Choi et al (2020) conducted a prospective, double-blind, randomized controlled trial comparing a single 5 mg epidural dexamethasone dose (group A) with intermittent repeated doses totaling 15 mg (group B) in patients (n=42) with zoster-associated pain (ZAP) beyond the acute phase (30–180 days after rash onset). The primary outcome was change in NRS pain score and the secondary outcome was complete remission of PHN. The percentage of patients with ≥50% pain reduction was not significantly different between groups ($p = 0.110$). However, complete remission of PHN was significantly higher in group B (80.95%) than group A (28.57%, $p = 0.001$). The study was limited by the lack of a placebo control group, small sample size, and exclusion of patients with well-established PHN (>180 days).

Chuang et al (2025) performed a systematic review and meta-analysis of 13 studies (9 RCTs [n=815] and 4 observational studies [n=253]) evaluating various nerve blocks for acute herpes zoster, including paravertebral blocks (PVB), erector spinae plane (ESP) blocks, epidural blocks, and intercostal nerve blocks. The meta-analysis of 6 RCTs showed that nerve blocks significantly reduced VAS pain scores at 4 weeks but not at 12 weeks. PVB and ESP blocks significantly decreased PHN incidence at 3 and 6 months. Notably, the four observational studies comparing epidural or intercostal nerve blocks with other techniques provided only weak evidence for their use, highlighting the need for more high-quality RCTs specifically evaluating epidural approaches for acute herpes zoster.

Ultrasound-Guided ESI

There is limited peer-reviewed literature regarding the overall health benefit of ultrasound guidance

during epidural steroid injections compared to fluoroscopy or CT guidance.

Jang et al (2020) conducted a retrospective comparative review of 122 patients to compare ultrasound (US)-guided selective nerve root block (SNRB; n=44), fluoroscopy (FL)-guided interlaminar cervical epidural steroid injection (IL-CESI; n=41), and FL-guided transforaminal CESI (TF-CESI; n=37) for radicular pain in the lower cervical spine. Neck Disability Index and pain scores improved at 1, 3, and 6 months in all groups, with no significant differences between groups. No intravascular contrast spread was observed in the US-guided group, compared with 2 patients in the FL-guided IL group and 7 in the FL-guided TF group. Despite the advantages of no radiation exposure and real-time visualization of soft tissue structures, the authors acknowledged that ultrasound technique is operator-dependent and cannot independently confirm the spinal level reached by the injectate.

Ahmed et al (2023) performed a meta-analysis of seven randomized controlled trials comparing ultrasonography (USG)-guided versus conventional fluoroscopy (FL)-guided ESIs for radiculopathy. There was no statistically significant difference in pain reduction between groups at the lumbosacral level at 1 month or 3 months. Functional improvement was also comparable between groups. USG guidance was associated with a significantly lower risk of inadvertent vascular puncture (OR 0.21; 95% CI 0.07–0.64) and shorter procedure time compared to FL guidance. There was no significant difference in the need for repeat ESIs between groups. Study limitations include heterogeneity due to inclusion of both cervical and lumbosacral levels, different epidural approaches, and different steroids used. The authors concluded that USG-guided ESIs are noninferior to FL-guided ESIs in terms of pain reduction and functional improvement.

Kimura et al (2023) conducted a systematic review and meta-analysis of 8 RCTs (n=962) to compare US-guided versus FL- or CT-guided spinal nerve injections. There was little to no difference in pain reduction or functional disability between groups. US guidance probably reduced major adverse events (0.7% vs 6.5%) and minor adverse events (2.1% vs 4.2%), and significantly reduced procedure time (MD −4.19 min; 95% CI −5.09 to −3.30). The authors concluded that US-guided injections remained effective while reducing adverse events compared to conventional guidance.

Injectates – Biologics (e.g., Platelet Rich Plasma, Stem Cells, Amniotic Fluid)

Sanapati et al (2018) conducted a systematic review and single-arm meta-analysis of the effectiveness of platelet-rich plasma (PRP) and mesenchymal stem cell (MSC) injections in managing low back and lower extremity pain. Twenty-one studies met inclusion criteria (12 lumbar disc injections, 5 epidural, 3 lumbar facet joint, and 3 sacroiliac joint studies). Disc injections of PRP and MSCs showed Level III evidence, while epidural, facet joint, and sacroiliac joint injections demonstrated Level IV evidence. The authors concluded that MSCs and PRP may be effective in managing discogenic low back pain, radicular pain, facet joint pain, and sacroiliac joint pain, but the evidence lacked high-quality randomized controlled trials.

Wang and Zhang (2025) conducted a systematic review and meta-analysis of 7 studies (4 RCTs and 3 prospective studies; n=416) comparing epidural PRP versus corticosteroid injection for lumbar radicular pain. Corticosteroids significantly reduced Oswestry Disability Index (ODI) scores at 4 weeks

(p = 0.0008), with no significant differences in VAS or ODI scores between groups at other time points. Complication rates were similar, though incomplete reporting may underestimate risks. The authors concluded that PRP did not demonstrate superior improvements over corticosteroid injections for lumbar radicular pain, while corticosteroids showed significant short-term functional improvement. The review was limited by low study quality and heterogeneity in PRP preparation methods.

Generally, the outcomes from clinical studies reflect that a diagnostic facet joint injection may assist in determining whether specific interventions targeting the facet joint are indicated.

Manchikanti et al (2015) stated that despite interventional procedures being common as treatment strategies for facet joint pathology, there is a paucity of literature investigating these therapeutic approaches. A systematic review and best evidence synthesis of the effectiveness of therapeutic facet joint interventions in managing chronic spinal pain was conducted to evaluate and update the clinical utility of therapeutic lumbar, cervical, and thoracic facet joint interventions in managing chronic spinal pain. A total of 21 randomized controlled trials (RCTs) and 5 observational studies were assessed. The limitations of this systematic review include an overall paucity of high-quality studies and the lack of investigations related to thoracic facet joint injections. Based on the present assessment for the management of spinal facet joint pain, the evidence for long-term improvement is Level II for therapeutic facet joint nerve blocks in the cervical, thoracic, and lumbar spine.

Wardhana et al (2022) acknowledge that a few studies have explored the effectiveness of facet interventions for chronic lumbar pain, but there has been no clear consensus of which procedures are more superior. In a meta-analysis, this study aimed to compare the effectiveness of corticosteroid injection (CI) and radiofrequency (RF) ablation for the treatment of lumbar facet joint (LFJ) pain. In total, 7 studies (n=552 patients) were included in the analysis. The corticosteroid agents were methylprednisolone in 4 trials, betamethasone in 2 trials, and dexamethasone in 1 trial. Pulsed RF was performed in 4 trials, whereas continuous RF was performed in 3 trials. Treatment with CI was associated with higher pain intensity score than RF ablation (3 trials; p < 0.00001), with substantial heterogeneity. Pain intensity scores at 6 months were significantly higher in patients treated with CI than RF ablation (7 trials, p = 0.0002), with substantial heterogeneity. The estimated effect of CI on pain intensity score at 12 months when CI was compared to RF ablation showed a statistically insignificant increase (p = 0.08), with substantial heterogeneity. Overall, the authors concluded that the pooled analysis from limited trials showed a benefit of RF to the improvement of pain intensity and functional disability when comparing RF with CI for the treatment of LFJ pain.

Pasuhirunnikorn et al (2023) evaluated the effect of prolonged concordant response and functional clinical improvement between lidocaine and bupivacaine for cervical medial branch block (CMBB) in chronic cervical facet syndrome. Sixty-two patients diagnosed with chronic cervical facet syndrome were randomized into either lidocaine or bupivacaine groups. The patients, pain assessor, and pain specialist were blinded. The therapeutic CMBB was performed under ultrasound guidance. Either 2% lidocaine or 0.5% bupivacaine with a volume of 0.5-1 milliliter (mL) per level was injected according to the patient's pain symptoms. The primary outcome was the duration of pain reduction by at least 50%. The Numerical Rating Scale (NRS) of 0-10 and the Neck Disability Index questionnaire were recorded. There was no significant difference in the duration of 50% and 75% pain reduction and

Neck Disability Index between the lidocaine and bupivacaine groups. Lidocaine provided significant pain reduction up to 16 weeks ($P < 0.05$) and significant improvement in neck functional outcomes up to 8 weeks ($P < 0.01$) compared to the baseline. Bupivacaine yielded significant pain alleviation for up to 8 weeks for pain upon neck mobilization ($P < 0.05$) and demonstrated notable improvement in neck function up to 4 weeks ($P < 0.01$) compared to the baseline. CMBB using lidocaine or bupivacaine provided clinical benefits in prolonged analgesic effect and improving neck functions for chronic cervical facet syndrome. Lidocaine illustrated better performance and could be considered a local anesthetic of choice regarding the prolonged concordance response.

Manchikanti et al (2024) evaluated the effectiveness of facet joint nerve blocks as a therapeutic modality in managing chronic axial spinal pain of facet joint origin by conducting a systematic review and meta-analysis of randomized controlled trials (RCTs) and observational studies. The primary outcome measure was the proportion of patients with significant relief and functional improvement of greater than 50% of at least 3 months. Duration of relief was categorized as short-term (less than 6 months) and long-term (greater than 6 months). Despite the availability of multiple studies, the paucity of literature is considered as the major drawback. Based on the present systematic review and meta-analysis with 9 RCTs and 12 non-randomized studies, the evidence is Level II with moderate to strong recommendation for therapeutic facet joint nerve blocks in managing spinal facet joint pain.

PROFESSIONAL GUIDELINE(S)

Facet Joint Interventions for Management of Chronic Spinal Pain

In 2020, the American Society of Interventional Pain Physicians (ASIPP) published guidelines on facet joint interventions for management of chronic spinal pain (Manchikanti 2020).

- Facet joint nerve blocks for diagnosis are recommended with moderate to strong strength for the lumbar spine (evidence level I–II), moderate strength for the cervical spine (evidence level II), and moderate strength for the thoracic spine (evidence level II), using a criterion standard of ≥80% pain relief with dual comparative blocks.
- Radiofrequency ablation for treatment is recommended with moderate strength for the lumbar and cervical spine (evidence level II) and weak to moderate strength for the thoracic spine (evidence level III).
- Facet joint nerve blocks are recommended for treatment of pain in the lumbar spine (moderate strength recommendation; evidence level II), cervical spine (moderate strength recommendation; evidence level II), and thoracic spine (weak to moderate strength recommendation; evidence level III).
- Intra-articular injections received a weak recommendation with lower levels of evidence (level III–V across spinal regions).

Sacroiliac Joint – Ablation and Injection

In 2020, North American Spine Society (NASS) acknowledge the limited available data and that the optimal procedural technique has not been established. However, based on this limited data, NASS indicates it is reasonable to offer coverage for thermal radiofrequency neurotomy at the L5 dorsal ramus and S1-S3 sacral lateral branches for SIJ pain. NASS does not include recommendation details for other ablative techniques (e.g., pulsed RF, laser, cooled RF, cryoablation).

The American Society of Pain and Neuroscience (ASPN) Best Practice Guideline for the Treatment of Sacroiliac Disorders (Sayed 2024) recommends RFA of the lateral branches of the S1-S3 dorsal rami along with the L5 dorsal rami (and possibly L4) after an appropriate trial of conservative care and appropriate response to diagnostic blockade. Dual diagnostic blockade of the L5 dorsal ramus and S1-S3 sacral lateral branches with ≥50% improvement in pain and function is the preferred strategy prior to neuroablative procedures. The ASPN notes that rarer modalities such as intra-articular chemical neurolysis and cryoablation have low-quality evidence supporting mild efficacy with limitations due to adverse effect profile.

In 2025, the American Academy of Pain Medicine (AAPM) and American Society of Regional Anesthesia & Pain Medicine (ASRA-PM) issued multispecialty consensus practice guidelines on SIJ complex pain (McCormick 2025), developed by an international working group, and endorsed by 21 organizations. The consensus found strong evidence for sacral lateral branch RFA to provide relief for at least 6 months in individuals with extra-articular pathology. The guidelines recommend targeting S1-S3 lateral branches in all patients (Grade A, high certainty), with consideration of the L5 dorsal ramus and S4 lateral branch based on individual anatomy (Grade B, moderate certainty). Stronger evidence supports larger lesions or more aggressive lesioning strategies over less stringent techniques. The evidence for cryoablation was found to be very limited.

For radicular pain, the North American Spine Society (NASS) (2020) finds that there is sufficient literature to suggest that a trial of ESIs for radicular pain caused by conditions other than disc herniation is appropriate prior to considering surgical intervention. NASS cites multiple randomized-controlled trials (RCTs) that demonstrate lumbar epidural steroid injections (LESIs) are effective in the treatment of lumbar radiculitis caused by disc herniation. Similarly, citing that several conditions may cause cervical radicular pain, with literature regarding interlaminar (IL) ESIs demonstrating durable improvements in pain and disability for 12 and 24 months for a variety of cervical pathologic conditions. The literature on cervical transforaminal (TF) ESIs is limited to observational studies including reduction in surgical intervention has been demonstrated, and the biochemical pathology involved is likely similar to lumbar radicular etiologies.

For lumbar referred pain, NASS (2020) finds that the literature suggests LESIs are effective in reducing pain in this patient population. It is noted that this treatment seems to be less effective in this group than in patients with herniated discs. In addition, data show that LESI is equivalent to epidural local anesthetic likely due to the suppression of neurogenic inflammation by the local anesthetic. Based on these data, it is felt that a trial of LESIs is reasonable prior to the consideration of surgical intervention.

NASS' (2020) evidence-based clinical guidelines for diagnosis and treatment of low back pain reported that there is insufficient evidence to make a recommendation for or against the use of

caudal or interlaminar epidural steroid injections in patient with low back pain (Grade I).

The American Society of Interventional Pain Physicians (ASIPP) published comprehensive evidenced-based guidelines for facet joint interventions in the management of chronic spinal pain (Manchikanti 2020). Patients testing positive for facet joint pain may undergo either therapeutic facet joint nerve blocks or radiofrequency neurotomy based on patients' preferences, values, and physician expertise. Once facet joint pain is excluded, the patient may be treated with epidural injections.

The American Society of Interventional Pain Physicians (ASIPP) published an updated guideline on the use of epidural injections in the management of chronic spinal pain (Manchikanti 2021). The following recommendations were made

- For patients with disc herniation:
    - The evidence is Level I for caudal epidural injections, lumbar interlaminar epidural injections, lumbar transforaminal epidural injections, and cervical interlaminar epidural injections with strong recommendation for long-term effectiveness.
    - For thoracic disc herniation, based on one relevant, high-quality RCT of thoracic epidural with fluoroscopic guidance, with or without steroids, the evidence is Level II with moderate to strong recommendation for long-term effectiveness.
- For patients with spinal stenosis:
    - Based on one high-quality RCT in each category the evidence is Level III to II for fluoroscopically guided caudal epidural injections with moderate to strong recommendation and Level II for fluoroscopically guided lumbar and cervical interlaminar epidural injections with moderate to strong recommendation for long-term effectiveness.
    - The evidence for lumbar transforaminal epidural injections is Level IV to III with moderate recommendation with fluoroscopically guided lumbar transforaminal epidural injections for long-term improvement.
- For patients with axial discogenic pain, the evidence for axial discogenic pain without facet joint pain or sacroiliac joint pain in the lumbar and cervical spine with fluoroscopically guided caudal, lumbar and cervical interlaminar epidural injections, based on one relevant high quality RCT in each category is Level II with moderate to strong recommendation for long-term improvement, with or without steroids.
- For acute proven disc herniation with radiculitis with disabling pain or to avoid surgical intervention, herpes zoster, post herpetic neuralgia, CRPS I and II, epidural injections may be performed at physician discretion without additional pain duration or conservative management requirements.

A 2022 American Society of Pain and Neuroscience (ASPN) guideline provides recommendations for the use of epidural steroid injections in the treatment of low back pain (Sayed 2022). Grade A consensus recommendations include:

- Interlaminar epidural injections for treatment of low back and radicular pain originating from disc disease, spinal stenosis and for chronic back/leg pain after surgical intervention.
- Transforaminal epidural injections for treatment of low back and radicular pain originating from disc disease, spinal stenosis and for chronic back/leg pain after surgical intervention.
- Caudal epidural injections for treatment of low back and radicular pain originating from disc disease, spinal stenosis and for chronic back/leg pain after surgical intervention when interlaminar or transforaminal approaches are not feasible
- Use of either steroid or local anesthetic or the two classes of medication in combination for use in epidural injections for treatment of low back and radicular pain originating from disc disease, spinal stenosis and for chronic back/leg pain after surgical intervention.

In 2022, ASPN provided updated consensus guidance regarding best practices for minimally invasive lumbar spinal stenosis treatment (MIST) (Deer 2022). The guidelines note that most trials, on lumbar ESI, have demonstrated efficacy but there is considerable variability regarding epidural technique, medication, dosage, and duration of improvement. As a result, treatment efficacy for the modality has been difficult to determine, as foundational studies in support of the procedure come from different eras representing the evolution of evidence-based medicine and evidence-based study standards.

- Epidural steroid injections are recommended in the algorithm for the treatment of symptomatic lumbar spinal stenosis. Grade B; Level of certainty high; Level of evidence I-A)
- Epidural steroid injections may be repeated when a patient has significant temporary improvement in symptoms. Be aware that the number and frequency of injections may be limited by insurance and payer rules and regulations. Grade B; Level of certainty moderate; Level of evidence I-B).

In 2025, the American Academy of Neurology (AAN) Guidelines Subcommittee conducted a systematic review of 90 RCTs on the efficacy of epidural steroids for cervical and lumbar radicular pain and spinal stenosis published between January 2005 and January 2021 (Armon 2025). The review affirms limited efficacy of ESIs in reducing pain and disability in cervical and lumbar radiculopathies and possibly in lumbar spinal stenosis, largely in the short term. The panel made the following conclusions:

- For patients with cervical or lumbar radiculopathy, ESIs probably reduce short-term disability (moderate confidence).
- For patients with lumbar spinal stenosis, ESIs possibly reduce short-term disability (low confidence, confidence downgraded for heterogeneity). There were no studies evaluating ESIs in cervical spinal stenosis.
- For patients with cervical or lumbar radiculopathy, ESIs possibly decrease long-term disability (low confidence).

- For patients with lumbar spinal stenosis, ESIs possibly reduce long-term disability (low confidence). There were no studies evaluating cervical stenosis.
- For patients with cervical or lumbar radiculopathy, ESIs probably provide short-term pain reduction (moderate confidence).
- For patients with lumbar spinal stenosis, ESIs probably do not provide short-term pain reduction (moderate confidence). No studies were available for cervical stenosis.
- For patients with cervical or lumbar spinal radiculopathy, there is insufficient evidence to determine whether ESIs provide long-term pain reduction (very low confidence).
- For patients with lumbar spinal stenosis, there is insufficient evidence to determine whether ESIs reduce long-term pain (very low confidence). There were no studies evaluating cervical stenosis.
- Epidural steroid injections are possibly equally effective in patients with lumbar and cervical disease (low confidence, anchored by imprecision), considering that there is only 1 RCT meeting inclusion criteria for cervical radiculopathy.
- There is no significant difference between interlaminar, transforaminal, and caudal ESIs in the outcomes of short-term disability or pain or long-term disability or pain.

Ultrasound Guidance

In 2020, the North American Spine Society (NASS) published coverage policy recommendations for epidural steroid injections & selective spinal nerve blocks which indicates there is insufficient safety and efficacy data to support ultrasound guidance for any approach delivering ESI.

Injectates – Biologics (e.g., Platelet Rich Plasma, Stem Cells, Amniotic Fluid)

The American Society of Pain and Neuroscience (ASPN) identified the educational need for an evidence-based guideline on regenerative medicine therapy for chronic pain and convened a multispecialty working group to evaluate the evidence (D'Souza 2024). The expert panel made the following relevant statements:

- Consensus Point 29. While epidural injections with autologous-conditioned serum (ACS) may improve radicular pain symptoms, some evidence suggests that it is not superior to corticosteroid injection (Level I, Grade C).
- Consensus Point 30. Epidural injections with PRP or other PRP-related products may alleviate radicular pain symptoms in radiculopathy, although studies had a high risk for bias (Level I, Grade C).
- Consensus Point 34. PRP injection at the site of pain for post-herpetic neuralgia as an adjunct to oral neuropathic analgesics may be associated with improved pain intensity compared to medications alone (Level II-2, Grade C).

In 2025, the American Society of Interventional Pain Physicians (ASIPP) published comprehensive evidence-based guidelines for regenerative therapies in the management of chronic low back pain (Manchikanti 2025). The panel made the following relevant statements:

- Epidural injections with PRP are supported by Level III (fair) evidence, with a moderate consensus-based clinical recommendation.
- Intradiscal injections with PRP are supported by Level III (fair) evidence, with a moderate consensus-based clinical recommendation.
- Intradiscal injections with bone marrow aspirate concentrate (BMAC) are supported by Level III (fair) evidence, with a moderate consensus-based clinical recommendation.
- Facet joint injections with PRP and MSCs are supported by Level IV (limited) evidence, with a moderate consensus-based clinical recommendation.

Sacroiliac joint injections with PRP are supported by Level IV (limited) evidence, with a low consensus-based clinical recommendation.

REGULATORY STATUS

The U.S. Food and Drug Administration (FDA) regulates devices and instruments used during interventional pain procedures as medical devices. All devices and instruments including related components require FDA approval before marketing and use in the United States to ensure they are safe and effective for human use. Refer to the FDA Medical Device website. Available from: https://www.fda.gov/medical-devices [accessed 2026 Sept 12]

The FDA lists the most serious type of medical device recalls as well as early alert communications about corrective actions being taken by companies that the FDA believes are likely to be the most serious type of recalls. Available from: https://www.fda.gov/medical-devices/medical-device-safety/medical-device-recalls-and-early-alerts [accessed 2026 Sept 12]

CODE(S)

- Codes may not be covered under all circumstances.
- Code list may not be all inclusive (AMA and CMS code updates may occur more frequently than policy updates).
- (E/I)=Experimental/Investigational
- (NMN)=Not medically necessary/appropriate

CPT Codes

Code	Description
Epidural Steroid Injection	
62320	Injection(s), of diagnostic or therapeutic substance(s) (e.g., anesthetic, antispasmodic, opioid, steroid, other solution), not including neurolytic substances, including needle or catheter placement, interlaminar epidural or subarachnoid, cervical or thoracic; without imaging guidance

Code	Description
62321	Injection(s), of diagnostic or therapeutic substance(s) (e.g., anesthetic, antispasmodic, opioid, steroid, other solution), not including neurolytic substances, including needle or catheter placement, interlaminar epidural or subarachnoid, cervical or thoracic; with imaging guidance (i.e., fluoroscopy or CT)
62322	Injection(s), of diagnostic or therapeutic substance(s) (e.g., anesthetic, antispasmodic, opioid, steroid, other solution), not including neurolytic substances, including needle or catheter placement, interlaminar epidural orsubarachnoid, lumbar or sacral (caudal); without imaging guidance
62323	Injection(s), of diagnostic or therapeutic substance(s) (e.g., anesthetic, antispasmodic, opioid, steroid, other solution), not including neurolytic substances, including needle or catheter placement, interlaminar epidural or subarachnoid, lumbar or sacral (caudal); with imaging guidance (i.e., fluoroscopy or CT)
64479	Injection(s), anesthetic agent(s) and/or steroid; transforaminal epidural, with imaging guidance (fluoroscopy or CT), cervical or thoracic, single level
64483	Injection(s), anesthetic agent(s) and/or steroid; transforaminal epidural, with imaging guidance (fluoroscopy or CT), lumbar or sacral, single level
Facet Joint Injections / Medial Branch Blocks	
64490	Injection(s), diagnostic or therapeutic agent, paravertebral facet (zygapophyseal) joint (or nerves innervating that joint) with image guidance (fluoroscopy or CT), cervical or thoracic; single level
64493	Injection(s), diagnostic or therapeutic agent, paravertebral facet (zygapophyseal) joint (or nerves innervating that joint) with image guidance (fluoroscopy or CT), lumbar or sacral; single level
0213T	Injection(s), diagnostic or therapeutic agent, paravertebral facet (zygapophyseal) joint (or nerves innervating that joint) with ultrasound guidance, cervical or thoracic; single level
0216T	Injection(s), diagnostic or therapeutic agent, paravertebral facet (zygapophyseal) joint (or nerves innervating that joint) with ultrasound guidance, lumbar or sacral; single level
Paravertebral facet joint radiofrequency neurolysis/medial branch transection	
64633	Destruction by neurolytic agent, paravertebral facet joint nerve(s), with imaging guidance (fluoroscopy or CT); cervical or thoracic, single facet joint
64635	Destruction by neurolytic agent, paravertebral facet joint nerve(s), with imaging guidance (fluoroscopy or CT); lumbar or sacral, single facet joint

Code	Description
Sacroiliac Joint Injection	
27096	Injection procedure for sacroiliac joint, anesthetic/steroid, with image guidance (fluoroscopy or CT) including arthrography when performed
64451	Injection(s), anesthetic agent(s) and/or steroid; nerves innervating the sacroiliac joint, with image guidance (i.e., fluoroscopy or computed tomography)
G0260	Injection procedure for sacroiliac joint; provision of anesthetic, steroid and/or other therapeutic agent, with or without arthrography
