MEDICAL POLICY

Medical Policy Title	**Intraocular Lens (IOL) Implants**
Policy Number	**9.01.14**
Current Effective Date	**August 1, 2026**
Next Review Date	**October 2027**

Our medical policies are based on the assessment of evidence based, peer-reviewed literature, and professional guidelines. Eligibility for reimbursement is based upon the benefits set forth in the member's subscriber contract. (Link to Product Disclaimer)

POLICY STATEMENT(S)

I. The use of a monofocal (spherical or aspheric) intraocular lens (IOL) as replacement of the natural crystalline lens of the eye following cataract extraction is considered **medically appropriate.**

II. The use of a multifocal IOL, an astigmatism-correcting lens, or an accommodating/trifocal IOL following cataract extraction is considered **not medically necessary**, as no superior medical benefit for these lenses has been demonstrated over the monofocal IOL, other than decreasing the need for corrective eye wear.

POLICY GUIDELINE(S)

In a manner similar to the Centers for Medicare and Medicaid Services (CMS), individuals may choose to receive an astigmatism-correcting, multifocal or accommodating IOL (please refer to the CMS synopsis at the end of this policy). Individuals must sign a beneficiary notice waiver and agree to assume liability for the additional expense of the multifocal or accommodating lens. Reimbursement will be provided for only the cost of a standard or monofocal IOL. Individuals should be apprised of this option by their eye surgeon prior to the cataract extraction surgery.

DESCRIPTION

The eye functions much like a camera with two lenses. The first lens is the cornea, a clear membrane that covers the front of the eye. The second lens is the eye's natural crystalline lens, which is located behind the pupil. The cornea is responsible for about 70 percent of the eye's focusing power, while the natural lens "fine tunes" the image before it is focused on the retina at the back of the eye. The natural lens accomplishes this fine-tuning function by changing shape to accommodate both near objects and those that are further away. Ciliary muscles and zonules are attached to the lens and are

Proprietary Information of Capital District Physicians' Health Plan, Inc. | CDPHP Universal Benefits,® Inc. | Capital District Physicians' Healthcare Network, Inc.

responsible for its ability to change shape. A cataract is a hardening and opacification of the normally transparent crystalline lens within the eye. Cataract formation usually occurs as part of the aging process but may also be congenital in nature. Rarely, a cataract may form when related to trauma or inflammation of the eye or may also result from the use of some medications. Cataracts may result in progressive loss of vision with the degree of loss depending on the location, size, and density of the cataract. Cataract surgery is indicated when the visual function no longer meets the individual's needs and there is a reasonable likelihood of vision improvement with the procedure. The current cataract procedure of choice is an extracapsular technique (removes only the lens) with the implantation of an intraocular lens.

IOLs are used to replace the natural lens and restore the optical focusing power of the eye. The more common replacement lenses include monofocal, multifocal or accommodating IOLs.

Monofocal IOLs are the current standard of treatment. This type of IOL usually has a fixed focusing power, which provides good distance vision and sometimes intermediate vision, but does not correct the individuals near vision, because the full accommodating ability of the eye is lost. Thus, the placement of a monofocal IOL usually requires corrective lenses or eyeglasses after surgery for reading and near-vision tasks. While a traditional, fixed monofocal IOL is spherical (the front surface is uniformly curved), an aspheric monofocal IOL is slightly flatter in the periphery, allowing for a better contrast sensitivity and a reduction in visual aberrations. The advent of aspheric IOLs has enhanced the quality of visual outcome for monofocal lenses.

Multifocal IOLs are designed to provide distance and near vision and are referred to as pseudoaccommodative lenses or dynamic lenses. The multifocal IOL structure allows light rays to be focused from both distance and near. This type of lens does not restore good intermediate vision, but the need for eyeglasses for near vision correction appears to be much less with the use of multifocal IOLs, compared to the monofocal IOL. Reports of increased glare, halos at night, variable loss of clarity, and low-contrast acuity have been reported by individuals with the use of multifocal IOLs, creating patient dissatisfaction with the multifocal IOL variety.

Accommodating or trifocal IOLs are designed to provide good distance, intermediate, and near vision. The accommodating IOL has hinges at both ends, to facilitate forward and backward movement, and interacts with the eye's ciliary muscles and zonules, allowing variable-focus capability. This type of lens allows individuals to see a continuous range of vision and greatly reduces the need for post-operative corrective lenses. Multifocal and accommodating IOLs are sometimes referred to as presbyopia correcting IOLs.

Astigmatism-correcting IOLs, also known as toric IOLs, provide correction or reduction of pre-existing astigmatism (astigmatism that was present before cataract surgery) by incorporating a special curvature into the IOL. Prior to the advent of toric IOLs, pre-existing astigmatism could only be corrected by making limbal relaxing incisions into the cornea during cataract surgery to change its curvature, or by wearing astigmatism-correcting eyeglasses after surgery.

SUPPORTIVE LITERATURE

A Cochrane review (Leyland 2003, 2006) comparing multifocal to monofocal lenses post-cataract surgery, found no statistical difference between the use of these IOLs relative to best-corrected

visual acuity, although unaided near vision was improved with the use of multifocal lenses. Review of the literature found no studies to support that the pseudo-accommodating or accommodating lens technology is superior to standard-use monofocal IOLs. The long-term stability of the accommodative effect of these lenses is unknown, and some individuals may still require corrective lenses after the multifocal or accommodative lenses are placed.

A 2012 update of the Cochrane review by Calladine and colleagues noted that there was moderate quality evidence that similar distance acuity is achieved with both types of lenses. There was also evidence that people with multifocal lenses had better near vision, but methodological and statistical heterogeneity meant that they did not calculate a pooled estimate for effect on near vision. Total freedom from use of glasses was achieved more frequently with multifocal than monofocal IOLs. Adverse subjective visual phenomena, particularly haloes, or rings around lights, were more prevalent and more troublesome in participants with the multifocal IOL, and there was evidence of reduced contrast sensitivity with the multifocal lenses. They concluded that multifocal IOLs are effective at improving near vision relative to monofocal IOLs. Whether that improvement outweighs the adverse effects of multifocal IOLs will vary between individuals. Motivation to achieve spectacle independence is likely to be the deciding factor.

de Silva et al (2016) updated the Cochrane review of multifocal versus monofocal IOL after cataract extraction. Their analysis included 20 trials that included data on 2,061 individuals (3,194 eyes). These trials were conducted in Europe (13), China (three), USA (one), Middle East (one), India (one) and one multicenter study in Europe and the USA. Most of these trials compared multifocal with monofocal lenses; two trials compared multifocal lenses with monovision. There was considerable variety in the make and model of lenses implanted. There was moderate-certainty evidence that the distance acuity achieved with multifocal lenses was not different to that achieved with monofocal lenses (eyes = 682; studies = 8). Individuals receiving multifocal lenses may achieve better near vision (eyes = 782; studies = 8). The authors noted this to be low-certainty evidence because of risk of bias in the included studies and high heterogeneity. Individuals receiving multifocal lenses may be less spectacle dependent (eyes = 1000; studies = 10). The authors again noted this to be low-certainty evidence because of risk of bias and evidence of publication bias. Adverse subjective visual phenomena were more prevalent and more troublesome in participants with a multifocal IOL compared with monofocals (glare, eyes = 544; studies = 7, low-certainty evidence and haloes, eyes = 662; studies = 7; moderate-certainty evidence). In one study, the investigators noted that more people in the multifocal group underwent IOL exchange in the first year after surgery (6 participants with multifocal vs 0 participants with monovision). The authors concluded multifocal IOLs are effective at improving near vision relative to monofocal IOLs although there is uncertainty as to the size of the effect. Whether that improvement outweighs the adverse effects of multifocal IOLs, such as glare and haloes, will vary between people. Motivation to achieve spectacle independence is likely to be the deciding factor.

PROFESSIONAL GUIDELINE(S)

The American Academy of Ophthalmology 2022 preferred practice pattern (Miller) regarding care for cataracts in the adult eye states the use of presbyopia correcting IOLs may improve a patient's quality of life by improving near and intermediate vision and decreasing the need for corrective

eyewear after cataract surgery, though patient selection is critical. Patients should be informed of the potential compromise in quality of vision associated with the various choices. These patients were found to have more glare, halos, and reduced contrast sensitivity than patient with monofocal IOLs (good, strong quality of evidence). Intraocular lens implantation is the method of choice for correcting aphakia, unless there are specific contraindications. Posterior chamber IOL implantation inside the capsular bag is the optimal method for most cases. Cataract surgeons can choose from a wide variety of posterior chamber IOL styles and materials to find an appropriate lens to match their patients' needs. Intraocular lens optic size, shape, haptic configuration, optic edge design, optic and haptic materials, and chromophore content are engineered with a variety of characteristics. Foldable IOLs are commonly used because of their ability to fit through small incisions, and they have largely replaced rigid polymethyl methacrylate (PMMA) posterior chamber IOLs. Foldable IOLs can be made from silicone, hydrophilic acrylic, and hydrophobic acrylic. All foldable IOL materials are associated with minimal giant-cell foreign-body reaction. Surgeons should be familiar with the unique positive and negative features of each IOL type with regard to material, design, and insertion system.

REGULATORY STATUS

The United States Food and Drug Administration (FDA) regulates intraocular lenses as medical devices. All intraocular lenses including related components require FDA approval before marketing and use in the United States to ensure they are safe and effective for human use. Refer to the FDA Medical Device website. Available from: https://www.fda.gov/medical-devices [accessed 2025 Sep 10]

CODE(S)

- Codes may not be covered under all circumstances.
- Code list may not be all inclusive (AMA and CMS code updates may occur more frequently than policy updates).
- (E/I)=Experimental/Investigational
- (NMN)=Not medically necessary/appropriate

CPT Codes

Code	Description
66982	Extracapsular cataract removal with insertion of intraocular lens prosthesis (one-stage procedure), manual or mechanical technique (e.g., irrigation and aspiration or phacoemulsification), complex, requiring devices or techniques not generally used in routine cataract surgery (e.g., iris expansion device, suture support for intraocular lens, or primary posterior capsulorrhexis) or performed on patients in the amblyogenic developmental stage; without endoscopic cyclophotocoagulation
66983	Intracapsular cataract extraction with insertion of intraocular lens prosthesis (one-stage procedure)

Code	Description
66984	Extracapsular cataract removal with insertion of intraocular lens prosthesis (one-stage procedure), manual or mechanical technique (e.g., irrigation and aspiration or phacoemulsification); without endoscopic cyclophotocoagulation
66985	Insertion of intraocular lens prosthesis (secondary implant), not associated with concurrent cataract removal
66986	Exchange of intraocular lens
66987	Extracapsular cataract removal with insertion of intraocular lens prosthesis (one-stage procedure), manual or mechanical technique (e.g., irrigation and aspiration or phacoemulsification), complex, requiring devices or techniques not generally used in routine cataract surgery (e.g., iris expansion device, suture support for intraocular lens, or primary posterior capsulorrhexis) or performed on patients in the amblyogenic developmental stage; with endoscopic cyclophotocoagulation
66988	Extracapsular cataract removal with insertion of intraocular lens prosthesis (one-stage procedure), manual or mechanical technique (e.g., irrigation and aspiration or phacoemulsification); with endoscopic cyclophotocoagulation
66989	Extracapsular cataract removal with insertion of intraocular lens prosthesis (one-stage procedure), manual or mechanical technique (e.g., irrigation and aspiration or phacoemulsification), complex, requiring devices or techniques not generally used in routine cataract surgery (e.g., iris expansion device, suture support for intraocular lens, or primary posterior capsulorrhexis) or performed on patients in the amblyogenic developmental stage; with insertion of intraocular (e.g., trabecular meshwork, supraciliary, suprachoroidal) anterior segment aqueous drainage device, without extraocular reservoir, internal approach, one or more
66991	Extracapsular cataract removal with insertion of intraocular lens prosthesis (one-stage procedure), manual or mechanical technique (e.g., irrigation and aspiration or phacoemulsification); with insertion of intraocular (ego, trabecular meshwork, supraciliary, suprachoroidal) anterior segment aqueous drainage device, without extraocular reservoir, internal approach, one or more

MEDICAL POLICY

Medical Policy Title	**Intraosseous Basivertebral Nerve Ablation for Child Health Plus (CHP), and Essential Plan (EP) Members**
Policy Number	**7.01.124**
Current Effective Date	**January 1, 2027**
Next Review Date	**September 2027**

Our medical policies are guides to evaluate technologies or services for medical necessity. Criteria are established through the assessment of evidence based, peer-reviewed scientific literature, and national professional guidelines. Federal and state law(s), regulatory mandates and the member's subscriber contract language are considered first in the determination of a covered service. (Link to Product Disclaimer)

POLICY STATEMENT(S)

I. Thermal ablation of the intraosseous basivertebral nerve (BVN) is considered **medically appropriate** when documentation meets **ALL** the following:

A. Individual is 18 years of age or older;

B. Chronic low back pain for a minimum of 6 months;

C. Pain failed to adequately improve, or was not tolerated, despite a minimum of 6 months of conservative treatment that includes **BOTH** of the following:

1. Non-pharmacologic management includes **ANY** of the following:

a. Acupuncture;

b. Chiropractic treatment;

c. Cognitive behavioral therapy; **or**

d. Supervised physical therapy (PT); **and**

2. Pharmacologic management includes **ANY** of the following:

a. Interventional pain management with epidural steroid injections (ESI) or facet-based interventions;

b. Nonsteroidal anti-inflammatory drugs (NSAIDs); **or**

c. Oral analgesic therapy;

D. Clinical presentation is consistent with vertebrogenic pain (e.g., persistent low back pain, deep midline pain, pain aggravated by bending, prolonged standing, or sitting);

E. Modic Type 1 and/or Type II endplate changes at least one (1) vertebral level from L3 to S1 documented on magnetic resonance imaging (MRI) within the previous 12 months;

F. Pain presentation includes **BOTH** of the following:

1. Axial low back pain as the primary symptom; **and**

2. Pain causes functional impairment (e.g., reduced mobility, impaired activities of daily living);

G. The procedure will be performed using fluoroscopic or computed tomography (CT) guidance.

II. Thermal ablation of the intraosseous basivertebral nerve (BVN) is contraindicated and **not medically necessary** for **ANY** of the following:

A. Active infection, local or systemic;

B. Bleeding or clotting disorder;

C. Compromised bone integrity with **any** of the following diagnoses:

1. osteoporosis (T-score ≤ -2.5);
2. spinal malignancy;
3. trauma/compression fracture involving the intended treatment level; **or**
4. vertebral fragility fracture;

D. History of basivertebral nerve ablation at the requested vertebral level;

E. History of spinal surgery at the requested vertebral level;

F. Imaging evidence (MRI, CT, X-ray) identifies an alternative cause of low back pain symptoms (e.g., degenerative scoliosis, disc herniation, lumbar stenosis, spondylolisthesis);

G. Implanted electronic devices (e.g., pacemaker, defibrillator, neurostimulator);

H. Modic Type 3 (sclerotic) endplate changes;

I. Pain localized to the anterior column/midline, with other pain generators (discogenic, facet, radicular, sacroiliac) reasonably ruled out;

J. Pregnancy;

K. Primary presenting symptoms include **any** of the following:

1. lumbar radiculopathy;
2. nerve compression/impingement (e.g., stenosis);
3. neurogenic claudication; **or**
4. radicular pain;

L. Severe cardiac or pulmonary impairment;

M. Skeletal immaturity (younger than 18 years of age).

DESCRIPTION

Intraosseous basivertebral nerve ablation (BVNA) is a minimally invasive, image-guided procedure used to treat chronic vertebrogenic low back pain. Vertebrogenic pain is thought to originate from damaged vertebral endplates and is transmitted to the central nervous system through the basivertebral nerve (BVN), an intraosseous nerve that courses within the vertebral body. Endplate damage is commonly associated with Modic Type 1 and/or Type 2 changes seen on MRI.

During the procedure, a bipolar radiofrequency probe is advanced percutaneously through a transpedicular approach into the vertebral body under fluoroscopic guidance. Radiofrequency energy is then applied to the basivertebral nerve within the inner, spongy (cancellous) bone of the vertebral body, thermally ablating the nerve to interrupt the transmission of pain signals from the affected endplates. The vertebral body itself and its structural integrity are preserved.

BVNA is generally considered for skeletally mature patients with chronic axial low back pain of at least six months' duration who have not adequately improved with conservative (nonsurgical) management and who demonstrate Modic Type 1 and/or Type 2 endplate changes at one or more levels from L3 through S1 on MRI. The goal of treatment is durable reduction in pain and improvement in function.

Supporting definitions:

- Activities of daily living (ADLs) refer to basic self-care tasks that individuals perform to maintain their well-being and live independently. These tasks include bathing or showering; dressing; eating; toileting; transferring (getting in and out of bed or chair).
- Computed tomography (CT) is an imaging test that uses X-rays to computer analysis to generate cross sectional images of the internal structures of the body that can be displayed in multiple planes.
- Conservative management is an approach to treating back pain, neck pain and related spinal conditions utilizing non-surgical treatment options, such as physical therapy, medication and injections.
- Fluoroscopy is a study of moving body structures, similar to an X-ray "movie." A continuous X-ray beam is passed through the body part being examined and is transmitted to a TV-like monitor so that the body part and its motion can be seen in detail. Fluoroscopy, as an imaging tool, enables physicians to look at many body systems, including the skeletal, digestive, urinary, respiratory, and reproductive systems.

- Magnetic resonance imaging (MRI) uses a strong magnetic field and radiofrequency pulses to energize hydrogen protons in body tissues, then constructs images from the different signals emitted as those protons return toward equilibrium.
- Modic changes are magnetic resonance imaging (MRI) signal changes related to spinal degeneration in the vertebral endplate and adjacent bone marrow, also described as reactive vertebral body changes within the cancellous bone adjacent to the vertebral end plates.
    - Type I: Reflects marrow edema and inflammation
    - Type II: Fatty replacement of bone marrow
    - Type III: Subchondral or bony sclerosis
- Neurogenic claudication is the symptom pattern typically associated with lumbar spinal stenosis in which lower-extremity, buttock, or back pain, numbness, weakness, or paresthesias are brought on by standing or walking and relieved by sitting or spinal flexion, often termed pseudoclaudication.
- Osteoporosis is a skeletal disorder characterized by compromised bone strength, often described as low bone mass with microarchitectural deterioration, that increases bone fragility and fracture risk. Defined as a T-score of -2.5 or lower compared with a young adult reference mean in postmenopausal women and in men aged 50 years or older.
- Vertebrogenic pain refers to chronic low back pain arising from damaged vertebral endplates and transmitted through the basivertebral nerve. MRI evidence of Modic Type 1 or Type 2 changes is commonly present.

SUPPORTIVE LITERATURE

The published evidence supports intraosseous basivertebral nerve ablation (BVNA) as an effective, durable treatment for vertebrogenic chronic low back pain in appropriately selected patients with Modic type 1 or 2 endplate changes at L3–S1.

PROFESSIONAL GUIDELINE(S)

In 2022, the International Society for the Advancement of Spine Surgery (ISASS) (Lorio 2022) recognized intraosseous BVN ablation as a safe, predictable, and durable treatment for chronic axial vertebrogenic low back pain identified by established clinical criteria and Modic type 1 and/or type 2 changes on MRI. The recommendation rests on Level I evidence with a systematic review and two randomized controlled trials showing statistically significant reductions in pain and improvements in function, with benefit maintained beyond 5 years after a single treatment.

In 2022, the American Society of Pain and Neuroscience (ASPN) published best practice guidelines for the diagnosis and treatment of vertebrogenic pain with BVN ablation (Sayed 2022). A multidisciplinary concluded that moderate-to-high quality evidence supports BVNA for improving pain, function, and quality of life, reducing opioid use, and achieving high patient satisfaction, with

clinically meaningful and statistically significant superiority over standard care in carefully selected patients.

The 2023 North American Spine Society (NASS) Basivertebral Nerve (BVN) Ablation Coverage Recommendations supports percutaneous interosseous radiofrequency ablation of the BVN for individuals who are:

- Skeletally mature with chronic low back pain for at least 6 months;
- Inadequately improved despite nonsurgical management;
- Have Type 1 or Type 2 Modic changes at endplates between L3 and S1.

NASS notes a growing evidence base that damage to innervated vertebral endplates produces vertebrogenic back pain transmitted via the BVN, with percutaneous intraosseous radiofrequency ablation emerging as an interventional option. NASS does not support transforaminal epiduroscopic BVN laser ablation, citing only a single promising case series and the need for further study.

REGULATORY STATUS

The U.S. Food and Drug Administration (FDA) regulates radiofrequency generators as medical devices. All radiofrequency generators including related components require FDA approval before marketing and use in the United States to ensure they are safe and effective for human use. Refer to the FDA Medical Device website. Available from: https://www.fda.gov/medical-devices [accessed 2026 Sep 12]

The FDA lists the most serious type of medical device recalls as well as early alert communications about corrective actions being taken by companies that the FDA believes are likely to be the most serious type of recalls. Available from: https://www.fda.gov/medical-devices/medical-device safety/medical-device-recalls-and-early-alerts [accessed 2026 Sep 12]

CODE(S)

- Codes may not be covered under all circumstances.

Disclaimer Notice

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgment when deciding the most appropriate care to enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

Background

Aromatic l-amino acid decarboxylase (AADC) deficiency is an extremely rare autosomal recessive genetic disorder. AADC deficiency can be caused by more than 580 changes (variants) in a gene called *DDC* (which stands for DOPA decarboxylase, another name for AADC). AADC catalyzes chemical reactions responsible for the synthesis of neurotransmitters, including epinephrine, norepinephrine, dopamine, and serotonin. Affected individuals can appear normal at birth, but most will develop symptoms during the first months of life. Symptoms can include abnormal eye movements, movement disorders (especially dystonia) and autonomic dysfunction (excessive sweating, temperature instability, drooping eyelids (ptosis), nasal congestion and hypoglycemic episodes. Sleep and mood disturbances are also common. Fewer than 350 patients have been reported in the medical literature. Half of these patients are Asian individuals, and a fifth are people with Taiwanese ancestry. Males and females seem to be equally affected. The estimated prevalence in the U.S. based on cerebrospinal fluid (CSF) analysis and genetic testing is roughly 1-2:1,000,000 live newborns.

Diagnosis is based on a complete clinical evaluation and high index of suspicion. Lab diagnosis includes lumbar puncture analyzing metabolites, metabolite 3-O-methyl-dopa (3OMD) in plasma or dried blood spots, which is increased in patients with the disease, measurement of the AADC enzyme activity in the blood, and genetic testing identifying pathogenic variants in the DDC gene.

There is limited scientific evidence for the efficacy of most treatment options due to the rarity of AADC deficiency, and medications are used to help manage the symptoms of the disease. Treatments include dopamine agonists, MAO-B inhibitors, and pyridoxine. Other medications may be used depending on the patient's symptoms.

On November 14, 2024, Kebilidi (eladocagene exuparvovec-tneq) was approved under the accelerated pathway in the United States indicated for the treatment of adult and pediatric patients with aromatic L-amino acid decarboxylase (AADC) deficiency. Kebilidi had already been approved in Europe, the U.K., Israel, Brazil, and Taiwan as Upstaza, albeit in a more narrowed patient population. Kebilidi is an adeno-associated virus (AAV) vector-based gene therapy administered as four intraputaminal infusions in a single stereotactic neurosurgical procedure. The SmartFlow Neuro Cannula is currently the only FDA authorized device indicated for use to administer Kebilidi.

The safety and effectiveness of Kebilidi were demonstrated in an open-label, single-arm clinical study in 13 pediatric patients with confirmed diagnosis of AADC deficiency. At the start of the study, twelve of the 13 patients had the severe phenotype of AADC deficiency, defined as having no motor milestone achievement at baseline, and no clinical response to standard of care therapies. and decreased AADC activity in the plasma. Patients treated with Kebilidi were compared to untreated patients (natural history). Motor milestone assessments were completed for 12 of the 13 patients at week 48 after receiving the treatment (one patient dropped out of the study prior to Week 48). Eight (67%) of the 12 treated patients achieved a new gross motor milestone at week 48: 3 patients achieved full head control, two patients achieved sitting with or without assistance, two patients achieved walking backwards and the patient with the "variant" severe phenotype was able to sit unassisted. The two patients who achieved walking backwards at week 48 were treated before two years of age. The four patients who were unable to achieve new gross motor milestones at week 48 were treated between the ages of 2.8 and 10.8 years. In comparison, none of the 43 untreated patients with the severe phenotype had documented motor milestone achievement at last assessment at a median age of 7.2 years (range 2 to 19 years).

The most common adverse reactions (≥ 15%) of Kebilidi are dyskinesia, pyrexia, hypotension, anemia, salivary hypersecretion, insomnia, low levels of potassium, phosphate, and/or magnesium, and procedural complications such as respiratory and cardiac arrest. It is also contraindicated in patients who have not achieved skull maturity assessed by neuroimaging.

Summary

Effective Date of Policy:	5/28/2026
Indications	Treatment of adult and pediatric patients with aromatic L-amino acid decarboxylase (AADC) deficiency
ICD10 Diagnosis Codes	E70.81
Availability	single-dose 2 mL vial (each mL of suspension contains a nominal concentration of 5.6×10^{11} vg of eladocagene exuparvovec-tneq)
Duration	Approval will be provided for 6 months to allow sufficient time for administration

Required Criteria for Approval

1. Kebilidi must be prescribed by or in consultation with a neurologist or metabolic specialist with expertise in aromatic L-amino acid decarboxylase (AADC) deficiency or neurotransmitter disorders **AND**
2. The procedure must be performed by a neurosurgeon trained in stereotactic neurosurgery
    a. The neurosurgeon performing the procedure must confirm, using neuroimaging (CT or MRI), that the patient has achieved skull maturity **AND**
3. Attestation that the administering facility has the following capabilities is required:
    a. Stereotactic neurosurgical capability (including MR-guided or frame-based systems)
    b. Pediatric neuroanesthesia support
    c. Inpatient neurology and neurosurgical postoperative care
4. The patient must be between 16-months and 10-years of age **AND**
5. The patient must have a diagnosis of aromatic L-amino acid decarboxylase (AADC) deficiency confirmed by ALL of the following:
    a. Molecular genetic testing confirming biallelic pathogenic or likely pathogenic variants in the DDC gene
    b. Biochemical confirmation of disease that includes at least ONE of the following:
        i. Elevated plasma 3-O-methyldopa (3-OMD) **OR**
        ii. Reduced cerebrospinal fluid (CSF) homovanillic acid (HVA) OR 5-hydroxyindoleacetic acid (5-HIAA)
    c. Attestation from the treating specialist that the patient's clinical presentation is consistent with AADC deficiency (e.g., hypotonia, oculogyric crises, movement disorder, developmental delay with onset in infancy) **AND**
6. The patient must have a severe phenotype of AADC deficiency, defined as the inability to achieve **ANY** of the following motor milestones independently: sitting, standing, or walking (with or without assistive device). Documentation of a motor function assessment (e.g., PDMS-2, Bayley-III) within 6 months of the request must be submitted **AND**
7. The patient must not have:
    a. Significant brain structure abnormality on neuroimaging that would preclude safe stereotactic neurosurgery or compromise expected efficacy.
    b. Anti-AAV2 neutralizing antibody titer >1:1200 or ELISA OD >1
    c. Confirmed diagnosis of pyridoxine 5'-phosphate oxidase (PNPO) deficiency or tetrahydrobiopterin (BH4) deficiency
8. Kebilidi is indicated for a one-time, single-dose intraputaminal use only and therefore will not be authorized for retreatment. Retreatment will be considered Experimental/Investigational when any FDA approved gene therapy, or any other gene therapy under investigation, has been previously administered
9. The recommended dose of Kebilidi is four 0.08 mL (0.45×10^{11} vg) intraputaminal infusions in a single stereotactic neurosurgical procedure. Please refer to Kebilidi FDA-approve prescribing information for complete dosage and administration instructions.
10. Kebilidi (eladocagene exuparvovec-tneq) is considered investigational when the above criteria are not met.
11. Kebilidi (eladocagene exuparvovec-tneq is considered investigational for all other indications.
12. Authorization will be granted for 6 months from the date of approval to allow sufficient time for pre-procedural workup, scheduling, and administration.
    a. If treatment is not administered within the 6-month authorization window, a new prior authorization request is required with updated clinical documentation, including repeat anti-AAV2 antibody testing.

Considerations

- Prior authorization is obtained through the CDPHP pharmacy department.
- Physician acknowledges that CDPHP will request documentation, not more frequently than biannually, of follow-up patient assessments such as gross motor milestone achievement, as well as documentation of relevant clinical status while the patient is under the care of the physician.
- Unless otherwise indicated within drug specific criteria, the drugs listed in this policy are administered by a health care professional and therefore are covered under the medical benefit.
- Utilization Management are contract dependent. Refer to specific contract/benefit language for exclusions.
    - Coverage criteria may be dependent on the contract renewal date.
    - Coverage of drugs listed in this policy are contract dependent.
    - Not all contracts/benefits allow coverage of health care professional administered drugs as part of their pharmacy benefit
    - Not all contracts/benefits cover all medical infusible drugs.

- Clinical documentation must be submitted for each request (initial and recertification) unless otherwise specified (e.g., provider attestation required). Supporting documentation includes, but is not limited to, progress notes documenting previous treatments and treatment history, diagnostic testing, laboratory test results, genetic testing or biomarker results, imaging, and other objective or subjective measures of clinical benefit. For recertification, continued approval requires documentation demonstrating that the requested product is providing ongoing benefit to the patient, evidenced by improvement or stability in the disease state or condition, and that continued use remains medically necessary. Ongoing use of the requested product must continue to align with the current policy's preferred formulary. Recertification reviews may result in a requirement to trial more cost-effective treatment alternatives as they become available (e.g., generics, biosimilars, or other guideline-supported treatment options). Requested dosing must remain consistent with FDA-approved or off-label/guideline-supported dosing recommendations.
- For members with Medicare Advantage, medications with a National Coverage Determination (NCD) and/or Local Coverage Determination (LCD) will be covered pursuant to the criteria outlined by the NCD and/or LCD. NCDs/LCDs for applicable medications can be found on the CMS website at https://www.cms.gov/medicare-coverage-database/search.aspx. Indications that have not been addressed by the applicable medication's LCD/NCD will be covered in accordance with criteria determined by the Health Plan (which may include review per the Health Plan's Off-Label Uses of FDA Approved Drugs policy). Step therapy requirements may be imposed in addition to LCD/NCD requirements.
- All utilization management requirements outlined in this policy are compliant with applicable New York State insurance laws and regulations. Policies will be reviewed and updated as necessary to ensure ongoing compliance with all state and federally mandated coverage requirements.
- Manufacturers may either discontinue participation in, or may not participate in, the Medicaid Drug Rebate Program (MDRP). Under New York State Medicaid requirements, physician-administered drugs must be produced by manufacturers that participate in the MDRP. Products made by manufacturers that do not participate in the MDRP will not be covered under Medicaid Managed Care/HARP lines of business. Drug coverage will not be available for any product from a non-participating manufacturer. For a complete list of New/Reinstated & Terminated Labelers please visit: https://www.medicaid.gov/medicaid/prescriptiondrugs/medicaid-drug-rebate-program/newreinstated-terminated-labeler-information/index.html
- This policy is based on available evidence as of the last review date. Coverage determinations are subject to applicable plan documents, state and federal regulations, and individual patient circumstances. This policy does not constitute medical advice.
- For commercial contracts, medical necessity determinations align with the Certificate of Coverage issued by the Health Plan, which states that covered services must be clinically appropriate and not primarily for the convenience of the member, the member's family, or the provider.
- The following applies to all gene and cellular therapies unless otherwise specified within the drug-specific coverage criteria:
    - Administration, Retreatment, and Treatment with Additional or Other Gene/Cellular Therapies
        - One-Time Administration
            - Most gene and cellular therapies, whether autologous, allogeneic ("off-the-shelf"), or in vivo gene-transfer therapies, are designed and studied as one-time treatments.
            - Repeat dosing, reinfusion, or sequential therapy with other gene or cellular products has not been established as safe, effective, or clinically appropriate.
    - Retreatment/Repeat Administration
        - Retreatment with the same gene or cellular therapy product is considered experimental and investigational because:
            - Clinical trials evaluated these therapies as single-administration interventions
            - Safety, efficacy, and durability of a second administration have not been established
            - Risks of immune activation, insertional mutagenesis, or vector immunity may be increased with repeat dosing
    - Treatment with an Additional or Other Gene/Cellular Therapy
        - Treatment with an additional or different gene or cellular therapy after prior exposure to any gene or cellular therapy is currently considered experimental and investigational as there is lack of evidence demonstrating the following:
            - Anticipated clinical benefit beyond available standard therapies
            - Safety of sequential administration
            - Justification for selecting a second gene/cellular intervention after a prior one
        - This includes, but is not limited to:
            - Switching between CAR-T products (e.g., CD19 → CD19 or CD19 → BCMA)
            - Switching between autologous and allogeneic cellular therapies
            - Sequential use of CAR-T, TCR-T, NK-cell therapies, or other genetically engineered cell therapies
            - Receiving a gene therapy after previous gene or cellular therapy exposure

- Receiving an in vivo gene therapy following any prior vector-based therapy

- Prior Gene/Cell Therapy Exposure
  - An individual is generally not eligible for additional gene or cellular therapy if they have previously received:
    - Any autologous cellular therapy (e.g., CAR-T, TCR-T, TIL),
    - Any allogeneic genetically modified cellular therapy,
    - Any in vivo gene therapy (e.g., AAV, lentiviral vector)
    - Any ex vivo gene-modified cell product
    - Are being considered for any other gene or cellular therapy without documented evidence supporting safety and anticipated benefit.
- Coverage Determination
  - Absent peer-reviewed evidence demonstrating safety and benefit, retreatment or sequential therapy is considered investigational and will not be covered.

Policy/Procedure Name: Ketamine solution for injection **Control Number: 1350/20.000430**

Disclaimer Notice

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgment when deciding the most appropriate care for enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

Background

Ketamine is a rapid-acting general anesthetic producing an anesthetic state characterized by profound analgesia, normal pharyngeal-laryngeal reflexes, normal or slightly enhanced skeletal muscle tone, cardiovascular and respiratory stimulation, and occasionally a transient and minimal respiratory depression. The mechanism of action is primarily due to antagonism of NMDA receptors in the central nervous system. Ketamine has been approved by the U.S. Food and Drug Administration (FDA) for diagnostic and surgical procedures that do not require skeletal muscle relaxation, for the induction of anesthesia prior to the administration of other general anesthetic agents, and to supplement low-potency agents such as nitrous oxide.[1] Ketamine for the treatment of psychiatric disorders and/or pain is an off-label use and considered experimental and investigational at this time. Refer to policy: Experimental, Investigational & Non-Standard Treatments/Clinical Trials, Control Number, 1370/20.000152.

Psychiatric disorders

While preliminary studies demonstrate short-term outcomes with ketamine infusions in patients suffering from treatment resistant depression, there is insufficient long-term data to support its use at this time. Studies available currently are moderate in size, short in duration, low in design quality, and had limited or no follow-up to assess the duration of treatment effects. More studies are needed to demonstrate safety and efficacy before ketamine can be considered an appropriate or medically necessary treatment for psychiatric and/or pain disorders. Additionally, consideration must be given as ketamine has abuse potential and it is associated with psychological side effects such as dissociative or psychotomimetic effects.[2]

The American Psychiatric Association (APA) guidelines for the treatment of posttraumatic stress disorder, bipolar disorder, obsessive-compulsive disorder, and major depressive disorder have not been updated within the last decade and do not address ketamine. In 2017, the American Psychiatric Association (APA) published an evidence review and consensus opinion of the use of ketamine in treatment-resistant depression. The APA noted that "while ketamine may be beneficial to some patients with mood disorders, it is important to consider the limitations of the available data and the potential risk associated with the drug when considering treatment options. Risks include suicidal ideation and potential for substance abuse.[3]

Due to the lack of established clinical value, CDPHP considers ketamine to be experimental and investigational for psychiatric disorders.

Esketamine is the S-enantiomer of ketamine, which binds with greater affinity to the N-methyl D-aspartate (NMDA) receptor and enhances glutamine release in the brain. Spravato (esketamine) is Food and Drug Administration (FDA) an approved therapy in conjunction with an oral antidepressant for treatment resistance depression and depressive symptoms in adults with major depressive disorder with acute suicidal ideation or behavior. The onset of action is 20 to 40 minutes. Due to risks for serious adverse outcomes resulting from sedation, dissociation, and abuse and misuse, Spravato is available only through a restricted Risk Evaluation and Mitigation Strategy (REMS) program.[4] Refer to policy: Spravato (esketamine) Control Number: 1350/20.000370.

Pain conditions

A review of clinical literature for the use of ketamine infusions for chronic pain reveal that there is limited evidence that suggests ketamine may provide temporary relief to some chronic pain patients. However, there is insufficient evidence to advocate the routine use of this treatment for patients with chronic pain. Of particular concern are the significant adverse effects on the central and peripheral nervous system. Little data is available concerning appropriate dosing and long-term administration. The overall health benefit of ketamine infusions for chronic pain cannot be determined due to the limited evidence and severity of side effects. Additional clinical trials are needed to evaluate the long-term safety and efficacy before its use can be considered clinically appropriate.[5]

In 2018, the American Society of Regional Anesthesia and Pain Medicine, the American Academy of Pain Medicine, and the American Society of Anesthesiologists issued a joint consensus guideline on the use of intravenous ketamine for treatment of chronic pain. The authors found:

- Weak evidence supporting use of IV ketamine for short-term improvement in patients with spinal cord injury pain
- Moderate evidence supporting use of IV ketamine for improvement in patients with Complex Regional Pain Syndrome (CRPS) up to 12 weeks

- Weak or no evidence for immediate improvement with IV ketamine use for other pain conditions, including mixed neuropathic pain, fibromyalgia, cancer pain, ischemic pain, headache, and spinal pain

Of note, the authors footnote this paper indicating that the document has neither been presented to nor approved by either the American Society of Anesthesiologists Board of Directors or House of Delegates and therefore is not an official or approved statement or policy of the Society.[6]

Due to the lack of established clinical value, CDPHP considers ketamine to be experimental and investigational for pain conditions.

Summary	
Effective Date of Policy:	12/8/2021
Indications	FDA approved indication: • diagnostic and surgical procedures that do not require skeletal muscle relaxation, • the induction of anesthesia prior to the administration of other general anesthetic agents, and • supplement low-potency agents such as nitrous oxide
Availability	Multiple concentrations J3490
Duration	Not applicable
Coverage	Ketamine may be covered for FDA-approved indications according to provider contract terms Outpatient use of ketamine will not be covered for off-label use

MEDICAL POLICY

Medical Policy Title	**Kidney Transplantation**
Policy Number	**07.02.04**
Current Effective Date	**July 1, 2026**
Next Review Date	**April 2027**

Our medical policies are guides to evaluate technologies or services for medical necessity. Criteria are established through the assessment of evidence based, peer-reviewed scientific literature, and national professional guidelines. Federal and state law(s), regulatory mandates and the member's subscriber contract language are considered first in the determination of a covered service. (Link to Product Disclaimer)

POLICY STATEMENT(S)

I. Kidney transplants are **medically appropriate** for candidates with documented progressive end stage renal disease (ESRD) when **EITHER** of the following indications are present:

   A. A measured (actual urinary collection) creatinine clearance level or calculated glomerular filtration rate (GFR) (or another reliable formula) less than or equal to 20ml/min; **or**

   B. The initiation of dialysis.

II. Kidney retransplants after a failed primary kidney transplant are considered **medically necessary** when the criteria in Policy Statement I are met.

III. The following conditions are absolute contraindications to kidney transplantation:

   A. Presence of malignancy (other than non-melanoma skin cancers), unless malignancy has been completely resected, or unless (upon medical review) it is determined that malignancy has been treated with a small likelihood of recurrence and acceptable future risks;

   B. Ongoing or recurring infections that are not effectively treated;

   C. Serious cardiac or pulmonary, other ongoing comorbid conditions that create an inability to tolerate transplant surgery;

   D. Demonstrated non-adherence to medical recommendations, which places the organ at risk.

IV. Kidney transplantation is considered a relative contraindication in human immunodeficiency virus (HIV) positive individuals, unless **ALL** of the following criteria are met:

   A. Cluster of Differentiation 4 (CD4) count greater than 200 cells/mm^3;

   B. Undetectable HIV-1 ribonucleic acid (RNA);

   C. On Stable anti-retroviral therapy for greater than three (3) months; **and**

   D. All other criteria within the policy are met.

07.02.01 Pancreas Transplant: (Pancreas Transplant Alone, Pancreas Transplant after Kidney Transplant, Simultaneous Pancreas Kidney Transplant): Islet Cell Transplant

POLICY GUIDELINE(S)

I. Recipient Selection

A. Each individual considered for renal transplantation will have an evaluation completed by the transplant center for potential difficulties that would complicate and diminish the success of transplantation. Consideration will be given to the individual's risk of death without transplantation, along with the presence and severity of potential contraindications to transplantation. Candidates considered for transplant must be psychologically stable, demonstrate motivation and compliance, and have no ongoing problems with drug or alcohol abuse.

B. Nutritional issues are important predictors of surgical outcomes. For candidates with a body mass index (BMI) outside of the "normal range," documentation of dietary counseling will be required at the time of evaluation and while on the waiting list.

C. Diabetic complications often fall into the realm of relative contraindications (except for significant cardiovascular disease); however, renal transplantation is associated with improved survival in individuals with end-stage renal disease (ESRD) caused by type 1 diabetes mellitus. Individuals with diabetes may be candidates for combined kidney-pancreas transplantation.

II. Prior authorization requirements are contract dependent. Approval for all transplants, including arrangements with an approved transplant center, may be required.

III. Pre-transplant evaluation documentation must include the following clinical information (if testing is unable to be performed, the rationale for not performing the testing must be included in the documentation):

A. Clinical Evaluation:

1. Confirmation of diagnosis;
2. Identification of comorbidities;
3. Current assessment of co-morbidities;
4. Management of co-morbidities; and
5. Consult notes (if applicable).

B. Psycho-Social Evaluation:

1. Identification of stressors (family support, noncompliance issues, motivational issues, alcohol, or smoking/substance abuse).

C. Performance Status:

1. Karnofsky performance score;

2. Palliative Performance Scale (PPS) score;
3. Eastern Cooperative Oncology Group (ECOG) performance status; or
4. Lansky Play-Performance Scale (for age 1 to 16 years).

D. Oral Health Evaluation;

E. Lab Tests:

1. Complete Blood Count (CBC), metabolic profile;
2. Serologies: Cytomegalovirus (CMV); Hepatitis B and C; and
3. Human Immunodeficiency Virus (HIV) Testing.

F. Cardiac Assessment:

1. 12 Lead Electrocardiogram (EKG);
2. Stress (exercise, nuclear, or dobutamine); and
3. Echocardiogram (Echo) or Multigated Acquisition (MUGA) Scan.

G. Pulmonary Assessment:

1. Chest x-ray;
2. Pulmonary function tests (PFTs) for high-risk respiratory failure (COPD, emphysema, alpha 1-antitrypsin deficiency, hepatopulmonary syndrome, or significant smoking history); and

H. Age-appropriate Screening Tests: Please refer to the U.S Preventive Services Task Force (USPSTF) [Internet] for list of age-appropriate screening guidelines (e.g., colorectal cancer screening, cervical cancer screening for guidance). [accessed 2026 Feb 25]. Available from: https://uspreventiveservicestaskforce.org/uspstf/

IV. Hepatitis C virus (HCV) infections are common among individuals with chronic renal failure and result in significant morbidity and mortality. Therefore, the assessment of hepatitis C virus infection in the potential recipient has a major clinical significance. HCV infections are associated with an increased risk of death, irrespective of whether the individual stays on dialysis or has a renal transplant. Transplantation has a beneficial, rather than adverse, effect on long-term survival in an anti-HCV-positive individual. An HCV-positive status is not a contradiction for renal transplantation.

V. A person who gives consent to be a live organ donor should be competent, willing to donate, free from coercion, medically and psychologically suitable, fully informed of the risks and benefits as a donor, and fully informed of the risks, benefits, and alternative treatment available to the recipient. The benefits to both donor and recipient must outweigh the risks associated with the donation and transplantation for the living donor organ.

VI. Candidates may be wait-listed at more than one transplant center. Since waiting time priority is first calculated among candidates at all hospitals within the local donation area, listing at

transplant centers in different local allocation areas is recommended. Requirements for multiple-listed candidates may vary among transplant centers. When possible, results of tests used in the evaluation for the transplant at one center should be used at subsequent centers where the individual is listed.

VII. Transplant re-authorization must be completed annually while actively waiting for a transplant. Re-authorization documentation must be within the past 11 months (unless specified) and include the following clinical information (if testing is unable to be performed, the rationale must be included in the documentation). If the individual's health condition has not changed from the previous year some testing would not be applicable.

A. Clinical Evaluation:

1. Updated list of diagnoses to include identification of comorbidities, current assessment, and treatment plan.
2. Specialty consultation notes (if applicable).

B. Current functional ability as evidenced by current Karnofsky performance score (KPS); Palliative Performance Scale (PPS) score; ECOG, or Lansky Play-Performance Scale.

C. Follow-up Oral Health Evaluation;

D. Lab Tests:

1. CBC, metabolic profile;
2. Serologies: CMV, Hepatitis B and C; and
3. HIV testing (If applicable).

E. Cardiac Assessment:

1. 12 Lead EKG (If applicable);
2. Stress (exercise, nuclear, or dobutamine) (If applicable); and
3. Echo or Muga scan (If applicable).

F. Pulmonary Assessment:

1. Chest x-ray (If applicable);
2. Pulmonary function tests (PFTs) for high-risk respiratory failure (COPD, emphysema, a-1-antitrypsin deficiency, hepatopulmonary syndrome, or significant smoking history); **and**

G. Age-appropriate Screening Tests: Please refer to the USPSTF [Internet] for a list of age-appropriate screening guidelines (e.g., colorectal cancer screening, cervical cancer screening for guidance). [accessed 2026 Feb 25]. Available from: https://uspreventiveservicestaskforce.org/uspstf/

DESCRIPTION

The kidneys are two bean-shaped organs located on each side of the spine just below the rib cage. Kidneys are about the size of a fist. Their main function is to filter blood toxins and transform the waste into urine to be eliminated. When kidneys lose filtering abilities, harmful levels of fluid and waste accumulate in the body, which can result in kidney (renal) failure. Estimated glomerular filtration rate (eGFR) is a calculation used to estimate how well the kidneys are filtering certain products produced by the body. In adults, the normal eGFR number is usually 90-100. Which means that the kidney function is 90-100%. eGFR declines with age, even in people without kidney disease.

The National Kidney Foundation (NKF) states that Stage 5 chronic kidney disease (end-stage renal disease) is eGFR less than 15 for 3 months or more, or the individual is on dialysis. GFR estimate is considered the best measure of kidney function (NKF 2023).

Individuals with kidney failure are treated with dialysis, or with transplant.

A kidney transplant is the removal of a healthy kidney from a living donor or deceased (cadaveric) donor and the placement of the kidney into a person whose kidneys are no longer functioning properly. Transplant recipients require life-long immunosuppression to prevent rejection. Individuals are prioritized for transplant by mortality risk and severity of illness criteria developed by the Organ Procurement and Transplantation Network (OPTN) and United Network of Organ Sharing (UNOS). Data collected in 2023 (Lentine et al) show over 28,000 kidney transplantations performed in the United States in that year, with a rise noted due to an increase in deceased donor transplants. Five-year graft survival rates were 90% for living donor transplants and 82.2% for deceased donor transplants (ages 18-34 years). There were more than 140,000 adult candidates on the waiting list in 2023.

SUPPORTIVE LITERATURE

Chaudhry et al (2022) published a systematic review that compared survival for waitlisted patients with kidney failure who received a transplant compared to those who remained on the transplant waiting list. A total of 48 observational studies were included in the systematic review, of which 18 studies were suitable for meta-analysis. Results demonstrated a 55% reduction in the risk of mortality in patients who received a transplant compared to those who remained on dialysis.

Kainz et al (2022), retrospectively compared the association of time on the waitlist with survival of those who received a second transplant to those who remained on the waitlist. A total of 2,346 individuals from the Austrian Dialysis and Transplant Registry and Eurotransplant were included in the study. Inclusion criteria were individuals with a failed first graft, who were over the age of 18 years, and waitlisted for a second kidney transplantation in Austria between the years of 1980 and 2019. Study results demonstrated that second kidney transplantation improved survival at 10 years of follow-up compared with those remaining on the waitlist. The survival difference diminished in the individuals with longer wait times after loss of the first allograft. Individuals with a waitlist for retransplantation of 1 year or less, gained 8.0 life months compared to those who remained on the waiting list for 8 years (0.1 life month gained).

<u>Kidney Retransplant</u>

Pediatric kidney transplant recipients will likely require a retransplant in their lifetime. Gupta et al (2015) retrospectively analyzed OPTN data, focusing on patients who had an initial kidney transplant as children. A total of 2,281 patients were identified. Included were those who had their first transplant before 18 years of age and a second kidney transplant at any age following. In multivariate analysis, the length of first graft survival and age at second graft were significantly associated with second graft survival. Specifically, the first graft survival time of more than 5 years was associated with better second graft survival. However, patients who were between 15 and 20 years old at second transplant were at increased risk of second kidney graft failure compared with individuals in other age groups. It is likely that most pediatric renal allograft recipients will require one or more retransplants during their lifetime. Unfortunately, the use of a second or subsequent graft in pediatric recipients has inferior long-term graft survival rates compared with initial grafts, with decreasing rates with each subsequent graft (Saeed et al 2024).

More recent research is aimed at strategies to prevent transplant rejection, while cell-based therapies are being investigated to minimize the impacts of immunosuppression.

PROFESSIONAL GUIDELINE(S)

The 2021 Chronic Kidney Disease Epidemiology Collaboration (2021 CKD-EPI) removed race as a variable from the GFR equation and recalibrated the other coefficients variables (e.g., age, sex, and serum creatinine). Subsequently, the National Kidney Foundation and American Society of Nephrology Task Force recommended that the 2021 CKD-EPI equation be implemented for eGFR reporting (Delgado et al 2022).

OPTN requires all transplant hospitals to use race-neutral calculations when estimating a candidate's GFR for any purpose covered by OPTN policy. Kidney transplant programs are required to assess their waiting lists and correct wait times for any African American kidney candidates disadvantaged by having their kidney function overestimated because of the use of a race-inclusive calculation (OPTN 2023).

Kidney Disease Improving Global Outcomes (KDIGO) 2024 Clinical Practice Guideline for the Evaluation and Management of CKD recommended considering "planning for preemptive kidney transplantation or dialysis access in adults when the GFR is < 15-20ml/min per 1.734 m^2 or risk of kidney replacement therapy (KRT) is greater than 40% over 2 years."

REGULATORY STATUS

Kidney transplants, as surgical procedures, do not require U.S. Food and Drug Administration (FDA) approval.

The Health Resources Services Administration (HRSA) oversees the transplantation of vascularized human organs through the Organ Procurement and Transplantation Network (OPTN), which was established through the National Organ Transplant Act (NOTA) approved by U.S. Congress in October 1984. It served as a model for development of other transplant networks worldwide, directing how organ allocation would be managed on a national basis. The model was developed through a unique public-private partnership with the United Network for Organ Sharing (UNOS). For more information

view the UNOS website, available from: https://unos.org/about/ [accessed 2026 Feb 26].

The HIV Organ Policy Equity (HOPE) Act was enacted in November 2013 and amended regulations of NOTA. The amendment removed clinical research and institutional review board (IRB) requirements for transplantation of kidneys and livers from donors with HIV to recipients with HIV.

CODE(S)

- Codes may not be covered under all circumstances.
- Code list may not be all inclusive (AMA and CMS code updates may occur more frequently than policy updates).
- (E/I)=Experimental/Investigational
- (NMN)=Not medically necessary/appropriate

CPT Codes

Code	Description
50300	Donor nephrectomy (including cold preservation); from cadaver donor, unilateral or bilateral
50320	Donor nephrectomy (including cold preservation); open, from living donor
50323	Backbench standard preparation of cadaver donor renal allograft prior to transplantation, including dissection and removal of perinephric fat, diaphragmatic and retroperitoneal attachments, excision of adrenal gland, and preparation of ureter(s), renal vein(s), and renal artery(s), ligating branches, as necessary
50325	Backbench standard preparation of living donor renal allograft (open or laparoscopic) prior to transplantation, including dissection and removal of perinephric fat and preparation of ureter(s), renal vein(s), and renal artery(s), ligating branches, as necessary
50327	Backbench reconstruction of cadaver or living donor renal allograft prior to transplantation; venous anastomosis, each
50340	Recipient nephrectomy (separate procedure)
50360	Renal allotransplantation, implantation of graft; without recipient nephrectomy
50365	Renal allotransplantation, implantation of graft; with recipient nephrectomy
50370	Removal of transplanted renal allograft
50380	Renal auto-transplantation, reimplantation of kidney

POLICY STATEMENT(S)

Knee Arthroplasty

Total Knee Arthroplasty

I. Total knee arthroplasty is **medically necessary** when **ALL** the following are met:
   A. BMI 40 kg/m² or less;
   B. Pain results in functional impairment that limits range of motion and interferes with activities of daily living;
   C. Conservative management meets **either** of the following:
      1. Conservative management is not required when **any** of the following is documented:
         a. Osteonecrosis/Avascular Necrosis (AVN);
         b. Malignancy involving the knee or adjacent structures;
         c. Distal femur or proximal tibia malunion/nonunion fracture;
         d. Failed partial knee arthroplasty;

e. Severe deformity, condylar collapse, or end-stage bone-on-bone disease; **or**

2. For all other indications, conservative management must include **both** the following:
   a. Physical Therapy (PT) meets **all** the following:
      i. Supervised by a licensed PT, chiropractor, or through tele-rehab PT;
      ii. Participation for a minimum of 6 weeks during the previous 6 months; **and**
      iii. Failure to improve symptoms or functional impairments;
   b. Pain management includes **any** of the following:
      i. Non- pharmacologic pain management such as modification of activity/protective weight-bearing/use of an orthotic;
      ii. Intra-articular corticosteroid injection; **or**
      iii. Medication management (e.g., non-steroidal anti-inflammatory drugs [NSAIDS]); **and**

D. Condition includes **either** of the following:
   1. Disease is progressed into an uninvolved compartment; **or**
   2. **All** the following are met:
      a. Arthritic condition includes **any** of the following:
         i. Osteoarthritis;
         ii. Inflammatory arthropathy;
         iii. Post-traumatic arthritis; **and**
      b. Knee pain causing loss of function for 12 weeks or more that interferes with activities of daily living;
      c. Weight-bearing radiographs within the last 3 to 6 months demonstrate advanced degenerative joint disease including **one (1)** or more of the following:
         i. Bone-on-bone contact involving two or more knee compartments;
         ii. Marked narrowing of the joint space; **or**
         iii. Moderate-to-severe osteoarthritic changes (Kellgren-Lawrence grade III or IV.

<u>Total Knee Arthroplasty-Revision</u>

II. Revision total knee arthroplasty is **medically necessary** when **ALL** the following are met:
   A. BMI less than 40 kg/m²;
   B. Pain results in functional impairment that limits range of motion and interferes with activities of daily living;

C. Prosthetic failure or removal requirement due to infection;

D. Weight-bearing radiographs within the last 3 to 6 months or physical examination demonstrate **one (1)** or more of the following:

1. Aseptic loosening;
2. Component instability;
3. Component failure;
4. Prosthetic recall;
5. Osteolysis;
6. Periprosthetic infection;
7. Periprosthetic fracture;
8. Recurrent instability, dislocation, or subluxation.

III. Total knee arthroplasty is **not medically necessary** for **ANY** of the following contraindications:

A. Active local or systemic infection;

B. Uncontrolled diabetes mellitus (HbA1c greater than 8%);

C. Uncontrolled hypertension;

D. Nicotine or tobacco, including cigar, cigarette, e-cigarette, nicotine pouch, smokeless tobacco or vape pen use within 6 weeks of surgery;

E. Intra-articular corticosteroid injection within 12 weeks of surgery;

F. Clinically unstable or unmanaged comorbid condition(s);

G. Material allergy incompatible with implantation;

H. Untreated or unmanaged substance use disorder.

<u>Partial Knee Arthroplasty (PKA) or Unicompartmental Knee Arthroplasty (UKA)</u>

IV. A partial knee arthroplasty (PKA) or unicompartmental (UKA) knee arthroplasty is **medically necessary** when documentation supports **ALL** the following:

A. The remaining knee compartments do not demonstrate degenerative changes;

B. The anterior cruciate ligament is functional, either through native integrity or prior successful reconstruction/repair;

C. The individual has **one (1)** of the following:

1. Advanced unicompartmental osteoarthritis;
2. Isolated medial or lateral compartment osteoarthritis (Kellgren-Lawrence grade III or IV); **or**

3. Post-traumatic arthritis limited to a single compartment;

D. BMI is **either**:
   1. 40 kg/m² or less; or
   2. If BMI is 40 kg/m² or greater, documented weight reduction of at least 10% before surgery;

E. Conservative management must include **both** of the following:
   1. Physical Therapy (PT) meets **all** the following:
      a. Supervised by a licensed PT, chiropractor, or through tele-rehab PT;
      b. Participation for a minimum of 6 weeks during the previous 6 months; **and**
      c. Failure to improve symptoms or functional impairments;
   2. Pain management includes **any** of the following:
      a. Non- pharmacologic pain management such as modification of activity/protective weight-bearing/use of an orthotic;
      b. Intra-articular corticosteroid injection; **or**
      c. Medication management (e.g., NSAIDS);

F. Pain in the last 12 weeks (or more) has resulted in functional impairment that limits range of motion and interferes with activities of daily living or painful weight-bearing;

G. Physical examination is consistent with advanced unicompartmental disease and include **one (1)** or more of the following:
   1. Contracture;
   2. Crepitus;
   3. Correctable angular deformity (valgus deformity of 20 degrees or less or varus deformity of 15 degrees or less);
   4. Joint swelling or effusion;
   5. Instability; **or**
   6. Restricted range of motion;

H. Recent knee radiographs demonstrate at least **one (1)** of the following:
   1. Severe narrowing of the affected compartment joint space;
   2. Bone-on bone contact confined to a single compartment; **or**
   3. Moderate-to-severe osteoarthritic degeneration (Kellgren-Lawrence grade III or IV) within the last 3 to 6 months.

V. PKA or UKA are **contraindicated** when **ANY** of the following are present:

A. Presence of osteoporosis or osteopenia;
B. Active local or systemic infection;
C. Uncontrolled diabetes mellitus (HbA1c greater than 8%);
D. Nicotine or tobacco, including cigar, cigarette, e-cigarette, nicotine pouch, smokeless tobacco or vape pen use in the 6 weeks prior to surgery;
E. Intra-articular corticosteroid injection in the operative joint within 12 weeks of surgery;
F. Meniscectomy, total, in remaining compartment;
G. Angular deformity or contracture (or contracture exceeding the specified range) with **any** of the following:
    1. Fixed valgus deformity greater than 20 degrees;
    2. Fixed varus deformity greater than 15 degrees;
    3. Flexion contracture of at least 15 degrees;
    4. Flexion of less than 110 degrees;
H. Clinically unstable or unmanaged comorbid condition(s);
I. Material allergy incompatible with implantation;
J. Untreated or unmanaged substance use disorder.

Patellofemoral Arthroplasty (PFA)

VI. A patellofemoral knee arthroplasty (PFA) is **medically necessary** when **ALL** the following are met:
    A. BMI is 40 kg/m² or less;
    B. The individual has **one (1)** of the following:
        1. Unsuccessful outcome following a patellofemoral extensor mechanism unloading procedure;
        2. Severe patellofemoral osteoarthritis (Kellgren- Lawrence grade III or IV) limited to a single knee compartment;
        3. Isolated anterior knee pain or patellar pain that has persisted for 3 months or longer and is further exacerbated by functional activities including stairs, inclines, transfers or prolonged sitting;
    C. Pain in the last 12 weeks (or more) has resulted in functional impairment that limits range of motion and interferes with activities of daily living or painful weight-bearing;
    D. Conservative management must include **both** of the following:
        1. Physical Therapy (PT) meets **all** the following:

a. Supervised by a licensed PT, chiropractor, or through tele-rehab PT;
b. Participation for a minimum of 6 weeks during the previous 6 months; **and**
c. Failure to improve symptoms or functional impairments;

2. Pain management includes **any** of the following:
   a. Non- pharmacologic pain management such as modification of activity/protective weight-bearing/use of an orthotic;
   b. Intra-articular corticosteroid injection; **or**
   c. Medication management (e.g., NSAIDS); **and**

E. Physical examination includes **one (1)** or more of the following:
1. Contracture;
2. Crepitus;
3. Deformity;
4. Joint swelling or effusion;
5. Patellar instability; **or**
6. Restricted range of motion;

F. Weight-bearing radiographs confirm **both** the following:
1. No degenerative changes in the lateral or medial compartments; **and**
2. **either** of the following:
   a. Severe narrowing of the patellofemoral joint space; **or**
   b. Patellofemoral bone-on bone contact confined to a single compartment.

VII. A patellofemoral arthroplasty is **contraindicated** in **ANY** of the following:
A. Active local or systemic infection;
B. Abnormal patellofemoral alignment or tracking;
C. Uncontrolled diabetes mellitus (HbA1c greater than 8%);
D. Uncontrolled hypertension;
E. Inflammatory arthritis;
F. Knee instability related to ligament deficiency;
G. Nicotine or tobacco, including cigar, cigarette, e-cigarette, nicotine pouch, smokeless tobacco or vape pen use in the 6 weeks prior to surgery;
H. Intra-articular corticosteroid injection in the operative joint within 12 weeks of surgery;

I. Meniscectomy, total, in remaining compartment;

J. Clinically unstable or unmanaged comorbid condition(s);

K. Material allergy incompatible with implantation;

L. Untreated or unmanaged substance use disorder;

M. Fixed flexion contracture of 10 degrees or more.

Diagnostic Knee Arthroscopy

VIII. Diagnostic knee arthroscopy is **medically necessary** when documentation supports **ALL** the following:

A. Weight-bearing radiographs do not demonstrate moderate-to-severe osteoarthritic degeneration (Kellgren-Lawrence grade III or IV), including anteroposterior and Rosenberg views when available;

B. Pain in the last 12 weeks (or more) has resulted in functional impairment that limits range of motion and interferes with activities of daily living or painful weight-bearing;

C. Conservative management must include **both** of the following:

1. Physical Therapy (PT) meets **all** the following:

a. Supervised by a licensed PT, chiropractor, or through tele-rehab PT;

b. Participation for a minimum of 6 weeks during the previous 6 months; **and**

c. Failure to improve symptoms or functional impairments;

2. Pain management includes **any** of the following:

a. Non- pharmacologic pain management such as modification of activity/protective weight-bearing/use of an orthotic;

b. Intra-articular corticosteroid injection; **or**

c. Medication management (e.g., NSAIDS);

D. Conventional diagnostic studies have failed to establish a definitive diagnosis, including **both**:

1. Plain radiographs; **and**

2. MRI;

E. Physical examination is consistent with intra-articular knee pathology and includes **one (1)** or more of the following:

1. Joint swelling or effusion;

2. Restricted range of motion; **or**

3. A positive meniscal provocation examination consistent with joint-line tenderness.

Arthroscopic Chondroplasty

IX. Arthroscopic chondroplasty of the knee is **medically necessary** when **ALL** the following are met:
   A. Conservative management must include **both** of the following:
      1. Physical Therapy (PT) meets **all** the following:
         a. Supervised by a licensed PT, chiropractor, or through tele-rehab PT;
         b. Participation for a minimum of 6 weeks during the previous 6 months; **and**
         c. Failure to improve symptoms or functional impairments;
      2. Pain management includes **any** of the following:
         a. Non- pharmacologic pain management such as modification of activity/protective weight-bearing/use of an orthotic;
         b. Intra-articular corticosteroid injection; **or**
         c. Medication management (e.g., NSAIDS);
   B. Weight-bearing radiographs conducted within the previous 3 to 6 months demonstrate minimal degenerative joint disease, consistent with Kellgren-Lawrence grade 0 or I;
   C. Knee pain that has resulted in functional impairment that interferes with activities of daily living, work-related activities, routine ambulation, participation in athletics, or other age-appropriate activities;
   D. The presence of mechanical symptoms consistent with intra-articular knee pathology, including **one (1)** or more of the following during weight bearing activity:
      1. Painful clicking or popping;
      2. Recurrent catching; **or**
      3. True mechanical locking or limitation of joint motion.

Debridement

X. Debridement, with or without chondroplasty, is **medically necessary** when documentation supports **ONE (1)** of the following clinical indications, when associated criteria are met:
   A. Arthrofibrosis, when **all** the following are met:
      1. Weight-bearing radiographs do not demonstrate moderate-to-severe osteoarthritic changes (Kellgren-Lawrence grade III or IV);
      2. Clinical findings are consistent with arthrofibrosis, including pain, stiffness, and restricted range of motion;
      3. A physical therapy program (including telehealth-based rehabilitation when appropriate) that is provided by a physical therapist or chiropractor for at least 6 weeks in the past 6

months;

B. Debridement of femoral condyle or tibial plateau articular cartilage when **all** the following are met:
   1. Absence of moderate-to-severe osteoarthritis on weight-bearing radiographs;
   2. Conservative management must include **all** of the following:
      a. Use of an orthotic/brace;
      b. Physical Therapy (PT) meets **all** the following:
         i. Supervised by a licensed PT, chiropractor, or through tele-rehab PT;
         ii. Participation for a minimum of 6 weeks during the previous 6 months; **and**
         iii. Failure to improve symptoms or functional impairments;
      c. Pain management includes **any** of the following:
         iv. Intra-articular corticosteroid injection; **or**
         v. Medication management (e.g., NSAIDS);
   3. Recurrent joint effusions (**two [2]** or more episodes);
   4. MRI findings demonstrating an unstable chondral lesion within the previous 3 to 6 months;
   5. Knee pain that has resulted in functional impairment;

C. Patellofemoral chondrosis when **all** the following are met:
   1. No evidence of an alternative pain generator, including:
      a. Referred pain;
      b. Bursitis;
      c. Radicular pain; **or**
      d. Tendinopathy;
   2. Weight-bearing radiographs do not demonstrate moderate-to-severe osteoarthritis (Kellgren-Lawrence grade III or IV);
   3. Conservative management must include **all** of the following:
      a. Use of an orthotic/brace;
      b. Physical Therapy (PT) meets **all** the following:
         i. Supervised by a licensed PT, chiropractor, or through tele-rehab PT;
         ii. Participation for a minimum of 6 weeks during the previous 6 months; **and**
         iii. Failure to improve symptoms or functional impairments;

c. Pain management includes **any** of the following:
   i. Intra-articular corticosteroid injection; **or**
   ii. Medication management (e.g., NSAIDS);

D. Anterior knee pain localized to the patellofemoral compartment;

E. Functional limitation attributable to the patellofemoral symptoms;

F. Osteochondritis Dissecans (Pediatric Population), when **all** the following are met:

1. At least **two (2)** of the following are present:
   a. Restricted range of motion;
   b. Limping;
   c. Locking or catching symptoms;
   d. Joint pain, particularly during or after activity;
   e. Joint swelling; **or**
   f. Localized tenderness;
2. Imaging conducted within the previous 3 to 6 months includes **both** radiographs and MRI;
3. Conservative management must include **all** of the following:
   a. Use of an orthotic/brace;
   b. Physical Therapy (PT) meets **all** the following:
      i. Supervised by a licensed PT, chiropractor, or through tele-rehab PT;
      ii. Participation for a minimum of 6 weeks during the previous 6 months; **and**
      iii. Failure to improve symptoms or functional impairments;
4. Presence of at least **one (1)** of the following factors associated with failure of nonoperative management:
   a. Lesion size greater than 150 mm^2;
   b. Lesion extending into shoulders or talus;
   c. Limited remaining skeletal growth potential; **or**
   d. Unstable or detached osteochondral lesion.

<u>Removal of a Loose or Foreign Body</u>

XI. Arthroscopic or open removal of an intra-articular loose body or foreign body of the knee is **medically necessary** when **ALL** the following are met:

A. Symptoms are present and include:

1. Pain, with **one (1)** or more of the following:
    a. Buckling during weight-bearing activities;
    b. Instability or weakness; **or**
    c. Mechanical symptoms including clicking, popping, catching, or locking;

B. Imaging requirements are met:
1. Knee radiographs obtained within the previous 3 to 6 months; **or**
2. MRI obtained within the previous 3 to 6 months;

C. **any** of the following indications are present:
1. Intra-articular loose body;
2. Foreign body within the knee joint; **or**
3. Impinging osteophyte contributing to symptoms.

Synovectomy and/or Synovial Biopsy

XII. Synovectomy or synovial biopsy is **medically necessary** when documentation supports **ONE (1)** of the following clinical indications:

A. Hemarthrosis, when **both** of the following are met:
1. Associated with trauma, coagulation disorder, or bleeding disorder; **and**
2. Diagnosis confirmed by physical examination, joint aspiration, MRI, or a combination of these;

B. Symptomatic Synovial Plica, when **all** the following are met:
1. Examination and MRI findings support the diagnosis of plica;
2. Conservative management must include **both** of the following:
    a. Physical Therapy (PT) meets **all** the following:
        i. Supervised by a licensed PT, chiropractor, or through tele-rehab PT;
        ii. Participation for a minimum of 6 weeks during the previous 6 months; **and**
        iii. Failure to improve symptoms or functional impairments;
    b. Pain management includes **any** of the following:
        i. Activity modification, protected weight-bearing, brace, or orthotic use;
        ii. Intra-articular corticosteroid injection; **or**
        iii. Pharmacologic treatment (e.g., NSAIDS or analgesics);
3. Joint aspiration or corticosteroid injection has been performed when clinically appropriate;

C. Proliferative Synovial Disease, when **all** the following are met:
   1. Condition includes **one (1)** or more of the following:
      a. Pigmented villonodular synovitis (PVNS);
      b. Synovial chondromatosis;
      c. Sarcoid synovitis;
      d. Traumatic hypertrophic synovitis; **or**
      e. Similar proliferative synovial disorder;
   2. Diagnosis is confirmed by biopsy, MRI, clinical history, or a combination of these;
   3. Conservative management must include **both** of the following:
      a. Physical Therapy (PT) meets **all** the following:
         i. Supervised by a licensed PT, chiropractor, or through tele-rehab PT;
         ii. Participation for a minimum of 6 weeks during the previous 6 months; **and**
         iii. Failure to improve symptoms or functional impairments;
      b. Pain management includes **any** of the following:
         i. Activity modification, protected weight-bearing, brace, or orthotic use;
         ii. Intra-articular corticosteroid injection; **or**
         iii. Pharmacologic treatment (e.g., NSAIDS or analgesics);

D. Rheumatoid Synovitis, when **all** the following are met:
   1. Rheumatoid arthritis with symptomatic synovial involvement;
   2. Conservative management must include **both** of the following:
      a. Physical Therapy (PT) meets **all** the following:
         i. Supervised by a licensed PT, chiropractor, or through tele-rehab PT;
         ii. Participation for a minimum of 6 weeks during the previous 6 months; **and**
         iii. Failure to improve symptoms or functional impairments;
      b. Pain management includes **any** of the following:
         i. Activity modification, protected weight-bearing, brace, or orthotic use;
         ii. Intra-articular corticosteroid injection; **or**
         iii. Pharmacologic management (e.g., NSAIDS or analgesics);
   3. Disease remains refractory following at least 6 months of disease-modifying antirheumatic drug (DMARD) therapy.

XIII. Arthroscopic Knee Procedures are **contraindicated** when an intra-articular corticosteroid injection has been administered within 4 weeks of the planned arthroscopic procedure.

Knee Ligament Reconstruction and/or Repair- Pediatric/Skeletally Immature

XIV. Anterior cruciate ligament (ACL) reconstruction is **medically necessary** in skeletally immature individuals when **ALL** the following are met:

A. At least **two (2)** of the following are present:
   1. Audible pop at the time of injury;
   2. Difficulty achieving full knee extension;
   3. Instability during cutting, pivoting, jumping, or athletic activities;
   4. Localized joint tenderness;
   5. Pain with weight-bearing activities;
   6. Quadriceps muscle atrophy;
   7. Reduced range of motion;
   8. Swelling occurring within 6 to 8 hours following injury;

B. Knee radiographs obtained within the previous 3 to 6 months;

C. MRI obtained within the previous 3 to 6 months;

D. **Either** of the following indications are present:
   1. Complete ACL tear associated with significant instability; **or**
   2. Partial ACL tear with ongoing instability despite a structured rehabilitation program

Knee Ligament Reconstruction and/or Repair- Adult

XV. Anterior cruciate ligament (ACL) reconstruction is **medically necessary** when **ALL** the following criteria are met:

A. Conservative management must include **all** of the following:
   1. Use of an orthotic/brace;
   2. Physical Therapy (PT) meets **all** the following:
      a. Supervised by a licensed PT, chiropractor, or through tele-rehab PT;
      b. Participation for a minimum of 6 weeks during the previous 6 months;
      c. Includes attempts at full-joint extension; **and**
      d. Failure to improve symptoms or functional impairments;
   3. Pain management includes **any** of the following:
      a. Intra-articular corticosteroid injection; **or**

b. Medication management (e.g., NSAIDS);

B. **All** age-specific criteria must be met:

1. Individuals aged 18-25 years must meet **all** the following criteria:

a. Weight-bearing radiographs do not demonstrate advanced degenerative joint disease (Kellgren-Lawrence grade III or IV);

b. Symptomatic functional instability symptoms;

c. ACL rupture confirmed by **all** the following:

i. MRI performed within the previous 6 to 12 months;

ii. Physical examination demonstrates objective anterior instability, including **one (1)** or more of the following:

a) Positive anterior drawer test with increased anterior tibial translation compared with the uninvolved knee;

b) Positive Lachman examination with increased tibial translation and a diminished, soft, or absent endpoint; **or**

c) Positive pivot-shift examination;

iii. Physical Therapy* for range of motion requirements are met, including **either** of the following:

a) Physical therapy is NOT required for individuals with full range of motion defined as having **any** of the following:

1) Extension to 0 degrees;

2) Flexion ≥ 130 degrees;

3) Symmetry to the contralateral limb; **or**

b) Physical therapy* is required for individuals with restricted range of motion defined as having **any** of the following:

1) Loss of full extension;

2) Measurable side-to-side ROM asymmetry;

3) Pain-limited range of motion affecting functional activities;

4) Reduced flexion;

*A physical therapy program (including telehealth-based rehabilitation when appropriate) must be provided by a physical therapist or chiropractor for at least 6 weeks in the past 6 months and must attempt a full-joint extension.

OR

2. Individuals aged 26-40 years must meet **all** the following criteria:
    a. Weight-bearing radiographs do not demonstrate advanced degenerative joint disease (Kellgren-Lawrence grade III or IV);
    b. The individual reports symptomatic instability resulting in recurrent giving-way episodes, pivoting limitations, safety concerns, or impairment of daily activities, occupational demands, athletic participation, or other desired functional activities;
    c. ACL rupture confirmed by **all** the following:
        i. MRI performed within the previous 6 to 12 months;
        ii. Physical examination demonstrates objective anterior instability, including **one (1)** or more of the following:
            a) Positive anterior drawer test with increased anterior tibial translation compared with the uninvolved knee;
            b) Positive Lachman examination with increased tibial translation and a diminished, soft, or absent endpoint; **or**
            c) Positive pivot-shift examination;

OR

3. Individuals 40 years of age or greater must meet **all** the following criteria:
    a. Weight-bearing radiographs do not demonstrate advanced degenerative joint disease (Kellgren-Lawrence grade III or IV);
    b. The individual reports symptomatic instability resulting in recurrent giving-way episodes, pivoting limitations, safety concerns, or impairment of daily activities, occupational demands, athletic participation, or other desired functional activities;
    c. ACL rupture confirmed by MRI within the last 6 to 12 months.

<u>Multiple Ligament Reconstruction</u>

XVI. Reconstruction or repair of multiple knee ligaments is **medically necessary** when **BOTH** the following are met:
    A. The presence of at least **two (2)** of the following:
        1. Weight-bearing difficulty or the need for protective bracing due to pain or instability;
        2. Functional impairment affecting activities of daily living, occupational activities, **or** athletic participation;
        3. Instability, including recurrent giving-way, buckling, or rotational instability;
        4. Localized joint-line tenderness or pain consistent with ligamentous or meniscal injury;
        5. Symptoms such as catching, locking, or painful clicking; or

6. Joint swelling or effusion following the injury; **and**

B. Documentation confirms injury involving **two or more** major stabilizing ligaments of the knee, as demonstrated by **either** of the following:

1. MRI; **or**
2. Physical examination is consistent with multiligamentous* instability.

*Multiligament knee injuries do not require prior conservative management, as these injuries are characteristically unstable and are unlikely to be adequately managed with physical therapy, bracing, or other nonoperative treatments alone.

Posterior Cruciate Ligament (PCL) Reconstruction

XVII. Posterior cruciate ligament (PCL) reconstruction is **medically necessary** when **ALL** the following are met:

A. Weight-bearing radiographs do not demonstrate moderate-to-severe osteoarthritis (Kellgren-Lawrence grade III or IV);

B. MRI obtained within the previous 3 to 6 months demonstrates a near-complete or complete PCL tear;

C. Reported knee instability, weakness, or episodes of giving-way;

D. Objective physical examination is consistent with PCL insufficiency, including **any** of the following:

1. Positive posterior drawer examination;
2. Reverse pivot-shift test;
3. Positive quadriceps active test;
4. Posterior sag sign; **or**
5. Tibial drop-back sign;
6. Conservative management must include **all** of the following:
   a. Physical Therapy (PT) meets **all** the following:
      i. Supervised by a licensed PT, chiropractor, or through tele-rehab PT;
      ii. Participation for a minimum of 6 weeks during the previous 6 months; **and**
      iii. Failure to improve symptoms or functional impairments;
   b. Pain management includes **any** of the following:
      i. Nonpharmacologic management including activity modification, protected weight-bearing, brace, or orthotic use; **or**
      ii. Medication management (e.g., NSAIDS or analgesics);

Lateral Collateral Ligament (LCL) or Medial Collateral Ligament (MCL) Repair/Reconstruction

Isolated repair or reconstruction of the lateral collateral ligament (LCL) or medial collateral ligament (MCL) is uncommon and is generally performed in conjunction with treatment of additional ligamentous injuries.

Requests for collateral ligament repair or reconstruction in the absence of an acute traumatic injury will be assessed individually based on the clinical circumstances.

Arthroscopic Meniscectomy or Meniscal Repair

XVIII. Arthroscopic meniscectomy is **medically necessary** when **ALL** the following are met:

A. Weight-bearing radiographs do not demonstrate advanced osteoarthritis (Kellgren-Lawrence grade IV);

B. **One (1)** of the following clinical scenarios is present:

1. Individual is younger than 18 years of age;
    a. MRI confirms a meniscal tear; and
    b. Physical examination is consistent with meniscal pathology;

C. Repairable tear pattern, when **all** the following are met:

1. MRI demonstrates **any** of the following:
    a. Meniscal root tear;
    b. Peripheral tear involving the vascular zone; **or**
    c. Other repairable meniscal tear;
2. Pain localizes to the involved compartment on physical examination;
3. Bucket-handle tear, when **all** the following are met:
    a. MRI confirms a bucket-handle meniscal tear;
    b. Acute traumatic injury with a locked knee; **and**
    c. Examination demonstrates meniscal findings or loss of terminal extension;
4. Symptomatic meniscal tear after unsuccessful conservative management:
    a. Physical examination is consistent with a meniscal tear;
    b. Clinical findings include **ONE (1)** or more:
        i. Joint-line pain with forced hyperextension;
        ii. Joint-line pain with maximal flexion; or
        iii. Catching or locking symptoms;

D. Conservative management must include **all** of the following:

a. Physical Therapy (PT) meets **all** the following:
   i. Supervised by a licensed PT, chiropractor, or through tele-rehab PT;
   ii. Participation for a minimum of 6 weeks during the previous 6 months; **and**
   iii. Failure to improve symptoms or functional impairments;
b. Pain management includes **any** of the following:
   i. Nonpharmacologic management including activity modification, protected weight-bearing, brace, or orthotic use; **or**
   ii. Intra-articular corticosteroid injection;
   iii. Medication management (e.g., NSAIDS or analgesics); **and**

E. Imaging performed within the previous 3 to 6 months demonstrates **either:**
1. Mild, minimal, or no arthritic change on weight-bearing radiographs; **or**
2. MRI-confirmed meniscal tear with mild or absent degenerative findings and **all** the following:
   a. No full-thickness cartilage loss;
   b. No moderate or severe cartilage thinning;
   c. No meniscal extrusion;
   d. No greater than mild osteophyte formation; **and**
   e. No subchondral cystic change or bone edema.

XIX. Arthroscopic meniscal repair is **medically necessary** when **ALL** the following are met:

A. Weight-bearing radiographs do not demonstrate advanced osteoarthritis (Kellgren-Lawrence grade III or IV);
B. **All** age-based criteria are met:
1. Individual younger than eighteen (18) years:
   a. MRI demonstrates a meniscal tear with physical examination supporting meniscal pathology; including **any** of the following:
      i. Meniscal root tear;
      ii. Peripheral tear involving the vascular zone;
      iii. Other repairable meniscal tear and compartment-specific pain is present on examination; **or**
2. Individual is 19-40 years:
   a. Examination demonstrates **one (1)** or more:

i. Joint-line pain with hyperextension;
ii. Joint-line pain with maximal flexion;
iii. Catching or locking symptoms;

b. Imaging performed within the previous 3 to 6 months demonstrates **either:**
i. Mild, minimal, or no arthritic change on weight-bearing radiographs; **or**
ii. MRI-confirmed meniscal tear with mild or absent degenerative findings and **all** the following:
a) No full-thickness cartilage loss;
b) No moderate or severe cartilage thinning;
c) No meniscal extrusion;
d) No greater than mild osteophyte formation;
e) No subchondral cystic change or bone edema; **or**

3. Individual is 41 years of age or older:
a. Examination demonstrates **one (1)** or more:
i. Joint-line pain with hyperextension;
ii. Joint-line pain with maximal flexion; **or**
iii. Catching or locking symptoms;
b. Imaging requirements outlined above are satisfied;
c. Conservative management meets **either** of the following:
i. Conservative management is not required when **any** of the following is documented:
a) Acute traumatic unstable meniscal tear with mechanical symptoms;
b) Displaced bucket-handle tear;
c) Extension block or inability to fully extend the knee;
d) Obstructing meniscal fragment producing loss of motion;
e) True mechanical locking of the knee; **or**
ii. For all other indications, conservative management must include **all** of the following:
a) Physical Therapy (PT) meets **all** the following:
1) Supervised by a licensed PT, chiropractor, or through tele-rehab PT;
2) Participation for a minimum of 6 weeks during the previous 6 months;

3) Failure to improve symptoms or functional impairments; **and**

b) Pain management includes **any** of the following:

1) Nonpharmacologic management including activity modification, protected weight-bearing, brace, or orthotic use; **or**

2) Intra-articular corticosteroid injection;

3) Medication management (e.g., NSAIDS or analgesics).

XX. Arthroscopic meniscectomy or meniscal repair is **contraindicated** when **ANY** of the following are present:

A. Intra-articular corticosteroid injection administered within four weeks prior to the planned procedure;

B. Advanced osteoarthritis including **either**:

1. Kellgren-Lawrence grade IV osteoarthritis when meniscectomy is requested; **or**

2. Kellgren-Lawrence grade III or IV osteoarthritis when meniscal repair is requested;

C. Degenerative, non-traumatic meniscal pathology when partial meniscectomy is proposed.

<u>Meniscal Allograft Transplantation</u>

XXI. Meniscal allograft transplantation is **medically necessary** when **ALL** the following are met:

A. BMI is less than 40kg/m²;

B. Individual is less than 40 years of age and is skeletally mature;

C. Weight-bearing radiographs do not demonstrate **either** of the following:

1. Moderate-to-severe articular degeneration corresponding to Modified Outerbridge grade III or IV; **or**

2. Moderate-to-severe osteoarthritis (Kellgren-Lawrence grade III or IV);

D. Lower extremity alignment demonstrates no significant varus or valgus deformity;

E. Conservative management must include **all** of the following:

1. Non-steroidal anti-inflammatory drugs (NSAIDS) or analgesics;

2. Physical Therapy (PT) meets **all** the following:

a. Supervised by a licensed PT, chiropractor, or through tele-rehab PT;

b. Participation for a minimum of 6 weeks during the previous 6 months; **and**

c. Failure to improve symptoms or functional impairments;

3. Pain management includes **at least one (1)** of the following:

a. Nonpharmacologic management including activity modification, protected weight-

bearing, brace, or orthotic use; **or**

b. Intra-articular corticosteroid injection;

F. Ligamentous stability has been established before transplantation or will be addressed concurrently;

G. MRI demonstrates a meniscal-deficient compartment or prior diagnostic evaluation confirms subtotal or total meniscectomy.

XXII. Meniscal Allograft Transplantation is **not medically necessary** for **ANY** of the following:

A. Intra-articular corticosteroid injection within 4 weeks of the proposed procedure; or

B. **Any** of the following conditions, which have not been corrected, either before or in conjunction with the planned procedure:

1. Full-thickness articular cartilage defects, including advanced focal chondral lesions (e.g., International Cartilage Repair Society Grade III or IV or Outerbridge Grade IV);
2. Ligamentous insufficiency resulting in joint instability;
3. Coronal plane malalignment greater than 5 degrees of varus or valgus; **or**
4. Severe osteoarthritis (Kellgren-Lawrence grade IV).

<u>Patellar Realignment</u>

XXIII. Patellar realignment is **medically necessary** when documentation supports **ONE (1)** of the following:

A. Symptomatic patellar maltracking or malalignment and **all** the following:

1. Imaging demonstrates abnormal patellofemoral alignment or patellar maltracking;
2. Imaging does not identify an associated fracture or intra-articular loose body;
3. Physical examination demonstrates **both**:
   a. Patellofemoral pain; **and**
   b. Patellar instability findings, including apprehension or a positive J-sign;

B. Conservative management must include **all** of the following:

1. Physical Therapy (PT) meets all the following:
   a. Supervised by a licensed PT, chiropractor, or through tele-rehab PT;
   b. Participation for a minimum of 3 months during the previous 6 months; **and**
   c. Failure to improve symptoms or functional impairments;
2. Pain management includes **at least one (1)** of the following:
   a. Nonpharmacologic management including activity modification, protected weight-bearing, brace, or orthotic use;

b. Intra-articular corticosteroid injection; **or**

c. Medication management (e.g., NSAIDS or analgesics);

C. Recurrent patellar instability and **both** of the following:

1. **Two (2)** or more documented patellar dislocations or subluxation events; **and**
2. **Either** of the following are met:
   a. Imaging demonstrates medial patellofemoral ligament insufficiency; **or**
   b. Physical examination confirms patellar instability with a positive apprehension test;

D. Acute traumatic patellar dislocation with associated structural injury demonstrated on imaging, including **one (1)** or more of the following:

1. Intra-articular fracture;
2. Osteochondral fracture; **or**
3. Loose body.

XXIV. Lateral retinacular release is **medically necessary** for **EITHER** of the following:

A. Diagnostic imaging demonstrates confirms patellar tilt and physical examination identifies isolated patellofemoral pain that is reproduced with patellar tilt testing; **or**

B. Symptomatic lateral patellofemoral cartilage pathology and **all** the following are met:

1. Weight-bearing radiographs show no evidence of moderate-to-severe osteoarthritis (Kellgren-Lawrence grade III or IV);
2. Imaging findings or intraoperative assessment confirm a cartilage lesion involving the lateral trochlear surface of the femur or the lateral patellar facet;
3. Conservative management must include **all** of the following:
   a. Physical Therapy (PT) meets **all** the following:
      i. Supervised by a licensed PT, chiropractor, or through tele-rehab PT;
      ii. Participation for a minimum of 6 weeks during the previous 6 months; **and**
      iii. Failure to improve symptoms or functional impairments; and
   b. Pain management includes **at least one (1)** of the following:
      i. Nonpharmacologic management including activity modification, protected weight-bearing, brace, or orthotic use;
      ii. Intra-articular corticosteroid injection; **or**
      iii. Medication management (e.g., NSAIDS or analgesics).

<u>Knee Lysis of Adhesions</u>

XXV. Knee arthroscopy with lysis of adhesions is **medically necessary** when **EITHER** of the following is met:

A. Post-surgical stiffness following ligament reconstruction or knee joint reconstruction, and **all** the following:
   1. At least 12 weeks have elapsed since the prior procedure;
   2. Physical examination demonstrates **either**:
      a. Knee flexion is less than 105 degrees; **or**
      b. Flexion contracture greater than 10 degrees;
   3. A physical therapy program (including telehealth-based rehabilitation when appropriate) provided by a physical therapist or chiropractor has been completed for at least 6 weeks within the 6 months without meaningful improvement in symptoms or function'

B. Arthrofibrosis associated with prior knee trauma or resolved knee infection, and **both** of the following:
   1. At least 12 weeks have passed since the traumatic event or resolution of infection; **and**
   2. Manipulation under anesthesia is planned in conjunction with the lysis of adhesions procedure.

<u>Manipulation Under Anesthesia (MUA)</u>

XXVI. Manipulation under anesthesia of the knee is **medically necessary** when **ALL** the following criteria are met:

A. Conservative management must include **all** of the following:
   1. Physical Therapy (PT) meets **all** the following:
      a. Supervised by a licensed PT, chiropractor, or through tele-rehab PT;
      b. Participation for a minimum of 6 weeks during the previous 6 months;
      c. Failure to improve symptoms or functional impairments; **and**
   2. Pain management includes **at least ONE (1)** of the following:
      a. Nonpharmacologic management including activity modification, protected weight-bearing, brace, or orthotic use;
      b. Medication management (e.g.,NSAIDS) or analgesics; **and**

B. Diagnostic evaluation performed within the previous 3 to 6 months includes **both** the following:
   1. Computed tomography (CT) imaging;
   2. Knee radiographs confirming **both**:

a. Intact surgical hardware when present; **and**

b. Absence of a mechanical cause for restricted motion (e.g., component malposition or fracture); **and**

C. Clinical findings demonstrate **all** the following:

1. Flexion contracture greater than ten (10) degrees;
2. Knee flexion less than 90 degrees; **and**
3. Pain and stiffness has resulted in functional impairment and interferes with activities of daily living.

Restorative Cartilage Procedures of the Knee

Restorative cartilage procedures include osteochondral autograft transfer, osteochondral allograft transplantation, autologous chondrocyte implantation, mosaicplasty, microfracture, abrasion arthroplasty, subchondral drilling, or similar cartilage restoration techniques.

XXVII. Restorative cartilage procedures are **medically necessary** when documentation supports **EITHER** of the following:

A. Focal Chondral or Osteochondral Defect, when **all** the following are met:

1. Weight-bearing radiographs do not demonstrate moderate-to-severe osteoarthritis (Kellgren-Lawrence grade III or IV);
2. Individual is skeletally mature and younger than 50 years of age; requests for older individuals may be considered when activity demands and clinical circumstances support intervention;
3. Conservative management must include **all** of the following:
   a. Physical Therapy (PT) meets **all** the following:
      iv. Supervised by a licensed PT, chiropractor, or through tele-rehab PT;
      v. Participation for a minimum of 6 weeks during the previous 6 months;
      vi. Failure to improve symptoms or functional impairments; **and**
   b. Pain management includes **at least one (1)** of the following:
      vii. Nonpharmacologic management including activity modification, protected weight-bearing, brace, or orthotic use;
      viii. Intra-articular corticosteroid injection; **or**
      ix. Medication management (e.g., NSAIDS or analgesics); **and**
4. MRI confirms **one (1)** of the following:
   a. Full-thickness weight-bearing cartilage lesion measuring less than 2.5 cm^2;

b. Single full-thickness grade III or IV Outerbridge lesion measuring between 1.0 cm^2 and 2.0 cm^2 and involving only one articular surface; **or**

c. Full-thickness chondral or osteochondral lesion involving the femoral condyle or trochlea measuring less than 2.5 cm^2;

5. Localized knee pain has been present for at least 6 months and results in significant functional limitation;
6. Physical examination demonstrates restricted range of motion and/or mechanical symptoms including clicking, popping, catching, or locking;
7. Physical examination or imaging confirms **both**:
   a. ligamentous stability; **and**
   b. Intact meniscal integrity;

B. Patellofemoral Chondrosis, when **all** the following are met:
1. Examination demonstrates pain localized to the patellofemoral compartment;
2. Imaging demonstrates patellofemoral chondrosis classified as Outerbridge grade III or IV;
3. Weight-bearing radiographs do not demonstrate moderate-to-severe osteoarthritis (Kellgren-Lawrence grade III or IV);
4. Anterior knee pain results in functional impairment that interferes with activities of daily living;
5. Symptoms correlate with the documented patellofemoral chondral abnormality;
6. Conservative management must include **all** of the following:
   a. Physical Therapy (PT) meets **all** the following:
      i. Supervised by a licensed PT, chiropractor, or through tele-rehab PT;
      ii. Participation for a minimum of 6 weeks during the previous 6 months;
      iii. Failure to improve symptoms or functional impairments; **and**
   b. Pain management includes **at least ONE (1)** of the following:
      i. Nonpharmacologic management including activity modification, protected weight-bearing, brace, or orthotic use;
      ii. Intra-articular corticosteroid injection; **or**
      iii. Medication management (e.g., NSAIDS or analgesics).

DESCRIPTION

Several factors increase the risk of developing knee osteoarthritis, including advanced age, increased body weight, bone density abnormalities, meniscal derangement, sex, and prior trauma. Individuals with knee osteoarthritis commonly experience pain and functional limitations that may interfere with ambulation, activities of daily living, or the ability to work. Imaging may demonstrate the severity of disease through findings such as joint space narrowing, osteophyte formation, subchondral sclerosis, or exposed bone.

The Kellgren-Lawrence Grading System is a radiographic grading system that has been developed for describing osteoarthritic changes to the knee. When used, the radiographic findings are typically reported within one of the following categories:

- Grade 0 – No radiographic features of osteoarthritis are present;
- Grade I – Doubtful narrowing of joint space and possible osteophytic lipping;
- Grade II – Definite osteophytes and possible narrowing of joint space;
- Grade III – Moderate multiple osteophytes, definite narrowing of joint space, some sclerosis, and possible deformity of bone contour;
- Grade IV – Large osteophytes, marked narrowing of joint space, severe sclerosis, and definite deformity of bone contour.

Modified Outerbridge Classification is a system that has been developed for judging articular cartilage injury to the knee. This system allows delineation of varying areas of chondral pathology, based on the qualitative appearance of the cartilage surface as viewed on MRI, and can assist in identifying those injuries that are suitable for repair techniques. The characterization of cartilage in this system is as follows:

- Grade I – softening with swelling;
- Grade II – fragmentation and fissuring less than one square centimeter (1 cm2);
- Grade III – fragmentation and fissuring greater than one square centimeter (1 cm2);
- Grade IV – subchondral bone exposed.

Initial management typically consists of conservative treatment, which may include physical therapy, exercise, weight loss, nonsteroidal anti-inflammatory medications, and intra-articular injections. These treatments are generally attempted before surgical intervention is considered, except in circumstances such as significant trauma where conservative treatment would not be expected to provide meaningful benefit.

Knee arthroplasty, also known as knee replacement, is a commonly performed orthopedic procedure

in which damaged portions of the knee joint are resurfaced and replaced with prosthetic components made of materials such as metal, plastic, or ceramic. The procedure is most commonly performed for advanced osteoarthritis but may also be indicated for inflammatory arthritis or osteonecrosis with secondary arthritis when symptoms and functional impairment warrant surgical intervention. Potential complications of knee arthroplasty include infection, pulmonary embolism, deep vein thrombosis, nerve injury, and the need for subsequent revision surgery.

Arthroscopy and Associated Procedures

Damage to the articular cartilage or menisci of the knee may develop over time or result from an acute injury. Individuals with these conditions may experience pain, swelling, catching, or locking, which can limit the ability to fully extend the knee and interfere with activities of daily living.

When surgical treatment is indicated, knee arthroscopy is a minimally invasive procedure that may be performed to evaluate and treat the affected structures. During the procedure, the surgeon makes small incisions and inserts a fiber-optic camera through one incision and surgical instruments through another to repair or remove torn or frayed tissue or loose fragments.

Because arthroscopic surgery is not without risk, conservative treatment is generally recommended as first-line therapy and may include supervised physical therapy, activity modification, nonsteroidal anti-inflammatory drugs (NSAIDs) or other analgesics for pain management, and intra-articular injections. Recommended durations of conservative therapy vary among published sources, generally ranging from four to 12 weeks depending on the specific procedure and clinical indication. Arthroscopy most commonly involves debridement and meniscectomy, though chondroplasty, loose body removal, and ligament reconstruction are also performed.

Ligament Reconstruction and Repair

The knee has four main cruciate ligament complexes that respond to the loads and forces placed upon them by body weight, ground reaction, and external trauma. The anterior cruciate ligament (ACL), medial collateral ligament (MCL), posterior cruciate ligament (PCL) and posterolateral corner (PLC). The ACL and PCL help with anteroposterior stability, which resists the forward and backward displacement of the tibia. The MCL is the primary restraint against valgus rotation ("knock-kneed" alignment), and the PLC is a complex of ligaments that resists varus ("bow-legged" alignment). Injuries involving multiple ligaments do not require prior conservative management.

Meniscal procedures

The meniscus is a set (one medial, one lateral) of fibrocartilage pads that help to distribute and absorb the loads and forces placed upon the knee, while reducing contact stress on the articular cartilage, additionally stabilizing the joint. Conservative treatment is preferred over surgery in the setting of most meniscal tears. Partial meniscectomy is the removal of torn pieces of mensicus related to non-traumatic pathology. Partial arthroscopic meniscectomy has been associated with future osteoarthritis risk and high rates of knee replacement.

Patellofemoral Realignment Procedures

The patella (kneecap) normally rides up and down within a shallow groove at the end of the thigh

bone. Several things can disrupt this smooth tracking:

- The patella is pulled too far to one side.
- The patella sits too high in the groove.
- The groove itself is too flat or shallow.

When tracking is disrupted, the kneecap can rub, cause pain, or dislocate, and the cartilage behind the kneecap can wear down, adding to the pain.

Realignment procedures are designed to correct whichever problem is present, tightening or reconstructing the ligaments that hold the kneecap in place, reshaping a groove that is too flat, or relocating the bony bump (tubercle) just below the kneecap to change its pull. Malalignment is confirmed by imaging. A lateral retinacular release is a procedure to divide tissue on the lateral side of the patella to relieve excessive lateral tilt and pressure. These operations are considered for symptomatic individuals only after physical therapy, bracing, and other conservative treatments have failed.

After surgery, trauma, infection, or prolonged immobilization, the knee can develop adhesions-arthrofibrosis, that mechanically limits motion. When conservative management such as physical therapy and bracing fails to restore adequate function and near-full extension, surgery is considered.

Surgeons arthroscopically release and remove these adhesions using shavers, radiofrequency or ablation devices, and cutting tools. Manipulation of the joint under anesthesia commonly follows the release to further improve range of motion, particularly flexion.

Restorative Cartilage procedures

Osteochondral autografting and allografting are used for full-thickness cartilage defects of weight-bearing surfaces caused by trauma or by conditions such as osteochondritis dissecans. The goal is to restore the cartilage surface along with its supporting bone, improving joint function and reducing pain. The surgeon harvests one or more plugs of cartilage and bone from the patient's own non-/less-weight-bearing surfaces (autograft) or from a donor joint (fresh or cryopreserved allograft). The base of the defect is abraded or curetted down to subchondral bone, and the graft is press-fit into place.

Mosaicplasty (osteochondral autograft transfer, or OATS) harvests cylindrical bone-cartilage plugs from the patient's own knee and transplants them into a focal defect. After the lesion is excised and the base refreshed, grafts are taken from low-weight-bearing areas such as the intercondylar notch or trochlear margins, and a recipient tunnel is created and sized. The plug is seated by press-fit; when several are used, they are arranged side by side in a mosaic pattern to resurface the area. Autograft is best suited to smaller lesions (generally <2–4 cm^2) because of limited donor tissue.

Osteochondral allograft transplantation (OCA) is conceptually similar but uses donor (cadaver) tissue, often as a single larger plug that fills the entire defect. Because there is no donor-site limitation, OCA is favored for larger lesions (>2 cm^2). For optimal cartilage restoration, any associated instability (e.g., ligament deficiency), malalignment, or meniscal loss should be corrected at the same time.

Autologous chondrocyte implantation (ACI) treats deep, larger (typically >2–4 cm^2) full-thickness defects in two stages: cartilage cells (chondrocytes) are first harvested arthroscopically and expanded in culture, then implanted into the defect at a second operation, where they regenerate a cartilage-like surface. ACI is generally reserved for larger lesions in higher-demand patients.

These restoration techniques are reserved for symptomatic, skeletally mature patients with imaging-confirmed focal chondral or osteochondral defects and maintained (or concurrently restored) ligament stability, including those with patellofemoral chondrosis.

SUPPORTIVE LITERATURE

Knee Arthroplasty

Total knee arthroplasty (TKA) is an effective surgical treatment for appropriately selected patients with symptomatic moderate-to-severe knee osteoarthritis. Randomized controlled evidence has demonstrated greater improvements in pain and physical function following TKA combined with nonsurgical treatment compared with comprehensive nonsurgical treatment alone, with benefits evaluated through two years of follow-up (Skou et al., 2015, 2017).

Knee Arthroscopy and Associated Procedures

A 2019 Cochrane systematic review by Palmer et al. evaluated the benefits and harms of surgical interventions for symptomatic mild-to-moderate knee osteoarthritis. The review included individuals with knee pain and imaging evidence of Kellgren-Lawrence grade 1, 2, or 3 osteoarthritis. Outcomes assessed included pain, function, radiographic progression, quality of life (QOL), short-term serious adverse events, reoperation rates, and withdrawals due to adverse events.

Five randomized controlled trials involving 566 participants compared surgical with non-surgical interventions. One U.S. study involving 320 participants compared arthroscopic partial meniscectomy (APM) followed by physical therapy, consisting of home-based exercises, with physical therapy (PT) alone. This was the primary comparison reported in the review. A second U.S. study involving 32 participants compared arthroscopic surgery, including debridement with or without synovectomy or chondroplasty, with closed-needle joint lavage using saline. Two studies involving 152 participants, including 120 from Pakistan and 32 from the United Kingdom, compared arthroscopic surgery, consisting of washout with or without debridement, with hyaluronic acid injection. One study involving 62 participants from the Netherlands compared high tibial osteotomy with knee joint distraction surgery. Compared with non-surgical treatment, surgery was associated with a 0.2% reduction in pain, a 0.8% improvement in function, and a 1% increase in serious adverse events. Five participants in the surgical group subsequently underwent total knee replacement. Progression of osteoarthritis and quality of life were not measured. The quality of evidence was rated as low because of limitations in study design and small sample sizes. The authors concluded that there may be little difference between APM and a home exercise program for the treatment of mild-to-moderate knee osteoarthritis.

A second Cochrane systematic review, published by O'Connor et al. in 2022, evaluated the benefits and harms of arthroscopic surgery compared with placebo surgery or non-surgical treatment for

degenerative knee disease, including osteoarthritis and degenerative meniscal tears. Sixteen randomized or quasi-randomized controlled trials met the inclusion criteria. Four trials involving 380 participants compared arthroscopic surgery with placebo surgery. In the remaining trials, arthroscopic surgery was compared with exercise (eight trials; 1,371 participants), a single intra-articular glucocorticoid injection (one trial; 120 participants), non-arthroscopic lavage (one trial; 34 participants), nonsteroidal anti-inflammatory drugs (one trial; 80 participants), or weekly hyaluronic acid injections for five weeks (one trial; 120 participants).

Most trials without a placebo control were susceptible to bias, including selection bias (56%), performance bias (75%), detection bias (75%), attrition bias (44%), and selective reporting bias (75%). The placebo-controlled trials were less susceptible to bias, with none considered at risk for performance or detection bias. The primary findings focused on the comparison between arthroscopic and placebo surgery. At three months, participants who underwent arthroscopic surgery had improvements of 4.6 points in pain, 0.1 points in knee function, and 5.6 points in quality of life compared with placebo surgery, based on 0-to-100-point scales. At five years, 8% more participants who underwent arthroscopic surgery rated their treatment as successful compared with those who underwent placebo surgery. Serious adverse events were 2% more frequent among participants who underwent arthroscopic surgery. The authors concluded that knee arthroscopy does not provide clinically important benefits in pain or function for degenerative knee disease. However, the certainty of evidence for some outcomes was limited by heterogeneity among trials and the small number of events.

Ligament Reconstruction and Repair

Evidence supporting best practices for ACL injury is evolving and that which is available today is of low-quality. Clinical decision making is based on recommendations from international consensus groups (Diermeier et al 2020), and professional society guidelines.

Meniscal Procedures

Migliorini et al (2023) conducted a meta-analysis comparing outcomes of meniscal repair and meniscal resection in patients with symptomatic meniscal tears. The analysis included 20 comparative studies, consisting of 16 retrospective studies and four prospective clinical investigations, representing 31,783 patients. Studies evaluating all types of meniscal repairs and tears were eligible, regardless of surgical technique, tear etiology, or prior conservative treatment, provided that follow-up was at least 12 months. The mean patient age was 37.6 ± 14.0 years, mean BMI was 28.3 ± 3.2 kg/m², and the mean interval from injury to surgery was 12.1 ± 10.2 months. No randomized controlled trials were included, resulting in an overall moderate-to-high risk of bias. At a mean follow-up of 6 years, meniscal repair was associated with a lower rate of knee osteoarthritis compared with partial meniscectomy; however, no significant differences were observed in patient-reported outcome measures, medial joint space width, or treatment failure rates.

Patellofemoral Realignment Procedures

Straume-Naesheim and colleagues (2026) reported three-year outcomes from a previously conducted randomized controlled trial (Erickson et al 2019) that compared recurrent instability in patients with

recurrent lateral patellar dislocation without significant underlying anatomic risk factors who underwent medial patellofemoral ligament reconstruction (MPFL-R) (n=30) with those who received active rehabilitation alone (n=31). Individuals aged 12 to 30 years were eligible if they did not have severe trochlear dysplasia and had a tibial tuberosity-trochlear groove distance of ≤20 mm on computed tomography (CT). Participants were randomized to undergo knee arthroscopy with isolated MPFL-R followed by active rehabilitation (MPFL group) or knee arthroscopy without reconstruction followed by active rehabilitation (control group). At three years, outcomes included subjective persistent patellar instability and patient-reported outcome measures (PROMs), including the Knee injury and Osteoarthritis Outcome Score (KOOS), Kujala Knee Score, Cincinnati Knee Rating System, and Noyes Sports Activity Rating Scale. Persistent subjective patellar instability was reported by 5 patients in the MPFL group (16.7%) compared with 15 patients in the control group (53.6%), corresponding to an odds ratio of 5.8 (95% CI, 1.7-19.4; P=.003). Both groups demonstrated improvement during the first year of follow-up and significant improvements from baseline to three years across all PROMs. However, no statistically significant differences in PROM scores were observed between the groups at any follow-up time point.

The authors identified several study limitations, including the study methodology, small sample size, lack of questions specifically addressing persistent instability within the PROM instruments, and the single-center design using a single MPFL reconstruction technique.

Motion Restoration Procedures

Reddy and colleagues (2024) conducted a systematic review to characterize the treatment strategies and reported outcomes for arthrofibrosis following knee arthroscopy or anterior cruciate ligament reconstruction (ACLR), including differences between pediatric and adult populations. Of 1,208 articles identified, 42 studies met the eligibility criteria, including 29 (69.0%) involving adults and 13 (31.0%) involving pediatric patients. Manipulation under anesthesia (MUA), lysis of adhesions (LOA), or a combination of these procedures was evaluated in 39 studies (92.8%), while two studies (4.8%) evaluated pharmacologic treatment. Interpretation of the findings was limited by substantial variability in the definitions and diagnostic criteria used for knee arthrofibrosis. In addition, the review did not address arthrofibrosis resulting from other etiologies, including trauma or multiligamentous knee injury. Overall, MUA and/or LOA were the most frequently reported treatment strategies for arthrofibrosis following knee arthroscopy or ACLR.

Cartilage Restoration Techniques

Evidence is sufficient to consider osteochondral allografting medically appropriate as a technique to repair large (e.g., 10 cm2), full-thickness chondral defects of the knee caused by acute or repetitive trauma.

Several systematic reviews of randomized controlled trials (RCTs) have evaluated autologous osteochondral transplantation for cartilage repair of the knee in the short- and mid-term. When compared with abrasion techniques (e.g., microfracture, drilling), there is evidence that autologous osteochondral transplantation decreases failure rates and improves outcomes in patients with medium-size lesions (e.g., 2-6 cm^2) when measured at longer follow-up. This is believed to be due to

the improved durability of the natural hyaline cartilage compared with the fibrocartilage that is obtained with abrasion techniques. Factors shown to affect success in observational studies are male sex, younger age, and lesions smaller than 3 cm^2. Thus, there is a relatively narrow range of lesion size for which autologous osteochondral transplantation is most effective. In addition, the best results have been observed with lesions on the femoral condyles, although treatment of trochlea and patella lesions also improves outcomes. Correction of malalignment is important for the success of the procedure.

Zamborsky and colleagues (2020) completed a systematic review and network meta-analysis that evaluated the most appropriate surgical interventions for patients with knee articular cartilage defects. A total of 21 articles (from 12 RCTs) were analyzed with a total population of 891 patients. Follow-up varied widely among the included studies, ranging from 12 months to 15 years. Of the surgical interventions evaluated, microfracture was associated with significantly higher failure rates compared to autologous chondrocyte implantation at 10 years of follow-up. No significant differences in failure rates were seen between microfracture and osteochondral autograft transplantation, matrix-induced autologous chondrocyte implantation, or characterized chondrocyte implantation at 2, 5, and 10 years of follow-up. Osteochondral autograft transplantation was associated with significantly more excellent or good results at >3 years of follow-up as compared to microfracture, whereas microfracture was associated with significantly poorer results as compared to autologous chondrocyte implantation and matrix-induced autologous chondrocyte implantation. No significant differences between the interventions were noted regarding reintervention, biopsy types, or adverse events. Based on efficacy and safety, autologous chondrocyte implantation was ranked as the best intervention for failure outcome at 10 years of follow-up, followed by osteochondral autograft transplantation, then microfracture. Microfracture was consistently ranked worse than cartilage repair techniques for other outcomes including quality of tissue repair and return-to-activity rates.

There is sufficient data published in the peer-reviewed literature to conclude that autologous chondrocyte transplantation results in relief of symptoms and improved function in patients who had failed conservative management and arthroscopic or other surgical treatments. Several studies include reports of histological examinations of the graft site showing stable hyaline cartilage after surgery.

Migliorini and colleagues conducted a systematic review of the literature in 2022 to evaluate the safety and efficacy of ACI for chondral defects of the knee in skeletally immature patients. A total of 9 studies (three prospective and six retrospective studies) representing 251 procedures were analyzed for patient reported outcome measures and complications. The mean age of the patients was 16.4 ±0.7 years, and the mean length of follow up was 44.2±29.4 months. Studies with follow up less than 12 months were not included in the review. Authors analyzed the KOOS score, Visual Analog Scale (VAS), Tegner Activity Scale, Lysholm Knee Score, and the International Knee Document Committee (IKDC) Score. Increases were identified in the KOOS (+41.9/100 [P=0.003]), IKCD (+33.2/100 [P=<0.0001]), and Lysholm (+20.6/100 [P=0.02]). The VAS score was reduced by 3.6/10 (P=0.004) points. There was no statistically significant improvement noted in the Tegner scale. Authors expressed concern with the rate of complications. More than 12% of patients demonstrated graft hypertrophy and 5.6% of procedures were considered failures. It is believed that

these numbers were underestimated given an unclear reporting of complications in several of the studies. Several other limitations of the studies were noted, including the lack of control groups creating a moderate risk of bias. There was also a limited sample size, and lack of quantitative data to conduct analyses. Further, there was a difference in the method of membrane application (suture versus fibrin glue) between studies which may have negatively impacted the results. Authors concluded that ACI of chondral defects in the knees of skeletally immature patients is effective in improving patient reported outcome measures, however the review was granted a level of evidence of III, noting that the safety profile of ACI in skeletally immature patients is controversial and requires further investigation.

PROFESSIONAL GUIDELINE(S)

The American Academy of Orthopaedic Surgeons (AAOS) has five knee-related clinical practice guidelines listed under its lower extremity quality programs:

Management of Acute Isolated Meniscal Pathology, 2024 [accessed 10/05/26]

Diagnosis and Treatment of Osteochondritis Dissecans, 2023 [accessed 10/05/26]

Management of Anterior Cruciate Ligament Injuries, 2022 [accessed 10/05/26]

Surgical Management of Osteoarthritis of the Knee, 2022 [accessed 10/05/26]

Management of Osteoarthritis of the Knee (Non-Arthroplasty), 2021[accessed 10/05/26]

In 2022, AAOS published evidence-based clinical practice guidelines on surgical management of osteoarthritis of the knee after a review of the clinical evidence available. Recommendations were defined as being "strong" if there was evidence from two or more high-quality studies, two or more moderate quality studies, or statements resulting in a strong or moderate strength following Evidence to Decision framework upgrading and/or downgrading.

The guidelines include the following as quality of evidence "high" and a "strong" strength of recommendation:

- There is no difference in postoperative functional scores between patients with a BMI <30 and obese patients (BMI 30-39.9); however, there may be increased risk of complications in morbidly obese patients (≥40), in particular, surgical site infections.
- Optimization of perioperative glucose control (<126mg/dl) after total knee arthroplasty should be attempted in diabetic and non-diabetic patients with HgbA1C <6.5, as hyperglycemia can lead to less favorable postoperative
- outcomes and higher complication rates.
- Evidence reports that there is no difference between patellar surfacing or non-patellar resurfacing in total knee arthroplasty
- Cruciate retaining (CR) and posterior stabilized (PS) total knee arthroplasty (TKA) designs have similarly efficacious/favorable postoperative outcomes.

- The practitioner should not use patient specific technology (e.g., guides, cutting blocks) because there is no significant difference in patient outcomes, function, or pain as compared to conventional total knee arthroplasty (TKA). Additionally, it does not reduce operating time, blood loss, length of stay, and/or complications.
- There is no difference in composite/functional outcomes or complications between kinematic or mechanical alignment principles in total knee arthroplasty.

The guidelines state the following as quality of evidence "high" and a "moderate" strength of recommendation:

- The practitioner can use unicompartmental arthroplasty vs total knee arthroplasty for patients with predominantly medial compartment osteoarthritis, as evidence reports improved patient reported and functional outcomes in the short term; however, long-term rates of revision in unicompartmental knee arthroplasty may be higher than total knee arthroplasty.
- There is no difference in outcomes, function, or pain between navigation and conventional techniques

The guidelines also provide "options" when there is little or no evidence on a particular topic. They state the following in regard to smoking cessation:

"Smoking cessation should be attempted before total knee arthroplasty, as a history of smoking may result in higher complications, lower functional scores, higher pain scores, and SSIs." (Quality of evidence: low, strength of option "consensus").

Cartilage Restoration Techniques

In 2017, The National Institute for Health and Care Excellence (NICE) published guidance on autologous chondrocyte implantation for treating symptomatic articular cartilage defects of the knee, recommending it be used as an option only if:

- The person has not had previous surgery to repair articular cartilage defects;
- There is minimal osteoarthritic damage to the knee (as assessed by clinicians experienced in investigating knee cartilage damage using a validated measure for knee osteoarthritis;
- The defect is over 2cm2;
- The procedure is done at a tertiary referral center.

In 2018, the National Institute for Health and Care Excellence (NICE) issued new guidance on mosaicplasty for symptomatic articular cartilage defects of the knee (IPG607). The guidance states that the evidence for the safety and efficacy of mosaicplasty for knee cartilage defects is adequate to support the use of the procedure.

In 2022, the American Society of Pain and Neuroscience (ASPN) published the Consensus Guidelines on Interventional Therapies for Knee Pain (STEP Guidelines) (Hunter 2022). These guidelines were developed by a multidisciplinary panel of experts, including specialists in pain management, anesthesiology, orthopedic surgery, and rehabilitation medicine. The guideline makes the following

recommendation statements:

- "Mosaicplasty is an effective long-term treatment option for patients 18–50 years old with hyaline cartilage lesions 2–5 cm2 (Level I, Grade A, Consensus Moderate)."
- OAT is an effective knee joint preservation technique (Level II, Grade C, Consensus Weak).

For larger lesions, autograft osteochondral harvesting carries a great of risk of morbidity and as such osteochondral allograft transplantation (OAT) has traditionally been used. Laboratory studies demonstrate superior chondrocyte viability with fresh allografts; however, good results and chondrocyte viability have still been demonstrated with frozen grafts implanted within 28 days from harvest."

REGULATORY STATUS

The U.S. Food and Drug Administration (FDA), through the Center for Devices and Radiological Health (CDRH), regulates medical devices used in orthopedic procedures, including certain implants, prostheses, fixation devices, surgical instruments, and other devices that may be used in knee surgery. Refer to the FDA regulations for orthopedic devices, 21 CFR Part 888. Available from: https://www.ecfr.gov/current/title-21/chapter-I/subchapter-H/part-888 [accessed 2026 Oct 6].

The FDA maintains information regarding medical device recalls and early alerts. Available from: https://www.fda.gov/medical-devices/medical-device-safety/medical-device-recalls-and-early-alerts [accessed 2026 Oct 6]

The FDA also regulates vaccines, blood and blood products, and biologics via the Center for Biologics Evaluation and Research (CBER) which ensures the safety, efficacy, and quality of these products. Refer to the FDA vaccines/blood/biologics website. Available from: https://www.fda.gov/vaccines-blood-biologics [accessed 2026 Oct 6]

Additionally, the FDA maintains information for consumers and health professionals on vaccine, blood and biologics warnings and other safety information. Available from: Recalls (Biologics) | FDA [accessed 2026 Oct 6]

Carticel received FDA approval in 1997 through a biologics license application for the culturing of chondrocytes. The approval restricted Carticel to use for the repair of symptomatic cartilaginous defects of the femoral condyle (medial, lateral, or trochlear), caused by acute or repetitive trauma in patients who have had an inadequate response to a prior arthroscopic or other surgical repair procedure. The product was phased out with the development of MACI.

In December 2016, the FDA approved MACI (autologous cultured chondrocytes on porcine collagen membrane) for the repair of symptomatic single or multiple full-thickness cartilage defects of the knee, with or without bone involvement, in adults. MACI is the first FDA-approved, cellularized, scaffold product that applies tissue engineering processes to grow cells on scaffolds using healthy cartilage tissue from the patient's own knee. The package insert includes the following contraindications: known history of hypersensitivity to gentamicin, other aminoglycosides, or products of porcine or bovine origin, severe osteoarthritis of the knee, inflammatory arthritis, inflammatory

joint disease, or uncorrected congenital blood coagulation disorders, prior knee surgery (within 6 months), excluding surgery to procure a biopsy or a concomitant procedure to prepare the knee for a MACI implant, inability to cooperate with a physician-prescribed post-surgical rehabilitation program.

CODE(S)

- Codes may not be covered under all circumstances.
- Code list may not be all inclusive (AMA and CMS code updates may occur more frequently than policy updates).
- (E/I)=Experimental/Investigational
- (NMN)=Not medically necessary/appropriate

CPT Codes

Code	Description
27310	Arthrotomy, knee, with exploration, drainage, or removal of foreign body (e.g., infection)
27332	Arthrotomy, with excision of semilunar cartilage (meniscectomy) knee; medial OR lateral
27333	Arthrotomy, with excision of semilunar cartilage (meniscectomy) knee; medial AND lateral
27334	Arthrotomy, with synovectomy, knee; anterior OR posterior
27340	Excision, prepatellar bursa
27365	Radical resection of tumor, femur or knee
27403	Arthrotomy with meniscus repair, knee
27405	Repair, primary, torn ligament and/or capsule, knee; collateral
27407	Repair, primary, torn ligament and/or capsule, knee; cruciate
27409	Repair, primary, torn ligament and/or capsule, knee; collateral and cruciate ligaments
27455	Osteotomy, proximal tibia, including fibular excision or osteotomy (includes correction of genu varus [bowleg] or genu valgus [knock-knee]); before epiphyseal closure
27466	Osteoplasty, femur; lengthening
27516	Closed treatment of distal femoral epiphyseal separation; without manipulation
27517	Closed treatment of distal femoral epiphyseal separation; with manipulation, with or without skin or skeletal traction

Code	Description
27519	Open treatment of distal femoral epiphyseal separation, includes internal fixation, when performed
27412	Autologous chondrocyte implantation, knee
27415	Osteochondral allograft, knee, open
27416	Osteochondral autograft(s), knee, open (e.g., mosaicplasty) (includes harvesting of autograft[s])
27418	Anterior tibial tubercleplasty (e.g., Maquet type procedure)
27420	Reconstruction of dislocating patella; (e.g., Hauser type procedure)
27422	Reconstruction of dislocating patella; with extensor realignment and/or muscle advancement or release (e.g., Campbell, Goldwaite type procedure)
27424	Reconstruction of dislocating patella; with patellectomy
27425	Lateral retinacular release, open
27427	Ligamentous reconstruction (augmentation), knee; extra-articular
27428	Ligamentous reconstruction (augmentation), knee; intra-articular (open)
27429	Ligamentous reconstruction (augmentation), knee; intra-articular (open) and extra-articular
27472	Repair, nonunion or malunion, femur, distal to head and neck; with iliac or other autogenous bone graft (includes obtaining graft)
27570	Manipulation of knee joint under general anesthesia (includes application of traction or other fixation devices)
29850	Arthroscopically aided treatment of intercondylar spine(s) and/or tuberosity fracture(s) of the knee, with or without manipulation; without internal or external fixation (includes arthroscopy)
29851	Arthroscopically aided treatment of intercondylar spine(s) and/or tuberosity fracture(s) of the knee, with or without manipulation; with internal or external fixation (includes arthroscopy)
29855	Arthroscopically aided treatment of tibial fracture, proximal (plateau); unicondylar, includes internal fixation, when performed (includes arthroscopy)
29856	Arthroscopically aided treatment of tibial fracture, proximal (plateau); bicondylar, includes internal fixation, when performed (includes arthroscopy)
29866	Arthroscopy, knee, surgical; osteochondral autograft(s) (e.g., mosaicplasty) (includes harvesting of the auto-graft[s])

Code	Description
29867	Arthroscopy, knee, surgical; osteochondral allograft (e.g., mosaicplasty)
29868	29868 Arthroscopy, knee, surgical; meniscal transplantation (includes arthrotomy for meniscal insertion), medial or lateral
29870	29870 Arthroscopy, knee, diagnostic, with or without synovial biopsy (separate procedure)
29873	Arthroscopy, knee, surgical; with lateral release
29874	Arthroscopy, knee, surgical; for removal of loose body or foreign body (eg, osteochondritis dissecans fragmentation, chondral fragmentation)
29875	Arthroscopy, knee, surgical; synovectomy, limited (eg, plica or shelf resection) (separate procedure)
29876	Arthroscopy, knee, surgical; synovectomy, major, 2 or more compartments (eg, medial or lateral)
29877	Arthroscopy, knee, surgical; debridement/shaving of articular cartilage (chondroplasty)
29879	Arthroscopy, knee, surgical; abrasion arthroplasty (includes chondroplasty where necessary) or multiple drilling or microfracture
29880	Arthroscopy, knee, surgical; with meniscectomy (medial AND lateral, including any meniscal shaving) including debridement/shaving of articular cartilage (chondroplasty), same or separate compartment(s), when performed
29881	Arthroscopy, knee, surgical; with meniscectomy (medial OR lateral, including any meniscal shaving) including
29882	Arthroscopy, knee, surgical; with meniscus repair (medial OR lateral)
29883	Arthroscopy, knee, surgical; with meniscus repair (medial AND lateral)
29884	Arthroscopy, knee, surgical; with lysis of adhesions, with or without manipulation (separate procedure)
29885	Arthroscopy, knee, surgical; drilling for osteochondritis dissecans with bone grafting, with or without internal fixation (including debridement of base of lesion)
29887	Arthroscopy, knee, surgical; drilling for intact osteochondritis dissecans lesion with internal fixation
29888	Arthroscopically aided anterior cruciate ligament repair/augmentation or reconstruction

Code	Description
29889	Arthroscopically aided posterior cruciate ligament repair/augmentation or reconstruction

Disclaimer Notice

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgment when deciding the most appropriate care to enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

Background

Leukocyte adhesion deficiency (LAD) syndromes are a group of rare disorders affecting the immune system and are characterized by defects affecting how leukocytes respond and migrate to wound or infection sites. There are three subtypes of this primary immunodeficiency disease: LAD I is caused by mutations of the *ITGB2* gene, LAD II is caused by mutations of the *SLC35C1* gene, and LAD III is a mutation in the gene for Kindlin 3. Severity and symptoms vary person to person however all affected individuals develop an increased susceptibility to developing recurrent bacterial and fungal infections. In infants, umbilical cord complications (delayed separation and omphalitis), impaired wound healing, and persistent Leukocytosis is common in LAD-I. Patients with severe cases of LAD-I express 2% of normal levels of CD18-expressing neutrophils.

Specifically addressing LAD-I, the estimated prevalence is one case per one million people and those afflicted with a severe form carry a significant mortality risk (> 60%) in those under two who do not receive a stem cell transplant. Hematopoietic Stem Cell Transplant is the only curative treatment for this condition and requires one to match with a donor.

Kresladi (marnetegragene autotemcel) is a gene therapy containing autologous hematopoietic stem cells that have been genetically modified with a lentiviral vector to deliver a functional copy of the ITGB2 gene (targeting those with LAD-I). Mechanistically, this therapy functions to deliver the gene encodes the beta-2 integrin component CD18, a key protein that facilitates leukocyte adhesion and enables extravasation from blood vessels to fight infection. In addition to stem cell collection, treatment with Kresladi requires myeloablative conditioning prior to infusion, as well as inpatient monitoring post infusion.

In its October 3, 2023 press release, Rocket Pharmaceuticals reported that in a Phase 1/2 Kresladi demonstrated 100% overall survival at 12 months post infusion (and for the entire duration of follow-up) for all nine patients with LAD-I with 12 to 24 months of available follow-up. These nine subjects were between five months and nine years of age. Results from the trial also showed large decreases compared with pre-treatment history in the incidences of significant infections, combined with evidence of resolution of disease-related skin lesions and restoration of wound repair capabilities. In a relative comparator, results from a 2021 multicenter, retrospective study of data collected from 84 patients with LAD-I and -III who received allogeneic HSCT between 2007 and 2017 demonstrated a three-year overall survival of 83%.

On March 26, 2026, the FDA granted accelerated approval to Kresladi. The safety and effectiveness of Kresladi were established in an open-label study in nine pediatric patients with molecularly confirmed *ITGB2*-associated, severe LAD-I. All of the patients received Kresladi as a single IV infusion at a median dose of 4.3×10^6 CD34+ cells/kg (range: 2.8 to 10×10^6 CD34+ cells/kg). Kresladi increased key biomarker (CD18 and CD11a) expression 12 months post-infusion, with sustained effects through 24 months post-infusion. All nine patients enrolled in the pivotal Kresladi study remained alive through 24 months of follow-up and continue to be followed post-approval.

Summary

Effective Date of Policy:	9/23/2026
Indications	Treatment of pediatric patients with severe leukocyte adhesion deficiency-I (LAD-I) due to biallelic variants in ITGB2 without an available human leukocyte antigen (HLA)-matched sibling donor for allogeneic hematopoietic stem cell transplant
ICD10 Diagnosis Codes	Subcode(s) of D72
HCPCS Code	J3590; No permanent code assigned yet
Availability	*See FDA Prescribing Information*
Duration	6 months to allow one-time administration

Required Criteria for Approval

1. Must be at least 3 months of age
2. Prescribed by or in consultation with an immunologist, hematologist, or prescriber that specializes in the treatment of leukocyte adhesion deficiency (LAD)
3. Enrollee has confirmed diagnosis of Severe LAD-I as demonstrated by:
    a. Molecular genetic testing revealing a characteristic mutation in the ITGB2 gene
    b. Flow cytometry indicating:
        i. CD18 expression on < 2% neutrophils (polymorphonuclear neutrophils (PMNs)) OR
        ii. CD18+ PMNs are > 2% with < 2% CD11a or CD11b expressing PMNs with documented ITGB2 mutation and clinical history consistent with LAD-I
4. Enrollee has clinical history supporting Severe LAD-I including:
    a. Recurrent, often severe, bacterial and/or fungal infections. These infections are most often involving skin and mucous membranes
    b. Absence of pus formation at the site of infection
    c. For neonates, delayed detachment of umbilical cord along with infection of umbilical cord stump
    d. Other indicative conditions include periodontitis and gingivitis
5. Must have documentation that the patient does not have a human leukocyte antigen (HLA)-identical related donor available for hematopoietic stem cell transplant
6. The patient must be eligible to undergo hematopoietic stem cell transplant (HSCT)
7. Patients with any of the following will not be eligible for coverage (documentation, including laboratory results [taken within the past 3 months] is required):
    a. Hepatic dysfunction defined as bilirubin > 1.5x upper limit of normal (ULN) or alanine aminotransferase (ALT) or asparate aminotransferase (AST) > 2.5x ULN
    b. Renal dysfunction as defined by either Grade 3 or higher abnormalities in serum sodium, potassium, calcium, magnesium or phosphate as defined by NCI Common Terminology Criteria for Adverse Events (CTCAE) v5.0, or the requirement for either peritoneal dialysis or hemodialysis
    c. Pulmonary dysfunction as defined by either:
        i. need for supplemental oxygen during the prior 2 weeks (in absence of acute infection)
        ii. Oxygen saturation (by pulse oximetry) < 90%
    d. Significant medical conditions, including documented human immunodeficiency virus (HIV) infection, poorly controlled diabetes, poorly controlled hypertension, poorly controlled cardiac arrhythmia or congestive heart failure; or arterial thromboembolic events (including stroke or myocardial infarction) within the 6 prior months
8. Kresladi is indicated for one-time single-dose intravenous use only and therefore will not be authorized for retreatment. Retreatment will be considered experimental and investigational when any FDA approved gene therapy, or any other gene therapy under investigation, has been previously administered.
9. Use of Kresladi is considered experimental and investigational when the above criteria are not met.
10. Use of Kresladi to treat other indications will be considered experimental and investigational.
11. Approval will be for 6 months to allow one-time administration

Considerations

- Prior authorization is obtained through the CDPHP pharmacy department.

Background

Alpha-mannosidosis is a lysosomal storage disorder characterized by the deficiency of the enzyme alpha-D mannosidase. The disease is caused by mutations in the MAN2B1 gene and occurs at a rate of roughly 1-2 per million live births. Alpha-mannosidosis presents in a highly heterogenous fashion but can be generally classified into three types based on severity and speed of progression. Type 1 is a mild form that is normally recognized after 10 years of age. Patients present with myopathy, but not with skeletal abnormalities, and progression is slow. Type 2 is a moderate form that is normally recognized before age 10. Patients present with myopathy and skeletal abnormalities, but progression is normally still slow. Across both type 1 and type 2, other symptoms can include mild to moderate intellectual disability, impaired hearing, ataxia, and immunodeficiency. Type 3 is the most severe form, with clinical presentation within the first year of life characterized by rapid progression of intellectual disability, hydrocephalus, ataxia, hepatosplenomegaly, skeletal abnormalities, and coarse facial features. In Type 3, death occurs either prenatally or early in life due to progressive central nervous system involvement or infection.

Velmanase alfa is a recombinant human alpha-mannosidase enzyme replacement therapy approved by the FDA for the treatment of non-central nervous system manifestations of alpha-mannosidosis. Once internalized by the cell, velmanase-alfa is transported into lysosomes where it catalyzes the degradation of accumulated mannose-containing oligosaccharides. Velmanase-alfa does not cross the blood brain barrier, and therefore does not treat the neurological aspects of alpha-mannosidosis.

In a phase III, randomized, double-blind, placebo-controlled trial, velmanase alfa was compared with placebo in 25 patients with alpha-mannosidosis. Primary endpoints were changes in serum oligosaccharide levels and three minutes stair climb test at week 52. Secondary endpoints included changes in six-minute walk test and forced vital capacity percentage. At week 52, there was a statistically significant reduction in oligosaccharide levels, with a mean relative change of -77.6% (95% CI -81.6 to -72.8%) in the velmanase alfa group compared with – 24.1% (95% CI -40.3 to -3.6) in the placebo group. Motor and pulmonary endpoints were not statistically significant, but results were noted to trend towards improvement in the active treatment group relative to placebo.

In a phase 2 pediatric study, five patients with alpha-mannosidosis who were under six years of age (3.7-5.9 years, mean - 4.5 years) were treated with 1 mg/kg of velmanase alfa once weekly. At 24 months, it was found that the mean percentage change from baseline in serum oligosaccharides was -65.8%.

Summary

Effective Date of Policy:	2/12/2026
Indications	Treatment of non-central nervous system manifestations of alpha-mannosidosis
ICD10 Diagnosis Codes	E77.1
HCPCS	J0217
Availability	Single dose vials containing 10 mg of velmanase alfa as a lyophilized powder
Duration	Initial approval: 12 months Subsequent approval: 12 months

Required Criteria for Initial Approval

All of the following conditions for the requested indication must be met in order to approve therapy:

Indication	Inclusion Criteria	Recommended Dosing
Alpha-mannosidosis (FDA approval) ICD10: E77.1	• The request is submitted by a provider with expertise in the treatment of alpha-mannosidosis • The member has a confirmed diagnosis of alpha-mannosidosis as defined by alpha-mannosidase activity in leukocytes or fibroblasts < 10% of normal activity • Member has Type 1 (mild) or Type 2 (moderate) alpha-mannosidosis without central nervous system manifestations • Member is able to ambulate independently	• 1 mg/kg of actual body weight once weekly as an IV infusion

Exclusion Criteria
• History of hematopoietic stem cell transplant bone marrow transplant • Member cannot walk without support • Member has Type 3 alpha mannosidosis (severe alpha-mannosidosis)

Continuation Criteria
• Requests will be reviewed per criteria every twelve months • Documentation of positive clinical response to therapy, attested by the provider (i.e., improvement or stabilization in motor function, FVC, reduction in frequency of infections, etc.)

Considerations
• Prior authorization is obtained through the CDPHP pharmacy department

MEDICAL POLICY

Medical Policy Title	**Left Atrial Appendage Closure Devices**
Policy Number	**7.01.92**
Current Effective Date	**January 1, 2026**
Next Review Date	**September 2027**

Our medical policies are guides to evaluate technologies or services for medical necessity. Criteria are established through the assessment of evidence based, peer-reviewed scientific literature, and national professional guidelines. Federal and state law(s), regulatory mandates and the member's subscriber contract language are considered first in the determination of a covered service. (Link to Product Disclaimer)

POLICY STATEMENT(S)

I. Percutaneous left atrial appendage (LAA) occlusion (e.g., the WATCHMAN, Amplazter Amulet) devices are considered **medically appropriate** when **ALL** of the following criteria are met:

   A. U.S. Food and Drug Administration (FDA) approved device;

   B. Nonvalvular atrial fibrillation (AF);

   C. Increased risk of stroke and systemic embolism, based on CHA_2DS_2-VASc score greater than or equal to two (2);

   D. Systemic anticoagulation therapy is recommended;

   E. Long-term risks of systemic anticoagulation outweigh the risks of the device implantation. (See Policy Guideline section)

II. Surgical exclusion/excision of the LAA during cardiac surgery is **medically appropriate** when **ALL** of the following criteria are met:

   A. Individual is planning to continue long-term anticoagulation post-surgery;

   B. When goal is to reduce the risk of stroke;

   C. Individual is diagnosed with atrial fibrillation;

   D. Individual has a CHA_2DS_2-VASc score greater than or equal to two (2) or equivalent stroke risk.

III. Percutaneous left atrial appendage closure devices are considered **investigational** when the above criteria are not met.

IV. Surgical LAA exclusion devices, including the AtriClip device, in individuals with AF for stroke prevention is considered **investigational** for **EITHER** of the following indications:

   A. As a stand-alone procedure; **or**

   B. undergoing a thoracoscopic cardiac procedure.

POLICY GUIDELINE(S)

I. The balance of risks and benefits associated with implantation of a percutaneous LAA occlusion device for stroke prevention, as an alternative to systemic oral anticoagulation, should be determined on an individual basis, through administration of an evidence-based decision tool, taking into account a patient's demonstrated bleeding episodes.

II. The patient's suitability for short-term oral anticoagulation but inability to take long-term oral anticoagulation, must be documented in the medical record and decided by a shared decision-making interaction between the patient and non-implanting physician(s) involved in the patient's care (primary care physician and/or primary cardiologist).

DESCRIPTION

Stroke is the most serious complication of atrial fibrillation (AF). The estimated incidence of stroke in untreated patients with AF is 5% per year. Stroke associated with AF is primarily embolic in nature, tends to be more severe than the typical ischemic stroke, and causes higher rates of mortality and disability. As a result, stroke prevention is one of the main goals of AF treatment. Stroke in AF occurs primarily as a result of thromboembolism from the left atrium. The lack of atrial contractions in AF leads to blood stasis in the left atrium, and this low-flow state increases the risk for thrombosis. The area of the left atrium with the lowest blood flow in AF, and, therefore, the highest risk of thrombosis, is the left atrial appendage (LAA). It has been estimated that 90% of left-atrial thrombi occur in the LAA.

$CHADS_2$ or the CHA_2DS_2-VASc stratification scores

The $CHADS_2$ or the CHA_2DS_2-VASc are frisk stratification scores used to calculate the risk of stroke in patients with AF. The $CHADS_2$ score assigns points for each of the following findings: congestive heart failure, hypertension, age greater than 75, diabetes, stroke/transient ischemia attack/thromboembolism. The CHA_2DS_2-VASc assigns points for some of the same findings (congestive heart failure, hypertension, diabetes, stroke/transient ischemia attack/thromboembolism), but with some different or additional criteria: age greater than or equal to 65, vascular disease, gender category.

Anti-Coagulation Treatment

The main treatment for stroke prevention in AF is anticoagulation, which has proven efficacy. Warfarin is the predominant agent in clinical use. A number of newer anticoagulant medications, including dabigatran, rivaroxaban, and apixaban, have received FDA approval for stroke prevention in nonvalvular AF and have demonstrated non-inferiority to warfarin in clinical trials. While anticoagulation is effective for stroke prevention, there is an increased risk of bleeding. Also, warfarin requires frequent monitoring and adjustments, as well as lifestyle changes. Dabigatran does not require monitoring. However, unlike warfarin, the antithrombotic effects of dabigatran are not

reversible with any currently available hemostatic drugs.

A number of risk scores have been developed to estimate the risk of significant bleeding in patients treated with systemic anticoagulation. An example is the HAS-BLED score, which assesses the annual risk of significant bleeding in AF patients treated with warfarin. The score ranges from 0 to 9, based on a number of clinical characteristics: hypertension, abnormal renal and/or liver function, stroke, bleeding, labile international normalized ratios, advanced age (older than 65), drug and/or alcohol use. Scores of 3 or greater are considered to be associated with high risk of bleeding.

Surgical Removal or Exclusion

Surgical removal, or exclusion, of the LAA is often performed in patients with AF who are undergoing open heart surgery for other reasons. Percutaneous LAA closure devices have been developed as a non-pharmacologic alternative to anticoagulation for stroke prevention in AF patients. The devices may prevent stroke by occluding the LAA, thus preventing thrombus formation. Several versions of LAA occlusion devices have been developed.

The WATCHMAN and WATCHMAN FLX left atrial appendage systems (Boston Scientific, Maple Grove, MN) are self-expanding, nickel titanium devices. The devices have a polyester covering and fixation barbs for attachment to the endocardium. Implantation is performed percutaneously through a catheter delivery system, utilizing venous access and transseptal puncture to enter the left atrium. Following implantation, patients are anticoagulated with warfarin or alternate agents for approximately one to two months. After this period, patients are maintained on antiplatelet agents (e.g., aspirin and/or clopidogrel) indefinitely.

The Lariat Loop Applicator is a suture delivery device that is placed around the outside of the LAA and tightened to seal the LAA off from the rest of the heart. This procedure can be done by going through the groin and chest wall. Rather than opening up the chest (open-heart surgery), a long needle is passed under the rib cage to gain access.

The Amplatzer Amulet Left Atrial Appendage Occluder (LAAO) is a second-generation permanent implanted device. It was developed to provide protection against thromboembolic events in high-risk, AF patients by Left Atrial Appendage Closure (LAAC). The device is made of a Nitinol (nickel-titanium) mesh with polyester fabric cover. The Amplatzer Amulet is placed in the patient's left atrial appendage (LAA), the device is intended to prevent blood clots formed in the LAA from entering the bloodstream and potentially causing a stroke.

The AtriClip Left Atrial Appendage Exclusion System has approval from the U.S. Food and Drug Administration for surgical LAA occlusion for stroke prevention in patients with AF. The AtriClip is made of two parallel titanium tubes with elastic nitinol springs covered by knit braided polyester. The delivery allows for application on a beating heart, as well as allows redeployment in case of initial suboptimal placement.

SUPPORTIVE LITERATURE

WATCHMAN Devices

Doshi et al (2023) reported the 2-year results of The PINNACLE FLX trial. The trial evaluated the

safety and efficacy of the next-generation WATCHMAN FLX device for left atrial appendage closure in patients with non-valvular atrial fibrillation who were at increased risk of stroke. Conducted across 29 U.S. centers, the study enrolled 395 patients with a mean age of 74 and an average CHA_2DS_2-VASc score of 4.2. At the 2-year mark, the device demonstrated a low rate of ischemic stroke or systemic embolism at 3.4%, which was significantly better than the 8.7% performance goal. Other notable outcomes included a 9.3% rate of all-cause mortality, 5.5% cardiovascular death, 3.4% stroke, and 10.1% major bleeding. There were no additional device-related complications such as embolization or symptomatic thrombi reported after the first year. These final results confirm that the WATCHMAN FLX device offers favorable long-term safety and efficacy for stroke prevention in this high-risk population.

The PREVAIL trial, conducted by Holmes et al (2014), was a randomized controlled study designed to address limitations identified in the earlier PROTECT-AF trial following the FDA's 2009 decision not to approve the WATCHMAN device. This study enrolled 407 patients with nonvalvular atrial fibrillation at moderate-to-high stroke risk (primarily $CHADS_2 \geq 2$) and randomized them in a 2:1 ratio to receive either the WATCHMAN left atrial appendage closure device or standard warfarin therapy. Patients in the device group received short-term warfarin and aspirin post-implantation, transitioning to dual antiplatelet therapy and then long-term aspirin alone if adequate closure was confirmed. The trial evaluated three non-inferiority primary endpoints at 18 months using Bayesian methods that incorporated prior PROTECT-AF data. Results showed that the WATCHMAN device did not meet non-inferiority criteria for the first primary endpoint (composite of stroke, cardiovascular death, or systemic embolism) because the upper confidence limit exceeded the predefined margin. Similarly, non-inferiority was not met for the second endpoint (late ischemic stroke or systemic embolism) based on relative risk, although it was achieved when assessed using rate differences. Importantly, the third endpoint—focused on early safety outcomes including procedural complications—did meet non-inferiority criteria. Overall, while PREVAIL demonstrated improved procedural safety compared to earlier studies, its efficacy results were mixed and did not fully confirm non-inferiority of the WATCHMAN device versus warfarin for preventing thromboembolic events.

Reddy et al (2011) reported Longer-term follow-up from the PROTECT AF. At a mean follow-up of 2.3 years, the results were similar to the initial report. The relative risk for the composite primary outcome in the WATCHMAN group, compared with the warfarin group, was 0.71, and this met non-inferiority criteria with a confidence of greater than 99%. Complications were more common in the WATCHMAN group, with an estimated rate of 5.6% per year, compared with 3.6% per year in the warfarin group.

Holmes et al (2009) conducted a randomized, unblinded trial that evaluated the non-inferiority of an LAA closure device, compared with warfarin, for stroke prevention in AF. The single RCT published is the PROTECT-AF study, the trial randomized 707 patients from 59 centers in the U.S. and Europe to the WATCHMAN device or warfarin treatment in a 2:1 ratio. Mean follow-up was 18±10 months. The primary efficacy outcome was a composite end point of stroke (ischemic or hemorrhagic), cardiovascular or unexplained death, or systemic embolism. There was also a primary safety outcome, which was a composite end point of excessive bleeding (intracranial or gastrointestinal bleeding) and procedure-related complications (pericardial effusion, device embolization, procedure-

related stroke). The primary efficacy outcome occurred at a rate of 3.0 per 100 patient years in the LAA closure group, compared with 4.9 per 100 patient years in the warfarin group (rate ratio (RR), 0.62; 95% credible interval (CrI), 0.35 to 1.25). Based on these outcomes, the probability of noninferiority was greater than 99.9%. For the individual components of the primary outcome, cardiovascular/ unexplained death and hemorrhagic stroke were higher in the warfarin group. In contrast, ischemic stroke was higher in the LAA closure group at 2.2 per 100 patient years, compared with 1.6 per 100 patient years in the warfarin group (RR=1.34; 95% Crl, 0.60 to 4.29). The primary safety outcome occurred more commonly in the LAA closure group, at a rate of 7.4 per 100 patient years, compared with 4.4 per 100 patient years in the warfarin group (RR=1.69; 95% CrI, 1.01 to 3.19). The higher adverse event rates for the LAA closure group were primarily the result of early adverse events associated with placement of the device. The most frequent type of complication related to LAA closure device placement was pericardial effusion requiring intervention, which occurred in 4.8% of patients (22/463).

Amplatzer Amulet Occluder

Lakkireddy et al (2021) conducted a randomized control trial was conducted to evaluate the safety and effectiveness of the dual-seal mechanism of the Amulet LAA Occluder compared to the Watchman device (Amplatzer Left Atrial Appendage Occluder IDE Trial). Patients with nonvalvular atrial fibrillations at increased risk of stroke were randomly assigned (1:1) to undergo percutaneous implantation of a LAA occlude (Amulet or Watchman device). The primary endpoints included safety, effectiveness, and the rate of LAA occlusion at 45 days. Prespecified secondary endpoints included a composite of all strokes, systemic embolism, or cardiovascular/unexplained death at 18 months, major bleeding at 18 months and superiority test of the three primary end points. A total of 1878 patients were enrolled; the Amulet occlude was noninferior to the Watchman device for primary safety end point 14.5% versus 14.7%. Procedure-related complications were higher for the Amulet Occluder 4.5% versus 2.5%, largely related to more frequent pericardial effusion and device embolization. The Amulet Occluder was noninferior to the Watchman device for the primary effectiveness end point 2.8% versus 2.8%, and the composite of stroke, systemic embolism, or cardiovascular/unexplained death 5.6% versus 7.7%. The rate of major bleeding was similar between groups 11.6% versus 12.3%. LAA occlusion was higher for the Amulet Occluder than for the Watchman device 98.9% versus 96.8%. The Amulet was noninferior for safety and effectiveness of stroke prevention for nonvalvular atrial fibrillation compared with the Watchman device and superior for LAA occlusion. Procedure related complications were higher with the Amulet Occluder and decreased with operator experience.

Whitlock et al (2021) reported the results of the Left Atrial Appendage Occlusion Study (LAAOS) III that randomized 4,811 individuals with preexisting AF to LAA occlusion, or no occlusion scheduled to undergo cardiac surgery. Following post-randomization exclusions prior to surgery, 2,379 individuals were included in the occlusion group and 2,411 were included in the no occlusion group. The treating surgeon selected occlusion method. Among those with data regarding the occlusion method, 15% underwent LAA occlusion with an epicardial closure device (e.g., AtriClip). The primary outcome was the incidence of ischemic stroke or systemic arterial embolism. At a mean 3.8 years follow-up, occlusion was associated with a significant reduction in risk of the primary outcome when compared

with no occlusion, without an increased risk of post-procedural bleeding or mortality. Occlusion appeared to result in greater risk reduction among those using either oral anticoagulation DOAC or vitamin K antagonist therapy at baseline than in those not on anticoagulant therapy. Anticoagulant use was 83% in the occlusion group and 81% in the no occlusion group at the time of hospital discharge, and the majority of study participants in both groups continued to use anticoagulants at 1- (80% and 79%), 2- (77% and 78%), and 3-year follow-up (75% and 78%). In conclusion among the individuals with AF who had cardiac surgery completed, most continued antithrombotic therapy. The risk of ischemic stroke or systemic embolism was lower with concomitant LAAO performed during cardiac surgery than without it.

Nietlispach et al (2013) reported a 10-year single center study on the experience with Amplatzer devices for LAA occlusion. The study included 152 patients from a single institution in Europe. Short-term complications occurred in 9.8% (15/152) of patients. Longer-term adverse outcomes occurred in 7% of patients, including two strokes, one peripheral embolization, and four episodes of major bleeding. Device embolization occurred in 4.6% (7/152) of patients. Other, smaller series of patients treated with the Amplatzer device include a series from several European studies and one from China with small sample sizes. All of these series reported high procedural success, but also reported various complications such as vascular complications, air embolism, esophageal injury, cardiac tamponade, and device embolization.

Wiebe et al (2013) reported results of a retrospective cohort of 60 patients with NVAF who had a CHA_2DS_2-VASc score of at least 1 and contraindications to warfarin anticoagulation, and who underwent percutaneous LAA closure with the Amplatzer device. Contraindications to warfarin were defined as the contraindications identified on the warfarin product label, a history of severe bleeding while receiving anticoagulant therapy, and a history of bleeding tendencies in the absence of anticoagulation or blood dyscrasia, along with the inability to maintain a stable INR, a known hypersensitivity to warfarin, or a high-risk of falling. Patients received heparin during the closure procedure; they were maintained on clopidogrel for three months post-procedure, and daily aspirin indefinitely. Device implantation was successful in 95% of patients. Over a median follow-up of 1.8 years, no patients experienced a stroke. The rate of major bleeding complications was 1.9% during the year of follow-up.

AtriClip

Wang et al (2024) conducted a prospective study aimed to evaluate the clinical outcomes of thoracoscopic left atrial appendage occlusion (LAAO) using the AtriClip PRO2 device. The study included 144 procedures; 56 standalone and 88 performed alongside other minimally invasive surgeries, all by a single surgeon. The results showed no mortality or major complications, with a 100% success rate in complete LAA closure and 87% follow-up imaging completion. Patients who underwent standalone procedures and discontinued anticoagulation experienced no thromboembolic events over 180 patient-years of follow-up. The findings support the safety and efficacy of thoracoscopic AtriClip placement, suggesting it as a reliable alternative to percutaneous methods, with future randomized trials recommended for comparative evaluation.

Ahmed et al (2023) reported the results of this retrospective study evaluating outcomes of surgical

left atrial appendage (LAA) occlusion using the AtriClip in 78 patients with long-standing persistent atrial fibrillation undergoing hybrid convergent ablation. At 3–6 months post-procedure, contrast-enhanced cardiac CT revealed that nearly half of patients (46.2%) had a residual LAA stump, with an average depth of about 4 mm; notably, 19% had a stump ≥10 mm, and one patient required additional endocardial closure. Over one year of follow-up, three patients experienced stroke, one had a device leak of 6 mm, and no thrombus formation near the clip was observed. Overall, the findings highlight a relatively high incidence of incomplete LAA closure with AtriClip and underscore the need for larger, long-term studies to better understand the clinical and thromboembolic implications of residual LAA stumps.

Lariat Device

Bartus et al (2012) conducted the largest case series on the efficacy of the lariat device for LAA closure. This study enrolled 89 patients with AF and either a contraindication to warfarin or previous warfarin failure. A total of 85/89 (96%) had successful left atrial ligation, and 81/89 (91%) had complete closure immediately. There were three access-related complications, two cases of severe pericarditis post-operatively, one late pericardial effusion, and two cases of unexplained sudden death. There were two late strokes, which the authors did not attribute to an embolic source. At one-year follow-up, complete closure was documented by echocardiography in 98% of available patients (n=65). In a smaller, earlier series from the same research group, 13 patients were treated with the Lariat device, 11 of whom were treated as part of percutaneous radiofrequency ablation for AF. One of the 11 procedures was terminated due to unsuccessful placement, and the other 10 procedures were successful, with complete closure verified on echocardiography. There was one procedural complication in which the snare was unable to be removed and needed to be retrieved by thoracoscopy.

PROFESSIONAL GUIDELINE(S)

The American College of Cardiology/American Heart Association (ACC/AHA) 2023 Guideline for the Diagnosis and Management of Atrial Fibrillation, Joglar et al (2023) lists the following recommendations:

Concomitant Surgical LAA Exclusion/Excision in Individuals with AF:

- In patients with AF undergoing cardiac surgery with a CHA_2DS_2-VASc score ≥2 or equivalent stroke risk, surgical LAA exclusion, in addition to continued anticoagulation, is indicated to reduce the risk of stroke and systemic embolism. (Class of Recommendations (COR):1; Level of Evidence (LOE): A)
- In patients with AF undergoing cardiac surgery and LAA exclusion, a surgical technique resulting in absence of flow across the suture line and a stump of <1 cm as determined by intraoperative transesophageal echocardiography should be used. (COR:1; LOE: A)
- In patients with AF undergoing cardiac surgery with CHA_2DS_2-VASc score ≥2 or equivalent stroke risk, the benefit of surgical LAA exclusion in the absence of continued anticoagulation to reduce the risk of stroke and systemic embolism is uncertain. (COR:2b; LOE: A)

Percutaneous Approaches to Occlude the LAA:

- In patients with AF, a moderate to high risk of stroke (CHA_2DS_2 score ≥2), and a contraindication to long-term oral anticoagulation due to a nonreversible cause, percutaneous LAAO (pLAAO) is reasonable. (COR:2a; LOE: B-NR)
- In patients with AF and a moderate to high risk of stroke and a high risk of major bleeding on oral anticoagulation, pLAAO may be a reasonable alternative to oral anticoagulation based on patient preference, with careful consideration of procedural risk and with the understanding that the evidence for oral anticoagulation is more extensive. (COR:2b; LOE: B-R)

The Society of Thoracic Surgeons released the 2023 clinical practice guidelines for the surgical treatment of atrial fibrillation; recommendations include the following:

- "For concomitant LAA management- LAA obliteration for AF is recommended for all first-time nonemergent cardiac surgery procedures, with or without concomitant surgical ablation, to reduce morbidity from thromboembolic complications." (COR: I, LOE: A)
- For stand-alone LAA management- Isolated surgical LAA obliteration may be considered in patients with longstanding persistent AF, a high stroke risk, and contraindications for or failure of long-term oral anticoagulation." (COR: IIb, LOE: B-NR)

In 2021, the National Institute on Health and Care Excellence (NICE) recommended consideration of LAA occlusion if anticoagulation is contraindicated or not tolerated.

The updated 2016 European Society of Cardiology (ESC) Guidelines, developed in collaboration with the European Association for Cardio-Thoracic Surgery, EACTS, recommend consideration of percutaneous LAAC for patients at high stroke risk with contraindications to long-term oral anticoagulation.

REGULATORY STATUS

The United States Food and Drug Administration (FDA) regulates LAAO devices as medical devices. All LAAO devices including related components require FDA approval before marketing and use in the United States to ensure they are safe and effective for human use. Refer to the FDA Medical Device website. Available from: https://www.fda.gov/medical-devices [accessed 2026 Jun 16]

The FDA lists the most serious type of medical device recalls as well as early alert communications about corrective actions being taken by companies that the FDA believes are likely to be the most serious type of recalls on our website by the date that the FDA posts the information on our website. Available from: Medical Device Recalls | FDA [accessed 2026 Jun 16]

Percutaneous devices that are currently approved by the FDA include:

- Watchman device LAA closure device, (Watchman and Watchman FLX) (Boston Scientific Corporation, Marlborough, MA), received FDA approval in March 2015.
- The WATCHMAN FLX device received FDA approval in July 2020
- The Amplatzer Amulet LAA occlude (Abbott, Minneapolis, MN), received FDA approval in August

2021.

The Amplatzer cardiac plug (St. Jude Medical, Minneapolis, MN), is FDA-approved for closure of atrial septal defects but has not received FDA approval for LAA closure.

CODE(S)

- Codes may not be covered under all circumstances.
- Code list may not be all inclusive (AMA and CMS code updates may occur more frequently than policy updates).
- (E/I) =Experimental/Investigational
- (NMN)=Not medically necessary/appropriate

CPT Codes

Code	Description
33267 (E/I)	Exclusion of left atrial appendage, open, any method (e.g., excision, isolation via stapling, oversewing, ligation, plication clip)
33268	Exclusion of left atrial appendage, open, performed at the time of other sternotomy or thoracotomy procedure(s), any methods (e.g., excision, isolation via stapling, oversewing, ligation, plication, clip) (List separately in addition to code for primary procedure)
33269 (E/I)	Exclusion of left atrial appendage, thoracoscopic, any method (e.g., excision, isolation via stapling, oversewing, ligation, plication, clip)
33340	Percutaneous transcatheter closure of the left atrial appendage with endocardial implant, including fluoroscopy, transseptal puncture, catheter placement(s), left atrial angiography, left atrial appendage angiography, when performed, and radiological supervision and interpretation

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgment when deciding the most appropriate care to enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

Background

Metachromatic leukodystrophy (MLD) is a rare autosomal recessive genetic disorder that results in progressive loss of motor and cognitive function. MLD has a prevalence of 1:40,000-160,000 worldwide as an autosomal recessive hereditary neurodegenerative disease. The disease is caused by one of over 250 mutations in the *ARSA* gene that codes for the enzyme arylsulfatase-A (ARSA), or rarely the *PSAP* gene that codes for saposin B, which activates ARSA. Both ARSA and saposin B are required to break down sulfatide fats in the myelin forming cells (oligodendrocytes and Schwann cells) of the central and peripheral nervous system, respectively. In MLD, as sulfatide fats accumulate, they cause breakdown of the myelin sheath (i.e., demyelination), permanently damaging nerves and triggering a secondary neurodegenerative process. This process leads to deterioration of motor and cognitive function. In addition, sulfatide fats can also accumulate outside the nervous system: including the gallbladder causing gallbladder thickening, biliary sludge, polyp formation and subsequent acute biliary complications, and/or an increased risk of gallbladder cancer.

The severity of the condition depends on the residual activity of ARSA and is categorized by age of onset, classified into three types being late infantile, juvenile, and adult.

The **late infantile MLD (LI-MLD)** form, which is the most common (50-60% of all cases) is also the most severe as clinical manifestation begins before 30 months of age. This type has minimal ARSA activity, thus rapid neurodegeneration which can start with gait abnormalities and progress to neuropathy and developmental regression. The terminal stage of this type is characterized by severe psychomotor retardation (loss of walking, if ever obtained) with breathing/swallowing difficulties and unfortunately leads to the death of patients with late infantile form in childhood (typically within eight years of diagnosis).

The juvenile MLD form has a slower progression of disease and patients may survive until early adulthood. There are two further subtypes: **early juvenile (EJ-MLD)** and late juvenile. EJ-MLD has a symptom onset of 30 months – six years of age whereas seven to 16 years of age is seen in late juvenile. Symptoms include cognitive impairment (learning disabilities) and behavioral issues. This disease can also progress rapidly in this population, especially after a loss of independent ambulation with significant disability seen within three years of symptom onset, and a total of 10-20 years of survival after symptoms begin.

The least severe and least common form of the disease is the adult form of MLD. This usually begins manifestation after 16 years of age and presents as psychoses, cognitive/behavioral impairment, ataxia, polyneuropathy, and epileptic seizures. It is commonly misdiagnosed as early-onset dementia or schizophrenia due to its slow progression. This could be attributable to symptoms that can include hallucinations and illusions with depressive disorder and sudden mood swings. The finals stages of adult form of MLD are similar to the former types and the life expectancy of this type is 20-30 years after diagnosis.

The diagnosis of this condition relies upon clinical manifestations, genetic analysis for the ARSA and PSAP genes, magnetic resonance imaging of the brain and biochemical tests of the ARSA enzymatic activity. Detection of mutations by sequencing is the most accurate method for diagnosing hereditary genetic diseases. However, diagnosis can be made using other methods (e.g., determination of ARSA activity or sulfatide levels as well as MRI) since not all the mutations associated with the disease have been currently identified. The disease course can be monitored by following ARSA enzyme activity, with specific substates that allow for this: methylumbelliferyl sulfate (4-MUS) and ρ.NCS (preferred substrate) are synthetic substrates for ARSA and arylsulfatase B (ARSB) and a natural substrates: d3-C18: 0-sulfatide.

The treatment options for MLD has been limited due to the difficulty of treating this disease of the nervous system via the poor permeability of the blood-brain barrier. This condition would require distribution of medication to the central and peripheral nervous system to prevent progression of the disease. Pre-symptomatic treatment via a bone marrow transplants (BMT) or hematopoietic stem cell transplantation (HSCT) is considered to have some therapeutic potential but is also considered controversial. In those with juvenile forms of MLD who receive BMT AFTER the onset of symptoms, demyelination occurs in 31% of cases, with a theory being that the BMT is administered too late. HSCT is noted as a therapeutic option, including a 40 subject cohort report, concluding that this is a viable treatment for MLD with significant limitations. Seventeen LI-MLD, J-MLD and adult subtype (A-MLD) survivors were evaluable for long-term adaptive functioning, activities of daily living, and/or cognition. Relative cognitive sparing was observed despite overall global decline. Later onset phenotypes may benefit most from early, pre-symptomatic HSCT. Unfortunately, with both BMT and HSCT it is described that it is possible that the amount of ARSA secreted by normal cells after the transplantation may not be enough to cross-correct a deficiency in the cells of the

patients' nervous system.

Institute for Clinical and Economic Review[3] states,

> Allogeneic hematopoietic stem cell transplant (HSCT) is sometimes offered as a treatment to attempt to slow down progression of disease, but it is uncertain what benefit it provides to late infantile or early juvenile MLD. However, since newborn screening for MLD has not been widely implemented, many patients are diagnosed too late to be considered for treatments other than supportive care.

The only other therapies are supportive to manage some of the clinical manifestations that occur with this disease such as antiepileptic drugs, muscle relaxants or anti-inflammatory therapies.

Lenmeldy (Atidarsagene autotemcel, arsa cel, OTL-200) is a one-time gene therapy for MLD caused by mutations in the ARSA gene. The therapy involves an autologous stem-cell transplant process. First, hematopoietic stem and progenitor cells are harvested from the patient. The cells are then sent to the manufacturer and CD34+ cells are then transduced with a lentiviral vector carrying a functional ARSA gene; cryopreserved cells are then shipped back to the treatment center. After a myeloablative conditioning regimen with busulfan, the cells are then delivered via intravenous infusion. Once the cells have engrafted, the CD34+ cells repopulate the bone marrow, giving rise to peripheral blood mononuclear cells (PBMCs) that can produce the normal to supranormal levels of ARSA enzyme.

Arsa-cel was studied in two key trials, phase I/II and a phase II study. Additionally, there were a small number of children studied through the expanded access frameworks (EAFs) and Compassionate Use Programs (CUPs). The two main trials were single-arm, open-label studies involving children with a diagnosis of MLD confirmed through biochemical and molecular confirmation. Between all studies, 35 children were treated and analyzed. The subtypes of MLD were: pre-symptomatic late infantile (n-18), presymptomatic early juvenile (n-8), early symptomatic early juvenile MLD (n-9). These subjects were compared to 43 natural history patients from a previously conducted study. Because of the length of the enrollment period (over ten years), not all arsa-cel patients reached specific follow-up points. Additionally, all arsa-cel treated MLD patients were reported to have deviated from the protocol with a missed or out of window assessment. Thus, not every patient contributed to each outcome at every timepoint. There were no deaths in up to 11 years of follow-up (up to 12 years of chronological age) in the presymptomatic LI-MLD group treated with arsa-cel. In the natural history cohort, the probability for survival at 12 chronological years was 0.23. In contrast to the LI-MLD subtype, there was not as large a difference in survival probabilities across treated EJ-MLD patients and those in the natural history cohort. In the pre-symptomatic EJ-MLD group (n=8), there was one death 415 days after arsa-cel infusion that was deemed unrelated to gene therapy or MLD; the survival probability was 0.88 up to 11 years of chronological age. In the early symptomatic EJ-MLD groups treated with arsa-cel (n=9), there were no deaths up to 19 years of chronological age, based on data provided by the manufacturer. Two deaths occurred in early symptomatic EJ-MLD patients due to disease progression; however, these two patients were excluded from analyses based on exclusion criteria being met.

In terms of GMFM-88 functional scores, at 24 months all arsa-cel treated patients had much higher GMFM-88 total scores compared to the natural history cohort subjects, as well as GMFC-MLD levels and ARSA enzyme activity levels.

In terms of safety, the most common side effects are fever, low WBCs, stomatitis, respiratory tract infections, rash, device related infections, other viral infections, pyrexia, gastroenteritis, and hepatomegaly. From a laboratory perspective, elevated D-dimer, neutropenia, and elevated liver enzymes were appreciated. Importantly, a warning exists for thrombosis and thromboembolic events, where a provider must consider the prophylactic use of anti-thrombotic agents prior to treatment with Lenmeldy. This is a result of one patient death in the pre-symptomatic EJ-MLD group, from ischemic cerebral infarction.

ICER reviewed this therapy and determined that for those that are considered presymptomatic late infantile and early juvenile MLD, the evidence rating is A, and a rating of B+ for those with early symptomatic early juvenile disease.
ICER further explains their ratings.[3]

> Given that the early onset forms of MLD are rapidly progressive and fatal, and the majority of presymptomatic LI and EJ-MLD patients who underwent arsa-cel therapy remained either asymptomatic or with mild symptoms, we conclude that in children with presymptomatic LI-MLD and presymptomatic EJ-MLD, we have high certainty of a substantial net health benefit ("A").
> The magnitude of benefit and certainty in that benefit are both smaller for treatment of children with early symptomatic EJ-MLD. These children will not return to normal health, treatment with busulfan carries a risk of death, and long-term outcomes are less certain. Additionally, clinical experts, based on experience in patients treated with hematopoietic stem cell therapy, were concerned that, in some patients, treatment with arsa-cel may carry the risk of hastening progression of physical and cognitive decline before stabilization occurs. Given these uncertainties, in children with early symptomatic EJ-MLD, we have moderate certainty of a small or substantial net health benefit with high certainty of at least a small net health benefit ("B+"). However, families for whom the possible risk of initial faster progression after treatment with arsa-cel is determinative may reasonably conclude that current evidence is insufficient.

ICER - Atidarsagene Autotemcel for Metachromatic Leukodystrophy, Final Evidence Report[3]

Summary	
Effective Date of Policy:	7/14/26
Indications	Specific subtypes of MLD
ICD10 Diagnosis Codes:	E75.25
HCPCS Code	J3391
Availability	Per FDA Prescribing Information
Duration	Authorization will be provided for 6 months to allow sufficient time for administration

Required Criteria for Initial Approval

All of the following conditions for the requested indication must be met in order to approve therapy:

Specific Indication	Inclusion Criteria	Recommended Dosing Regimen

Indication
Treatment of children with pre-symptomatic late infantile (PSLI), pre-symptomatic early juvenile (PSEJ) or early symptomatic early juvenile (ESEJ) metachromatic leukodystrophy (MLD) (FDA approval)
 	
ICD10: E75.25
	• Therapy is being requested by a provider who is knowledgeable in the management of MLD
	• Must have a diagnosis of MLD confirmed by ALL of the following:
	  ○ Biochemical Testing:
	  ▪ Deficient Arylsulfatase-A (ARSA) enzyme activity in leukocytes (ARSA activity below the normal range in peripheral blood mononuclear cells or fibroblasts) AND
	  ▪ 24-hour urine collection showing elevated sulfatide levels; AND
	  ○ Molecular Testing:
	  ▪ Identification of two pathogenic or novel ARSA alleles; AND
	• Must have a diagnosis of one of the following forms of MLD:
		• **For autologous use only**
		• **One-time single-dose intravenous use only**
		
		• Enrollees are required to undergo hematopoietic stem cell (HSC) mobilization followed by apheresis to obtain CD34+ cells for manufacturing
		• The minimum recommended dose is based on the MLD disease subtype

	○ Pre-symptomatic late infantile (PSLI) MLD defined by: ▪ Expected disease onset ≤ 30 months of age AND ▪ Pre- symptomatic status defined as the absence of neurological signs and symptoms of MLD or physical exam findings limited to abnormal reflexes and/or clonus (excluding abnormal reflexes or abnormalities on brain magnetic resonance imaging and/or nerve conduction tests not associated with functional impairment (ex: no tremor, no peripheral ataxia)) ○ Pre-symptomatic early juvenile (PSEJ) MLD defined by: ▪ Expected disease onset > 30 months and less than 7 years of age AND ▪ Pre- symptomatic status defined as the absence of neurological signs and symptoms of MLD or physical exam findings limited to abnormal reflexes and/or clonus (excluding abnormal reflexes or abnormalities on brain magnetic resonance imaging and/or nerve conduction tests not associated with functional impairment (ex: no tremor, no peripheral ataxia)) ○ Early symptomatic early juvenile (ESEJ) MLD defined by: ▪ Disease onset > 30 months and less than 7 years of age AND ▪ Early symptomatic status defined as GMFC-MLD Level 0 with ataxia or GMFC-MLD Level 1 and IQ ≥ 85 • The patient must be eligible for an autologous hematopoietic stem cell transplant (HSCT) **If approved, physician will evaluate risk factors for thrombosis prior to and after Lenmeldy infusion and consider prophylaxis with anti-thrombotic agents prior to treatment.	(see FDA Prescribing Information) • Myeloablative conditioning must be administered before infusion of Lenmeldy

Exclusion Criteria

Therapy will not be approved if any of the above Inclusion Criteria are not met OR any of the below Exclusion Criteria are met:

- Enrollee has any of the following:
  - Human immunodeficiency virus, hepatitis C virus, and/or hepatitis B virus positive
  - Neoplastic disease
  - Cytogenetic alteration typical of myelodysplastic syndrome (MDS) or acute myeloid leukemia (AML)
  - End-organ dysfunction or other severe disease
  - Allogeneic hematopoietic stem cell transplant (HSCT) in past 6 months or evidence of residual cells of donor origin
- Lenmeldy (atidarsagene autotemcel) is considered not medically necessary when the above criteria are not met
- Lenmeldy (atidarsagene autotemcel) is considered not medically necessary for all other indications, including late juvenile and adult forms of MLD.

Continuation Criteria

Continuation criteria is not applicable, Lenmeldy is only authorized for one lifetime treatment and therefore repeat administration will not be covered. Retreatment will be considered not medically necessary when any FDA approved gene therapy, or any other gene therapy under investigation, has been previously administered

Considerations

- Prior authorization is obtained through the CDPHP pharmacy department.
- Qualified treatment centers: https://lenmeldy.com/#qtc
- Physician acknowledges that CDPHP will request documentation, not more frequently than biannually, of follow-up patient assessments including serial neurologic and functional measurements and other clinical assessments while the patient is under the

care of the physician.

Gross Motor Function Measure (GMFM): An assessment tool measuring changes in gross motor function over time with intervention across five dimensions: 1) lying and rolling, 2) sitting, 3) crawling and kneeling, 4) standing, and 5) walking, running, and jumping. Scores range from 0 to 100 with a higher score indicating better performance. In trials, an improvement of 10% between treated and natural history patients' GMFM scores was considered a clinically relevant change in response to treatment.
**It is important to note that the normal range of GMFM-88 differs according to chronological age of the child.

Gross Motor Function Classification in MLD (GMFC-MLD): A classification of children's movements like sitting and walking ranging from level 0 where children can walk without support to level 6 where children lose all locomotion and head and trunk control.
See below for more detail:

GMFC-MLD Level[42]	
Level 0	Walking without support with quality of performance normal for age
Level 1	Walking without support but with reduced quality of performance, i.e. instability when standing or walking
Level 2	Walking with support. Walking without support not possible (fewer than five steps)
Level 3	Sitting without support and locomotion such as crawling or rolling. Walking with or without support not possible
Level 4	Sitting without support but no locomotion OR sitting without support not possible, but locomotion such as crawling or rolling
Level 5	No locomotion nor sitting without support, but head control is possible
Level 6	Loss of any locomotion as well as loss of any head and trunk control

GMFC: gross motor function classification

CDPHP Pharmacy Services 7/14/2026

New: 4/2024

Revised	Reviewed
4/2025, 12/2025, 5/2026, 7/2026	

Revision Date	Changes Made
4/2025	Added additional exclusion criteria: Enrollee has any of the following: • Human immunodeficiency virus, hepatitis C virus, and/or hepatitis B virus positive • Neoplastic disease • Cytogenetic alteration typical of myelodysplastic syndrome (MDS) or acute myeloid leukemia (AML) • End-organ dysfunction or other severe disease
12/2025	Updated authorization duration to 6 months to allow adequate time for administration
5/2026	Removed qualified treatment center Reworded forms of MLD
7/2026	Removed age and weight requirement

MEDICAL POLICY

Medical Policy Title	**Light and Laser Therapies for Dermatologic Conditions**
Policy Number	**8.01.21**
Current Effective Date	**9/1/2026**
Next Review Date	**October 2026**

Our medical policies are based on the assessment of evidence based, peer-reviewed literature, and professional guidelines. Eligibility for reimbursement is based upon the benefits set forth in the member's subscriber contract. (Link to Product Disclaimer)

POLICY STATEMENT(S)

I. The following treatments are considered **medically appropriate**:

A. Ultraviolet B (UVB) light, alone or in combination with other treatment modalities (e.g., topical coal tar [Goeckerman treatment]), when **ALL** the following criteria are met:

1. In the absence of **ALL** contraindications including the following:
   a. Xeroderma pigmentosum;
   b. Disorders with significant light sensitivity (e.g., albinism); **and**
   c. Lupus erythematosus;
2. Treatment is for **ANY** of the following indications:
   a. Moderate to severe psoriasis that is not responsive to topical or systemic (e.g., methotrexate) drug therapies alone;
   b. Eczema/atopic dermatitis that is not responsive to topical or systemic drug therapies alone or that interferes with an individual's normal functional capacity;
   c. Cutaneous T-cell lymphoma (e.g., mycosis fungoides);
   d. Vitiligo of sun-exposed regions (such as the face, neck, and dorsum of the hands) because the depigmented skin is sun-sensitive, is subject to severe sunburn, and may pose a risk for skin cancer; **or**
   e. Lichen planus;

B. Psoralen Ultraviolet A (PUVA) when **ALL** the following criteria are met:

1. In the absence of **ALL** the following contraindications:
   a. Xeroderma pigmentosum;
   b. Disorders with significant light sensitivity (e.g., albinism);
   c. Lupus erythematosus;
   d. Pregnancy;
   e. Breast-feeding; **and**

f. Uremia and hepatic failure;

2. Treatment is for **ANY** of the following indications:

a. Severe, disabling psoriasis that is not responsive to conservative therapy or UVB therapy;

b. Severe, disabling eczema/atopic dermatitis that is not responsive to conservative therapy or UVA/UVB therapy;

c. Cutaneous T-cell lymphoma (e.g., mycosis fungoides [MF]);

d. Vitiligo of sun-exposed regions (such as the face, neck, and dorsum of the hands) because the depigmented skin is sun-sensitive, is subject to severe sunburn, and may pose a risk for skin cancer; **or**

e. Severe lichen planus;

C. Ultraviolet A (UVA) light, alone or in combination with other treatment modalities, when **ALL** the following criteria are met:

1. In the absence of **ALL** contraindications including the following:

a. Xeroderma pigmentosum;

b. Disorders with significant light sensitivity (e.g., albinism); **and**

c. Lupus erythematosus;

2. Treatment is for **ANY** of the following indications:

a. Eczema/atopic dermatitis that is not responsive to topical or systemic drug therapies alone or that interferes with an individual's normal functional capacity; **or**

b. Lichen planus;

D. Targeted phototherapy using an excimer lamp or laser device that has received Section 510(k) approval from the U.S. Food and Drug Administration (FDA) (e.g., Fencer 308 Excimer Laser, XTRAC XL excimer laser and VTRAC excimer lamp system, BClear lamp, and European-manufactured Excilite and Excilite µ XeCL lamps) when **ALL** the following criteria are met:

1. In the absence of **ALL** contraindications including the following:

a. Xeroderma pigmentosum;

b. Disorders with significant light sensitivity (e.g., albinism); **and**

c. Lupus erythematosus;

2. Treatment is for **ANY** of the following indications:

a. Moderate-to-severe localized psoriasis comprising less than 20% of the body area for which narrowband UVB or PUVA is indicated; **or**

b. Mild-to-moderate psoriasis that is unresponsive to conservative treatment;

E. Home phototherapy utilizing UVB radiation for the treatment of moderate-to-severe psoriasis, comprising at least 3% of the body area, **OR** eczema/atopic dermatitis, that is not responsive to conservative therapies, when **ALL** the following criteria are met:

1. In the absence of **ALL** contraindications including the following:
   a. Xeroderma pigmentosum;
   b. Disorders with significant light sensitivity (e.g., albinism); **and**
   c. Lupus erythematosus;
2. The patient's dermatologist has submitted a letter of medical necessity stating the reason that the home-based, rather than office-based, therapy is needed;
3. The patient has had ineffective courses of treatment using topical or systemic drug therapy; **and**
4. The patient is motivated and reliable, ensuring that treatment is pursued correctly and consistently and that exposures are accurately recorded;

F. Photodynamic Therapy (PDT) with 5-aminolevulinic acid (5-ALA) topical preparations, when **ALL** the following criteria are met:

1. In the absence of **ALL** contraindications including the following:
   a. Xeroderma pigmentosum;
   b. Disorders with significant light sensitivity (e.g., albinism); **and**
   c. Lupus erythematosus;
2. Treatment is for **ANY** of the following:
   a. Actinic keratoses
   b. Superficial basal cell skin cancer, only when surgery and/or radiation is contraindicated; **or**
   c. Bowen's disease (squamous cell carcinoma in situ), only when surgery and/or radiation is contraindicated;

G. Pulsed Dye Laser for the treatment of port wine birthmarks.

II. **ALL** of the following treatments are considered **investigational**:

A. Targeted phototherapy (e.g., the XTRAC XL and VTRAC lamp, the BClear lamp, and the European-manufactured Excilite and Excilite μ XeCL lamps) for **ANY** of the following indications:

1. First-line treatment of mild psoriasis;
2. Treatment of generalized psoriasis or psoriatic arthritis; **or**

3. Vitiligo;

B. PDT with topical preparations for the treatment of other dermatologic conditions, including, but not limited to, acne vulgaris, regional squamous cell carcinoma, and non-superficial basal cell carcinoma;

C. Treatment of acne with light or laser therapy, (e.g., pulsed dye laser, smooth beam laser, photopneumatic therapy [TheraClear Acne System]).

RELATED POLICIES

Corporate Medical Policy

11.01.03 Experimental or Investigational Services

POLICY GUIDELINE(S)

I. The number of treatments required for clearance and remission for both UVB and PUVA therapy is based upon the severity of the disease and the individual response to treatment. The number of psoriatic flare-ups that a person experiences in a lifetime also varies by severity of the disease.

II. UVB therapy usually begins with three (3) to five (5) sessions per week until clearing is achieved, followed by maintenance therapy with a gradual reduction in sessions until sessions are no longer required. PUVA therapy begins with two (2) to three (3) sessions per week for initial clearing, then one (1) to two (2) times a month for maintenance. If no improvement in the psoriatic lesions is seen after four (4) weeks of either UVB or PUVA therapy, treatment should be discontinued.

III. Medical necessity documentation, such as a treatment plan and/or photographs, is generally not required until after a threshold of 30 visits.

IV. The number of treatments required for clearance and remission for atopic dermatitis/eczema and for re-pigmentation in vitiligo for both UVB a PUVA therapy is based upon the severity of the disease and the individual response to treatment.;

V. In general, a phototherapy home unit should be purchased only when there is anticipation of long-term use.

VI. PUVA is rarely indicated for children or young adults because of its potential long-term side effects.

VII. Light and laser treatment should be used with caution in the following circumstances:

A. History or family history of melanoma;

B. History of non-melanoma skin cancer, extensive solar damage, and previous treatment with ionizing arsenic;

C. Pemphigus or pemphigoid;

D. Immunosuppression;

E. Cataracts and aphakia;

F. Photosensitivity; and

G. Uremia and hepatic failure.

VIII. The National Psoriasis Foundation defines the classifications of psoriasis as: Mild < 3%; Moderate 3-10%, and Severe > 10%. However, the severity of psoriasis is also measured by how psoriasis affects a person's quality of life. For example, psoriasis can have a serious impact on one's daily activities even if it involves a small area such as the palms of the hands or soles of the feet.

DESCRIPTION

Ultraviolet light therapy is exposure to the skin with non-ionizing radiation for therapeutic benefit. It may involve exposure to UVB, UVA, or various combinations of UVB and UVA radiation.

Goeckerman therapy is a psoriasis treatment that was developed in 1921 and involves the use of coal tar in combination with UVB phototherapy. It is a safe and effective option for patients with severe or recalcitrant psoriasis. Coal tar and UVB are thought to work in concert to inhibit angiogenesis and keratinocyte proliferation, as well as to decrease T-lymphocyte numbers in the skin and alter inflammatory cytokine expression.

Photochemotherapy is the therapeutic use of radiation in combination with a photosensitizing chemical, currently PUVA. Psoralens make the skin more sensitive and responsive to this wavelength of light. It can be taken orally, applied topically, or added to a bath via a solution for soaking into the skin.

Excimer laser, a xenon chloride (XeCl) laser (e.g., XTRAC, Ex-308 laser), emits a narrow beam of UVB light from a handheld unit which results in a much higher concentration of UVB exposure than in the standard phototherapy unit. The use of excimer laser may shorten the number of exposures necessary, and only specific areas of the body are treated with the laser, limiting the number of exposures and the area being treated, potentially reducing the harmful effects of UV radiation.

PDT using 5-ALA has been investigated as a treatment of actinic keratoses (AK), skin cancers, and superficial dermatologic lesions such as Bowen’s disease. Levulan Kerastick is one example of a topical preparation of 5-ALA. The Levulan Photodynamic system is a two-step treatment, involving application of Levulan Kerastick, then exposure of the area to blue light via the BLU-U Blue Light Photodynamic Therapy Illuminator.

Topical application of methyl aminolevulinate (Metvix, MAL), followed by exposure with the CureLight Broadband (Model CureLight 01), a proprietary red-light source, or the PhotoCure Aktilite CL128 lamp, an LED-based narrow band (630 nm) red light technology device, is another variant of photodynamic therapy for skin lesions. Although MAL is an approved photosensitizer for PDT, it is no longer produced in the United States (NCCN, 2025).

Pulsed Dye Lasers (PDL) which use yellow light wavelengths (585-600 nm) that selectively target both oxyhemoglobin and deoxyhemoglobin. PDLs penetrate up to 2 mm in the skin. Newborns and young children, who have thinner skin, tend to respond well to this type of laser; the response in thicker and darker lesions may be lower.

Photopneumatic devices are a combination of light therapy and vacuum suction devices that mechanically clear obstructed pores and aim to visibly reduce acne lesions. An example of this type of device is the TheraClear X Acne System (Strata Skin Sciences, Horsham, Pennsylvania).

SUPPORTIVE LITERATURE

Psoriasis

The published data has demonstrated that psoriasis has an excellent response rate when treated with either UVB or PUVA. The overall risk of complications from phototherapy and photochemotherapy are low, when compared to the thousands of patients treated with these therapies. Phototherapy and photochemotherapy have been standard treatment alternatives used by dermatologists for severe psoriasis and for vitiligo.

Peer-reviewed literature is limited; however, the published evidence supports the use of targeted phototherapy for the treatment of moderate-to-severe psoriasis comprising less than 20% of the body area for which NB-UVB or PUVA is indicated, and for the treatment of mild-to-moderate psoriasis that is unresponsive to conservative treatment. There is insufficient evidence to support the use of targeted phototherapy for the first-line treatment of mild psoriasis or for the treatment of generalized psoriasis or psoriatic arthritis.

Eczema/Atopic Dermatitis

Published data have demonstrated that phototherapy in the form of UVA, UVB, and PUVA have been proven to be safe and effective treatments, with a low overall risk of complications, for eczema/atopic dermatitis.

Mycosis Fungoides

The peer-reviewed literature consists of small case series that indicate good outcomes when phototherapy in the form of PUVA and UVB is used for the treatment of mycosis fungoides, a very rare lymphoma of the skin.

Vitiligo

A 2016 systematic review identified three studies that compared targeted phototherapy with a 308 nm excimer lamp to NB-UVB and three studies that compared the excimer lamp to the excimer laser. No differences between the excimer lamp and NB-UVB were identified for the outcome of 50% or greater re-pigmentation (RR=1.14; 95% CI, 0.88 to 1.48) (Lopes). For re-pigmentation of 75% or greater, only two small studies were identified, and the relative risk was 1.81 (95% CI, 0.11 to 29.52), showing a lack of precision in the estimate. For the three studies that compared the excimer lamp to the excimer laser, there were no significant differences between treatments for either 50% or greater re-pigmentation (RR=0.97; 95% CI, 0.84 to 1.11) or 75% or greater re-pigmentation

(RR=0.96; 95% CI, 0.71 to 1.30). All treatments were most effective in lesions located on the face, with the worst response being lesions on the extremities. There was some evidence of an increase in adverse events such as blistering with targeted phototherapy.

Baeet al (2017) performed a systematic review and meta-analysis of patient response to narrowband UV-B (NBUVB) phototherapy and psoralen-UV-A (PUVA) phototherapy in the treatment of vitiligo. Inclusion criteria consisted of: (1) prospective studies; (2) participants with a diagnosis of generalized or symmetrical vitiligo; (3) at least one phototherapy group; (4) at least 10 participants in each treatment arm; (5) treatment duration of at least 12 weeks or 24 treatment sessions; (6) outcomes measured based on all vitiligo lesions on the participants whole or half body; and (7) degree of re-pigmentation based on a quartile scale. In the final analysis, 35 studies were included, with 29 studies of 1201 patients undergoing NBUVB phototherapy and nine studies of 227 patients undergoing PUVA phototherapy. A mild response (≥ 25%) to NBUVB phototherapy occurred in 62.1% of 130 patients in three studies at three months, 74.2% of 232 patients in 11 studies at six months, and 75.0% of 512 patients in eight studies at 12 months. A marked response, defined as ≥ 75%, was achieved in 13.0% of 106 patients in two studies at three months, 19.2% of 266 patients in 13 studies at six months, and 35.7% of 540 patients in nine studies at 12 months. For PUVA phototherapy, at least a mild response occurred in 51.4% of 103 patients in four studies at six months and 61.6% of 72 patients in three studies at 12 months. After at least six months of NBUVB phototherapy, at least a mild response occurred on the face and neck in 82.0% of 153 patients, and a marked response in 44.2%, while hands and feet received a mild response in 11.0% of 172 patients, and no marked responses of the same group. The authors could not determine the appropriate treatment duration of phototherapy but did verify treatment duration of at least one year to achieve maximal response and suggested at least six months of treatment to determine responsiveness to NBUVB phototherapy. Overall, treatment response to NBUVB phototherapy was better than PUVA therapy. The most responsive body sites were the face and neck, with hands and feet being the least responsive.

A 2015 systematic review (Sun 2015) was conducted of randomized, controlled trials (RCTs) that focused on treatment of vitiligo with the 308 nm excimer laser. Authors identified seven RCTs with a total of 390 patients. None of the studies was conducted in the United States. Three of the trials compared the excimer laser with an excimer lamp. Four studies compared the excimer laser with narrowband (NB)-UVB; however, two of these were not published in English, and one had a sample size of only 14 patients. The fourth study, published in 2010, did not report efficacy outcomes such as clinical response rate or re-pigmentation rate; but reported on the proportion of patients with various types of re-pigmentation: perifollicular, marginal, diffuse, or combined. Re-pigmentation rates did not differ significantly between groups treated with the excimer laser versus NB-UVB. The authors conducted a meta-analysis of the two studies that were not published in English, so results cannot be verified, but they reported that the likelihood of a minimum 50% re-pigmentation rate was significantly higher with the excimer laser, compared with NB-UVB (risk ratio, 1.39, 95% confidence interval [CI], 1.05 to 1.85) and that, in qualitative analysis, neither of these studies showed significant benefit of the excimer laser for achieving a minimum 75% re-pigmentation rate.

Studies addressing targeted phototherapy for treating vitiligo tended to have small sample sizes, few

were designed to isolate the effect of laser therapy, and were heterogeneous (e.g., different interventions or combinations of interventions, and different comparison interventions), making it difficult to pool study findings or to draw conclusions about the efficacy of targeted phototherapy for vitiligo.

Actinic Keratosis

Studies demonstrate that photodynamic therapy with 5-ALA is an effective nonsurgical technique for treating non-hyperkeratotic AKs of the face and scalp, with an acceptable rate of recurrence of 19% over 12 months. In two placebo-controlled RCTs, significantly more patients had complete clearance of AKs of the upper extremities with ALA and blue light, compared to placebo at 12 weeks (Schmieder 2012; Jiang 2019).

Basal Cell Skin Cancer

Lichen Planus

Dawood et al (2022) conducted a retrospective, single-center, cohort study which showed more than half of the 192 studied patients were disease-free for at least 4.8 years after a single course of Narrowband UVB (NB UVB). Younger aged and male patients achieved better outcomes while female patients and patients with lighter skin phototypes appeared to have higher major response rates.

Weber et al (2022) compared NB UVB with psoralen plus UVA photochemotherapy in a retrospective analysis. They reported the therapeutic outcome and the number of treatments required for achieving a complete or good response were comparable for NB-UVB and PUVA. Both were very effective and demonstrated their beneficial use in patients with generalized cutaneous LP. Based on the lower rate of side effects and its greater ease of use, the authors recommended NB-UVB be considered as the first-line phototherapeutic modality for this indication. In non-responding patients or in case of unavailability of NB-UVB, oral or bath PUVA may serve as a valid alternative therapeutic measure.

Port Wine Birthmarks

Sturge-Weber syndrome (SWS) is a neurocutaneous disorder that classically presents with a triad of vascular anomalies affecting the skin, eyes, and brain. Previously, the trigeminal nerve distribution of a PWB of the face was used to identify risk of SWS. However, recent evidence has demonstrated that PWBs are vascular, not neurologic, in embryologic origin, and facial PWBs at highest risk for the brain involvement of SWS involve the forehead location. Furthermore, a PWB involving the upper or lower eyelid carries a risk of glaucoma, which requires lifelong monitoring. The gold standard of treatment for PWB is the pulsed dye laser, which has many advantages when started as early as possible in infancy. Poliner et al (2022) states based on strong evidence, PDL is safe to use in children and is the gold standard of treatment for PWBs. PDL is most effective at fading the PWB when initiated early in infancy, preferably within the first year of life. Initiating treatment at this age also optimizes psychosocial development, minimizes school absenteeism, and minimizes the need for general anesthesia during early treatments.

Sabeti et al (2021) published a consensus statement of guidelines for treating SWS and PWB with

input from 12 nationally peer-recognized experts in dermatology with experience treating patients with SWS. The committee stated Treatment of PWBs is indicated to minimize the psychosocial impact and diminish nodularity and potentially tissue hypertrophy. Better outcomes may be attained if treatments are started at an earlier age. In the US, pulsed dye laser is the standard for all PWBs regardless of the lesion size, location, or color. When performed by experienced physicians, laser treatment can be safe for patients of all ages. The choice of using general anesthesia in young patients is a complex decision that must be considered on a case-by-case basis. These recommendations are intended to help guide clinical practice and decision-making for patients with SWS and those with isolated PWBs and may improve patient outcomes.

Acne

Overall, the literature investigating the use of photodynamic therapy or photopneumatic therapy in the treatment of acne consists of very small studies in which the patient is also the control. These studies lack long-term data on effectiveness and safety. Due to the small sample sizes of the published trials, lack of long-term follow-up, small number of studies on any particular type of laser, and paucity of studies comparing light therapy to standard acne treatments, the evidence is insufficient to draw conclusions about the impact of laser treatments on health outcomes in patients with active acne.

PROFESSIONAL GUIDELINE(S)

The National Institute for Health and Care Excellence (NICE) updated its Clinical Guideline for Psoriasis: Assessment and Management in 2017. The guidelines suggest offering narrowband ultraviolet B (UVB) phototherapy to people with plague or guttate-pattern psoriasis that cannot be controlled with topical treatments alone, to consider psoralen (oral or topical) with local ultraviolet A (PUVA) irradiation to treat palmoplantar pustulosis, and, when considering PUVA for psoriasis (plaque type or localized palmoplantar pustulosis), to discuss other treatment options and associated risk of increased skin cancer.

NICE procedural guidance for photodynamic therapy for non-melanoma skin tumors (including premalignant and primary non-metastatic skin lesions) were released in 2006. They state evidence of efficacy of this procedure for the treatment of basal cell carcinoma, Bowen's disease and actinic (solar) keratosis is adequate to support its use for these conditions. Evidence is limited on the efficacy of this procedure for the treatment of invasive squamous cell carcinoma. Recurrence rates are high and there is a risk of metastasis.

The American Academy of Dermatology and National Psoriasis Foundation guidelines (2019) for the management and treatment of psoriasis with phototherapy state the Goeckerman regimen is an old treatment, there are no RCTs or systematic reviews evaluating its effectiveness and long-term risks. Photo carcinogenesis is a theoretical risk but has not been demonstrated despite long-term follow-up. The most common reported adverse effects have been local burning as a result of tar sensitivity ("tar smarts"). The necessary time investment on the part of the patient is a disadvantage of Goeckerman therapy, and outpatient treatment requires close proximity to a capable medical facility. The relatively rapid and robust clinical response seen with the Goeckerman regimen, the long duration of remission,

and the low adverse effect profile render Goeckerman therapy an attractive option for the treatment of psoriasis, particularly for those with resistant disease. Because of the messy and cumbersome nature of tar application and the wide availability of highly effective NB-UVB, the Goeckerman regimen is no longer commonly used. Despite this, there is ample evidence to recommend this treatment for psoriasis.

The American Academy of Dermatology published guidelines for the management of Atopic Dermatitis recommend phototherapy as a second-line treatment, after failure of first-line treatment (emollients, topical steroids, and topical calcineurin inhibitors) (Davis 2024). Phototherapy can be used as maintenance therapy in patients with chronic disease. The light modality chosen should be guided by factors such as availability, cost, patient skin type, skin cancer history, and patient use of photosensitizing medications. Home phototherapy under the direction of a physician may be considered for patients who are unable to receive phototherapy in an office setting. Most current literature reports on the efficacy and safety of narrow band UVB. Wherever possible, use a light source that minimizes the potential for harm under the supervision of a qualified clinician.

In 2007, the International Society for Photodynamic Therapy in Dermatology published consensus-based guidelines on the use of PDT for nonmelanoma skin cancer. Based on efficacy and cosmetic outcome, the authors recommended PDT as a first-line therapy for actinic keratosis (Braathen 2007). The guideline recommended photodynamic therapy for superficial basal cell carcinoma as "a viable alternative when surgery would be inappropriate, or the patient or physician wishes to maintain normal skin appearance" and concludes that photodynamic therapy is at least as effective as cryotherapy or 5-FU for Bowen's disease. The authors found insufficient evidence to support the routine use of topical photodynamic therapy for squamous cell carcinoma.

In a 2021 Executive Summary, the American Academy of Dermatology published guidelines for the care and management of actinic keratosis [AK], which included conditional recommendations for the use of ALA red-light PDT or ALA blue-light PDT treatment for AKs and considered the associated risks of skin irritation, pain and cosmesis to represent a minimal potential for harm (Eisen). They highlighted the conditional recommendation is based on limited quality of evidence, however, noted that there is evidence suggesting complete clearance of AK with repeated treatment of ALA-PDT.

The National Comprehensive Cancer Network (NCCN) Clinical Practice Guidelines for basal cell skin cancer (NCCN 2025) indicate, that while cure rates are approximately 10% lower than for surgical treatment modalities, topical therapies including topical imiquimod, topical 5-fluroruracil (5-FU), photodynamic therapy (e.g., aminolevulinic acid [ALA], porifimer sodium) or cryotherapy may be considered as well as recommended when surgery is contraindicated or impractical. The guidelines report that most studies have focused on the superficial and nodular histologic subtypes, and several have found higher cure rates for superficial versus nodular subtypes in both low- and high-risk locations. Compared to other superficial therapies, PDT has similar efficacy as cryotherapy but with much better cosmetic outcomes. The literature has demonstrated varied results in comparison of PDT and imiquimod.

The NCCN Clinical Practice Guidelines for Squamous Cell Skin Cancer (NCCN 2025) state in patients with cutaneous squamous cell cancer (CSCC) in situ (Bowen disease), therapies such as

photodynamic therapy (e.g., ALA, Porfimer sodium) may be considered. PDT wit photosensitizing agents including methyl aminolevulinate (MAL) and 5-aminolevulinic acid (ALA) or porfimer sodium is another option for superficial SCC. MAL is no longer produced in the United States.

The NCCN Clinical Practice Guidelines for Primary Cutaneous Lymphoma (NCCN 2025) state UVB, including narrowband-UVB and PUVA/UVA are effective treatment options for patients with early-stage MF. Narrowband-UVB is the most common phototherapy approach and less skin damaging than PUVA/UVA. While some retrospective studies have reported that PUVA results in better responses and improved disease-free survival, others have reported that UVB is as effective as PUVA for the treatment of early-stage MF. It may be beneficial to start with narrowband-UVB than PUVA in patients with early patch stage or thin plaque disease since narrowband-UVB has less skin toxicity than broadband UVB and PUVA.

The European Academy of Dermatology and Venereology released guidelines on the management of lichen planus which state squamous cell carcinoma may arise from mucosal lesions (mouth, vulva, penile) and hypertrophic LP lesions (distal extremities) (Ioannides 2020). Case reports of SCC emerging from hypertrophic cutaneous LP lesions or chronic anogenital or esophageal lesions have been described. Persistent ulcers/lesions should undergo biopsy, particularly when resistant to therapy. Infections, osteoporosis, adrenal insufficiency, bone marrow suppression, renal damage and hyperlipidemia may occur due to medication. Lichen planus is a chronic disease, and the primary focus of treatment is to control symptoms and minimize damage. The treatment should be associated with the severity of the disease and the less possible side-effects and should improve the patients' quality of life. First line treatment for cutaneous LP includes topical medications. When LP persists second-line treatments recommended are broadband or narrowband UVB, and combination of UV and acitretin. Third line treatment includes photodynamic therapy and Nd-YAG laser, low-dose 308 nm excimer laser.

The American Academy of Pediatrics clinical practice guidelines for the management of infantile hemangiomas (IH) state there is a window of opportunity to treat problematic IHs (Krowchuck 2019). Consult early (by 1 month of age) for lesions that are potentially high risk because of potential for disfigurement, life-threatening complications, functional impairment, ulceration and underlying abnormalities. Surgery and/or laser treatment are most useful for the treatment of residual skin changes after involution. They may be used earlier to treat selected His. PDL has been used for several decades to treat IHs. There is wide recognition that PDL is effective and safe in removing residual macular erythema and superficial telangiectasias in involuting or involuted IHs, but it often requires several treatments to achieve optimal results.

American Academy of Dermatology 2024 guidelines for care of Acne Vulgaris state the available evidence is insufficient to develop a recommendation on the use of acne lesion/comedo extraction, laser and light-based devices, or photodynamic therapy with aminolevulinic acid for the treatment of acne (Reynolds). This includes 585-595 nm pulsed dye laser, neodymium-doped yttrium aluminum garnet laser, 1450 diode laser, potassium titanyl phosphate laser, infrared light-emitting diode, 635-670 nm red light, combined 420 nm blue light and 660 nm red light, 589 nm/1319 nm laser, or intense pulsed light. The ADD also conditionally recommends against adding pneumatic broadband light to adapalene 0.3% gel based on low certainty evidence from one (1) study. Adding pneumatic

broadband light to adapalene did not reduce acne lesion counts and was associated with risks of hyperpigmentation and purpura (Tangjaturonrusamee 2016).

REGULATORY STATUS

The United States Food and Drug Administration (FDA) regulates lasers and phototherapy as medical devices. All lasers and phototherapy including related components require FDA approval before marketing and use in the United States to ensure they are safe and effective for human use. Refer to the FDA Medical Device website. Available from: https://www.fda.gov/medical-devices [accessed 2025 Sep 16]

CODE(S)

- Codes may not be covered under all circumstances.
- Code list may not be all inclusive (AMA and CMS code updates may occur more frequently than policy updates).
- (E/I)=Experimental/Investigational
- (NMN)=Not medically necessary/appropriate

CPT Codes

Code	Description
10040 (*E/I)	Acne surgery (e.g., marsupialization, opening or removal of multiple milia, comedones, cysts, pustules) *E/I when utilized for TheraClear Acne System
17106	Destruction of cutaneous vascular proliferative lesions (e.g., laser technique); less than 10 sq cm
17107	Destruction of cutaneous vascular proliferative lesions (e.g., laser technique); 10.0 to 50.0 sq cm
17108	Destruction of cutaneous vascular proliferative lesions (e.g., laser technique); over 50.0 sq cm
96567	Photodynamic therapy by external application of light to destroy premalignant lesions of the skin and adjacent mucosa with application and illumination/activation of photosensitive drug(s), per day
96573	Photodynamic therapy by external application of light to destroy premalignant lesions of the skin and adjacent mucosa with application and illumination/activation of photosensitizing drug(s) provided by a physician or other qualified health care professional, per day
96574	Debridement of premalignant hyperkeratotic lesion(s) (i.e., targeted curettage, abrasion) followed with photodynamic therapy by external application of light to destroy premalignant lesions of the skin and adjacent mucosa with application and illumination/activation of photosensitizing drug(s) provided by a physician or other

Code	Description
	qualified health care professional, per day
96900	Actinotherapy (ultraviolet light)
96910	Photochemotherapy; tar and ultraviolet B (Goeckerman treatment) or petrolatum and ultraviolet B
96912	Photochemotherapy; psoralens and ultraviolet A (PUVA)
96913	Photochemotherapy (Goeckerman and/or PUVA) for severe photoresponsive dermatoses requiring at least 4-8 hours of care under direct supervision of the physician (includes application of medication and dressings)
96920	Excimer laser treatment for psoriasis; total area less than 250 sq cm
96921	Excimer laser treatment for psoriasis; 250 sq cm to 500 sq cm
96922	Excimer laser treatment for psoriasis; over 500 sq cm

MEDICAL POLICY

Medical Policy Title	**Limb Pneumatic Compression Devices for Venous Thromboembolism Prophylaxis**
Policy Number	**1.01.51**
Current Effective Date	**September 1, 2026**
Next Review Date	**September 2027**

Our medical policies are guides to evaluate technologies or services for medical necessity. Criteria are established through the assessment of evidence based, peer-reviewed scientific literature, and national professional guidelines. Federal and state law(s), regulatory mandates and the member's subscriber contract language are considered first in the determination of a covered service. (Link to Product Disclaimer)

POLICY STATEMENT(S)

I. Pneumatic compression device(s) are considered **medically appropriate** for venous thromboembolism (VTE) prophylaxis in the home when **ALL** the following are met:

   A. When used after major surgery (e.g. refers to procedures associated with a moderate to high risk of postoperative VTE ie: orthopedic, abdominal, pelvic, cancer, and trauma procedures and does not include minor outpatient procedures with immediate return to ambulation;

   B. When pharmacological prophylaxis is contraindicated due to an established risk factor documented in the medical records (e.g., risk for bleeding- see Policy Guidelines);

   C. Post-surgical use is up to 30 days.

II. Use of pneumatic compression device for prevention of venous thromboembolism (VTE), other than as described in Policy Statement I., is considered **not medically necessary**.

RELATED POLICIES

Corporate Medical Policy

1.01.17 Powered Compression Devices/Lymphedema Pumps

POLICY GUIDELINE(S)

I. Major orthopedic surgery includes total hip arthroplasty (THA), total knee arthroplasty (TKA), or hip fracture surgery (HFS).

II. The American College of Chest Physicians (ACCP) guidelines on prevention of venous thromboembolism (VTE) in orthopedic surgery patients list the following general risk factors for bleeding (Falck-Ytter 2012):

   A. Previous major bleeding (and previous bleeding risk similar to current risk);

   B. Severe renal failure;

   C. Concomitant antiplatelet agent; and

Proprietary Information of Capital District Physicians' Health Plan, Inc. | CDPHP Universal Benefits,® Inc. | Capital District Physicians' Healthcare Network, Inc.

D. Surgical factors: history of, or difficult-to-control, surgical bleeding during the current operative procedure, extensive surgical dissection, and revision surgery.

DESCRIPTION

Antithrombotic prophylaxis is recommended for surgical patients who are at moderate to high risk of postoperative VTE, which includes deep vein thrombosis (DVT) and pulmonary embolism (PE). Individuals may be classified as being moderate to high risk of VTE based on the surgical procedure and/or individuals characteristics. Mechanical prophylaxis using an intermittent pneumatic compression (IPC) device has been utilized as an adjunct or alternative to anticoagulation in the home setting for individuals in the postoperative period as a method to reduce VTEs.

For certain types of surgery, such as major orthopedic surgery (i.e., total knee arthroplasty, total hip arthroplasty, and hip fracture surgery), there is a particularly high risk of VTE due to the nature of the procedures and the prolonged immobility during and after surgery. Other surgical procedures vary in degree of increased risk of VTE and include abdominal surgery, pelvic surgery, cancer surgery, and surgery for major trauma. Numerous individual-related risk factors, such as increasing age, prior VTE, increasing body mass index (BMI), genetic predisposition, malignancy, pregnancy, and significant comorbidities, can be used in conjunction with the type of surgery to determine risk.

Pharmacologic prophylaxis is effective at reducing postoperative VTE, however, it has risks such as bleeding, allergic reactions, and development of heparin antibodies. Contraindications to pharmacologic prophylaxis include previous intolerance to these agents and increased risk of bleeding.

Pneumatic compression devices for prevention of DVT include various types of wraps for the arms or legs and a programmable control module. The wraps of some of these devices can provide cooling or heating to the extremity. Examples of devices that can be used in the home after discharge include the VascuTherm2 (Thermotek, Inc) and the Triple Play VT (Compression Solutions, Inc).

SUPPORTIVE LITERATURE

Studies involving the use of compression devices post-operatively are limited. The studies are often small and non-randomized, with considerable variation in comparison studies by type of compression stocking and intermittent compression device used, patient group, DVT detection method, and prophylaxis protocol. Many of the studies are in the setting of the hospital, rather than outpatient; consequently, conclusions from the hospital setting may not be able to be applied to the outpatient setting. In the outpatient setting, there are questions about the degree of compliance with the devices, including the ability to correctly use them in the absence of professional supervision.

Pneumatic Compression

Snyder et al (2017) conducted a randomized control trial that assessed the difference in the rate of deep venous thrombosis (DVT) following total knee arthroplasty (TKA) using aspirin (ASA)-based prophylaxis with or without extended use of mechanical pneumatic compression device (PCD) therapy. One hundred patients undergoing TKA, were placed on ASA for three weeks and were

randomized to receive PCD during hospitalization only or extended use at home up to six weeks post-operatively. Lower extremity Duplex venous ultrasonography was used to diagnose DVT at different time intervals. The rate of DVT was significantly lower for patients receiving extended use of PCD at 0% compared to 23.1% for those with inpatient use of PCD ($p < 0.001$).

Wang et al (2020) aimed to address the controversy whether the use of ICP is a more effective form of thromboprophylaxis than anticoagulants in individuals undergoing neurosurgery. The authors report that direct comparisons are difficult given the sparse and inconsistent studies; therefore, they summarized and compared the efficacy and safety of IPC and anticoagulants for the prevention of VTE in adults. The analysis included 18 trials comprising 2,474 patients. Both IPC and chemical prophylaxis were found to be more efficacious than the placebo in reducing the risk of DVT. Both IPC and chemical prophylaxis reduced the risk of pulmonary embolism (PE) significantly more than the placebo. Based on the available evidence of moderate-to-good quality, IPC is equivalent to anticoagulants for thromboprophylaxis in terms of efficacy. Evidence to support or negate the use of pharmacological prophylaxis in terms of safety is lacking. The results of ongoing and future large randomized clinical trials are needed.

Dietz et al (2022) conducted a randomized trial of aspirin alone (n=40) or aspirin/mobile compression pumps (n=40) after total joint arthroplasty was performed. Each group had greater than 94% compliance with aspirin use, with no difference between groups (P=0.55). Overall pump compliance during the first 14 days after hospital discharge was 51% (SD ± 33), which was significantly worse than aspirin compliance at 99% (SD ± 4.1) (P< 0.0001). Only 10 patients were compliant (>20 hr/d) with recommended pump use throughout the entire recommended period. There was no notable association between aspirin compliance and VTE within 90 days. There was no notable association between pump compliance and VTE at 90 days. However, average pump use compliance was 20% in patients with VTE and 54% in patients without VTE within 90 days. With the numbers available in this compliance study, there was no significant difference (P=0.11). The authors concluded that further study is warranted to define the duration of pump use required for clinical significance. The recommended use of compression pumps should continue to be examined.

Haykal et al (2022) report that critically ill patients (patients treated in a medical or surgical intensive care unit) are at high risk of venous thromboembolism (VTE) development (deep vein thrombosis [DVT] and/or pulmonary embolism). A meta-analysis of 5 RCTs (n=3,133 patients) evaluated the efficacy of intermittent pneumatic compression (IPC) prophylaxis in the lower limb compared with no treatment, anticoagulant use, or their combinations in reducing risk. There was a significant reduction of the incidence of VTE events when no treatment was compared with IPC, anticoagulation alone, or anticoagulation with IPC. In addition, there was a significant reduction in DVT when no treatment was compared with IPC, anticoagulation alone, or anticoagulation with IPC. However, there were no significant differences between other comparisons (IPC vs anticoagulation alone, anticoagulation alone vs anticoagulation with IPC, or anticoagulation with IPC vs IPC alone) regarding VTE or DVT incidence. Among critically ill patients, IPC alone, anticoagulation alone, and IPC with anticoagulation were associated with a significant reduction of VTE and DVT incidence compared with no treatment. However, there was no significant difference between these modalities when compared together.

Therefore, further larger studies comparing those different thromboprophylaxis modalities and their combinations are needed to provide more robust results for future clinical recommendations.

Non-Pneumatic Compression Devices

Labropoulos et al (2021) conducted a small (n=20) pilot, single-center, prospective comparative study to determine the potential ability of the Movement and Compression (MAC) System (Recovery Force USA) nonpneumatic compression device to favorably alter venous hemodynamics compared with pneumatic compression devices routinely available in clinical practice and to serve as a prequel to clinical studies evaluating its efficacy in preventing VTE. The researchers measured and compared the common femoral vein peak blood flow velocity, rise time to peak flow, and calculated peak flow velocity compared with baseline for five currently available mechanical compression devices using duplex ultrasonography in a group of subjects with different leg sizes. The peak flow velocity, compared with the baseline measurements, was significantly greater for the MAC System for three of the four comparisons (P<.001). The MAC had a significantly (P< .001) faster rise time to peak flow compared with the comparison devices. It was the only device to achieve the target peak flow velocity over baseline of at least three times in every body mass index group. Finally, the MAC System met the goal of <2.5 centimeters of device movement after ambulation in 100% of the measurements, with 75% of the measurements showing no movement of the device. The study is limited by the study design and lack of follow-up. The authors concluded that the device has promising performance, and the ability for the patient to remain mobile may allow for better compliance. Further studies are warranted.

PROFESSIONAL GUIDELINE(S)

In 2012, the American College of Chest Physicians (ACCP) published several clinical practice guidelines with recommendations on the use of postoperative intermittent pneumatic limb compression.

- Gould et al (2012) recommend the use of limb compression devices in general/non-orthopedic and abdominal-pelvic surgical patients who are at any risk for bleeding, rather than no prophylaxis or in addition to pharmacologic prophylaxis.
- Falck-Ytter et al (2012) recommended ICP for the prevention of VTE in orthopedic surgery patients for a minimum of 10-14 days rather than no antithrombotic prophylaxis (Grade 1C). The suggestion to extend prophylaxis to 35 days for patients undergoing major orthopedic surgery was a weak recommendation (Grade 2B) and did not specifically mention limb compression devices as a therapy option.
- Kahn et al (2012) suggest against the routine use of thromboprophylaxis in chronically immobilized people in a home setting.

In 2019, the American Society of Clinical Oncology (ASCO) released updates to the clinical practice guideline on VTE prophylaxis and treatment in individuals with cancer (Key 2019) recommending:

- Mechanical methods may be added to pharmacologic thromboprophylaxis but should not be

used as monotherapy for VTE prevention unless pharmacologic methods are contraindicated because of active bleeding or high bleeding risk. (Evidence quality: intermediate; Strength of recommendation: strong).

- A combined regimen of pharmacologic and mechanical prophylaxis may improve efficacy, especially in the highest-risk individuals. (Evidence quality: intermediate; Strength of recommendation: moderate)

In 2021, the American College of Obstetricians-Gynecologists (ACOG) published an updated practice bulletin on the prevention of VTE in gynecologic surgery, including the following recommendations:

- For gynecologic surgery patients who are at high risk of VTE and average risk of bleeding complications, dual thromboprophylaxis with a combination of mechanical prophylaxis (preferably with intermittent pneumatic compression) and pharmacologic prophylaxis. (Level A evidence)
- For gynecologic surgery patients at low risk of VTE, mechanical thromboprophylaxis (preferably with intermittent pneumatic compression) is recommended. Graduated compression stockings are a reasonable alternative if intermittent pneumatic compression is not available or is not preferred by the patient. Mechanical prophylaxis devices should be placed before initiation of surgery and continued until the patient is fully ambulatory. (Level B evidence)
- For gynecologic surgery patients who are at moderate risk of VTE and high risk of major bleeding complications, mechanical prophylaxis (preferably with intermittent pneumatic compression) is recommended. (Level B evidence)
- For gynecologic surgery patients at high risk of VTE for whom both LMWH and low-dose unfractionated heparin are contraindicated, or not available, mechanical prophylaxis alone (preferably with intermittent pneumatic compression) is recommended until the risk of bleeding diminishes. (Level B evidence)

In 2022, the International Consensus Meeting (ICM) brought together over 600 experts spanning a range of countries and medical professionals to conduct a comprehensive review of the literature and to generate practical recommendations for VTE prophylaxis across all type of orthopedic procedures. Published recommendations include:

- ICM-VTE general practice guidelines (2022a), 95% of the expert panel agreed that intermittent compression devices (ICD) provide protection against VTE development following orthopedic surgery. Utilizing these devices has been shown to be an effective prophylactic measure. The guideline did not address duration of use postoperatively. Noting that although portable IPC has shown effective mechanical prophylaxis for VTE after THA and TKA, the evidence is limited due to confounding variables.
- ICM-VTE hip and knee guidelines (2022b), 92% of the expert panel agreed that mechanical compressive devices can be used routinely in patients undergoing total hip arthroplasty (THA) or total knee arthroplasty (TKA) as venous thromboembolism (VTE) prophylaxis. However, further research should aim to clarify the most appropriate devices, duration of use, as well as

synergistic relationships with pharmacological agents. Furthermore, 82% of the expert panel agree that it appears that coadministration of aspirin (ASA) with pneumatic compression devices (PCD) may be more effective than ASA alone in prevention of venous thromboembolism (VTE) following total joint arthroplasty (TJA).

In 2023, the American Society of Clinical Oncology (ASCO) released an updated clinical practice guideline on VTE prophylaxis and treatment in patients with cancer (Key 2023). The guideline makes the following recommendations for thromboprophylaxis in this population:

- All patients with malignant disease undergoing major surgical intervention should be offered pharmacologic thromboprophylaxis unless contraindicated.
- Pharmacologic thromboprophylaxis for patients undergoing major surgery for cancer should be continued for at least 7-10 days.
- Extended pharmacologic thromboprophylaxis for up to 4 weeks postoperatively should be offered to patients undergoing major open or laparoscopic abdominal or pelvic surgery for cancer who have high-risk features, such as restricted mobility, obesity, history of VTE, or additional risk factors. In lower-risk surgical settings, the decision on appropriate duration of thromboprophylaxis should be made on a case-by-case basis.
- Mechanical methods may be added to pharmacologic thromboprophylaxis but should not be used as monotherapy for VTE prevention unless pharmacologic methods are contraindicated because of active bleeding or high bleeding risk (Type: evidence based; Evidence quality: intermediate; Strength of recommendation: strong).

In 2024, the American Pediatric Surgical Association Outcomes and Evidence-Based Practice Committee conducted a systematic review to describe the epidemiology of venous thromboembolism (VTE) in pediatric surgical and trauma patients and develop recommendations for screening and prophylaxis (Kelley-Quon 2024). Twenty-four manuscripts addressed mechanical prophylaxis of VTE in children.

- Recommendations for use are mostly extrapolated from adult data that support the use of sequential compression devices (SCDs) for reducing the risk of lower limb DVT; however, there is no evidence that antiembolism stockings decrease the risk of VTE in adult medical inpatients.
- For adolescents who have undergone major surgery, healthcare providers should consider SCDs in children at-risk for VTE when non-mobile only if an appropriately sized device is available.

According to the 2025 National Comprehensive Cancer Network (NCCN) guidelines for supportive care in cancer-associated venous thromboembolic (VTE) disease, hospitalized cancer patients should receive VTE prophylaxis with mechanical intermittent pneumatic compression (IPC) when anticoagulation is contraindicated. IPC for VTE prophylaxis following discharge or for at-risk ambulatory patients with cancer is not addressed in the guidelines. (V.1.2026)

REGULATORY STATUS

The U.S. Food and Drug Administration (FDA) regulates Limb Pneumatic Compression Devices as medical devices. All Limb Pneumatic Compression Devices including related components require FDA approval before marketing and use in the United States to ensure they are safe and effective for human use. Refer to the FDA Medical Device website. Available from: https://www.fda.gov/medical-devices [accessed 2026 Aug 24]

The FDA lists the most serious type of medical device recalls as well as early alert communications about corrective actions being taken by companies that the FDA believes are likely to be the most serious type of recalls. Available from: Medical Device Recalls | FDA [accessed 2026 Aug 24]

CODE(S)

- Codes may not be covered under all circumstances.
- Code list may not be all inclusive (AMA and CMS code updates may occur more frequently than policy updates).
- (E/I)=Experimental/Investigational
- (NMN)=Not medically necessary/appropriate

MEDICAL POLICY

Medical Policy Title	**Liver Transplantation**
Policy Number	**7.02.07**
Current Effective Date	**7/1/2026**
Next Review Date	**November 2026**

Our medical policies are based on the assessment of evidence based, peer-reviewed literature, and professional guidelines. Eligibility for reimbursement is based upon the benefits set forth in the member's subscriber contract. (Link to Product Disclaimer)

POLICY STATEMENT(S)

I. Liver transplantation for selected individuals with end-stage liver disease is considered **medically appropriate** for **ANY** of the following indications when criteria are met:

A. Hepatocellular diseases:

1. Alcoholic cirrhosis;
2. Viral hepatitis;
3. Autoimmune hepatitis;
4. Alpha-1 antitrypsin deficiency;
5. Hemochromatosis;
6. Non-alcoholic steatohepatitis cirrhosis/ metabolic dysfunction-associated steatohepatitis (MASH);
7. Protoporphyria; or
8. Wilson's disease;

B. Cholestatic liver diseases:

1. Primary biliary cirrhosis;
2. Primary sclerosing cholangitis with development of secondary biliary cirrhosis; or
3. Biliary atresia;

C. Vascular disease:

1. Budd-Chiari syndrome;

D. Primary hepatocellular carcinoma when:

1. Disease is organ confined, and the patient is not a candidate for subtotal liver resection;

E. Inborn errors of metabolism;

F. Trauma and toxic reactions;

G. Nonresectable hilar (extrahepatic) cholangiocarcinoma and as part of a neoadjuvant

Proprietary Information of Capital District Physicians' Health Plan, Inc. | CDPHP Universal Benefits,® Inc. | Capital District Physicians' Healthcare Network, Inc.

chemoradiation protocol when:

1. Absence of metastatic disease, **and**
2. For localized hilar tumors Stage I or II;

H. Nonresectable intrahepatic cholangiocarcinoma when:

1. Absence of metastatic disease confirmed by a staging laparoscopy or laparotomy; **and**
2. When combined with neoadjuvant chemoradiation;

I. Hepatoblastoma (non-metastatic):

J. Polycystic disease of the liver; **or**

K. Familial amyloid polyneuropathy.

II. Recipient Selection Guidelines

A. Cadaver Liver Recipient:

1. Model for End-stage Liver Disease (MELD) score equal to or greater than 9 (UNOS adjusts the MELD score for patients with hepatocellular cancer by adding points to their scores).
2. Patients with polycystic disease of the liver do not always develop progressive liver failure but may require transplantation due to the anatomic complications of a hugely enlarged liver. The MELD/PELD score may not apply to these cases. One of the following complications should be present:
   a. Enlargement of liver impinging on respiratory function;
   b. Extremely painful enlargement of liver; **or**
   c. Enlargement of liver significantly compressing and interfering with function of other abdominal organs.
3. The MELD/ Pediatric End-stage Liver Disease (PELD) score may apply to patients with amyloid polyneuropathy. Candidacy for liver transplant is an individual consideration based on the morbidity of the polyneuropathy. Many patients may not be candidates for liver transplant alone due to coexisting cardiac disease.

B. Living Donor Recipient:

1. MELD score equal to or greater than 9 and less than or equal to 25; and
2. Listed on the cadaveric liver transplant waiting list; **and**
3. Has suffered at least one (1) significant complication related to liver disease (e.g., variceal hemorrhage, spontaneous bacterial peritonitis, encephalopathy, or severe impairment to his or her quality of life due to, for example, fatigue, pruritis).

III. Contraindications to Liver Transplantation

A. Cadaveric Organ Recipient:

1. Relative contraindications include:

a. Major co-morbid illnesses such as ischemic heart disease, severe peripheral vascular disease, congestive cardiomyopathy, moderately severe COPD;

b. HIV infection unless **ALL** of the following criteria are met:

i. CD4 count greater than 100 cells/mm^3 for non-hepatitis C patients, greater than 200 cells/mm^3 for patients with hepatitis C;

ii. HIV-1RNA undetectable;

iii. On stable anti-retroviral therapy greater than 3 months;

iv. No other complications from AIDS (e.g., opportunistic infection, including aspergillus, tuberculosis, coccidioidomycosis; resistant fungal infections, Kaposi's sarcoma, or other neoplasm); **and**

v. Meets all other criteria for transplantation;

c. Presence of malignancy within 5 years of transplantation (other than non-melanoma skin cancers), or unless malignancy has been completely resected, or unless (upon medical review) it is determined that malignancy has been treated with small likelihood of recurrence and acceptable future risks;

d. Ongoing or recurring infections that are not effectively treated;

2. Absolute contraindications: uncontrolled behavioral health disorder that manifests in behaviors that that interfere with the patient's capacity to comply with surgical and follow-up management including but not limited to alcohol or substance abuse and major thought disorder.

B. Living Donor Organ Recipient:

1. Hepatocellular carcinoma if:

a. There is evidence of metastatic disease;

b. The recipient can expect less than a one-year disease-free outcome;

2. Simultaneous combined liver/kidney transplantation (however, in cases involving hyperoxalosis or other specific metabolic disorders, special consideration should be given to allowing simultaneous liver/kidney transplantation from two different donors).

IV. Living Donation Guidelines

A. Donor selection must be consistent with the New York State Department of Health, updates to that report, and relevant regulatory requirements.

B. Donor should be "emotionally related" to recipient (e.g., relative, previous known or current

acquaintance).

7.02.05 Small Bowel and Multvisceral Transplants in Adults and Children

POLICY GUIDELINE(S)

I. Prior authorization is contract dependent. Approvals for all transplants, including arrangements with an approved transplant center, may be required.

II. Pre-transplant evaluation documentation could include the following clinical information. If testing is unable to be performed, the rationale for not performing the testing must be included in the documentation.

A. Clinical Evaluation:

1. Confirmation of diagnosis;
2. Identification of comorbidities;
3. Treatment of co-morbidities;
4. Current assessment of co-morbidities;
5. Consult notes (if applicable).

B. Psycho-Social Evaluation:

1. Karnofsky performance score or Palliative Performance Scale (PPS) score.
2. Identification of stressors (family support, noncompliance issues, motivational issues, alcohol, or substance abuse).

C. Oral Health Evaluation

D. Lab Tests:

1. CBC, metabolic profile;
2. Serologies: CMV, Hepatitis B and C;
3. HIV Testing.

E. Cardiac Assessment:

1. 12 Lead EKG;
2. Stress (exercise, nuclear, or dobutamine);
3. Echo or Muga Scan.

F. Pulmonary Assessment:

Proprietary Information of Capital District Physicians' Health Plan, Inc. | CDPHP Universal Benefits,® Inc. | Capital District Physicians' Healthcare Network, Inc.

1. Chest X-ray;
2. Pulmonary function tests (PFTs) for high-risk for respiratory failure (COPD, emphysema, a-1-antritrypsin deficiency, hepatopulmonary syndrome, or significant smoking history);
3. Low dose screening CT for individuals considered high-risk for lung cancer (e.g., 20-30 pack history of smoking).

G. Age-Appropriate Screening Tests: Please refer to the U.S Preventive Services Task Force (USPSTF) website for list of age-appropriate screening guidelines. Available from: https://uspreventiveservicestaskforce.org/uspstf/ [accessed 2025 Oct 24]

III. Re-authorization

Transplant re-authorization must be completed annually while actively waiting for a transplant. Re-authorization documentation must be within the past 11 months (unless specified) and include the following clinical information (if testing is unable to be performed, the rationale must be included in the documentation). If your health condition has not changed from the previous year some testing would not be applicable.

A. Clinical Evaluation:
   1. Updated list of diagnoses to include identification of comorbidities, current assessment, and treatment plan.
   2. Specialty consultation notes (if applicable).

B. Current functional ability as evidence by current Karnofsky performance score (KPS); or Palliative Performance Scale (PPS) score.

C. Follow-up Oral Health Evaluation.

D. Lab Tests:
   1. CBC, metabolic profile;
   2. Serologies: CMV Hepatitis B and C; and
   3. HIV testing (If applicable).

E. E. Cardiac Assessment:
   1. 12 Lead EKG (If applicable); and
   2. Stress (exercise, nuclear, or dobutamine) (If applicable),
   3. Echo or Muga scan (If applicable).

F. Pulmonary Assessment:
   1. Chest x-ray (If applicable);
   2. Pulmonary function tests (PFTs) for high-risk for respiratory failure (COPD, emphysema, a-1-antritrypsin deficiency, hepatopulmonary syndrome, or significant smoking history)

(If applicable);

3. Low-dose screening CT for individuals considered high-risk for lung cancer (e.g., 20- to 30-pack history of smoking.

G. Age-appropriate Screening Tests: Please refer to the U.S Preventive Services Task Force (USPSTF) website for list of age-appropriate screening guidelines. Available from: https://www.uspreventiveservicestaskforce.org/uspstf/ [accessed 2025 Oct 24]

IV. Candidates who have end stage disease related to or impacted by alcohol consumption, including viral hepatitis, must demonstrate a period of abstinence through clinical treatment records (e.g., PCP, alcohol treatment programs). If the patient has been abstinent less than one month, a medical director consultation with the transplant center behavioral health team is required which includes an assessment by a trained Alcohol and Addiction Professional. The assessment should include history of addiction, harmful drinking patterns, awareness of harmful drinking by the patient, social environment along with family support, any identifiable psychiatric issues, and post-transplantation rehabilitation planning.

V. Candidates may be waitlisted at more than one transplant center. Since waiting time priority is first calculated among candidates at all hospitals within the local donation area, listing at transplant centers in different local allocation areas is recommended. Requirements for multiple-listed candidates may vary among transplant centers. When possible, results of tests used in the evaluation for the transplant at one center should be used at subsequent centers where the patient is listed.

DESCRIPTION

A liver transplant consists of replacing a diseased liver with a healthy liver or a segment of a healthy liver. Transplanted organs are harvested from either a cadaver (brain-dead donor) or from a living donor. In a living donor liver transplantation (LDLT) a portion of the liver is surgically removed from a healthy living person and placed into an individual whose liver is no longer working properly. The donor's remaining liver regrows and returns to its normal size, volume, and capacity within a couple of months after the surgery. At the same time, the transplanted liver portion grows and restores normal liver function in the recipient. Liver transplantation is currently the treatment of last resort for patients with end-stage liver disease.

The United Network for Organ Sharing (UNOS) uses the Model for End-stage Liver Disease (MELD) and Pediatric End-stage Liver Disease (PELD) criteria. Candidates who are less than 12 years old receive a PELD score, while candidates who are at least 12 years old receive a MELD score. These are calculated using a combination of the candidate's clinical lab values and reflect the probability of death on the waitlist within a 90-day period. Higher scores indicate a higher probability of mortality and increased urgency for transplant. Candidates that are considered urgent are assigned status 1A or 1B. MELD and PELD score ranges from six (6) to 40.

MELD calculator available from: https://optn.transplant.hrsa.gov/resources/allocation-calculators/meld-calculator/ [accessed 2025 Oct 24]

PELD calculator available from: https://optn.transplant.hrsa.gov/resources/allocation-calculators/peld-calculator/ [accessed 2025 Oct 24]

Donor morbidity and mortality are prime concerns in adult donors undergoing partial hepatectomy. Subjecting healthy donors to the risks of surgery, especially considering uncertain long-term outcomes, can be justified only in clinical circumstances in which the potential recipient has a compelling need for a living donor transplant; such as when a liver transplantation is the only therapeutic option, and a cadaveric transplantation is impossible or problematic for reasons such as anticipated waiting times. Due to the scarcity of donor organs and the success of living donation between parent and child, adult-to-adult living donor liver transplantation offers an option for appropriately screened recipients and donors.

SUPPORTIVE LITERATURE

Mazzaferro et al (1996) developed criteria to better determine which patients with hepatocellular carcinomas and cirrhosis were more likely to have better outcomes after liver transplant. They studied 48 patients with cirrhosis who had small, unresectable hepatocellular carcinomas and underwent treatment with liver transplant. The criteria for eligibility for transplantation were the presence of a tumor 5 cm or less in diameter in patients with single hepatocellular carcinomas and no more than three tumor nodules, each 3 cm or less in diameter, in patients with multiple tumors, with no evidence of macrovascular invasion or metastasis. They found that liver transplantation was an effective treatment for small, unresectable hepatocellular carcinomas in patients with cirrhosis, as their cohort demonstrated excellent long-term outcomes. Their protocol became known as the Milan Criteria and have been adopted by the American Association for the Study of Liver Diseases (AASLD).

Li et al (2025) published a meta-analysis which aimed to analyze liver transplant (LT) selection criteria through overall survival outcomes from post-operative data of patients with differing severity levels of acute-on-chronic liver failure (ACLF). They classified the severity grades according to the European Association for the Study of the Liver criteria. A total of 28,025 participants were included and the ACLF grades analysis showed that 33.7% of the patients were classified as ACLF-1, 35.1% as ACLF-2, and 31.2% as ACLF-3. Patients with ACLF-1 and ACLF-2 demonstrated favorable survival outcomes within one year, with survival rates reaching 87% [95% confidence interval (CI): 84%-91%] and 86% (95%CI: 81%-91%), respectively. Despite the relatively lower survival (73%, 95%CI: 66%-80%) and higher incidence of infection (48%, 95%CI: 29%-67%) observed in ACLF-3 patients, their survival exceeds those who do not undergo LT. Post-transplant survival was highest in North America across all ACLF grades.

PROFESSIONAL GUIDELINE(S)

The American Association for the Study of Liver Diseases (AASLD) and the American Society of Transplantation (AST) issued joint guidelines for evaluation for liver transplantation in adults (Martin 2014). "Liver transplant (LT) is indicated for severe acute or advanced chronic liver disease when the limits of medical therapy have been reached" and they make the following recommendations:

- "Evaluation for LT should be considered once a patient with cirrhosis has experienced an index complication such as ascites, hepatic encephalopathy, or variceal hemorrhage or hepatocellular dysfunction results in a MELD Score ≥15".
- "In a liver transplant candidate potentially treatable etiologies and components of hepatic decompensation such as ascites, hepatic encephalopathy, or variceal hemorrhage should be treated."
- "Potential liver transplant candidates with worsening renal dysfunction or other evidence of rapid hepatic decompensation should have prompt evaluation for liver transplant."
- Medical Comorbidities
    - "Obese patients (WHO class 1 and greater) require dietary counseling prior to LT."
    - "Class 3 obesity (BMI ≥40) is a relative contraindication to LT."
    - "Cardiac evaluation needs to include assessment of cardiac risk factors with stress echocardiography as an initial screening test with cardiac catheterization as clinically indicated."
    - "In the absence of significant comorbidities, older recipient age (>70 years) is not a contraindication to LT."
    - "Portopulmonary hypertension (POPH) should be excluded in LT candidates by routine echocardiography. For RVSP ≥45 mm Hg right heart cardiac catheterization is indicated."
    - "LT can be offered to potential recipients with POPH, which responds to medical therapy with an MPAP ≤35 mmHg."
    - "The presence of severe hepatopulmonary syndrome (HPS) is associated with increased mortality and affected individuals should undergo expedited LT evaluation."
    - "Simultaneous liver-kidney transplantation is indicated for LT candidates in whom renal failure reflects CKD with GFR <30 mL/min or acute kidney injury with dialysis >8 weeks or if extensive glomerulosclerosis is present."
- Tobacco use
    - "Tobacco consumption should be prohibited in LT candidates."
- Malignancy
    - "LT candidates with a prior extrahepatic malignancy should have received definitive treatment with adequate tumor-free survival prior to listing for LT."
    - "Candidates should undergo age and risk factor-appropriate cancer screening, e.g., colonoscopy, mammography, Papanicolaou smear."
- Infectious Diseases

- "LT candidates should be screened for bacterial, viral, and fungal infections prior to LT."
- "Treatment for latent TB should be initiated pre-LT."
- "Vaccination should be encouraged against pneumococcus, influenza, diphtheria, pertussis, and tetanus."
- "Live vaccines (mumps, measles, rubella, and varicella), if indicated, should be administered early in the evaluation process."
- "Patients with HIV infection are candidates for LT if immune function is adequate and the virus is expected to be undetectable by the time of LT."
- "LT transplant candidates with HCV have the same indications for LT as for other etiologies of cirrhosis."
- "Patients with HBV liver disease should receive antiviral therapy to suppress HBV replication pretransplant and continued surveillance for HCC."
- "LT should be considered in patients with decompensated autoimmune hepatitis who do not respond to or are not appropriate candidates for medical therapies."

- Psychosocial Evaluation
  - "Patients should be evaluated for and meet reasonable expectations for adherence to medical directives and mental health stability as determined by the psychosocial evaluation."
  - "Methadone-maintained patients should not be denied transplantation based on methadone use alone, and expectations of methadone reduction or discontinuation should not be a requirement for transplant listing."
  - "Patients should have adequate social/caregiver support to provide the necessary assistance both while waitlisted and until independently functioning in the postoperative period."
- Primary Biliary Cirrhosis (PBC)
  - "LT is indicated for decompensated PBC."
  - "Severe pruritus, refractory to medical therapy, may also be an indication for LT."
- Primary Sclerosing Cholangitis (PSC)
  - "LT is an effective therapy for decompensated liver disease due to PSC, including bouts of recurrent cholangitis and sepsis."
- Alcoholic Liver Disease
  - "Early referral of ALD patients for initiation of LT evaluation facilitates psychosocial assessment and setting addiction treatment goals."

  - "Given the chronic nature of alcohol dependence, ongoing monitoring is an important part of a comprehensive treatment plan."

- Acute Liver Failure (ALF)
  - "Patients with ALF require immediate referral to a liver transplant center."
  - "Patients with acetaminophen overdose should be evaluated for and meet reasonable expectations for adherence to medical directives and mental health stability as determined by the psychosocial evaluation."
- Hepatocellular Carcinoma
  - "LT is an effective therapy for HCC within the Milan criteria."
  - "LT may be an option for HCC in excess of the Milan criteria in combination with tumor downstaging to Milan."
- Cholangiocarcinoma
  - "Patients diagnosed with early-stage cholangiocarcinoma and deemed unresectable due to parenchymal liver disease or anatomic location may be considered for LT in combination with neoadjuvant chemoradiation."
- Metabolic Diseases
  - Nonalcoholic steatohepatitis (NASH)
    - "LT is an effective therapy for decompensated liver disease due to NASH or cryptogenic cirrhosis."
  - α-1-Antritrypsin Deficiency
    - "LT is indicated for decompensated cirrhosis due to α-1-antritrypsin deficiency."
  - Hereditary Hemochromatosis
    - "LT is indicated for decompensated cirrhosis due to hemochromatosis."
  - Wilson's Disease
    - "Urgent LT is indicated for Wilsonian acute liver failure."
    - "LT is indicated in decompensated cirrhosis due to Wilson's disease unresponsive to medical therapy."
    - "LT is not recommended as therapy for neuropsychological Wilson's disease, as LT does not reliably improve neurologic outcomes."
- Hereditary Amyloidosis
  - "LT should be considered in familial amyloid polyneuropathy (FAP) to eliminate hepatic amyloid production early in the course of disease and particularly prior to the development of cardiac and ocular complications, as these complications are not reliably

improved by LT."

- Primary Hyperoxaluria
    - "Preemptive LT (prior to the development of advanced renal disease) or combined liver and kidney transplantation in the setting of end stage renal disease (ESRD) are curative for primary hyperoxaluria and should be considered for patients who do not respond to medical therapy."
- MELD Exceptions
    - "For an LT candidate whose MELD score does not adequately reflect the severity of their liver disease, an appeal for MELD exception points should be made to the Regional Review Boards (RRB)."

The AASLD practice guidelines on diagnosis and treatment of alcohol-associated liver disease (Crabb 2020) recommend the following:

- "Patients without liver disease should be educated about safe levels of alcohol use for men (no more than two standard drinks per 24 hours) and women (no more than one standard drink per 24 hours)."
- "Patients with Alcohol-associated liver disease (ALD) or other liver diseases, in particular non-alcoholic fatty liver disease [NAFLD], NASH, viral hepatitis, and hemochromatosis, should be counseled that there is no safe level of drinking, and that they should abstain."
- "Potential LT candidates with ALD undergo evaluation by a mental health provider for full psychiatric diagnosis and adequate treatment planning."
- "Patients with decompensated alcohol-associated cirrhosis, CPT class C or MELD-Na of at least 21 should be referred and considered for liver transplantation."
- "Candidate selection for liver transplantation in alcohol-associated cirrhosis should not be based solely on a fixed interval of abstinence."
- "Liver transplantation may be considered in carefully selected patients with favorable psychosocial profiles in severe alcoholic hepatitis [AH] not responding to medical therapy."

The AASLD released a practice guideline for the prevention, diagnosis, and treatment of hepatocellular carcinoma (HCC) (Singal 2023). They state:

- "For patients with early-stage HCC who are ineligible for resection because of liver dysfunction or tumor multi-focality, LT is an optimal treatment strategy because it provides a cure for both HCC and the underlying liver disease. The Milan criteria (one lesion between 1 and 5 cm or two to three lesions between 1 and 3 cm) has been well established as the standard for optimal patient selection."
- "Liver transplantation should be the treatment of choice for transplant-eligible patients with early-stage HCC occurring in the setting of clinically significant portal hypertension and/or decompensated cirrhosis."

- "Liver transplantation should be the treatment of choice for transplant-eligible patients with HCC that recur within Milan criteria after surgical resection."

The National Comprehensive Cancer Network (NCCN) guidelines on hepatocellular carcinoma (V. 2.2025) recommend patients meeting the UNOS criteria should be considered for transplantation (cadaveric or living donation). Additionally, patients with tumor characteristics that are just outside of the UNOS guidelines may be considered for transplantation based on the institution. For those who have had successful downstaging therapy, transplantation can also be considered.

REGULATORY STATUS

The U.S. Food and Drug Administration (FDA) does not regulate the transplantation of vascularized human organ transplants such as kidney, liver, heart, lung, or pancreas. The Health Resources Services Administration (HRSA) oversees the transplantation of vascularized human organs. More information available from: https://www.fda.gov/vaccines-blood-biologics/tissue-tissue-products/tissue-and-tissue-product-questions-and-answers [accessed 2025 Oct 24]

HRSA information available from: https://data.hrsa.gov/topics/health-systems/organ-donation/ [accessed 2025 Oct 24]

CODE(S)

- (NMN)=Not medically necessary/appropriate

CPT Codes

Code	Description
47133	Donor hepatectomy (including cold preservation), from cadaver donor
47135	Liver allotransplantation; orthotopic, partial or whole, from cadaver or living donor, any age
47140	Donor hepatectomy (including cold preservation), from living donor; left lateral segment only (segments II and III)
47141	Donor hepatectomy (including cold preservation), from living donor; total left lobectomy (segments II, III, and IV)
47142	Donor hepatectomy (including cold preservation), from living donor; total right lobectomy (segments V, VI, VII, and VIII)

Code	Description
47143	Backbench standard preparation of cadaver donor whole liver graft prior to allotransplantation, including cholecystectomy, if necessary, and dissection and removal of surrounding soft tissues to prepare the vena cava, portal vein, hepatic artery, and common bile duct for implantation; without trisegment or lobe split
47144	Backbench standard preparation of cadaver donor whole liver graft prior to allotransplantation, including cholecystectomy, if necessary, and dissection and removal of surrounding soft tissues to prepare the vena cava, portal vein, hepatic artery, and common bile duct for implantation; with trisegment split of whole liver graft into 2 partial liver grafts (i.e., left lateral segment [segments II and III] and right trisegment [segments I and IV through VIII])
47145	Backbench standard preparation of cadaver donor whole liver graft prior to allotransplantation, including cholecystectomy, if necessary, and dissection and removal of surrounding soft tissues to prepare the vena cava, portal vein, hepatic artery, and common bile duct for implantation; with lobe split of whole liver graft into 2 partial liver grafts (i.e., left lobe [segments II, III, and IV] and right lobe [segments I and V through VIII])
47146	Backbench reconstruction of cadaver or living donor liver graft prior to allotransplantation; venous anastomosis, each
47147	Backbench reconstruction of cadaver or living donor liver graft prior to allotransplantation; arterial anastomosis, each

Code	Description
A52.15	Late syphilitic neuropathy
B15.0-B15.9	Acute hepatitis A (code range)
B16.0-B16.9	Acute hepatitis B (code range)
B17.10-B17.11	Acute hepatitis C (code range)

Code	Description
B17.8-B19.9	Other acute viral hepatitis (code range)
B25.1	Cytomegaloviral hepatitis
B66.1	Clonorchiasis
B66.3	Fascioliasis
C22.0	Liver cell carcinoma
C22.2-C22.9	Malignant neoplasm of liver and intrahepatic bile ducts (code range) (includes hepatoblastoma)
D64.0-D64.3	Sideroblastic anemia (code range)
D81.810	Biotinidase deficiency
D84.1	Defects in the complement system
E70.0-E71.30	Disorders of aromatic amino-acid metabolism (code range)
E72.00-E73.1	Other disorders of amino-acid metabolism (code range)
E74.39	Other disorders of intestinal carbohydrate absorption ~~(code range)~~
E74.4-E74.9	Other disorders of carbohydrate metabolism (code range)
E75.21-E75.3	Disorders of sphingolipid metabolism and other lipid storage disorders (code range)
E75.5-E75.6	Lipid storage disorders (code range)
E77.0-E77.9	Disorders of glycoprotein metabolism (code range)
E78.0-E78.9	Pure hypercholesterolemia (code range)
E80.0-E80.29	Disorders of porphyrin and bilirubin metabolism (code range)
E83.00-E83.19	Disorders of mineral metabolism (code range)
E88.89	Other specified metabolic disorders
E88.9	Metabolic disorder, unspecified
G60.0	Hereditary motor and sensory neuropathy
G60.2	Neuropathy in association with hereditary ataxia

Code	Description
G63	Polyneuropathy in diseases classified elsewhere
G65.0-G65.2	Sequelae of inflammatory and toxic polyneuropathies (code range)
G80.1-G80.9	Cerebral palsy (code range)
I82.0	Budd-Chiari syndrome
I99.9	Unspecified disorder of circulatory system
K71.0-K71.9	Toxic liver disease (code range)
K74.0	Hepatic fibrosis
K74.3-K74.69	Fibrosis and cirrhosis of liver (code range)
K75.2-K75.3	Other inflammatory liver diseases (code range)
K75.81-K75.89	Other specified inflammatory liver diseases (code range)
K75.9	Inflammatory liver disease, unspecified
K76.4	Peliosis hepatitis
K77	Liver disorders in diseases classified elsewhere
K80.30-K80.37	Calculus of bile duct with cholangitis (code range)
K83.0-K83.8	Other diseases of biliary tract (code range)
K87	Disorders of gallbladder, biliary tract and pancreas in diseases classified elsewhere
M34.83	Systemic sclerosis with polyneuropathy
Q44.2-Q44.3	Congenital malformations of gallbladder, bile ducts and liver (code range)
Q44.6	Cystic disease of liver
S31.609A	Unspecified open wound of abdominal wall, unspecified quadrant with penetration into peritoneal cavity, initial encounter
S36.112A	Contusion of liver, initial encounter

MEDICAL POLICY

Medical Policy Title	**Lung and Lobar Lung Transplant**
Policy Number	**7.02.10**
Current Effective Date	**July 1, 2026**
Next Review Date	**April, 2027**

Our medical policies are guides to evaluate technologies or services for medical necessity. Criteria are established through the assessment of evidence based, peer-reviewed scientific literature, and national professional guidelines. Federal and state law(s), regulatory mandates and the member's subscriber contract language are considered first in the determination of a covered service.
(Link to Product Disclaimer)

POLICY STATEMENT(S)

I. Lung transplantation is **medically appropriate** for carefully selected candidates who have irreversible, progressively disabling, end-stage pulmonary disease who meet **ALL** of the following criteria:

   A. Adequate cardiac status;

   B. Absence of infection, or absence of extrapulmonary infection in individuals with cystic fibrosis;

   C. No history of malignancy within five (5) years of transplantation, excluding non-melanomatous skin cancers; **and**

   D. Documentation of compliance with medical management.

II. Indications for a lung transplantation include, but are not limited to the following:

   A. Bilateral bronchiectasis;

   B. Congenital bronchiectasis;

   C. Alpha-1 antitrypsin deficiency;

   D. Primary pulmonary hypertension;

   E. Cystic fibrosis;

   F. Bronchopulmonary dysplasia;

   G. Idiopathic pulmonary fibrosis;

   H. Interstitial pulmonary fibrosis;

   I. Sarcoidosis;

   J. Scleroderma;

   K. Lymphangiomyomatosis;

   L. Emphysema;

   M. Eosinophilic granuloma;

Proprietary Information of Capital District Physicians' Health Plan, Inc. | CDPHP Universal Benefits,® Inc. | Capital District Physicians' Healthcare Network, Inc.

N. Bronchiolitis obliterans;

O. Recurrent pulmonary embolism;

P. Chronic obstructive pulmonary disease (COPD);

Q. Tuberculous fibrosis of lung;

R. Pneumoconiosis and other lung diseases due to external agents;

S. Eisenmenger's syndrome.

III. Lung transplant is considered a contraindication in human immunodeficiency virus (HIV) positive individuals, unless **ALL** the following criteria are met.:

A. Cluster of Differentiation 4 (CD4) count greater than 200 cells/mm^3;

B. Undetectable HIV-1 ribonucleic acid (RNA);

C. On stable anti-retroviral therapy for greater than three (3) months; **and**

D. All other criteria for transplantation within this policy are met.

Corporate Medical Policy

7.02.06 Heart & Heart/Lung Transplant

POLICY GUIDELINE(S)

I. Prior authorization requirements are contract dependent. Approvals for all transplants, including arrangements with an approved transplant center, may be required.

II. Recipient Selection Guidelines

Each recipient considered for transplantation should have an evaluation completed by the transplant center, for potential difficulties that would complicate and diminish the success of transplantation. Consideration will be given to the individual's risk of death without transplantation, along with the presence and severity of potential contraindications to transplantation.

The following general medical conditions can have an impact on the long-term outcome of lung transplant recipients:

A. Current use of corticosteroids is not a contraindication to transplantation. However, all attempts to discontinue these drugs or at least reduce the dose to less than or equal to 20 mg per day of prednisolone or prednisone should be made.

B. Nutritional issues are important predictors of surgical outcome. Individuals with an ideal body weight less than 70% or greater than 130% require either weight gain or weight loss to become eligible for transplant.

C. Substance abuse issues need to be addressed prior to lung transplantation. Candidates must

have been free of substance addiction (e.g., alcohol, tobacco, narcotics) for at least six (6) months. Appropriate preoperative biochemical monitoring is recommended in at-risk individuals.

D. Psychosocial problems that are unable to be resolved and that have a high likelihood of having a negative impact on the individual's outcome (e.g., poorly controlled major psycho-affective disorder, inability to comply with complex medication regimen) are a relative contraindication. A documented history of noncompliance with medical care or treatment plans, even in the absence of a documented psychiatric condition, is a relative contraindication.

E. Colonization with fungi or atypical mycobacteria is not an absolute contraindication to transplantation. Cases should be considered on an individual basis. Special care should be taken when a unilateral transplant is considered. When possible, pre-operative attempts to eradicate colonization with antibiotic therapy are appropriate. Adequately treated mycobacterium (M) tuberculosis is not a contraindication to lung transplantation.

F. Other medical conditions, when they have not resulted in organ damage, are generally acceptable in candidates for lung transplantation (e.g., systemic hypertension, diabetes mellitus, peptic ulcer disease) and should be optimally treated and well-controlled. In the presence of any comorbid medical condition with the potential for end-organ damage, a careful search should be made for evidence of organ dysfunction.

III. Pre-transplant evaluation documentation should include the following clinical information (if testing is unable to be performed, the rationale for not performing the testing must be included in the documentation):

A. Clinical Evaluation:

1. Confirmation of diagnosis;
2. Identification of comorbidities;
3. Current assessment of co-morbidities;
4. Management of co-morbidities;
5. Consult notes (if applicable);

B. Psycho-Social Evaluation:

1. Identification of stressors (family support, noncompliance issues, motivational issues, alcohol, or smoking/substance abuse).

C. Performance Status:

1. Karnofsky performance score;
2. Eastern Cooperative Oncology Group (ECOG) performance status;
3. Palliative Performance Scale (PPS) score; or

4. Lansky Play-Performance scale (for age 1 to 16 years);

D. Oral Health Evaluation;

E. Lab Tests:

1. Complete Blood Count (CBC), metabolic profile;
2. Serologies: Cytomegalovirus (CMV)*;* Hepatitis B and C;
3. Human Immunodeficiency Virus (HIV) Testing;

F. Cardiac Assessment:

1. 12 Lead Electrocardiogram (EKG); and
2. Echocardiogram (Echo) or Multigated Acquisition (MUGA) Scan

G. Pulmonary Assessment:

1. Chest x-ray;
2. Pulmonary function tests (PFTs) for high-risk respiratory failure (COPD, emphysema, alpha 1-antitrypsin deficiency, hepatopulmonary syndrome, or significant smoking history); and

H. Age-appropriate Screening Tests:

1. Please refer to the U.S. Preventive Services Task Force (USPSTF) [Internet] for a list of age-appropriate screening guidelines (e.g., colorectal cancer screening, cervical cancer screening for guidance). [accessed 2026 Mar 06]. Available from: https://www.uspreventiveservicestaskforce.org/uspstf/

IV. Transplant reauthorization is required annually while on the transplant waiting list, using the same criteria as pre-testing requirements (See Policy Guideline II). If the individual health condition remains unchanged from the previous year, some testing may be waived. If testing is not performed, a rationale must be provided, and documentation must be dated within the last 11 months, unless otherwise specified (e.g., age-related testing).

DESCRIPTION

The lungs are paired organs that consist of the right and left, each with different anatomical features and functions. Anatomically the right lung is divided into three lobes consisting of the upper, middle, and lower lobes. In contrast the left lung consists of two lobes, the upper and lower lobes. A lung (sometime called lobar) transplant is a surgical procedure in which a diseased or damaged lung is replaced with a healthy lung from a donor.

There are three main types of lung transplant. A single lung transplant consists of one diseased or damaged lung being removed and replaced with a donated lung. A double lung transplant consists of both lungs being removed and replaced with donated lungs. The third type of lung transplant is a heart to lung transplant which consists of a heart and both lungs being removed and replaced with a donor heart and lungs. Lungs that are suitable for transplantation are typically harvested from either

brain-dead donors or after the declaration of circulatory death. There's also the option of living donor lobar lung transplantation (LDLLT). LDLLT involves two healthy donors. The right and left lower lobes are retrieved from two healthy donors and are implanted into a single recipient. This procedure is primarily used for individuals who would not survive being on the wait list for a cadaver donor lung. Lung transplantation offers carefully selected individuals the only curative treatment for those with advanced lung disease of various nonmalignant etiologies.

Lung transplants can be performed on individuals of almost all ages from newborns to adults up to the age 65 and in certain cases over the aged 65. The indications for a lung transplant differ for adults and children. Cystic fibrosis and pulmonary arterial hypertension (PAH) have historically contributed to many young adult's lung transplants. In adults the primary indication for a lung transplant is chronic obstructive pulmonary disease (COPD) accounting for 40% of all lung transplantations perform worldwide (Kumar et al 2024). Interstitial lung disease, pulmonary vascular disease, bronchiectasis, and sarcoidosis were the other most common indications for adult lung transplants.

Lung transplantation is a major operation with significant surgical risk and a median post-transplant survival of 5.7 years (Ruck et al 2025). Advances in donor and recipient selection, improved surgical techniques, new immunosuppressive drugs, and better management of infections have improved long-term survival.

A shortage of lung donors remains a major limiting factor in the number of transplants performed. These disparities are likely due to the vulnerability of potential complications that occurred before and after brain death which can include thoracic trauma, aspiration, ventilator associated injuries, pneumonia, and neurogenic pulmonary edema. The lung allocation score (LAS) help prioritize individuals and improve outcomes. The LAS comprised of 12 physiological and demographic factors that influence mortality in individuals with advanced lung disease. LAS is determined by subtracting the predictive one-year survival without transplant from the predicted one-year survival with transplant then normalizing the score to a range of 0 to 100. Organs are allocated to individuals with the highest score before those with lower scores.

SUPPORTIVE LITERATURE

The International Society for Heart and Lung Transplantation (ISHLT) and the Organ Procurement Transplantation Network (OPTN) data registry suggest that inferior outcomes occur in adolescent lung transplant recipients. The reasons for these inferior outcomes remain undefined and they happen despite the adolescent recipients' young age and recipients lack of comorbidities. Paraskeva et al (2018) analyzed survival rates of adolescent lung transplant recipients using data from the ISHLT registry that consisted of recipients between the ages of 0 and 65 years who underwent 24,730 lung transplant procedures. Individuals between 10 and 24 years old at the time of transplant represented 9% of the registry cohort (n=2319), and they were compared with both old and young cohorts. Most adolescents (88%) were transplanted in middle to late adolescence, aged 15–24 years. The overall survival in the adolescent cohort was 65% at three years, which were like those observed in adults between 50 and 65 years of age, and significantly lower in comparison to the pediatric subgroup (73%; p=.006), and adults 25 to 34 years old (75%; p<.001) and 35 to 49 years old

(71%; p<.001). The adolescent group individuals between 15 and 19 years of age had the worst survival rates at 3 years (59%) compared with 10- to 14-year-old individual (73%; p<.001) and 20- to 24-year-old year individual (66%; p<.001). Cystic fibrosis (CF) was the main indication for transplantation in adolescent recipients (75% vs 13%; p o 0.001), whereas most adults was transplanted for emphysema and interstitial lung disease (ILD). Compared with the adult groups, more females were transplanted in adolescence. The registry study was biased towards including North American data and may contain potential data entry errors, or missing information. Additionally, there were no data reported on the differences in causes of mortality or the rates of graft dysfunction between the groups.

Mansour et al (2023) conducted a systematic review and meta-analysis comparing single lung transplant (SLT) versus bilateral lung transplant (BLT) for managing end stage chronic obstructive pulmonary disease. The study analyzed data from seven studies including 10,652 individuals and found that BLT is associated with more favorable survival rates than SLT. Subgroup analysis on survival rates of alpha-1 antitrypsin deficiency also displayed a trend favoring BLT compared with SLT at 1 year. However, the group had significant heterogeneity in baseline characteristics. The study also found that BLT recipients tend to have longer hospital stays and greater number of acute rejection events while SLT recipients tend to experience more postoperative complications. The authors concluded that BLT may be more effective approach for managing COPD, but further prospective studies are needed to confirm these findings.

Lung volume reduction (LVR) and lung transplantation (LTx) are management options for end stage COPD. Ahmad et al (2023) compared the outcomes of LVR and LTx in COPD individuals by pooling existing evidence. A meta-analysis of prospective studies on LVR and LTx published since 2000 was conducted. Baseline characteristics, perioperative variables, and clinical outcomes analysis was extracted. The analysis included 65 prospective studies comprising of 3,671 individuals. Mean age was 60 (95% confidence interval (CI): 58-62) years and comparable between the two groups. Females were 51% (95% CI: 30-71%) in the LTx group versus 28% (95% CI: 21-36%) in LVR group. Baseline 6-minute walk test (6MWT) and pulmonary function tests (PFT) were comparable except for the forced expiratory volume in 1 second (FEV1), which was lower in the LTx group (21.8% (95% CI: 16.8-26.7%) versus 27.3% (95% CI: 25.5-29.2%). Postoperatively, both groups experienced improved FEV1. However, LTx resulted in significantly higher FEV1 postoperatively (54.9% (95% CI: 41.4-68.4%) versus 32.5% (95% CI: 30.1-34.8%), but otherwise had comparable outcomes to LVR. Overall, there was no significant difference between the groups. Pooled survival overtime showed no significant difference. LTx led to greater improvement in FEV1 but had comparable outcomes to LVR.

Veno-arterial extracorporeal membrane oxygenation (V-A ECMO) has become increasingly popular for interoperative support during lung transplants even in uncomplicated cases. Pettenzuzzo et al (2024) conducted a systematic review and meta-analysis of the efficacy and safety of (V-A ECMO) and cardiopulmonary bypass (CBP) compared to an Off Pump strategy during lung transplant. The main outcomes assessed were intraoperative red blood cell (RBC) transfusion (units), fresh frozen plasma (FFP) transfusion (units), platelet (PLT) transfusion (units), postoperative invasive mechanical ventilation (IMV duration (days), intensive care unit (ICU) length of stay (LOS days), ECMO support,

and mortality (within the first 90 days after ICU admission). There were 27 observational studies with 6,113 individuals included. V-A ECMO and CBP were associated with higher blood product consumption, longer invasive mechanical ventilation (IMV) duration, prolonged ICU length of stays, longer surgical duration, and higher mortalities compared to off pump surgeries. VA ECMO overperformed CPB in nearly all other outcomes except for RBC transfusion. Older age, male gender, and body mass index >25kg/m2 negatively impacted several outcomes (RBC transfusion, ICU LOS, surgical duration, need of postoperative ECMO and mortality), regardless of the intraoperative extracorporeal support investigated. Researchers suggested that future studies are necessary to optimize and standardize the intraoperative management of lung transplants.

PROFESSIONAL GUIDELINE(S)

Idiopathic Pulmonary Fibrosis

The American Thoracic Society (ATS), European Respiratory Society, Japanese Respiratory Society, and the Latin American Thoracic Association published guidelines in 2011 for the diagnosis and management of individuals with idiopathic fibrosis. Lung transplantation was recommended for appropriately selected individuals with idiopathic pulmonary fibrosis (IPF [strong recommendation, low-quality evidence]). An update to this document was published in 2015 in which the committee did not make a recommendation regarding single versus bilateral lung transplantation for individuals with idiopathic fibrosis. The committee noted that it was unclear which option, single or bilateral lung transplantation, was preferable for long term outcomes. In 2022, the committee updated guidance on diagnosis and management of IPF and progressive pulmonary fibrosis recommending that individuals at increased risk of mortality should be referred for a lung transplantation upon diagnosis.

Chronic End Stage Lung Disease

The International Society for Heart and Lung Transplant (ISHLT) 2021 guidelines on the selection of lung transplant candidate states that "lung transplantation should be considered for adults with chronic, end-stage lung disease who meet all the following general criteria:

- High (>50%) risk of death from lung disease within 2 years if lung transplantation is not performed.
- High (>80%) likelihood of 5-year post-transplant survival from a general medical perspective if there is adequate graft function."

Cystic Fibrosis

- The Cystic Fibrosis Foundation consensus guidelines (2020) for the care of individuals with advanced cystic fibrosis lung disease recommend lung transplantation if congruent with the individual's goals.

Contraindications

ISHLT 2021 guidelines consider the following as absolute contraindications for a lung transplant:

- Malignancy with high risk of recurrence or death related to cancer.

Proprietary Information of Capital District Physicians' Health Plan, Inc. | CDPHP Universal Benefits,® Inc. | Capital District Physicians' Healthcare Network, Inc.

- Glomerular filtration rate < 40 mL/min/1.73m^2 unless being considered for multi-organ transplant.
- Acute coronary syndrome or myocardial infarction within 30 days (excluding demand ischemia).
- Stroke within 30 days.
- Liver cirrhosis with portal hypertension or synthetic dysfunction unless being considered for multi-organ transplant.
- Acute liver failure.
- Acute renal failure with rising creatinine or on dialysis and low likelihood of recovery.
- Septic shock.
- Active extrapulmonary or disseminated infection.
- HIV infection with detectable viral load.
- Limited functional status (e.g., non-ambulatory) with poor potential for post-transplant rehabilitation.
- Progressive cognitive impairment.
- Repeated episodes of non-adherence without evidence of improvement (Note: For pediatric individuals this is not an absolute contraindication and ongoing assessment of non-adherence should occur as they progress through different developmental stages.)
- Active substance uses or dependencies including current tobacco use, vaping, marijuana smoking, or intravenous (IV) drug use.

REGULATORY STATUS

Organ transplants, as surgical procedures, do not require U.S. Food and Drug Administration (FDA) approval. The Health Resources Services Administration (HRSA) oversees the transplantation of vascularized human organs through the Organ Procurement and Transplantation Network (OPTN). For more information view the OPTN website: https://www.hrsa.gov/optn [accessed 2026 March 06].

CODE(S)

- Codes may not be covered under all circumstances.
- Code list may not be all inclusive (AMA and CMS code updates may occur more frequently than policy updates).
- (E/I)=Experimental/Investigational
- (NMN)=Not medically necessary/appropriate

CPT Codes

Code	Description
32851	Lung transplant, single; without cardiopulmonary bypass
32852	Lung transplant, single; with cardiopulmonary bypass
32853	Lung transplant, double (bilateral, sequential, or en bloc); without cardiopulmonary bypass
32854	Lung transplant, double (bilateral, sequential, or en bloc); with cardiopulmonary bypass
32855	Backbench standard preparation of cadaver donor lung allograft prior to transplantation, including dissection of allograft from surrounding soft tissues to prepare pulmonary venous/atrial cuff, pulmonary artery, and bronchus; unilateral
32856	Backbench standard preparation of cadaver donor lung allograft prior to transplantation, including dissection of allograft from surrounding soft tissues to prepare pulmonary venous/atrial cuff, pulmonary artery, and bronchus; bilateral

Disclaimer Notice

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgment when deciding the most appropriate care to enrollees. The CDPHP coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

Background

Inherited retinal diseases (IRDs) are a heterogeneous group of conditions that include retinitis pigmentosa (RP) and Leber congenital amaurosis (LCA) and early-onset severe retinal dystrophy (EO[S]RD), which differ in severity and age of onset. IRDs are caused by mutations in >250 genes. Variants in the *RPE65* gene account for 0.6–6% of RP and 3–16% of LCA/EORD cases.

Luxturna (voretigene neparvovec-rzyl) was FDA approved in 2017 for the treatment of retinal dystrophy associated with biallelic RPE65 mutations. It is estimated that 1000–2000 people in the United States are affected by retinal dystrophy associated with a biallelic RPE65 mutation. Luxturna is a gene therapy administered one-time via subretinal injection in patients age 12 months and older. Using an adeno-virus vector, Luxturna delivers a functional copy of the *RPE65* gene to the cell nucleus. This allows functional RPE65 protein to be produced, completing the visual cycle and potentially improving vision.

Approval was based on results from the phase 3, open-label, randomized controlled trial in patients LCA. At 1 year, mean bilateral MLMT change score was 1·8 (SD 1·1) light levels in the intervention group versus 0·2 (1·0) in the control group (difference of 1·6, 95% CI 0·72–2·41, p=0·0013). 13 (65%) of 20 intervention participants, but no control participants, passed MLMT at the lowest luminance level tested (1 lux), demonstrating maximum possible improvement. No product-related serious adverse events or deleterious immune responses occurred.

Summary

Effective Date of Policy:	2/12/2026
Indications	Treatment of patients with confirmed biallelic RPE65 mutation-associated retinal dystrophy. Patients must have viable retinal cells as determined by the treating physician
ICD10 Diagnosis Codes	Select subcodes of H35.5
HCPCS Code	J3398
Availability	$5x10^{12}$ vector genomes (vg)/mL suspension for subretinal injection, supplied in a 0.5 mL extractable volume in a single-dose 2 mL vial for a single administration in one eye
Duration	6 months

Required Criteria for Initial Approval

All of the following conditions for the requested indication must be met in order to approve therapy

Indication	Inclusion Criteria	Dosing Regimen

Indication
Treatment of patients with confirmed biallelic RPE65 mutation-associated retinal dystrophy. Patients must have viable retinal cells as determined by the treating physician
 	
ICD10: Select subcodes of H35.5
	• Must be prescribed by an ophthalmic surgeon for administration at a certified treatment center AND
	• Must be ≥ 12 months of age based upon ongoing cell proliferation in those under 1 year of age AND
	• Must have a diagnosis of Biallelic RPE65 mutation-associated retinal dystrophy
	  ○ Diagnosis must be confirmed by genetic testing AND
	• Patient must have viable retinal cells
	  ○ Viable retinal cells must have been determined by retinal thickness on spectral domain optical coherence tomography (OCT >100 microns within the posterior pole) AND
	• Baseline full-field light sensitivity threshold (FST) test results for each eye must be submitted
		• A maximum of 1 dose of 1.5×10^{11} vg administered by subretinal injection in a total volume of 0.3 mL will be allowed per eye per lifetime

Continuation Criteria

- Not applicable – One lifetime administration per eye allowed. Authorization will be for 6 months to allow sufficient time for administration.

Considerations

- Patient must have medical drug coverage administered by CDPHP.
- Prior authorization is obtained through the CDPHP pharmacy department.

Background

Sickle cell disease (SCD) refers to a group of inherited blood disorders that are caused by a mutation in the β-globin gene, causing abnormal hemoglobin properties. The mutant hemoglobin is susceptible to continuous polymerization with other hemoglobin molecules in hypoxic environments. As the mutated hemoglobin (HbS) polymerizes, the red blood cell becomes deformed; rigid and inflexible in a "sickle" shape which leads to Vaso-occlusion and hemolysis severely affecting blood flow in these patients. Incidence of sickle cell disease is estimated at 300,000 to 400,00 live births throughout the world. It is estimated that 100,000 people are living with SCD in the United States.

Hallmark manifestations of SCD include recurrent vaso-occlusive events or crises (VOEs or VOCs) which can lead to acute pain crises. Vaso-occlusive crises can lead to episodes of severe pain as a result of decreased blood flow in microcapillaries and can include blood vessel blockage that can lead to tissue ischemia of the bone and bone marrow. These can lead to an increase in hospitalizations, and underlying medical complications such as severe infections, acute chest syndromes, acute splenic sequestration crisis, priapism, and stroke. There are several subtypes of SCD that exist that are determined by specific mutations in each hemoglobin gene. Severe SCD genotypes are listed as: βS/βS, βS/β0, and βS/β+. However, the available treatments that have been created thus far are independent of these subtypes.

America Society of Hematology guidelines recommend treating SCD based on need of complication. Guidelines exist for sickle cell disease with cardiopulmonary and kidney disease, transfusion support, cerebrovascular disease, management of acute and chronic pain, and stem cell transplantation.

Historically, Hydroxyurea has been the mainstay of treatment in SCD. This medication increases red blood cell fetal hemoglobin to reduce the amount of "sickled" cells being produced. Other available and FDA approved treatments for SCD include Endari (L-glutamine), Adakveo (crizanlizumab), and Oxybryta (voxelotor). Other interventions include hematopoietic stem cell transplantation (HSCT) which has shown to be curative in some individuals but depends on patient specific factors and compatible donor availability. Blood transfusions, and packed red blood cells may help as adjunctive therapy in unblocking blood vessels by delivering oxygen to the body. Stem cell gene therapy interventions are emerging for SCD and may offer a curative treatment for SCD complications.

Lyfgenia is approved by the FDA for the treatment of patients 12 years of age or older with sickle cell disease and a history of vaso-occlusive events. It utilizes a modified virus (lentivirus vector) to insert a functioning version of the HBB gene into the patient's own stem cells. The lentiviral vector in gene therapy is a method by which genes can be inserted, modified, or deleted in organisms. In comparison, exagamglogene autotemcel, (Casgevy) is known as CRISPR based technology through which gene editing increases the amount of fetal hemoglobin in red blood cells by deleting a portion of the BC11A gene.

In the pivotal Lyfgenia trial, 90% of participants achieved complete resolution of all VOEs between six and 18 months after Lyfgenia infusion and 30 of 31 patients were free of severe VOEs. The clinical trial for Lyfgenia has defined severe VOEs/VOCs as a medical event with no medically determined cause other than a vaso-occlusion requiring one of the following:

- Hospital or ED visit that exceeded 24 hours
- At least two visits to day unit or ED during a 72-hour period (with both visits requiring IV treatment)
- Priapism episode lasting more than two hours and leading to a medical facility

The Institute for Clinical and Economic Review (ICER) reviewed Lyfgenia as part of a review titled, "Gene Therapies for Sickle Cell Disease". In both trials for Lyfgenia and Casgevy, there were serious adverse events observed. These serious adverse effects were attributed to the myeloablative conditioning however were not infrequent and both therapies require chemotherapy before receiving them. ICER noted that uncertainly still remains about the long-term degree of risk of gene therapies in the real word, pointing out that at one point the FDA placed a clinical hold on Lyfgenia due to safety concerns around the hematologic malignancy risk (two cases of AML resulting in death). With Lyfgenia, in identifying the net health benefit, one needs to weigh the marked improvement in the small patient population with severe SCD alongside the potential harms of myeloablative conditioning and uncertainty in durability of benefit. **ICER noted that in those with severe SCD, Lyfgenia provides at least an incremental net benefit compared with standard of care and may provide a substantial net health benefit (B+).**

In comparing Casgevy and Lyfgenia, ICER noted the evidence as "insufficient" given the different mechanisms of action.

Summary	
Effective Date of Policy	1/1/2026
Indications	Sickle Cell Disease
ICD10 Diagnosis Codes	D57
HCPCS Code	J3394
Availability	*See FDA Prescribing Information*
Duration	Authorization will be for 6 months to allow sufficient time for administration

Required Criteria for Initial Approval

All of the following conditions for the requested indication must be met in order to approve therapy:

Specific Indication	Inclusion Criteria	Recommended Dosing Regimen

Treatment of patients 12 years of age or older with sickle cell disease and a history of vaso-occlusive events
(FDA approval)
	• Enrollee is at least 12 years of age
	• Therapy is requested by a hematologist with expertise in the management of Sickle Cell Disease
	• Enrollee has diagnosis of severe Sickle Cell Disease as defined by all of the following:
	  o Genetic confirmation of βS/βS genotype or βS/β0 or βS/β+ genotype. Additional genotypes will be considered on a case-by-case basis based on disease severity
	  o History of at least 2 severe vaso-occlusive events or crises (VOCs/VOEs) per year over the last 2 years. Severe VOC/VOE is defined as at least ONE of the following:
	  ▪ Acute pain episode that requires a visit to a medical facility and administration of pain medications (opioids or IV NSAIDs) or RBC transfusions
	  ▪ Acute chest syndrome (ACS), as indicated by presence of new pulmonary infiltrate associated with pneumonia-like symptoms, pain, or fever
	  ▪ Hepatic sequestration
	  ▪ Priapism lasting more than 2 hours and leading to a medical facility visit
	• Must have experienced ONE of the following pertaining to hydroxyurea:
	  o A therapeutic failure (ex. continued frequent and/or severe VOCs or ongoing, frequent transfusion requirements) to a ≥ 6 consecutive month trial of hydroxyurea at maximum tolerated dosing.
	  ▪ Adherence will be assess based on: Pharmacy refill history. If the patient does not have pharmacy benefits through this health plan, a recent pharmacy profile will be requested. Progress notes documenting usage of sample medication may also be requested
	  o A contraindication to hydroxyurea defined as a hypersensitivity to hydroxyurea or any component of the formulation
	  o Must have experienced two hematologic toxicity reactions with hydroxyurea that resulted in discontinuation of therapy
	  ▪ Hematologic toxicity with hydroxyurea is defined by neutrophil, platelet, hemoglobin and/or reticulocyte count abnormalities concurrent with hydroxyurea use suggestive of hematologic toxicity. After the first hematologic toxicity, hydroxyurea therapy should be stopped and can be restarted with a dose reduction upon hematologic recovery. If a second hematologic
		• The minimum recommended dose of Lyfgenia is 3 × 10^6 CD34+ cells/kg
		• Please refer to Lyfgenia FDA-approved prescribing information for complete dosage and administration instructions
		• Lyfgenia is for autologous use only

	toxicity is experienced, treatment should be discontinued • Enrollee has a Karnofsky performance status of ≥ 60 (≥ 16 years of age) or a Lansky performance status of ≥ 60 (< 16 years of age) • Must be used as a single agent therapy (not applicable to myeloablative conditioning therapy) • The patient must be eligible to undergo hematopoietic stem cell transplant (HSCT) • Patient has been screened and found negative for active infections of the following: hepatitis B virus (HBV), hepatitis C virus (HCV), and human immunodeficiency virus 1 &2 (HIV-1/HIV-2) in accordance with clinical guidelines prior to collection of cells (documentation of laboratory results taken within the past 3 months is required) • Patient will not receive concomitant therapy with any of the following: o Hydroxyurea for at least 2 months prior to mobilization and until all cycles of apheresis are completed o Disease-modifying agents (e.g., L-glutamine, voxelotor, crizanlizumab) for at least 2 months prior to mobilization • Prescriber must attest that the patient will not be re-started on hydroxyurea or other disease modifying therapies for SCD after receipt of Lyfgenia • For Commercial and Medicare: All requests for sickle cell gene therapy will require treatment with Casgevy (exagamglogene autotemcel)	

Exclusion Criteria

Therapy will not be approved if any of the below criteria are met:

- Enrollee has an accessible and willing 10/10 human leukocyte antigen (HLA)-matched related donor
- Enrollee has had prior treatment with an allogeneic stem cell transplant or prior treatment with gene therapy/editing product
- Enrollee has clinically significant and active bacterial, viral, fungal, or parasitic infection
- History of severe cerebral vasculopathy: defined by overt or hemorrhagic stroke; abnormal transcranial Doppler [≥ 200 cm/sec] needing chronic transfusion; or occlusion or stenosis in the polygon of Willis; or presence of Moyamoya disease
- History of advanced liver disease, defined as any of the following:
  - Persistent aspartate transaminase, alanine transaminase, or direct bilirubin value > 3× the upper limit of normal (ULN)
  - Baseline prothrombin time or partial thromboplastin time > 1.5× ULN.
  - History of cirrhosis or any evidence of bridging fibrosis, or active hepatitis
- Baseline creatinine clearance ≤ 70 mL/min/1.73 m^2 (documentation of laboratory results taken within the past 3 months is required)
- Any contraindications to the use of plerixafor during the mobilization of hematopoietic stem cells and any contraindications to the use of busulfan and any other medicinal products required during the myeloablative conditioning, including hypersensitivity to the active substances or to any of the excipients
- History of prior or current malignancy or immunodeficiency disorder, except previously treated, non-life threatening, cured tumors such as squamous cell carcinoma of the skin
- An immediate family member with a known or suspected Familial Cancer Syndrome
- Two or more α-globin gene deletions (documentation of results are required)

Continuation Criteria

- Not applicable
- Lyfgenia is indicated for one-time single-dose intravenous use only and therefore will not be authorized for retreatment.

Considerations

- Prior authorization is obtained through the CDPHP pharmacy department.

- Physician acknowledges that CDPHP will request documentation, not more frequently than biannually, of follow-up patient assessments including but not limited to the occurrence of VOE's/VOC's, laboratory findings, and other hematologic clinical events while under the care of physician.

GOVERNMENT PROGRAMS

CHILD HEALTH PLUS:	Subject to all terms and conditions noted in above application.
MEDICARE CHOICES:	Subject to all terms and conditions noted in above application.
SELECT/HARP PLAN:	Effective January 1st, 2026, Casgevy and Lyfgenia will be reimbursed by the NYS Medicaid fee-for-service (FFS) program for Managed Medicaid/HARP members. The prior authorization process for these medications will remain unchanged. The Plan will continue to review these medications for medical necessity.

CDPHP Pharmacy Services 1/1/2026

New: 12/2023

Policy History

Date	Note
12/2024	Changed policy name to Lyfgenia (lovotibeglogene autotemcel) following FDA approval
12/2025	Removed age limit to be at least 12 years of age or older Added criteria all requests for sickle cell gene therapy will require treatment with Casgevy (exagamglogene autotemcel) Removed criteria about being treated and followed for at least the past 24 months prior to requesting therapy in a medical center(s) that maintained detailed records on sickle cell disease history Updated inclusion criteria language for hydroxyurea use Updated exclusion criteria Updated approval duration to 6 months to allow adequate time for administration Updated language that use of Casgevy prior to Lyfgenia is applicable to Commercial and Medicare only Updated language regarding Medicaid applicability

DESCRIPTIONS

Lyme disease (LD) is a tick-borne disease that is endemic to several regions of North America. It is caused by the bacteria, Borrelia burgdorferi (Bb), which lives in the gut of Ixodes ticks. Ticks become infected with Bb while feeding on an infected host, typically rodents. The bacteria are transmitted to humans via the saliva of a feeding tick. LD may be a progressive disease and can occur in three stages: early localized, disseminated, and late. Early localized LD, or stage I, occurs in the weeks following the bite of an infected tick. The first sign of LD is a characteristic bull's eye rash, called erythema migrans, which forms at the site of the tick bite in most cases. The second stage of LD, called disseminated LD or stage II LD, occurs in the weeks to six months after infection. The bacteria spread from the primary site via cutaneous, lymphatic, and hematogenous routes, causing general signs and symptoms of infection and organ involvement. Untreated LD that has progressed for more than six months is called late LD, late disseminated LD, or stage III LD. Late LD can have a variety of manifestations including encephalitis, encephalomyelitis, cerebral arteritis, polyneuropathy, arthritis, or musculoskeletal pain despite adequate antibiotic treatment of the initial disease. There is considerable controversy over the existence of an additional stage of LD. Various names for this stage are used in the literature, including chronic LD, post-LD syndrome (PLDS), and post-treatment LD syndrome (PLDS). This

stage refers to those few patients who experience fatigue, cognitive dysfunction, and musculoskeletal pain despite adequate antibiotic treatment of the initial disease.

Pharmacy Policy

Intravenous Immune Globulin (IVIG), 1350/20.000143.

POSITION STATEMENT

In accordance with the Infectious Diseases Society of America, CDPHP considers oral/intravenous antibiotic therapy medically necessary in the treatment of Lyme disease, as indicated below.

Oral Antibiotic Therapy (10-28 days)

1. For the treatment of early localized or early disseminated Lyme disease associated with erythema migrans (10-14 days depending which antibiotic is prescribed).

2. For the treatment of Lyme arthritis for patients without clinically evident neurological disease (28 days).

Benefits for oral antibiotic therapy, for the indications stated above, will only be administered if the enrollee has a prescription drug benefit. Benefits are subject to the enrollee's prescription drug formulary.

Intravenous (IV) Antibiotic Therapy (up to 28 days)

Outpatient intravenous antibiotic therapy is considered medically necessary for enrollees with the diagnosis of Lyme disease only when it is based on the clinical presentation of signs and symptoms compatible with the disease and supported by a positive serologic and/or cerebrospinal fluid (CSF) titer by indirect immunofluorescence assay (IFA), or by enzyme immunoassay (ISA), which itself is validated by a positive Western blot test.

Capital District Physicians' Health Plan, Inc.
CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: LYME & OTHER TICK-BORNE DISEASES

Once a diagnosis of Lyme disease is established, intravenous antibiotic therapy is considered medically necessary for any of the following indications:

1. For the treatment of early Lyme disease with evidence of either of the following:
   - Neurological involvement manifested by meningitis or radiculopathy
   - Lyme carditis requiring hospitalization with continuous EKG monitoring (i.e., patients with significant PR prolongation > 300 milliseconds, other arrhythmias, or clinical manifestations of myopericarditis)

2. For the treatment of Lyme arthritis and/or Lyme-related neurological conditions that have proved refractory to a full course of recommended oral antibiotic therapy.

3. For the treatment of late Lyme disease with evidence of either of the following:
   - Recurrent arthritis after administration of a complete course of oral antibiotics
   - Central nervous system (CNS) or peripheral nervous system involvement

Benefits for outpatient intravenous antibiotic therapy, for the indications stated above, will be administered under the medical benefit and in accordance with the CDPHP resource coordination policy, Home Care Services, 1370/20.000048.

Post-Lyme Disease Syndrome

CDPHP considers additional antibiotic therapy in post-treatment, persistently fatigued patients (post-Lyme disease syndrome) experimental and investigational because intravenous antibiotic therapy has not been shown to be effective for this indication.

Guidelines from the American Academy of Neurology (2007), the Infectious Diseases Society of America (2006), and the European Federation of Neurological Societies (2009) do not recommend antibiotic therapy for patients with chronic, persistent subjective symptoms who have already received standard treatment for Lyme disease.

POLICY CONSIDERATIONS

Because of a lack of biologic plausibility, lack of efficacy, absence of supporting data, or the potential for harm to the patient, long-term (> 28 days) antibiotic therapy is not recommended for treatment of patients with any manifestation of Lyme disease.

EXCLUSIONS

CDPHP does not cover the use of any of the following treatments for Lyme disease as they are considered experimental, investigational, or unproven for this indication (this list may not be all-inclusive):

- A course of intravenous antibiotics lasting longer than 28 days.
- Intravenous antibiotics for early Lyme disease in the absence of neurological involvement manifested by meningitis or radiculopathy, or third-degree atrioventricular block
- Repeated or prolonged courses of parenteral or oral antibiotics
- Hyperbaric oxygen therapy
- Intravenous ascorbic acid or magnesium
- Intravenous hydrogen peroxide
- Ozone therapy
- Ultraviolet blood irradiation
- Use of intravenous immune globulin (IVIG) for the treatment of chronic Lyme disease
- Use of prophylactic antibiotic therapy for individuals with no objective clinical or laboratory evidence indicative of Lyme disease.
- Lyme Borrelia Nanotrap® (0316U)

Coverage of treatment of other tick-borne "co-infections" with antibiotics beyond IDSA-recommended treatment guidelines, since there are no recognized prolonged clinical phases of these infections that would warrant prolonged antibiotic therapy.

CDPHP PRODUCT VARIATIONS

CHILD HEALTH PLUS	Subject to all terms and conditions noted above in the policy.
MEDICARE ADVANTAGE	Subject to all terms and conditions noted above in the policy. Benefits for Medicare Part D prescription drugs are only available to enrollees who have elected the CDPHP Medicare Advantage product with the Part D option. The CDPHP Medicare Advantage product does not cover any prescription drugs not covered by Medicare. In addition, for those individuals enrolled in the CDPHP Medicare Advantage product who have not elected the Part D option, CDPHP only covers those prescription drugs covered by Medicare Parts A and B, not those covered by Part D.
SELECT PLAN/HARP	Subject to all terms and conditions noted above in the policy.

POLICY HISTORY

This section is intended to provide only highlights of the policy changes. The policy should always be reviewed in its entirety to ensure a comprehensive understanding of coverage.

Effective Date	Update
12/1/2023	Added to exclusions: • Lyme Borrelia Nanotrap® (0316U)
9/1/2023	Updated the recommended timeframe for oral antibiotic therapy and under IV therapy clarified treatment for Lyme carditis.
9/1/2021	Updated the recommended timeframe for oral antibiotic therapy.

MEDICAL POLICY

Medical Policy Title	**Management of Dry Eye Syndrome and Meibomian Gland Dysfunction (e.g., LipiFlow)**
Policy Number	**9.01.19**
Current Effective Date	**November 1, 2026**
Next Review Date	**December 2026**

Our medical policies are based on the assessment of evidence based, peer-reviewed literature, and professional guidelines. Eligibility for reimbursement is based upon the benefits set forth in the member's subscriber contract. (Link to Product Disclaimer)

POLICY STATEMENT(S)

I. The following procedures are considered **investigational**:

A. The use of eyelid thermal pulsation therapy (e.g., LipiFlow, iLux System, TearCare, Tixel i) to treat dry eye syndrome;

B. The use of tear film imaging (i.e., LipiView Ocular Surface Interferometer) to evaluate dry eye syndrome and meibomian gland dysfunction;

C. The use of near-infrared dual imaging (i.e., LipiScan Dynamic Meibomian Imager) to evaluate meibomian glands.

DESCRIPTION

Dry eye syndrome refers to a group of disorders resulting from either reduced production of the aqueous component or increased evaporation to the aqueous component of the eye. The pathophysiology of the latter condition, also known as evaporative dry eye (EDE), includes lid-related causes such as meibomian gland dysfunction (MGD) and blink problems, as well as ocular surface-related causes including mucin and contact lens dysfunction. MGD is a leading cause of dry eye throughout the world. As such, the Tear Film and Ocular Surface Society (TFOS) held an International Workshop on MGD to reach consensus on the following definition: MGD is a chronic, diffuse abnormality of the meibomian glands, commonly characterized by terminal duct obstruction and/or qualitative/quantitative changes in the glandular secretion. It may result in alteration of the tear film, symptoms of eye irritation, clinically apparent inflammation, and ocular surface disease. MGD typically results from increased keratinization of ductal epithelium, combined with increased viscosity of meibum.

Proprietary Information of Capital District Physicians' Health Plan, Inc. | CDPHP Universal Benefits,® Inc. | Capital District Physicians' Healthcare Network, Inc.

Meibomian glands are large sebaceous glands present in eyelids. They secrete lipids that form the superficial layer of tear film to protect the evaporation of the aqueous phase. Several factors, including age, diet, sex hormones, antibiotic usage, and the dysfunction of Meibomian glands, can alter the composition of lipids and proteins in meibum, resulting in altered tear film stability and function.

Treatment of MGD often involves a combination of therapies, including the application of heat to the eyelids using warm compresses, with or without manual massage to melt the abnormal meibum and facilitate its reentry into the tear film. Lipid-based artificial tears are used to restore thin or irregular lipid layers and facilitate temporary relief of symptoms. Pharmaceutical options include essential fatty acid supplementation, systemic tetracycline and azithromycin, topical antibiotics and corticosteroids, and topical tacrolimus ointment for refractory cases. Mechanical intervention involves debridement of eyelid margins and various methods to forcibly express abnormal meibum, with or without prior heating. In patients with severe terminal duct obstruction, conductive thermal pulsation treatment of the eyelids has been demonstrated to improve symptoms of MGD.

Eyelid thermal pulsation is a proposed treatment option for MGD, which is well recognized as the leading cause of dry eye syndrome. The treatment simultaneously applies heat to the palpebral surfaces of the upper and lower eyelids directly over the meibomian glands while also applying graded pulsative pressure to the outer eyelid surfaces, resulting in expression of the meibomian glands.

The LipiFlow system consists of a component that is inserted around the eyelids and a component to control the application of heat and pressure to the to the palpebral surfaces of both upper and lower eyelids. The inner portion of the apparatus applies a constant temperature of between 41°C and 43°C to the palpebral conjunctiva of the upper and lower eyelids. Simultaneously, the outer portion of the apparatus massages the outer eyelids from the base of the meibomian glands in the direction of the gland orifices, applying pulsatile pressure to the external eyelid surfaces (maximum 6 psi) for the 12-minute treatment cycle, expressing the meibomian glands during heating. The source of heat is a resistive (plastic) electric heater. Initial clinical studies revealed a single 12- minute treatment with the LipiFlow system is effective in patients with MGD.

This iLux System device consists of a hand-held instrument coupled to a single-use sterile disposable component that is positioned behind the eyelid. The iLux System allows the eye care professional (ECP) to view the eyelid margin through a magnifier, then warm the eyelid tissue to a target range of 40 to 42 ºC to melt the meibum blocking the gland orifices and then apply compression to the eyelid to express the melted meibum through the orifices. The inner eyelid temperature and amount of force applied are both displayed on the instrument allowing the ECP to titrate both heat and compression to optimize unclogging of the blocked gland. The source of heat is lime-green and infrared optical radiation produced by LEDs in the instrument. Treatment of upper and lower eyelids is sequential, and treatment time is typically between eight and twelve minutes.

The LipiView II Ocular Surface Interferometer to capture, archive, manipulate, and store digital images of the tear film, meibomian glands, ocular surface and eyelids. Using these images, the

LipiView Interferometer measures the absolute thickness of the tear film lipid layer. LipiView II, like its predicate LipiView, perform the same principal functions of ocular imaging and for specular observations of the tear film using white light interferometry. Neither device provides a diagnosis.

LipiScan Dynamic Meibomian Imager uses near infrared (NIR) illumination and an NIR-sensitive high-resolution camera to image the meibomian glands. LipiScan can be used to detect structural changes of meibomian glands.

SUPPORTIVE LITERATURE

Thermal Pulsation Therapy (e.g., LipiFlow, iLux System, TearCare, Tixel i)

A randomized controlled clinical study (Tauber 2020) was conducted to verify that the technological differences between the iLux System and the LipiFlow System do not adversely affect safety and effectiveness as it relates to indications for use. A total of 142 subjects (284 eyes) participated in the study, comprised of 101 women and 41 men, ages 19 to 86 years (mean = 54.9 ± 15.3 years). The subjects were randomized for treatment, in a 1:1 ratio into the iLux and LipiFlow treatment groups. The iLux arm of the study met the criteria for non-inferiority relative to the LipiFlow arm for the coprimary effectiveness endpoints – Meibomian Gland Score (MGS) and Tear Break-Up Time (TBUT) as well as the secondary effectiveness endpoint – Ocular Surface Disease Index (OSDI). MGS improved significantly from baseline in both treatment groups at both week 2 and week 4. MGS improvements did not differ significantly between the two treatment groups at either follow-up visit.

In a 2016 non-randomized clinical trial, Zhao and colleagues conducted a three-month single-institution trial comparing two warming methods in patients with MGD. A total of 50 patients were included in the study, 25 patients who underwent a single 12-min treatment session of thermal pulsation treatment, and 25 patients who underwent warm compresses applied for 10 min sessions twice daily for three months. Researchers concluded that in Asian patients with MGD, LipiFlow thermal pulsation demonstrated similar efficacy to twice daily warm compresses in reducing irritation symptoms and TBUT improvements. Both forms of treatment were safe and well tolerated. In addition to the low sample size, three participants from the warm compress group as well as one patient from the treatment group were lost to follow-up.

In an industry funded 2012 prospective, open label, randomized, crossover multicenter clinical trial, Lane and colleagues evaluated the safety and efficacy of the LipiFlow system compared to the iHeat Warm Compress (WC) for adults with MGD. A total of 139 patients were randomized to either the LipiFlow (n=69) and WC control group (n=70) and either received a single 12-minute LipiFlow treatment or two-week period of daily five-minute sessions of iHeat treatment, respectively. All treatment subjects were examined at day one, two weeks and four weeks, while WC subjects were given the option of entering LipiFlow cross-over arm at the two-week follow-up. Outcome measures included MG assessment, TBUT and dry eye symptoms. Additional safety outcomes such as adverse events, ocular health exam, ocular surface staining, intraocular pressure, visual acuity, and discomfort were also monitored. The results demonstrated a significant improvement in MG secretion and TBUT at two and four weeks in the LipiFlow group, as well as similar improvements in cross-over

arm at two weeks post-treatment. No such improvements were demonstrated in WC group, however. Additionally, LipiFlow resulted in a greater significant reduction in dry eye symptoms than the iHeat WC. There were no significant differences between groups in the incidence of non-serious device-related adverse effects. Researchers concluded the LipiFlow System was equally safe and significantly more effective than iHeat WC in the treatment of MGD and dry eye symptoms. As this study was funded by the manufacturer of LipiFlow and included an open-label design, the potential for investigator bias exists. Short follow-up period poses an additional limitation to this study.

Pang et al (2019) conducted a systematic review and meta-analysis of randomized controlled trials that compared the efficacy of vectored thermal pulsation treatment (VTPT) and warm compress treatment (WCT) in treating dry eye disease (DED). The primary outcome of gland function, as well as secondary outcomes of TBUT, Schirmer test, tear osmolarity, lipid layer thickness (LLT), Standard Patient Evaluation for Eye Dryness and improvement of subjective symptoms evaluated by the OSDI were examined. The study analysis consisted of four trials with a total of 385 patients. The analysis revealed a significantly greater improvement was observed in meibomian gland function, tear breakup time, and Standard Patient Evaluation for Eye Dryness at two to four weeks in the VTPT group than in the WCT group. A significantly greater decrease in OSDI was observed at two to four weeks and three months in the VTPT group than in the WCT group. Researchers concluded that a single 12-minute VTPT was more effective than traditional WCT in treating both objective and subjective measurements of DED. These findings require confirmation in randomized controlled trials with larger patient populations and longer treatment effect evaluation. Further, this meta-analysis highlights that many studies of VTPT are conducted in participants with mean age of 45-65, thus limiting the validity of data in a younger adult population. Additionally, authors acknowledged that it could not be confirmed whether WCT was conducted per protocol by participants assigned to that arm of included studies.

A Cochrane Database Systematic Review (Pucker 2024 and Yim 2025) was conducted to evaluate the effectiveness of LipiFlow for treating dry eye disease (DED) signs and symptoms and the safety of LipiFlow compared with sham or other available treatments for MGD in adults. Thirteen trials were included that randomized a total of 1,155 participants (28 to 236 participants randomized per study). There was no evidence of a difference in meibomian gland expression, meibum quality, or tear breakup time when comparing LipiFlow with basic warm compresses. When comparing LipiFlow plus eyelid hygiene with eyelid hygiene alone, there was no evidence of difference in signs or symptoms at any time point evaluated. The authors concluded the systematic review shows that LipiFlow performs similarly to other commonly used DED treatments with regards to DED signs and symptoms. The best available evidence was deemed to have a high level of bias, leading to low or very low certainty evidence. Additional research with adequate masking, a standardized testing methodology, and a sample representative of the MGD population is therefore needed before any firm conclusions can be drawn regarding comparative benefits and harms.

A systematic review and network meta-analysis (Ben Ephraim Noyman 2025) compared intense pulsed light (IPL), LipiFlow, TearCare, iLux, low-level light therapy (LLLT), and acupuncture for the treatment of dry eye disease (DED). Forty-five RCTs which included 3,455 participants were included

for analysis. Results showed TearCare combined with meibomian gland expression (MGX) demonstrated the highest efficacy for improving meibomian gland secretion (SMD - 10.08, 95% CI - 13.35 to - 6.82). IPL-based treatments, including IPL combined with diquafosol sodium or LLLT, significantly improved tear break-up time and symptom scores, with IPL alone ranking highest for symptom relief (P-score 0.811). Acupuncture was the only intervention significantly superior to conservative treatment for increasing Schirmer test values (SMD - 0.69, 95% CI - 1.06 to - 0.32). LipiFlow demonstrated modest improvements but was not significantly superior to other technologies. The authors concluded this study supports the need for standardized, long-term comparative studies.

Sadri and colleagues (2024) evaluated the safety and effectiveness of the thermo-mechanical action of Tixel C (Novoxel) compared with the thermal pulsation of LipiFlow (Johnson and Johnson) to treat MGD in a multicenter, prospective, randomized (1:1), evaluator masked study. Participants included 106 individuals (N=53 per group) with Ocular Surface Disease Index (OSDI) between 23 and 79, fluorescein tear break-up time (TBUT) <10 s and Meibomian Gland Score (MGS) ≤12 in each eye received bilateral thermo-mechanical action (TMA) or thermal pulsation (TP). The treatment consisted of three (3) sessions, two (2) weeks apart, for TMA and one (1) session for TP. TBUT, OSDI, MGS, and corneal and conjunctival staining (CCS) were assessed at baseline and at Weeks 4 and 12 post-last treatment session. The primary effectiveness endpoint was change in TBUT at Week 4. Results showed TBUT improved significantly ($p<0.001$) by 3.0±3.2 and 3.1±4.3 seconds after TMA and 2.7±2.7 and 3.3±3.6 seconds after TP, at Week 4 and Week 12, respectively. The change in TBUT for TMA was non-inferior to TP (linear mixed-effects model, $p<0.001$). OSDI, MGS and CCS significantly improved from baseline ($p<0.001$), with no significant between-group differences ($p>0.05$). OSDI improved by 26.4±21.1 and 28.6±22.4 after TMA and 18.8±21.0 and 21.9±18.5 after TP, at Week 4 and Week 12, respectively. No device-related adverse event occurred in either group. The authors concluded their study showed TMA with Tixel safely and effectively improved clinical signs and symptoms of evaporative dry eye disease associated with MGD over a 12-week period, comparable to TP with LipiFlow.

LipiView

While there are many studies employing LipiView ocular surface interferometer to assess LLT, there is little research validating its validity as a clinical tool. Zhao et al (2015) evaluated the repeatability of LipiView in measuring LLT in twenty subjects. Two investigators measured LLT of one eye of each patient three times in a single day. The results indicated similar limits of agreement for inter-observer and intra-observer measurements. Given the small sample size, repeatability of measurements in different patient subgroups could not be assessed, nor could results be generalized to patients with characteristics that vary from this small sample.

Esam et al (2025) published a review summarizing different LLT measurement techniques, normative values, and alterations in ocular surface disorders. They found advanced imaging techniques, such as LipiView, Oculus Keratograph 5M, and Tearscope, utilize interference principles, but are not interchangeable for measuring LLT. LLT ranges from 13 to 170 nm in healthy individuals, depending on the instrument and grading scale used. The reported central LLT values in DED vary from 33 to 84 nm, varying with disease severity. There are conflicting reports on the association between age,

gender, and LLT values. The significant overlap in LLT values between the normal individuals and DED patients precludes its role in the diagnosis of DED. Future studies exploring LLT variations under different environmental conditions and across larger cohorts with varying DED severity are essential to enhance clinical applicability.

LipiScan

There is a lack of evidence demonstrating the efficacy of LipiScan near-infrared dual imaging in the management of MGD.

PROFESSIONAL GUIDELINE(S)

The American Academy of Ophthalmology (AAO) published a technology assessment for thermal pulsation in the management of meibomian gland dysfunction and dry eye (Tao 2023) which states according to the current literature, a single application of thermal pulsation was safe and usually demonstrated a benefit at least comparable with standard daily warm compress therapy and eyelid hygiene in patients with MGD and dry eye. Four (4) of the included studies were sponsored and directly supported by relevant industry and raise concern over potential conflict. The three (3) level I studies without direct industry participation concluded that thermal pulsation treatment was not significantly different from eyelid hygiene control treatment. The durability beyond several months and cost efficacy remain uncertain. Because the inclusion parameters of this assessment captured only the LipiFlow system, the conclusions are limited to that product. Independent, unbiased studies of different thermal pulsation treatment frequencies and controlled studies of other thermal pulsation platforms in diverse populations are warranted to assess the long-term benefits of this intervention.

The AAO's Preferred Practice Pattern on dry eye syndrome (Amescua 2024) recommends in-office, physical heating and expression of the meibomian glands (including thermal pulsation devices) as a step 2 intervention for dry eye syndrome.

The AAO's Preferred Practice Pattern on Blepharitis (Lin 2024) stated that "there are also several in-office procedural treatments available that may theoretically unclog the inspissated meibomian gland orifices using intense pulsed light (IPL) or mechanical means (e.g., microblepharoexfoliation of the eyelid margin, meibomian gland probing, and/or devices using thermal pulsation). Although there have been industry-sponsored studies, independent, randomized, masked clinical trials have yet to be performed to assess efficacy of these costly, primarily fee-for-service treatments. (I-, Moderate, Discretionary)"

REGULATORY STATUS

The LipiFlow thermal pulsation system (TearScience Inc, Morrisville, NC) received U.S. Food and Drug Administration (FDA) approval in 2010 and is indicated for the application of localized heat and pressure therapy in adult patients with chronic cystic conditions of the eyelids, including MGD, also known as EDE or lipid deficiency dry eye.

The iLux System (Tear Films Innovations, Inc, San Diego, CA) received 510(k) marketing clearance in 2017. The iLux System is indicated for the application of localized heat and pressure therapy in adult patients with chronic diseases of the eyelids, including MGD, also known as EDE.

The Systane iLux2 (Tear Film Innovations, Inc, Carlsbad, CA) received 510(k) marketing clearance in 2020 for the application of localized heat and pressure therapy in adult patients with MGD, which is associated with evaporative dry eye, and to capture/store digital images and video of the meibomian glands.

The TearCare System (Sight Sciences, Menlo Park, CA) received 510(k) marketing clearance in 2021 for the application of localized heat and pressure therapy in adult patients with evaporative dry eye disease due to MGD, when used in conjunction with manual expression of the meibomian glands.

TearCare MGX (Sight Sciences, Menlo Park, CA) received 510(k) marketing clearance in 2023 for the application of localized heat therapy in adult patients with evaporative dry eye disease due to MGD, when used in conjunction with manual expression of the meibomian glands.

Tixel i (Novoxel Ltd, Covina, CA) received 510(k) marketing clearance in 2024 for the application of localized heat and pressure therapy in adult patients with evaporative dry eye disease due to MGD.

The LipiView II Ocular Surface Interferometer (TearScience Inc, Morrisville NC) received 510(k) marketing clearance in 2016 and is indicated for use by a physician in adult patients to capture, archive, manipulate and store digital images of…the tear film, meibomian glands, ocular surface, and eyelids.

LipiScan Dynamic Meibomian Imager (TearScience Inc, Morrisville NC) received 510K marketing clearance in 2018 and is indicated for use by a physician in adult patients to capture, archive, manipulate and store digital images of the meibomian glands.

MEDICAL POLICY

Medical Policy Title	**Maze Procedures for Atrial Fibrillation and Flutter**
Policy Number	**7.01.27**
Current Effective Date	**January 1, 2027**
Next Review Date	**June 2027**

Our medical policies are guides to evaluate technologies or services for medical necessity. Criteria are established through the assessment of evidence based, peer-reviewed scientific literature, and national professional guidelines. Federal and state law(s), regulatory mandates and the member's subscriber contract language are considered first in the determination of a covered service. (Link to Product Disclaimer)

This policy does not address percutaneous transcatheter ablation procedures for the treatment of cardiac arrhythmia.

POLICY STATEMENT(S)

I. Maze procedures performed on a non-beating heart during cardiopulmonary bypass are considered **medically appropriate** for the treatment of medically refractory, chronic, symptomatic atrial fibrillation or flutter, with or without concurrent cardiac surgery.

II. Minimally invasive, off-pump Maze procedures (e.g., mini thoracotomy); including Hybrid or convergent ablation procedures (defined as a combined percutaneous catheter and thoracoscopic surgical ablation approach), are considered **investigational** as a treatment of atrial fibrillation or flutter.

DESCRIPTION

Atrial fibrillation (AF) is the most common sustained cardiac arrhythmia, with a prevalence estimated at 0.4% of the population, increasing with age. AF is a supraventricular tachyarrhythmia, characterized by disorganized atrial activation with ineffective atrial ejection. The underlying mechanism of AF involves an interplay between electrical triggering events and the myocardial substrate that permits propagation and maintenance of the aberrant electrical circuit. The most common focal trigger of AF appears to be located within the cardiac muscle that extends into the pulmonary veins. Atrial flutter is considered a variant of AF. Due to the necessity of long-term drug therapy and its associated potential toxicity in patients with AF, surgical techniques have been developed as part of the armamentarium of alternative non-pharmacological treatments. Literature describes patients with drug-resistant AF and flutter as having experienced their arrhythmias for an

average of seven years or more and having unsuccessful results with an average of five or more antiarrhythmic medications.

The classic Cox Maze III procedure is a complex surgical procedure that involves sequential atriotomy incisions that interrupt potential re-entrant circuits, which interrupts the aberrant atrial conduction pathways in the heart in cases of AF. It is indicated for patients who do not respond to medical or other surgical antiarrhythmic therapies and is often performed in conjunction with correction of structural conditions of the heart, such as valve repair or replacement. The procedure has become the gold standard technique for the surgical treatment of drug-resistant AF. This procedure is performed on a non-beating heart during cardiopulmonary bypass.

The Maze procedure entails making incisions in the heart that:

I. Guide an impulse from the sinoatrial (SA) node to the atrioventricular (AV) node;

II. Preserve activation of the entire atrium; and

III. Block re-entrant impulses that are responsible for AF or atrial flutter (AFl).

Despite its high success rate, the traditional "cut and sew" Maze procedure has not been widely utilized other than for those patients who also require concomitant cardiac surgery necessitating the need for cardiopulmonary bypass. Therefore, simplification of the Maze procedure, sometimes referred to as the Cox-Maze IV procedure, has evolved with the use of different ablation tools, such as microwave, cryothermy, ultrasonography and radiofrequency energy sources to create atrial ablative lesions instead of employing the incisional technique used in the traditional Maze procedure.

Due to the complexity and technical difficulty, associated with the Cox-Maze procedure, less invasive, trans-thoracic, endoscopic, off-pump procedures to treat refractory AF are also being developed and evaluated. Examples of these minimally invasive, off-pump surgical techniques include the thoracoscopic Wolf Mini-Maze and the Ex-Maze which use a paracardioscopic approach.

Studies are also starting to emerge investigating a hybrid approach that combines off- pump surgical and endocardial percutaneous catheter ablation. Hybrid ablation or convergent procedure refers to a procedure that uses both thoracoscopic and percutaneous approaches in the same patient. Ablation is performed on the outer surface of the heart (epicardial) via the thoracoscopic approach, and on the inner surface of the heart (endocardial) via the percutaneous approach. The rationale for doing a hybrid procedure is that a combination of both techniques may result in more complete ablation. Thoracoscopic epicardial ablation is limited by the inability to perform all possible ablation lines, because the posterior portions of the heart are not accessible via thoracoscopy. Percutaneous, endoscopic ablation is limited by incomplete ablation lines that often require repeat procedures. By combining both procedures, a full set of ablation lines can be performed, and incomplete ablation lines can be minimized. This convergent ablation procedure has been proposed for highly symptomatic patients with persistent AF and long-standing persistent AF for whom stand-alone surgical or endocardial ablation procedures have provided unsatisfactory outcomes.

SUPPORTIVE LITERATURE

MAZE Procedure

Sakurai et al (2025) reported long-term survival outcomes from a systematic review and meta-analysis of 38 studies (n=41,678) comparing surgical ablation with no surgical ablation during cardiac surgery. The analysis included 9 RCTs and 15 comparative observational studies. The median follow-up was 62 months. Surgical ablation was associated with decreased risk of mortality (HR=0.78; 95% CI, 0.71 to 0.84), stroke (HR=0.60; 95% CI, 0.48 to 0.76), heart failure rehospitalization (HR=0.92; 95% CI, 0.87 to 0.96) and freedom from AF (RR=1.93; 95% CI, 1.50 to 2.49). Surgical ablation was also associated with higher risk of permanent pacemaker implantation (HR=1.35; 95% CI, 1.03 to 1.77).

The Catheter Ablation (CA) Versus Thoracoscopic Surgical Ablation (SA) in Long Standing Persistent Atrial Fibrillation (LSPAF) CASA-AF trial (Haldar 2020), is the first RCT that evaluated the efficacy and safety of thoracoscopic surgical ablation versus CA as the index procedure in 120 patients with long-standing persistent AF. A reduction in AF burden of ≥ 75% was seen in 67% in the surgical ablation group versus 77% in the CA group (OR, 1.13; 95% CI, 0.67 to 4.08; p=.3). Improvements in AF symptoms were increased following CA; surgical ablation was more expensive and was associated with fewer quality-adjusted life years (p=.02) compared with CA. Long-term (up to 3 years) outcomes of the CASA-AF trial were reported by Boyalla, et al (2024). One hundred and four (104) participants (90%) completed 36-month follow-up (CA, n=57 vs SA, n=47). Seven (7) participants (12%) in the CA group and 5 (11%) in the surgical ablation group were free from atrial fibrillation/tachycardia (AF/AT) ≥ 30 seconds at 36 months (HR=1.2; 95% CI, 0.81 to 1.83; p=.41]. 33 patients (58%) in the CA group versus 26 (55%) in the surgical ablation group had their AF/AT burden reduced by ≥ 75% (HR=1.04; 95% CI, 0.57 to 1.88; p=.91). The mean quality-adjusted life years, calculated as the area under the EuroQol 5 Dimension 5 Level questionnaire index score, were 2.5 (95% CI, 2.3 to 2.6) for CA versus 2.3 (95% CI, 2.1 to 2.5) for surgical ablation. The authors concluded this long-term study showed in symptomatic LSPAF, CA and SA were equally effective at achieving arrhythmia outcomes (freedom from AF/ AT ≥ 30 seconds and ≥ 75% burden reduction) after a single procedure without antiarrhythmic drugs. However, SA is significantly more costly than CA.

Evidence from a number of prospective and retrospective studies conclude that the Maze procedure is effective in restoring sinus rhythm in up to 90% of patients with medically refractory, chronic, symptomatic AF. In addition, there is evidence that, when performed in conjunction with valve repair or replacement, the Maze procedure may reduce the risk of stroke, compared with valve replacement alone (e.g., Reston 2005, Budera 2012, and Ad 2013).

Some case series investigating minimally invasive, off-pump procedures include only patients who have failed previous catheter ablation. These studies report high success rates following thoracoscopic ablation, suggesting that patients who fail catheter ablation may still benefit from thoracoscopic ablation. However, these series are small and do not provide complete information on comparative efficacy or adverse events (e.g., Okada 2013).

Hybrid MAZE Procedure

The CONVERGE trial (Delurgio 2020) was a prospective, multi-center, randomized controlled clinical trial, longitudinal study performed from December 2013 to August 2018 to compare the effectiveness of Hybrid Convergent procedure to endocardial catheter ablation (CA) and to demonstrate its safety

for treatment of symptomatic persistent and long-standing persistent AF. The trial enrolled 153 patients at 27 locations (25 in the USA and two in the UK). Patients were randomized at a rate of 2:1 and received either the hybrid Convergent procedure or an endocardial catheter ablation alone. Of 149 evaluated patients at 12 months post-procedure, primary effectiveness was achieved in 67.7 percent (67/99) patients with Hybrid Convergent and 50.0 percent (25/50) with CA (p=0.036) on/off previously failed AADs and in 53.5 percent (53/99) versus 32.0 percent (16/50) (p=0.0128) respectively off AADs. At 18-months using a 7-day Holter monitor, 74.0 percent (53/72) Hybrid Convergent and 55 percent (23/42) CA patients experienced > 90 percent AF burden reduction. There were no deaths, cardiac perforations or atrio-esophageal fistulas reported in the trial. The major adverse events (MAEs) rate through 30-days post intervention (primarily reported as inflammatory pericardial effusions) was 7.8 percent in the treatment arm, which was lower than the protocol pre-specified performance goal of 12 percent. There was also no long-lasting safety events observed in the trial. The clinical trial data showed a greater than 23 percent advantage for the Convergent arm over the control arm.

There is limited literature related to the use of the hybrid approach in the treatment of AF. While short-term outcomes appear promising, further studies are necessary to determine whether the hybrid approach is effective, especially in patients with persistent lone or long-standing persistent, drug-resistant AF (La Meir 2012, Pison 2012, Bisleri 2013, Gehi 2013). Recent studies and reviews focusing on the convergent ablation procedure include Delurgio and colleagues (2020); Larson and colleagues (2020) and Makati and colleagues (2020). Large population studies are needed as well as comparative studies to include direct comparisons of the hybrid ablation procedures with alternative treatment options.

Eranki et al (2023) reported results of a systematic review of mid-term (at least 2 year) outcomes of hybrid ablation. The review included 1,242 individuals from 15 retrospective cohort studies and 1 RCT with sample sizes ranging from 24 to 451. Mean follow-up was 32 (SD=8) months. The mean age of patients was 62 (SD=10) years. 73% of patients were men. Five (5) studies included patients with paroxysmal AF; the majority of the studies included patients with persistent and long-standing AF. Overall, the mid-term freedom from AF was 75% (95% CI, 67 to 82). Freedom from AF at years 1, 2, and 3 was 78%, 74%, and 74%, respectively. There were 12 deaths (0.97%) overall following the hybrid procedure; 10 occurred within 30 days of the procedure. Four (4) deaths were due to a direct mechanical complication of the procedure (atrio-esophageal fistulae) and 2 patients died of stroke. The pooled complication rate was 5.5% (95% CI, 3 to 9). The authors concluded the study shows Hybrid AF ablation offers promising mid-term freedom from AF reported at a mean follow-up of 31.5 months. The overall complication rate remains low.

Mhanna et al (2021) conducted a systematic review and meta-analysis of 8 controlled studies (including the DeLurgio 2020 RCT and the Maclean 2020 nonrandomized studies) of 797 patients with AF undergoing hybrid epicardial/endocardial (convergent) ablation (n=366) or standard endocardial ablation (n=431). Across the studies, the mean age of study participants was 61 years, 77% were male, 93% had persistent AF, and 18% had undergone a previous ablation. The included studies were all assessed as having low to moderate risk of bias. Based on pooled analyses, hybrid ablation was associated with greater freedom from atrial arrhythmia, but also an increased risk of adverse events that included bleeding, pericardial effusion, and cardiac tamponade. The study authors noted

that across studies 5 deaths were reported among hybrid ablation patients while no endocardial ablation patients died, but no risk estimate was reported. The authors concluded the meta-analysis showed that although hybrid ablation was associated with a higher success rate, this should be judged for increased periprocedural adverse events and extended hospital stay.

Eranki et al (2022) conducted a systematic review and meta-analysis of 4 RCTs and propensity score-matched studies (N=422) of hybrid convergent ablation. Hybrid convergent participants had significantly higher rates of freedom from AF than endocardial ablation participants (OR=2.8; 95% CI, 1.8 to 4.2; p<.01). Major post-operative complications were also significantly higher in hybrid convergent participants (OR=5.1; 95% CI; 1.7 to 15.5; p<.01). One death was reported in the hybrid convergent participants; no deaths were reported in the in the endocardial ablation participants.

Doll et al (2023) reported results of the Combined Endoscopic Epicardial and Percutaneous Endocardial Ablation versus Repeated Catheter Ablation in Patients with Persistent and Longstanding Persistent Atrial Fibrillation (CEASE-AF, NCT02695277) RCT. CEASE-AF is a multicenter RCT comparing hybrid combined epicardial and endocardial ablation to standard endocardial CA in 9 hospitals in Germany, Netherlands, United Kingdom, Czech Republic, and Poland between 2015 and 2020 including 154 participants (102 hybrid ablation; 52 standard ablation) with symptomatic, drug refractory persistent AF and left atrial diameter > 4.0 cm or longstanding persistent AF. Participants and study physicians were not blinded to treatment assignment; the core rhythm monitoring laboratory was blinded. In the hybrid CA group, pulmonary veins and left posterior atrial wall were isolated with thoracoscopic epicardial ablation including left atrial appendage exclusion and endocardial touch-up ablation was performed 91 to 180 days afterwards. In the standard CA group, endocardial PV isolation and optional substrate ablation were performed. The primary outcome was freedom from AF, atrial flutter, or atrial tachycardia lasting > 30 seconds through 12 months without class I/III anti-arrhythmic drugs except those not exceeding previously failed doses. Rhythm status was assessed with 48-hour Holter monitoring during scheduled visits and symptom-driven monitoring during unscheduled visits. 81% of participants had persistent AF. 75% were male and the mean age was 61 (SD=8) years. Race/ethnicity was not reported. Total procedure duration was significantly longer in the hybrid group (336 minutes, SD=97) compared to the CA group (252 minutes, SD=114, p < 0.001). Through 12-months follow-up, 72% (68/95) in the hybrid group were free from AF versus 39% (20/51) in the CA group (absolute risk difference = 32% (95% CI, 14 to 48; p < 0.001). In persistent AF subgroup, freedom from AF was 73% (56/77) in the hybrid group versus 42% (18/43) in the CA group (absolute risk difference=31% (95% CI, 10 to 48). In the longstanding persistent AF subgroup, freedom from AF was 67% (12/18) in the hybrid group compared to 25% (2/8) in the CA group (absolute risk difference=42% (95% CI, 4 to 73). Composite major complication rates within 30 days after the index procedure and 30 days after the second stage hybrid ablation or repeat standard ablation were 8% (8/102) and 6% (3/52) in the hybrid versus CA groups (p = 0.751). Through 12-months post-index procedure, composite major complications occurred in 9% (9/102) in the hybrid group versus 6% (3/52) in the CA group (p = 0.752). There was one death (myocardial infarction) in the hybrid group at 93 days post-index procedure. By the 12-month follow-up visit, 4% (4/95) in the hybrid group and 35% (18/51) in the CA group had additional ablation (p < 0.001). Cardioversions (pharmaceutical and electrical) were performed in 12% (11/95) in the hybrid group and 26% (13/51) in the CA group during this time frame (p =

0.037). The authors concluded the study showed hybrid epicardial-endocardial ablation had superior effectiveness compared to catheter ablation/repeat catheter ablation in persistent atrial fibrillation and longstanding persistent atrial fibrillation without significant procedural risk increase. This study was sponsored by AtriCure, Inc.

Lee et al (2022) reported results of the Epicardial Approach in Recurred Atrial Fibrillation (EPIREAF; NCT02979847) RCT comparing a combined epicardial and endocardial ablation approach (n=50) with a conventional endocardial ablation approach (n=50). In the combined approach, subxiphoid epicardial access was obtained under fluoroscopic guidance (hybrid convergent). Participants had symptomatic, persistent AF refractory or intolerant to antiarrhythmic drugs and prior endocardial ablation. EPIREAF was a single-center, open-label, unblinded trial enrolling participants from June 2016 to November 2019. Rhythm monitoring occurred via 12-lead ECG and 24-hour Holter monitoring at 1, 3, 6, 9, and 12 months after the procedure and then every 6 months thereafter. The primary efficacy outcome was time to recurrence of sustained (> 30 seconds) AF or atrial tachycardia following the 90-day blanking period within 12 months of the procedure. The reported safety outcome was occurrence of procedure-related complications within 24 hours after the procedure. Complications included death, any event requiring emergent surgery, severe bradycardia requiring cardiac pacing, pericardial effusion with tamponade or requiring transfusion, ischemic stroke, and procedure-related hematoma or vessel injury. The median age of participants was 59 years and 16% were women. Race/ethnicity of participants was not reported. The median CHA2DS2-VASc score was 1 and the median number of prior ablations was 1. The median procedure time was 232.5 minutes in the hybrid convergent group and 226 minutes in the CA group. 93 (93%) completed the trial. Events relevant to the primary outcome occurred in 16 patients in the treatment group and in 21 patients in the control group {Kaplan-Meier estimator percentages, 32 vs. 42%; hazard ratio, 0.71 [95% confidence interval (CI): 0.37-1.37]}. The periprocedural complication rate was lower in the treatment group [2 vs. 16%; odds ratio, 0.11 (95% CI: 0.00-0.87)] with similar achievement of the procedural endpoint in the two groups. In the redo procedure for persistent atrial fibrillation, the combined approach had no significant difference of recurrence-free survival, and a lower procedural complication rate compared with the conventional approach.

van der Heijden et al (2023) reported results of the Hybrid Versus Catheter Ablation in Persistent AF (HARTCAP-AF; NCT02441738) RCT. HARTCAP-AF was a single-center, open-label, unblinded trial randomizing 41 ablation-naive adults with symptomatic, long-standing persistent AF to either hybrid ablation (n=19) or CA (n=22) between October 2016 and December 2018. All randomized participants received their allocated treatment. The hybrid ablation was performed by an experienced surgeon and electrophysiologist in a single-stage procedure. Rhythm observation was performed with a 12-lead ECG and 24-hour-Holter monitor at 3 and 6 months or following report of symptoms. A 7-day-Holter was collected at 12 months. The primary efficacy outcome was freedom from any atrial tachyarrhythmia (lasting > 5 minutes) off antiarrhythmic drugs after the 3-month blanking period until 12 months. The primary safety outcome was a composite of major adverse events and complications occurring within 12 months of follow-up. Major adverse event included death, stroke, bleeding requiring transfusion and/or reoperation, cardiac tamponade or pericardial effusion requiring intervention, empyema, myocardial infarction, pericarditis requiring pericardiocentesis or (prolongation of) (re)hospitalization, pneumothorax requiring intervention (after removal of chest

tubes), gastroparesis, symptomatic pulmonary vein stenosis > 70%, or (persistent) diaphragmatic paresis. The median age of participants was approximately 65 years; approximately 90% of participants had persistent but not long-standing AF and approximately 10% had persistent, long-standing AF. Several baseline characteristics were not balanced between the 2 treatment groups: women (5% in hybrid vs 18% in CA); median AF duration (22 months in hybrid vs 33 months in CA); CHA2DS2-VASc score > 3 (53% in hybrid vs 27% in CA); and congestive heart failure (5% in hybrid vs 27% in CA). Race/ethnicity of participants was not reported. Median procedure time (4 hours 16 minutes vs 2 hours 53 minutes; p<.001) and length of hospital stay (4 days vs 2 days; p<.001) were significantly longer in the hybrid group. Radiation dose (31 cGycm2 vs 67 cGycm2; p=.004) and radiation exposure time (23 minutes vs 1 hour 54 minutes; p<.001) were significantly higher in the CA group. After 12 months, the freedom of atrial tachyarrhythmias off antiarrhythmic drugs was higher in the HA group compared with the CA group (89% vs 41%, P = 0.002). There was 1 pericarditis requiring pericardiocentesis and 1 femoral arteriovenous fistula in the HA group. In the CA arm, 1 bleeding from the femoral artery occurred. There were no deaths, strokes, need for pacemaker implantation, or conversions to sternotomy, and the number of (serious) adverse events was comparable between groups (21% vs 14%, P = 0.685). The authors concluded the study showed Hybrid AF ablation is an efficacious and safe procedure and results in better outcomes than catheter ablation for the treatment of patients with persistent AF. The study was funded by AtriCure, Inc.

Pannone et al (2023) published results from a study to assess the long-term outcomes of hybrid ablation in a large cohort of patients after both an initial and as a redo procedure. All consecutive patients undergoing hybrid AF ablation at UZ Brussel from 2010 to 2020 were retrospectively evaluated. Hybrid AF ablation was performed in a one-step procedure: (i) thoracoscopic ablation followed by (ii) endocardial mapping and eventual ablation. All patients received PVI and posterior wall isolation. Additional lesions were performed based on clinical indication and physician judgement. Primary endpoint was freedom from atrial tachyarrhythmias (ATas). A total of 120 consecutive patients were included, 85 patients (70.8%) underwent hybrid AF ablation as first procedure (non-paroxysmal AF 100%), 20 patients (16.7%) as second procedure (non-paroxysmal AF 30%), and 15 patients (12.5%) as third procedure (non-paroxysmal AF 33.3%). After a mean follow-up of 62.3 months ± 20.3, a total of 63 patients (52.5%) experienced ATas recurrence. Complications occurred in 12.5% of patients. There was no difference in ATas between patients undergoing hybrid as first vs. redo procedure (P = 0.53). Left atrial volume index and recurrence during blanking period were independent predictors of ATas recurrence. In a large cohort of patients undergoing hybrid AF ablation, the survival from ATas recurrence was 47.5% at ≈5 years follow-up. There was no difference in clinical outcomes between patients undergoing hybrid AF ablation as first procedure or as a redo.

PROFESSIONAL GUIDELINE(S)

The Heart Rhythm Society (HRS) (2017) has stated that a hybrid approach could hold significant promise for those patients with persistent lone or long-standing persistent, drug-resistant AF, offering improved results over minimal-access surgical ablation or catheter ablation alone. It might be

reasonable to apply the indications for stand-alone surgical ablation described above to patients being considered for hybrid surgical ablation (Class IIb, LOE C).

The Society of Thoracic Surgeons 2023 Clinical Practice Guidelines for the Surgical Treatment of Atrial Fibrillation (Wyler von Ballmoos 2024) state the gold standard of surgical ablation has remained the Cox maze procedure and its iteration, based on the original work of Dr. Cox. Given stronger longitudinal evidence of efficacy and longitudinal freedom from atrial fibrillation, antiarrhythmic drugs, as well as oral anticoagulation following a full biatrial Cox Maze, the field awaits more Journal Pre-proof homogeneous or randomized evidence on hybrid or epicardial ablation procedures that adhere to the concept of the Cox Maze lesion set. Epicardial ablation with atypical lesions remain exploratory until more robust evidence becomes available.

In 2023, updated American College of Cardiology (ACC) /American Heart Association (AHA) /American College of Clinical Pharmacy (ACCP)/ Heart Rhythm Society (HRS) Guideline for the Diagnosis and Management of Atrial Fibrillation were released (Joglar 2024). These updated guidelines state that a hybrid procedure might be reasonable to reduce the risk of recurrent atrial arrhythmia citing a weak level of evidence 2B recommendation and the Level of Evidence (LOE) was B-R (moderate-quality evidence from 1 or more RCTs; meta-analyses of moderate-quality RCTs).

REGULATORY STATUS

Several ablation systems have been approved or cleared for marketing by the U.S. Food and Drug Administration through the 510(k) process for cardiac tissue ablation (product code OCL) or PMA process (product code OCM).

Radiofrequency Ablation Approved or Cleared by the U.S. Food and Drug Administration

Device	**Manufacturer**
EPi-Sense Guided Coagulation System	Atricure
Medtronic DiamondTemp System	Medtronic
Cobra Fusion Ablation System	AtriCure
Medtronic Cardioblate and Cardioblate Gemini Systems	Medtronic
Cardima Ablation System	Cardima
Epicor Medical Ablation System	Epicor Medical
Isolator Systems	AtriCure
Estech COBRA Cardiac Electrosurgical Unit	Endoscopic Technologies

Coolrail Linear Pen	AtriCure

A number of cryoablation systems, which may be used during cardiac ablation procedures, have also been cleared for marketing.

Cryoablation Systems Approved or Cleared by the U.S. Food and Drug Administration

Device	**Manufacturer**
Cryocare Cardiac Surgery System	Endocare
SeedNet System	Galil Medical
SurgiFrost XL Surgical CryoAblation System	CryoCath Technologies; now Medtronic
Isis cryosurgical unit	Galil Medical
Artic Front Advance and Arctic Front Advance Pro and the Freezor Max Cardiac Cryoablation Catheters	Medtronic

CODE(S)

MEDICAL POLICY

Medical Policy Title	**Medical Management Obstructive Sleep Apnea (OSA)**
Policy Number	**1.01.07**
Current Effective Date	**January 1, 2027**
Next Review Date	**October 2027**

Our medical policies are based on the assessment of evidence based, peer-reviewed literature, and professional guidelines. Eligibility for reimbursement is based upon the benefits set forth in the member's subscriber contract. (Link to Product Disclaimer)

POLICY STATEMENT(S)

I. Oral appliances therapy (OAT) is **medically appropriate** for the treatment of obstructive sleep apnea (OSA) when the severity level (e.g., mild, moderate, severe) criteria are met:

A. Mild OSA

1. Documented diagnosis of OSA with Apnea-Hypopnea Index (AHI) or Respiratory Disturbance Index (RDI) ≥ 5 and ≤ 14, confirmed by a sleep study (e.g., PSG or home sleep study); when **BOTH** of the following criteria are met:

a. At least **ONE** of the following indications:

i. Hypertension;

ii. Heart disease;

iii. Stroke;

iv. Excessive daytime sleepiness;

v. Impaired cognition;

vi. Mood disorders; **or**

vii. Insomnia;

AND

b. The individual cannot tolerate or refuses continuous positive airway pressure (CPAP) therapy; **or**

c. The physician determines that the use of positive airway pressure (PAP) therapy is contraindicated.

B. Moderate OSA

1. Documented diagnosis of OSA with a severity level indicated by an AHI or RDI ≥ 15 and < 30 confirmed by a sleep study when **EITHER** of the following criteria are met:

a. The individual cannot tolerate or refuses CPAP therapy; **or**

b. The physician determines that the use of PAP therapy is contraindicated.

C. Severe OSA

1. Documented diagnosis of OSA with a severity level indicated by AHI or RDI ≥ 30, confirmed by a sleep study when **EITHER** of the following criteria are met:
    a. The individual cannot tolerate or refuses CPAP therapy; **or**
    b. The physician determines that the use of a PAP device is contraindicated.

II. The use of Oral Appliances (OAs) is **not medically necessary** for the following indications, which include but are not limited to:
    A. Upper Airway Resistance Syndrome (UARS) with or without snoring and without a diagnosis of OSA;
    B. Primary snoring (e.g., Slow Wave Ds8, and SnoreRX);
    C. Temporomandibular joint disorders (TMJD), (refer to CMP 11.01.17 Temporomandibular Joint Disorders for other indications);
    D. Central sleep apnea;

III. Prefabricated or non-custom OAs are **not medically necessary**.

IV. Daytime neuromuscular electrical stimulation devices (e.g., eXciteOSA) is **investigational** for the treatment of OSA.

V. The use of a sleep positioning trainer with or without vibration is considered **investigational** for the treatment of positional OSA.

VI. Replacement of a medically necessary OA is **eligible for coverage** after five (5) years, unless there is documented evidence of device failure or a clinically significant change in the patient's condition that necessitates earlier replacement (e.g., tooth loss or major dental reconstruction).

VII. Replacement of a medically necessary oral appliance due to misuse or neglect (e.g., lost, or misplaced) is **ineligible for coverage**.

#11.01.17 Temporomandibular Joint Disorders (TMJD)

POLICY GUIDELINE(S)

I. Attempts at behavioral modifications and lifestyle changes (e.g., good sleep hygiene, weight loss, avoidance of alcohol consumption in evening, smoking cessation, sleep position change, treatment of nasal congestion) for individuals with UARS and sleep apnea should be an integral part of the treatment regimen for sleep-disordered breathing.

II. The decision for the use and fabrication of an OA should be made by a sleep medicine physician (e.g., somnologist or sleep specialist; ear, nose, and throat [ENT] specialist) or by an experienced dentist/orthodontist in collaboration with a sleep specialist.

III. All impressions, try-ins, and adjustments and repairs are inclusive to the lifetime of the appliance after approval of the device.

DESCRIPTION

Sleep related breathing disorders are characterized by abnormal respiration during sleep, which may or may not also occur during wakefulness. These abnormalities can include pauses in breathing, shallow breathing, or reduced airflow, often leading to fragmented sleep and reduced oxygen levels. Other symptoms can include loud snoring, gasping, choking during sleep, morning headaches, dry mouth, daytime fatigue, sleepiness, mood changes, and cognitive issues. There are several types of sleep related breathing disorders. OSA (the most common type) causes physical blockage of the upper airway typically due to relaxed throat muscles during sleep. OSA in an adult is defined as recurrent episodes of complete or partial obstruction of the upper airway leading to reduced or absent breathing during sleep for greater than 10 seconds.

Upper airway resistance syndrome (UARS) is a milder form of obstructive sleep related breathing. The airway narrows but does not fully close. This can cause sleep fragmentation and fatigue.

Central sleep apnea occurs when the brainstem, which regulates breathing, does not respond appropriately to changes in carbon dioxide levels in the blood. This results in reduced or absent respiratory effort, leading to pauses in breathing during sleep. Central apneas are often linked to heart failure or neurological conditions. The central apneas occur without any airway obstruction.

Sleep related hypoventilation disorders causes inadequate breathing during sleep which can lead to high carbon dioxide levels. Hypoventilation disorders are common in obesity, neuromuscular disorders, or medication use.

Sleep related hypoxemia is sustained low oxygen levels during sleep without elevated carbon dioxide. Often due to lung diseases or other medical conditions.

Oral Appliances (OAs)

OAs can be prefabricated, ready-made, or custom fitted device worn in the mouth during sleep to treat OSA and snoring. They work by repositioning the jaw, tongue, or soft tissues to keep the airway open, allowing for uninterrupted breathing throughout the night. The most common type of oral appliance is the mandibular advancement device (MAD), which is custom made for each individual and adjustable to allow a dentist to modify the degree of jaw advancement as needed. The goal is to achieve the most comfortable and effective position for the individual. Examples of custom oral appliances include tongue-retaining devices, non-adjustable mandibular repositioning devices (MRDs), and adjustable MRDs. These appliances may be used as an alternative to other medical (e.g., CPAP and surgical (e.g., Uvulopalatopharyngoplasty) interventions.

AIO BREATHE (AIOMEGA LLC, Texas) is a lightweight MAD that increases airway size and repositions the jaw to keep the airway more open during sleep. It is recommended for mild to moderate sleep apnea and snoring.

ProSomnus EVO PH (ProSomnus Sleep Technologies), sleep and snore devices use medical grade polymers and hinge components to reposition and stabilize the jaw during sleep. The OA causes an increase in the pharyngeal space, reducing the risk of upper airway collapse. The device is recommended for snoring and to treat mild to moderate OSA.

iNAP (Somnics Health, Inc.) uses gentle suction to move the tongue forward. No mask or headgear is required.

Vivos (Vivos Therapeutics, Inc) OAs are noninvasive, custom-made devices designed to treat OSA and snoring. They function by repositioning the hard and soft tissues of the airway to enhance airflow and improve upper airway function. The Vivos System gradually remodels the upper airway and jaw structure over time to address the underlying anatomical causes of OSA. Recently, the United States Food and Drug Administration (FDA) approved Vivos OAs the treatment of severe OSA.

Neurostimulators

eXciteOSA is an FDA approved daytime therapy designed to treat snoring and mild OSA by strengthening tongue muscles through neuromuscular electrical stimulation (NMES). It is intended for adults aged 18 and older with an AHI less than 15. The device consists of a mouthpiece with four electrodes, two above and two below the tongue that are connected to a control unit via USB. It delivers electrical pulses to stimulate both intrinsic and extrinsic tongue muscles. This stimulation strengthens the muscles, helping to prevent the tongue from collapsing backward during sleep. As a result, it supports airway patency and contributes to the reduction of snoring and apnea events.

SUPPORTIVE LITERATURE

Oral Appliances (OAs)

The consistent findings among studies support the use of OAs as an alternative treatment method for individuals with sleep-related breathing disorders. A systematic review by Lim et al (2008) concluded that there is evidence indicating oral appliance therapy improves both subjective sleepiness and sleep-disordered breathing when compared to control treatments. Lim et al (2008) also conclude that CPAP appears to be more effective in improving sleep-disordered breathing than OA. The difference in symptomatic response between these two treatments is not significant, although it is not possible to exclude an effect in favor of either therapy.

Rossi et al (2021) conducted a systematic review of 17 randomized controlled trials (RCTs) to assess the clinical effectiveness of OAs in treating OSA. The review included RCTs with at least 50 participants, comparing OAs to CPAP, placebo, surgery, or other interventions. Findings showed that OAs significantly reduced both the AHI and the Oxygen Desaturation Index (ODI), including in some individuals with severe OSA. Custom-fitted, titratable devices were found to be more effective than non-custom or non-titratable alternatives. While CPAP generally achieved greater reductions in AHI, OAs were associated with higher patient compliance and better tolerability. In cases of mild to moderate OSA, some studies showed that OAs were non-inferior to CPAP. Additionally, improvements

in daytime sleepiness (Epworth Sleepiness Scale), snoring, and quality of life were observed, although these outcomes varied across studies.

Beri et al (2023) evaluated the effectiveness of OA therapy in treating OSA, focusing on the use of mandibular advancement devices (MADs) and tongue retaining devices (TRDs). The study used the AHI as the primary outcome measure. The inclusion criteria focused on adults with an AHI greater than 5, treated with MAD or TRD, and compared it to CPAP therapy. The analysis was based on a systematic review and meta-analysis of six randomized controlled trials conducted between 1998 and 2021. OA significantly improve AHI compared to baseline (Mean Difference = 13.40; 95% CI). CPAP outperformed OA in reducing AHI (Mean Difference = 8.40; 95% CI). TRDs showed comparable results to MADs in some studies. Researchers concluded that MADs are effective alternatives for patients with mild to moderate OSA, especially those that are intolerant to CPAP.

Electrical Stimulation Appliances

The current body of evidence supporting non-surgical neuromuscular electrical stimulation for OSA remains limited. High-quality data demonstrating its safety and clinical efficacy are lacking. Well-designed, controlled studies are needed to evaluate its therapeutic effectiveness, safety profile, and long-term outcomes. Two cohort studies (Kotecha et al (2021) and Baptista et al (2021)) studied habitual snorers who were treated with eXciteOSA. Both studies reported a reduction in snoring time measured by the Watch-PAT device and bed-partner-reported snorting was also decreased. A reduction in AHI was noted in those participants with mild OSA in the Kotecha study but there was no clinically significant reduction in AHI reported in the Baptista study. Both the Epworth Sleepiness Scale (ESS) and Pittsburgh Sleep Quality Index (PSQI) test showed improvements as reported by the participants as well as the bed partners. These studies suggest that daytime tongue stimulation may improve snoring, but the effect on OSA is uncertain.

PROFESSIONAL GUIDELINE(S)

The 2015 clinical practice guidelines jointly issued by the American Academy of Sleep Medicine (AASM) and the American Academy of Dental Sleep Medicine (AADSM) recommend oral appliance therapy for adult patients with OSA who are intolerant of CPAP therapy or prefer an alternative treatment. A standard recommendation is a strong recommendation based on high-quality evidence and a guideline is a moderate recommendation based on moderate quality evidence or expert consensus. Clinicians are encouraged to follow the recommendation and that exceptions maybe applied based on the individual circumstances.

Primary Snoring (No OSA)
Sleep physicians should prescribe oral appliances instead of offering no treatment for adults seeking help for primary snoring without obstructive sleep apnea. (Standard)

- OSA – Custom Devices Preferred
  When treating adults with OSA sleep physicians should recommend that a qualified dentist provide a custom, adjustable OAs rather than a non-custom device. (Guideline)
- OSA – CPAP Intolerance or Preference
  For adults with obstructive sleep apnea who cannot tolerate CPAP or prefer another option, sleep physicians should consider prescribing OA instead of leaving the condition untreated. (Standard)
- Dental Oversight
  Qualified dentists should monitor patients using OAs for OSA to detect and minimize dental side effects or bite changes, rather than providing no follow-up. (Guideline)
- Follow-Up Sleep Testing
  Sleep physicians should conduct follow-up sleep studies to confirm or improve the effectiveness of OA therapy, rather than relying on follow-up without testing. (Guideline)

The American Academy of Dental Sleep Medicine (AADSM) released an updated position statement in October 2022, on the use of OAT for the treatment of OSA. The statement affirms that OAT is an effective treatment for both OSA and snoring, and should be considered a first-line therapy, particularly for patients who are intolerant of CPAP therapy. The guidelines emphasize that patient evaluation and appliance fitting should be conducted by qualified dentists trained in dental sleep medicine. For optimal outcomes, the use of custom-fitted, titratable OAs is recommended. Additionally, the AADSM advises that patients be offered a trial of OA therapy prior to considering surgical interventions for OSA.

The American Academy of Otolaryngology Head and Neck Surgery (AAO-HNS) position statement (2021) on the use of oral appliances for the treatment of OSA recommends OAs as a treatment option for patients with OSA, particularly those who are unable to tolerate CPAP therapy. The AAO-HNS supports the use of custom-fitted OA provided by qualified dental professionals. The Academy emphasizes the importance of interdisciplinary collaboration between otolaryngologists, sleep physicians, and dental sleep medicine providers to ensure optimal patient outcomes. The AAO-HNS encourages ongoing monitoring and follow-up to assess treatment effectiveness and manage potential side effects, such as dental or jaw changes.

REGULATORY STATUS

The United States Food and Drug Administration (FDA) regulates oral appliances as medical devices. All oral appliances including related components require FDA approval before marketing and use in the United States to ensure they are safe and effective for human use. Refer to the FDA Medical Device website. Available from: https://www.fda.gov/medical-devices [accessed 2025 Sept 11]

The FDA lists the most serious type of medical device recalls as well as early alert communications about corrective actions being taken by companies that the FDA believes are likely to be the most serious type of recalls. Available from: Medical Device Recalls | FDA [accessed 2025 Sept 11]

MEDICAL POLICY

Medical Policy Title	**Medical Response to Contamination from Terrorist Attacks**
Policy Number	**11.01.09**
Current Effective Date	**November 1, 2026**
Next Review Date	**August 2027**

Our medical policies are guides to evaluate technologies or services for medical necessity. Criteria are established through the assessment of evidence based, peer-reviewed scientific literature, and national professional guidelines. Federal and state law(s), regulatory mandates and the member's subscriber contract language are considered first in the determination of a covered service. (Link to Product Disclaimer)

POLICY STATEMENT(S)

I. Testing, prophylaxis, and treatment (e.g., vaccination, antimicrobial or other pharmacological treatment) for terroristic agents, whether biological, chemical, or radiological, is considered **medically appropriate** when the following are met:

   A. Local, state, or national agencies advise that such testing or treatment is medically necessary;

   B. The service, vaccine, or drug is covered under the member's subscriber contract.

II. Coverage for all medically necessary aspects of diagnosis and treatment of illness or injury resulting from terrorism is considered **medically appropriate** when contract benefits are available for the specified services.

RELATED POLICIES

POLICY GUIDELINE(S)

Not Applicable

DESCRIPTION

A terroristic attack is the calculated use of violence or threat of violence against people, to attain goals that are political, religious, or ideological in nature through intimidation or coercion, or by instilling fear. Terroristic attacks can be achieved through biological emergency (bioterrorism), chemical emergency, or radiological emergency.

Bioterrorism is the intentional or threatened use of viruses, bacteria, fungi, or toxins from living organisms to produce death or disease in humans, animals, or plants. Biological agents include, but are not limited to, the organisms that cause anthrax, botulism, plague, ricin, smallpox, tularemia, viral hemorrhagic fevers (e.g., Ebola, Marburg, Lassa, Machupol), as well as food or waterborne organisms (e.g., salmonella, shigella dysenteriae).

Proprietary Information of Capital District Physicians' Health Plan, Inc. | CDPHP Universal Benefits,® Inc. | Capital District Physicians' Healthcare Network, Inc.

Terroristic chemical emergency occurs when a hazardous chemical is released that has a potential for harming the health of people. Examples of chemicals that may be used in terrorist attacks include, but are not limited to, nerve agents, mustards, and choking agents. Nerve agents (e.g., sarin, VX) are highly poisonous chemicals that cause neurological disruption and may lead to convulsion, paralysis, and respiratory failure. Mustards (e.g., sulfur mustard, nitrogen mustard) are vesicants, or blistering agents, which cause severe blistering of the eyes, respiratory tract, and skin on contact, damage to the immune system, and bone marrow suppression. Pulmonary or choking agents (e.g., phosgene) are chemicals that cause severe irritation or swelling of the respiratory tract, hypotension, and cardiac failure.

Terroristic radiation emergency occurs when radioactive material is introduced into the food or water supply, explosives are used to scatter radioactive material (also known as a "dirty bomb"), a nuclear facility is bombed or destroyed, or a nuclear device is exploded. The adverse effects of radiation exposure can range from mild effects (e.g., skin reddening) to serious effects (e.g., cancer, death) depending upon the amount of radiation absorbed, the type of radiation, the route of exposure, and the duration of exposure.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: MEDICALLY FRAGILE CHILDREN

POLICY EFFECTIVE DATE:	12/1/2025
Policy Control #:	1370/20.000514
Next Annual Review:	November, 2026

DISCLAIMER

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgement when deciding the most appropriate care to enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

RELATED POLICIES/DOCUMENTS

Resource Coordination Policies

Behavioral Health Policies
Home and Community Based Services for Children, 1370/20.000503

POSITION STATEMENT

A medically fragile child is defined as an individual who is under twenty-one years of age and has a chronic debilitating condition or conditions*, who may or may not be hospitalized or institutionalized, and meets **one or more** of the following criteria:

- Technologically dependent** for life or health sustaining function;
- Requires a complex medication regimen or medical interventions to maintain or to improve their health status; or
- In need of ongoing assessment or intervention to prevent serious deterioration of their health status or medical complications that place their life, health, or development at risk.

*Chronic debilitating conditions include bronchopulmonary dysplasia, cerebral palsy, congenital heart disease, microcephaly, pulmonary hypertension, and muscular dystrophy. The term "medically fragile child" shall also include traumatic brain injury, the nature of which typically requires care in a specialty care center for medically fragile children, even though the child does

not have a chronic debilitating condition or also meet one of the three conditions above.

**Examples of technologically dependent include children who require the following: oxygen support, invasive and non-invasive mechanical ventilation, pacemaker, implantable cardioverter defibrillators (ICD), ventricular drains, intravenous drugs, intravenous nutrition, gastrostomy or jejunostomy, ileostomy, colostomy, urethral catheterization, and dialysis.

POLICY CONSIDERATIONS

CDPHP applies the following clinical standards when making determinations for medical necessities regrading medically fragile children:

1. CDPHP will consider as medically necessary all covered services that assist medically fragile children in reaching their maximum functional capacity, taking into account appropriate functional capacities of children the same age.

2. CDPHP will not base determinations solely on review standards applicable or designed for adults.

3. CDPHP will take into account specific needs of the child and the circumstances pertaining to their growth and development.

4. CDPHP will accommodate unusual stabilization and prolonged discharge plans, as appropriate and will consider when developing and approving discharge plans, issues including sudden reversals of condition or progress which may make discharge decisions uncertain or more prolonged than for other children or adults.

5. CDPHP will identify an available provider of needed covered services, as determined through a person-centered care plan, to effect safe discharge from a hospital or other facility.

6. CDPHP will contract with providers with demonstrated expertise in caring for medically fragile children. CDPHP will adhere to medical necessity guidelines, ensuring network providers refer medically fragile children to suitable community facilities and providers, and review out of network care when participating providers cannot meet the child's needs.

EXCLUSIONS

Duplicate services being provided by a federal or state governmental agency, by a school district, or by a developmental learning center that are sufficient in meeting the needs of an individual.

MEDICAL POLICY

Medical Policy Title	**Medically Necessary Services**
Policy Number	**11.01.15**
Current Effective Date	**November 1, 2026**
Next Review Date	**October 2027**

Our medical policies are based on the assessment of evidence based, peer-reviewed literature, and professional guidelines. Eligibility for reimbursement is based upon the benefits set forth in the member's subscriber contract. (Link to Product Disclaimer)

POLICY STATEMENT(S)

I. The Health Plan provides benefits for services that are considered **medically necessary,** that are included in the member's contract (institutional care, medical care and services, technology, tests, treatments, drugs, dental care and supplies).

II. Services will be deemed **medically necessary** only when **ALL** of the following criteria are met:

- A. Services are appropriate and consistent with the diagnosis and treatment of the patient's medical condition;
- B. Services are required for the direct care and treatment or management of the patient's condition;
- C. If not provided, the patient's medical condition would be adversely affected;
- D. Services are provided in accordance with standards of generally accepted medical practice;
- E. Services are not primarily for the convenience of the patient, the patient's family, the provider of services, or another provider;
- F. They are the most appropriate service(s), rendered in the most efficient and economical way and at the most economical level of care that can safely be provided.

III. Inpatient level of care is only **medically necessary**, when the medical symptoms or conditions are such that diagnosis and treatment cannot safely be provided in any other setting (e.g., outpatient, physician's office, or at home).

IV. **Medical necessity** of a service is determined by the Health Plan and may consider **ANY or ALL** of the following criteria:

- A. Review of the patient's medical records. When no medical records are received (e.g., clinical note from requesting provider, lab tests, imaging studies, non-operative management if appropriate), the request will be denied not medically necessary;
- B. Reports in peer-reviewed medical literature;
- C. Reports and guidelines, published by nationally recognized health care organizations, which include supporting scientific data;
- D. Professional standards of safety and effectiveness that are generally recognized in the

United States for diagnosis, care or treatment;

E. Opinions of health professionals in the generally recognized health specialty involved;

F. Opinions of the attending professional providers;

G. Any other relevant information brought to the attention of the Health Plan.

V. A prescription, order or recommendation by a provider does **NOT** make a service:

A. Medically necessary;

B. The most appropriate treatment; or

C. That it will be covered by the Health Plan.

RELATED POLICIES

Corporate Medical Policy

11.01.03 Experimental or Investigational Services

POLICY GUIDELINE(S)

I. Under the New York Insurance Law, if a service has been authorized as medically necessary through the prior authorization process, the Health Plan may not deny a claim for the service unless the member is no longer covered on the date of service; the claim was not submitted in accordance with the contractual timeframes for submitting claims; the member's benefits are exhausted at the time the claim is received; the prior authorization was based on incomplete or inaccurate information; or there is a reasonable basis to believe that the member or provider has engaged in fraud. In the event that the Health Plan authorizes as medically necessary a course of treatment limited by number, time period or otherwise, then a request for treatment beyond the authorized course of treatment shall be deemed to be a new request, and any denial of such a request shall not be governed by the preceding sentence.

II. Determination as to a service being considered medically necessary or not medically necessary is made only through the Health Plan by an appropriate clinical peer reviewer. In most cases, a physician who is a Health Plan Medical Director acts as the clinical peer reviewer. Medical opinions of professional societies, peer review committees or other groups of physicians that are submitted for review will be evaluated. A clinical peer reviewer is a practitioner in the same profession and same or similar specialty as the practitioner who manages the care or provides the service.

III. Medical necessity determination will be based on documentation of clinical information available to provider at the time the order was created for the service. Documentation needs to support the requested service (please refer to the specific Corporate Medical Policy for the service).

DESCRIPTION

The purpose of this medical policy is to define the term "medically necessary" or "medical necessity"

and to provide clarification as to the criteria utilized by the Health Plan in determining whether requests for pre-service (e.g., prior authorization), concurrent, or post-service (e.g., initial determination, reconsideration, or appeal) approval are medically necessary.

Medically necessary, or medical necessity, is defined as health care services that a physician, exercising prudent clinical judgment, would provide to a patient for the purpose of preventing, evaluating, diagnosing or treating an illness, injury, disease or its symptoms, and that are:

I. In accordance with generally accepted standards of medical practice, which are based on:
   A. Credible scientific evidence published in peer-reviewed medical literature and generally recognized by the relevant medical community when available;
   B. Physician specialty society recommendations;
   C. The views of prudent physicians practicing in relevant clinical areas;
   D. Any other clinically relevant factors; and

II. Clinically appropriate in terms of type, frequency, extent, site, and duration; and considered effective for the patient's illness, injury or disease; and

III. Not primarily for the convenience of the patient, patient's family, patient's physician, or any other health care provider; and

IV. Not more costly than an alternative service or sequence of services at least as likely to produce equivalent therapeutic or diagnostic results as to the diagnosis or treatment of the patient's illness, injury or disease.

POLICY GUIDELINE(S)

I. The number of prostatic urethral lift implants will vary due to the unique characteristics of the prostate and prostatic urethra, but clinical data support an average of four (4) to five (5) implants per procedure.

II. PUL devices do contain nickel, patients that have a known allergy to nickel should have a discussion with their provider before consenting to the procedure.

DESCRIPTION

Benign prostatic hyperplasia (BPH) is one of the most common afflictions in the aging man. It is a histologic diagnosis defined as the proliferation of smooth muscle and epithelial cells within the transition zone of the prostate gland. The enlarged gland has been proposed to contribute to the overall lower urinary tract symptoms (LUTS) complex through direct bladder outlet obstruction (BOO) from enlarged tissue and from increased smooth muscle tone and resistance within the enlarged gland. Voiding symptoms have often been attributed to the physical presence of BOO. BPH does not necessarily require treatment. The decision to treat is based on an assessment of the impact of the symptoms on quality of life, which can be significant. Patients with persistent symptoms despite medical management may be considered for surgical treatment. The traditional standard treatment is transurethral resection of the prostate (TURP).

Prostatic Urethral Lift (PUL) (e.g. UroLift System)

Prostatic urethral lift (PUL) system (e.g. UroLift System) is a minimally invasive, that provides anterolateral mechanical traction of the lateral lobes of the prostate, opening the urethral lumen and reducing urinary obstruction. The delivery device contains a preloaded implant that deploys a permanent tensioning suture. The suture runs from the urethra to the outer prostatic capsule and serves to pull the lateral lobe of the prostate away from the urethra. Implants are delivered bilaterally to separate the encroaching lobes. Four to five implants are typically inserted, but this varies with the size and shape of the prostate. The UroLift System may be used to treat prostate glands measuring less than 80 milliliters (mL) and is implanted by a urologist in an outpatient or inpatient setting. The transurethral procedure to insert the UroLift is performed with the use of local or general anesthesia and oral sedation.

Transurethral Water Vapor Thermal Therapy (e.g. Rezūm System)

Transurethral water vapor thermal therapy has been investigated as a minimally invasive alternative to transurethral resection of the prostate. Transurethral water vapor thermal therapy is a transurethral needle ablation technique which injects radiofrequency-generated, sterile water vapor (~103 degrees C) into enlarged prostate tissue. As the steam encounters the prostatic tissue, it condenses back into water, releasing large amounts of thermal energy, disrupting the prostatic cell membranes, and leading to cell death and necrosis. It takes approximately three months for the body to reabsorb dead tissue, decreasing prostate volume and relieving LUTS. The thermal energy is confined to the prostrate, which reduces the risk of injury to other parts of the body. The procedure is performed under local anesthesia in an office or outpatient setting.

Prostate Artery Embolization (PAE)

Prostate artery embolization (PAE) is a minimally invasive outpatient procedure that involves the release of microscopic, plastic beads into the arteries that feed the prostate gland. The beads travel to the patient's prosthetic arteries, and once there, they permanently block off the blood flow that is causing the swelling in the prostate.

Transperineal Laser Ablation (TPLA)

Transperineal Laser Ablation (TPLA) is a minimally invasive procedure that involves use of a diode laser light which is passed through 300 µm optical fibers which are introduced transperineally and placed at a secure distance from urethra and bladder neck. EchoLaser Smart Interface assists easing needle positioning and increases safety. Several clinical trials are currently enrolling members for data collection.

Temporary Implantable Nitinol Device (iTIND)

Temporary implantable nitinol device (iTIND) is implanted cystoscopically and is designed to remodel the bladder neck and prostatic urethra through ischemic tissue necrosis and permanent mucosal incisions. iTIND was developed to be a truly minimally invasive, non-ablative therapy that does not carry the possible risks of leaving a permanent implant within the prostatic urethra. The iTind device expands and exerts pressure on prostatic tissue, causing ischemic necrosis, the creation of compression channels, and a remodeling of the prostatic urethra and the bladder neck. This stent-like device is left in place for only five to seven days before being removed.

Transurethral Waterjet Ablation (e.g. Aquablation)

Transurethral Waterjet Ablation (Aquablation) uses a specialized system that combines image guidance and robotics for the targeted heat-free removal of prostate tissue. The procedure is usually done with the patient under general or spinal anesthesia. Transrectal ultrasound is used throughout the procedure. A handpiece with an integrated cystoscope and ablation probe is inserted through the urethra and into the bladder. Positioning is confirmed by using visual markers on a computer screen, and the surgeon is able to plan the depth and angle of resection using the system software. Once the surgical mapping is complete, a high-speed jet of saline is delivered to the prostate at various flow rates, according to the depth of penetration needed. The ablated tissue is aspirated through ports in the handpiece and can be used for histological analysis.

Transurethral Balloon Dilatation (e.g. Optilume)

Transurethral balloon dilatation involves the insertion of a balloon catheter through the urethra into the prostatic urethra where it is inflated, theoretically pushing back prostate tissue and stretching the urethra where it has been narrowed by the prostate. An example of this includes but may not be limited to the Optilume Basic. The Optilume drug-coated balloon combines urethral dilation with circumferential topical delivery of paclitaxel.

SUPPORTIVE LITERATURE

Prostatic Urethral Lift

Roehrborn et al (2013) reported results of the L.I.F.T. (Luminal Improvement Following Prostatic Tissue Approximation for the Treatment of LUTS secondary to BPH) trial, which was the first multicenter, randomized, double-blinded trial of the prostatic urethral lift (PUL) for the treatment of LUTS secondary to BPH. Nineteen centers in three countries (United States, Canada, and Australia) enrolled 206 men, who were randomized 2:1 to treatment with either the PUL (n=140) or sham control (n=66) consisting of rigid cystoscopy. The primary endpoint was the reduction in AUASI at three months. Secondary measures included QOL, Benign Prostatic Hyperplasia Impact Index (BPHII), International Index of Erectile Function (IIEF), Male Sexual Health Questionnaire for Ejaculatory Dysfunction (MSHQ-EjD), Maximum urinary flow rate (Qmax), and PVR. Participants were followed for 12 months, with 123 PUL subjects included in the 12- month analysis. The primary endpoint was met with the PUL AUASI reduction 88% greater than sham control, 11.1 versus 5.9, respectively (p=0.003) and sustained at one year. Qmax increased 4.4 ml per second at three months and was sustained at 4.0 ml per second at 12 months, which was both clinically and statistically significant. Erectile function remained stable after the procedure. There were two serious adverse events, one clot retention and one bladder stone. Less serious adverse events (AE) (postoperative dysuria, hematuria, pain/discomfort, and urgency) were typically mild to moderate and resolved within two weeks. The authors concluded the prostatic urethral lift provides a clinically meaningful improvement in LUTS secondary to BPH and urinary flow and can be performed under local anesthesia with low morbidity and preservation of sexual function.

Sønksen et al (2015) conducted a randomized trial known as the BPH6 study, comparing PUL to TURP to determine LUTS improvement, recovery, worsening of erectile and ejaculatory function,

continence, and safety. A total of 80 men across 10 European centers received either PUL (n=45) or TURP (n=35). One patient in the PUL group was excluded from analysis for violation of the active urinary retention exclusion criteria. At 12-month follow-up, the PUL group demonstrated an average decrease of 11.4 in IPSS, while IPSS improvement after TURP was 15.4. PUL patients consistently had more rapid recovery than TURP patients (82% vs. 53% respectively). Significant improvements in IPSS, IPSS QoL, BPH II, and Qmax were observed in both groups over time. Erectile function was preserved in both PUL and TURP groups as measured by SHIM scores. The PUL group experienced an improvement in average ejaculatory score (MSHQEjD) from baseline ($p = 0.03$), but the TURP group suffered from a significant decline. For the BPH6 ejaculatory assessment, the response for the PUL group was 100%, significantly better than the 60.6% response for the TURP group ($p < 0.0001$). Continence preservation was comparable between the groups. The number of patients who experienced grade 2 and 3 adverse events was similar between groups. Of the participants who met the original BPH6 primary endpoint, 34.9% were in the PUL group and 8.6% were in the TURP group. Of the participants who met the modified BPH6 primary endpoint, 52.3% were in the PUL group and 20.0% were in the TURP group. Reintervention for failure to cure occurred in 6.8% (3/44) of PUL patients and 5.7% (2/35) of TURP patients (not significant). The authors concluded that both the PUL and TURP groups achieved significant symptom relief compared to baseline, with a superior symptom relief rate for TURP and a superior quality of recovery and preservation of ejaculatory function for PUL. Limitations include the short-medium follow-up, small sample size, and lack of blinding.

Roehrborn et al (2017) reported five-year results of the L.I.F.T. study. At five years of follow-up, data were available for 104 of 140 PUL subjects (74.3%). A total of 18 were lost to follow-up, nine died of unrelated causes; nine exited the study for other reasons. Surgical retreatment for failure to cure was 13.6%, with 4.3% receiving additional PUL implants and 9.3% undergoing TURP or laser ablation. The authors reported on two analyses, a per-protocol (PP) analysis and an intention-to-treat (ITT) analysis. A total of 72 patients were included in the PP analysis, after exclusions for protocol violations, additional BPH procedures, or treatment with BPH medication. Sustained improvements were reported based on the PP analysis in symptoms (36% IPSS), quality of life (50% QOL, 52% BPHII) and urinary flow rate (44% Qmax). No differences were seen between ITT and PP populations.

Gratzke et al (2017) reported two-year follow-up results from the BPH6 study. Over the two-year follow-up, six patients (13.6%) in the PUL group and two (5.7%) in the TURP group underwent secondary treatment for LUTS. Three additional patients discontinued study participation, resulting in 37 PUL patients and 32 TURP patients included in the two-year analysis. Significant improvements in International Prostate Symptom Score (IPSS), IPSS quality of life (QoL), BPH Impact Index (BPHII), and maximum urinary flow rate (Qmax) were observed in both groups throughout the two-year follow-up. Changes in IPSS and Qmax in the TURP group were superior to the PUL group. Improvements in IPSS QoL and BPHII score were not statistically different between the study groups. PUL resulted in superior quality of recovery, ejaculatory function preservation, and performance on the composite BPH6 index. Ejaculatory function bother scores did not change significantly in either treatment group. TURP significantly compromised continence function at two weeks and three

months. Only PUL resulted in statistically significant improvement in sleep.

Rukstalis et al (2019) reported on the MedLift study, an U.S. Food and Drug Administration (FDA) IDE extension of the L.I.F.T. randomized study designed to examine safety and efficacy of PUL for treatment of obstructive middle lobes (OML). Compared to lateral lobe subjects from the historical L.I.F.T. study, the 45 enrolled OML subjects' symptoms improved at least as much at every time point (OML range 13.5–15.9, LL range 9.9–11.1, p=0.01). The observed rate of post-procedure, device-related, serious complications was 0%, thereby achieving the primary safety composite endpoint. Published evidence, which includes the BPH6, L.I.F.T., and MedLift studies, support a clinically meaningful improvement in net health outcome.

Transurethral Water Vapor Thermal Therapy

McVary et al (2016) reported the results of a multi-center, randomized, controlled study (Rezum II study) using transurethral prostate convective water vapor thermal energy to treat LUTS associated with BPH. A total of 197 men aged 50 years and older were randomized 2:1 to thermal therapy, n=136, and control (insertion of a rigid cystoscope), n=61. The primary endpoint was an IPSS reduction at three months greater than 125% in the treatment group as compared to the control. Results showed IPSS was reduced by 50% compared with 20% reduction for control. Therapy outcomes for the treatment group, including Qmax, QoL ($p < 0.0001$) and BPHII ($p= 0.0003$), were significantly improved compared to control and sustained throughout 12 months. Two treatment subjects had three serious AEs adjudicated as procedure-related: extended urinary retention, nausea, and vomiting. The authors concluded that convective water vapor energy ablation of prostate adenomas provides statistically significant and clinically meaningful improvements within two weeks after treatment for LUTS due to BPH. Limitations of the study include the short follow-up period and small sample size.

McVary et al (2019) reported four-year outcomes of the randomized controlled trial of water vapor thermal therapy study. Out of the original 135 subjects who underwent water vapor therapy, 90 (66.7%) were included in the 48-month per protocol analysis. IPSS improvements from baseline remained consistent from the early response at three months (49.9%) to year 1 (52.2%), year 2 (50.7%), year 3 (49.7%), and year 4 (46.7%). Flowrate improvements were sustained relative to baseline, remaining significant, although an increase of 5.5 at one year to a mean 4.2 mL/s at four years was noted. Men with moderate and severe LUTS had symptomatic relief with similar IPSS improvements at four years of 46.1% and 46.9% and Qmax of 45% and 51.3%, respectively. QOL and BPH Impact Index remained improved at 43% and 52% respectively, $P <.0001$. Throughout the four years, urinary incontinence scores decreased significantly. Sexual function throughout two years after treatment shows that erectile function (IIEF) and ejaculatory function (MSHQ-EjD) scores remained unchanged but worsened at four years. At four years, surgical intervention was performed in six of 135 subjects (4.4%) including four subjects in whom a median lobe was identified but not treated. Comparatively, surgical retreatment rates for TUNA are 19.1% at three years and 14%-51% at five years. TUMT retreatment at five years is 8.9%-21%, and prostatic urethral lift procedure has a reported surgical retreatment of 10.6% at three years and 13.6% at five years. The authors concluded that water vapor thermal therapy provides effective symptom relief and improved QOL that remained durable throughout four years.

McVary et al (2021) reported his final five-year outcomes of the randomized controlled trial for water vapor thermal therapy for treatment of moderate to severe lower urinary tract symptoms secondary to benign prostatic hypertrophy (BPH). Significant improvement of lower urinary tract symptoms was observed at <3 months post-thermal therapy, remaining durable through 5 years in the treatment group. At five years, the International Prostate Symptom Score reduced 48%, quality of life increased 45%, maximum flow rate improved 44%, and the Benign Prostatic Hyperplasia Impact Index decreased 48%. Surgical re-treatment rate was 4.4% with no reports of device or procedure related sexual dysfunction or sustained de novo erectile dysfunction.

In addition, the efficacy and safety of Rezum water vapor thermal therapy was further supported through a prospective pilot study, a crossover study, and two retrospective studies where outcomes demonstrated improvements in patients International Prostate Symptom Score (IPSS), quality of life (QoL), Qmax and post void residual (PVR) without causing deterioration of sexual function.

Evidence for transurethral water vapor thermal therapy mostly consists of one small, short-term, sham controlled RCT with a five-year uncontrolled follow-up phase. LUTS improved more in the intervention group (50%) compared to sham (20%) at three months. Improvements were sustained through four years of follow-up. No adverse events of erectile or ejaculatory function were observed with scores unchanged through two years of follow-up. Based on the single, short-term, sham-controlled study with a five-year uncontrolled follow-up phase, BPH treatment with water vapor thermal therapy resulted in improved health outcomes which remained stable throughout the five years.

Prostate Artery Embolization (PAE)

Bhatia et al (2025) conducted a retrospective study evaluated the mid- to long-term safety and effectiveness of prostatic artery embolization (PAE) in 1,075 patients treated at a single center between January 2014 and July 2023. Patients had moderate-to-severe lower urinary tract symptoms (LUTS) or urinary retention who had undergone PAE. They were followed for a mean of 458.4 days and assessed at 1, 3, 6, and 12 months after PAE and thereafter. Mean prostate volume (PV) was 107 grams, and the median preprocedural IPSS was 23, QoL was 5, and IIEF-5 score was 17 and PSA level was 4.7ng/ml. In the LUTS subgroup, at 1–3, 6–12, and 48–60 months, the median IPSS values were 7, 6, and 9, respectively. Of 126 patients in the retention cohort, 119 (94%) were catheter-free at the 3-month follow-up. Up to 60 months after PAE, 90 patients (16% of reintervention eligible patients) required a second prostatic intervention. After PAE, 65.5% of patients were BPO medication–free at 1 year. Adverse events were rare, in 7 patients and resolved without lasting effects, including prostate sloughing, urosepsis and transient ischemic attacks. Overall, PAE demonstrated durable symptom relief, improved quality of life, and a favorable safety profile with sustained relief up to 60 months.

Brown et al (2024) conducted a randomized controlled trial to assess PAE as a first line therapy compared to medication in treatment of naïve men with prostate enlargement known as the P-EASY ADVANCE trial. The trial consisted of at 39 men with enlarged prostates, moderate-severe lower urinary tract symptoms and obstructed/equivocal urodynamic studies (UDS), and who had no prior treatment for BPH. They were randomized to receive either combined medical therapy or PAE.

Follow-up was conducted by assessing UDS, International Prostate Symptom Score (IPSS), uroflowmetry and ultrasound at short- to medium-term intervals and compared to baseline. Both interventions improved voiding and bladder outflow obstruction from baseline (unobstructed after PAE 63%, medication 28%). PAE patients had greater reduction in prostate size, incomplete emptying, total IPSS, and quality of life. In the medication group, altered ejaculation, erectile dysfunction and nauseas were more common. Although PAE showed to be more effective than the combined medical therapy, authors state that "further randomized comparative trials are planned to validate the role of PAE in mitigating obstructive BPH."

Müllhaupt et al (2024) conducted a randomized, open-label, single center trial of 103 patients with refractory LUTS/benign prostatic obstruction (BPO). They aimed to compare the safety and efficacy of PAE and TURP treatment at 5-year follow up. Primary outcome was the change in IPSS after PAE versus TURP. Secondary outcome included patient-reported outcomes, functional measures and adverse events. The outcomes were measured at 3, 6, 12, 24, and 60 months. Of the randomized patients with LUTS/BPO, 18/48 in the PAE group and 38/51 in the TURP group completed 5-year follow-up. Mean IPSS reduction was -7.78 for PAE and -11.57 for TURP (difference 3.79; 95% CI -0.66 to 8.24). TURP showed superior patient-reported outcomes except erectile function. At 5 years, TURP was more effective than PAE in improving urinary flow (9.30 vs 3.59 ml/s; difference -5.71) and reducing postvoid residual volume (219.97 vs 27.81 ml; difference 192.15). The study had notable limitations. Blinding of patients and physicians wasn't possible, and five patients per group were lost to follow-up. Additional dropouts left only 18 PAE and 38 TURP patients for analysis, reducing statistical power and preventing subgroup analysis. This likely contributed to the loss of significance in some comparisons at the 5-year follow-up. Furthermore, five of 20 patients who required TURP after unsatisfactory PAE outcomes could only undergo unilateral embolization, which may have impacted results. The authors state "the improvements in subjective and objective outcomes are more pronounced after TURP and thus PAE is not a definitive treatment in the long term for a relevant proportion of patients, especially those with advanced LUTS/BPO stage requiring maximum relief of bladder outlet obstruction."

Marchi et al (2023) conducted a retrospective single-center with the primary objective to assess long-term outcomes of PAE in 88 patients with acute urinary retention related to BPH. Urinary catheter was attempted at two weeks post PAE, success was defined as the absence of acute urinary retention recurrence. In the month following catheter removal 82% of patients were successful and 16% had immediate recurrence. Clinical success persisted for 66% of patients at long term follow-up (mean follow-up: 19.5 months ±16.5 [SD]; range: 2−74 months). Recurrence occurred at a mean of 16.2 months ±12.2 (SD) (range: 1.5−43 months) post-PAE. Overall, 24% patients of the cohort underwent prostatic surgery, at a mean of 10.4 months ± 12.2 (SD) (range: 1.2−42.4 months) from initial PAE. No correlations between patient variables or bilateral PAE and long-term clinical success were identified. Kaplan-Meier analysis showed a three-year catheter free probability of 60%. They state that further investigation is needed in patients with acute urinary retention (AUR) recurrence during long-term follow-up.

Carnevale et al (2020) conducted a retrospective single center study in 317 patients with moderate to severe BPH. Participants were followed for 96 months to evaluate the efficacy, and long-term results

of PAE for BPH. Participants received PAE, 94% received bilateral and 6% received unilateral. Over a median follow-up of 72 months, early clinical failure occurred in 1.9%, and 23% experienced symptom recurrence significantly higher in the unilateral group (42% vs. 21%). Average improvements included a 16-point drop in IPSS, 4-point improvement in quality-of-life score, 39 cm^3 reduction in prostate volume (39%), a 6 mL/sec increase in urinary flow (155%), and a 70 mL decrease in postvoid residual volume (48%), all statistically significant ($P < .05$). Higher baseline PSA levels were linked to lower recurrence risk (HR 0.9; 95% CI: 0.8–0.9; $P < .001$). Embolization with mixed particle sizes (100–500 µm group vs 300-500 µm group) showed no significant impact on recurrence. No patients reported urinary incontinence or erectile dysfunction. Limitations included, that early PAE procedures lacked cone-beam CT, cone-beam CT has since enhanced pelvic anatomy visualization and reduced both procedure and radiation time. Baseline IPSS was missing for men with catheters. Over 10 years, varied techniques and embolic agents were used, limiting consistency. Few patients had over five years of follow-up. The authors state that "although long-term results for PAE are promising, further investigations regarding optimal technical aspects of the procedure and patient selection are still required" stating that the data indicates it is a safe and effective procedure and has the potential to become an alternative procedure for BPH.

Transperineal Laser Ablation (TPLA)

Bianco et al (2021) presented at the 2021 American Urological Association annual meeting, the six month and twelve-month results of a study called transperineal laser ablation for benign prostatic hyperplasia (BPH): Feasibility and safety. This study was a Phase I trial, trial, whose objective was to evaluate feasibility, safety as well as three-, six- and twelve-months outcomes for TPLA. Twenty subjects were enrolled in this study. All subjects had complete lower urinary tract evaluation with pressure flow studies, international prostate symptom scores (IPSS) and sexual health inventory for men (SHIM) scores and ultrasonographic prostate volume measurements. Renal function biomarkers as well as PSA were collected. The protocol called for 2-4 Echolaser4 (Elesta Els, Italy) TPLA applications in the prostate under ultrasound guidance aided by the ELS tracing system. Although functional outcomes are pending, a 4-point median improvement in IPSS scores was seen at thirty days.

Temporary Implantable Nitinol Device (iTIND)

Kadner et al (2020) reported on the results of a single-arm, multicenter, international, prospective study that was conducted at nine sites from December 2014 to December 2016 under clinical trial NCT02145208. 81 men with symptomatic BPH (IPSS≥10, peak urinary flow <12mls/s and prostate volume < 75mls) were enrolled in this study. Kadner, et al., notes that a wash-out period of one month for alpha-blockers and six months for 5-alpha reductase inhibitors (5-ARIs) was mandatory to avoid variable confusion. The procedure was performed under light sedation with device implanted and removed five to seven days later with topical sedation. A total of 51 men completed follow up after two years. Mean Qmax and PVR were 7.62 ± 2.25 ml/s and 65.84 ± 38.46 ml at baseline, and IPSS and QoL scores were 20.51 ± 4.58 and 3.96 ± 0.87, respectively. Implantation procedures elicited average pain VAS scores of 3.2 ± 1.6 and were all technically successful with no intraoperative complications. Implants were retrieved 5.7 ± 0.9 days after deployment. All objective and subjective measures showed statistically significant improvements (p <

0.0001) from baseline levels at all assessment points. IPSS urinary symptoms were reduced by 12.00 ± 6.12 points at the end of the follow-up period. Quality of life scores reflected symptomatic relief, with patients reporting a mean reduction of 2.4 points from baseline. Maximum urinary flow rate (Qmax) rose to 16.00 ± 7.43 ml/s, an average increase of 8.38 ± 7.93 ml/s. No deterioration in PVR was observed by the end of the follow-up period. Results suggest, that iTind implantation for treatment of LUTS secondary to BPH is associated with minimal perioperative morbidity and provides rapid symptomatic and functional outcomes that are durable through 24 months follow-up. The need for reoperation or de-novo-medication is very low, except in patients with median lobes, who so far cannot be recommended for treatment. In contrast to medical and surgical alternatives, there is an indication that treatment with iTind does not pose a risk to ejaculatory and sexual functions, but this finding must be supported with further studies. The European Association of Urology guidelines acknowledge the emerging role of this device, no specific recommendation is given, and its formal role is therefore yet to be defined.

Transurethral Waterjet Ablation (Aquablation)

Aquablation for treatment of BPH has been assessed in a single RCT, known as WATER (Waterjet Ablation Therapy for Endoscopic Resection of Prostate Tissue). WATER was a noninferiority trial comparing aquablation with TURP in 181 participants at 17 sites in 4 countries. Participants were men ages 45 to 80 years with moderate-to-severe LUTS, defined as an IPSS 10 score ≥12, and prostate size between 30 and 80 cc. The primary efficacy endpoint was the difference between groups in the change in IPSS at 6 months, and the primary safety endpoint was the development of Clavien-Dindo persistent grade 1, or 2 or higher operative complications at 3 months. Primary endpoint results were reported by Gilling et al in 2018, 12-month results in Gilling et al (2019), and 3-year results in Gilling et al (2020). Additionally, a synthesis of the trial results up to 12 months was reported in a Cochrane systematic review conducted by Hwang et al (2019). On the primary efficacy outcome, aquablation was noninferior to TURP. At 6 months, mean IPSS decreased from baseline by 16.9 points for aquablation and 15.1points for TURP (mean difference 1.8 points; p<.0001 for noninferiority and p=.1347 for superiority). The primary safety endpoint rate was lower in the aquablation group compared to the TURP group (26% versus 42%, p=.0149). The rate of grade two (2) and greater events was similar in the two groups (20% for aquablation and 23%for TURP; p=.3038).

Berjaoui et al (2024) conducted a study to compare the long-term outcomes of Aqublation for small-to-moderate prostates (30-80 mL) in the WATER clinical trial, with the outcomes for large prostates (80-150 mL) in the WATER II clinical trial at a 5-year follow-up. Participants that made it to the 5-year follow up were 60 subjects from WATER II and 58 participants from WATER, just under half did not make it to the 5-year mark. Patients completed IPSS and Incontinence Severity Index (ISI) questionnaires. Also measured was uroflowmetry, PVR measurements, and standard laboratory testing. These questionnaires were repeated at months 1, 3, 6, 12, 24, 36, 48, and 60 months. PSA was repeated and 6 months and annually thereafter. Results demonstrated improvement in from baseline to 60 months in IPSS: WATER (22.9 to 7.0) and WATER II (23.2 to 6.8), Qmax: WATER (9.4 to 17.3 cc/s) and WATER II (8.7 to 17.1 cc/s). At the 5-year follow-up, patients that were medication-free for BPH (WATER: 99% and WATER II: 94%) and free from surgical retreatment

(WATER: 95%; WATER II: 97%).

Optilume

DeLong et al (2025) reported the 5-year study closeout results for the ROBUST I trial that evaluated the safety and efficacy of the Optilume drug-coated balloon (DCB) for men with short, recurrent bulbar urethral strictures. The trial consisted of 53 men with recurrent bulbar urethral strictures. The strictures were less than or equal to 2cm long and a lumen or greater that 12 French and have undergone between 1 and 4 prior endoscopic procedures, who all received the Optilume DCB. The outcomes were measured by symptom questionnaires, maximum urinary flow rate, postvoid residual, and freedom from repeat intervention. Of the 53 men, 31 completed all follow-up requirements, 58% achieved functional success at 5 years. Average IPSS improved from a mean of 25.2 at baseline to 7.2 at 5 years. 71.7% of the patients were free from repeat interventions throughout the 5 years. Urinary flow rate improved from 5.0 mL/s at baseline to 19.9mL/s. The average post void residual was reduced from 141.4 mL to 59.5 mL at 5 years. There was no serious treatment related adverse events, including erectile dysfunction. For men that wish to avoid urethroplasty based on this study Optilume is a safe and effective treatment option for appropriately selected men with recurrent bulbar urethral stricture.

Kaplan et al (2024) reported the 2-year long-term follow up from the PINNACLE study, a prospective, multicenter, randomized study that was evaluating the safety and effectiveness of the Optilume BPH catheter system. The study consisted of 148 men with symptomatic BPH, who were randomized in a 2:1 fashion to Optilume or a Sham. Success was measured by IPSS, peak urinary flow rate (Qmax), post void residual (PVR) urine, quality of life and sexual function, follow-up beyond 1 year was limited to those treated with the Optilume product. At 2 years 67.5% of participants treated with Optilume were considered symptomatic responders. Symptomatic responders are defined by ≥30% improvement in IPSS without medical or surgical retreatment. IPSS improved from 23.4 to 11.0, Qmax improved by 116.8% to 19%, PVR had a reduction (83.7 ± 70.3 (n = 99) to 65.9 ± 74.5 (n = 65)).

Kaplan et al (2024) reported the 4-year results of the prospective single arm, open-label, multicenter EVEREST clinical study. The study aimed to gather initial safety and efficacy data of the Optilume BPH Catheter System for the treatment of lower urinary tract symptoms (LUTS) secondary to BPH. The study consisted of 80 men with moderate-to-severe LUTS secondary to BPH who were treated with Optilume. Symptoms were assessed using IPSS, BPH Impact Index, Qmax and PVR. Previously reported symptom improvements were maintained through 4-year follow-up, which included reduction in IPSS and IPSS quality of life. Qmax was maintained in majority of men, with an average improvement from baseline and no adverse events were reported. Some limitations of the study include the lack of a control group and small number of participants.

PROFESSIONAL GUIDELINE(S)

The American Urological Association (AUA) guidelines for Management of Lower Urinary Tract Symptoms Attributed to BPH (Goueli 2026) state:

- TURP should be offered as a treatment option for patients with LUTS/BPH. (Moderate Recommendation; Evidence Level: Grade B)
- Transurethral incision of the prostate (TUIP) should be offered as an option for patients with prostates ≤30g for the surgical treatment of LUTS/BPH. (Moderate Recommendation; Evidence Level: Grade B)
- PVP should be offered as an option using 120W or 180W platforms for the treatment of LUTS/BPH. (Moderate Recommendation; Evidence Level: Grade B)
- PUL should be considered as a treatment option for patients with LUTS/BPH provided prostate volume 30-80g and verified absence of an obstructive middle lobe. (Moderate Recommendation; Evidence Level: Grade C)
- PUL may be offered as a treatment option to eligible patients who desire preservation of erectile and ejaculatory function. (Conditional Recommendation; Evidence Level: Grade C)
- Water Vapor Thermal Therapy (WVTT) should be considered as a treatment option for patients with LUTS/BPH provided prostate volume 30-80g. (Moderate Recommendation; Evidence Level: Grade C)
- WVTT may be offered as a treatment option to eligible patients who desire preservation of erectile and ejaculatory function. (Conditional Recommendation; Evidence Level: Grade C)
- Robotic waterjet treatment (RWT) may be offered as a treatment option to patients with LUTS/BPH provided prostate volume 30-80g. (Conditional Recommendation; Evidence Level: Grade C)
- PAE may be offered for the treatment of LUTS/BPH. PAE should be performed by clinicians trained in this interventional radiology procedure for prostate volume of ≥50cc following a discussion of the potential risks and benefits. (Conditional Recommendation: Evidence level: Grade B)

The National Institute for Health and care Excellence (NICE) 2021 guidelines for Transurethral water jet ablation for LUTS/BPH states that evidence on transurethral water jet ablation for lower urinary tract symptoms caused by benign prostatic hyperplasia raises no major safety concerns. The evidence on efficacy is limited in quality. Therefore, this procedure should only be used with special arrangements for clinical governance, consent and audit or research.

The Society of Interventional Radiology (SIR) provides broader indications, recommending PAE for patients with very large prostates (>80 cc), urinary retention, desire to preserve sexual function, prostatic hematuria, and patients who are poor surgical candidates. The SIR's 2026 updated practice guidance document notes increased acceptance of PAE and its inclusion in multiple international guidelines.

REGULATORY STATUS

The Rezūm System (NxThera, Inc., Maple Grove, MN) received Section 510(k) approval from the FDA in August 2015.

The FDA indications for Rezūm System are:

- Men ≥ 50 years of age;
- Prostate volume ≥ 30 cm^3 and ≤ 80 cm^3;
- Intended to relieve symptoms, obstructions;
- Reduce prostate tissue associated with BPH;
- Treatment of prostate with hyperplasia of the central zone and/or median lobe.

In 2013, the FDA granted a de novo classification clearance for the UroLift System.

In January 2017, the FDA granted Section 510(k) clearance for the UroLift System (UL400 and UL500) for the treatment of symptoms due to urinary outflow obstruction secondary to BPH, including lateral and median lobe hyperplasia, in men 45 years of age or older.

In December 2019, the FDA modified the list of contraindications for the UroLift System (UL400) from prostate volume greater than 80 cc to prostate volume greater than 100 cc. The FDA indicated that its decision was based on clinical review of both sponsored and independent clinical studies that included men with prostate volumes greater than 80 cc, which showed that the symptom response, quality of life, uroflowmetry, adverse events, and catheterization rates were equivalent to the outcomes of patients with prostate volumes less than 80cc.

In June 2020, the FDA granted section 510(k) clearance for the UroLift Advanced Tissue Control (ATC) System. A modification of the UroLift UL400 System, where the primary difference is the addition of a wing component on the distal tip of the UL400 which provides a larger footprint. This design feature is intended to provide better mobilization of tissue when performing the UroLift System procedure.

In July 2020, the FDA granted Section 510(k) clearance for the UroLift 2 System (UL2) for the treatment of urinary outflow obstruction secondary to BPH, including lateral and median lobe hyperplasia in men 45 years of age and older. The UL2 system is substantially equivalent to previous cleared generation devices. Minor device modifications have been made to the UL2 Delivery System (Delivery handle and implant cartridge) that do not affect the overall safety and effectiveness of the UroLift procedure. No modifications have been made to the UroLift Implant.

In 2020, the FDA expanded coverage of the UroLift system to treat prostates between 80-100 ccs.

The FDA Contraindications for the UroLift System are:

- Prostate volume of >100 cc;
- Urinary tract infection (UTI);
- Urethra conditions that may prevent insertion of delivery system into bladder;
- Urinary incontinence due to incompetent sphincter;

- Current gross hematuria.

Optilume was FDA approved in 2021 for the treatment of men with urethral strictures.

CODE(S)

- Codes may not be covered under all circumstances.
- Code list may not be all inclusive (AMA and CMS code updates may occur more frequently than policy updates).
- (E/I)=Experimental/Investigational
- (NMN)=Not medically necessary/appropriate

CPT Codes

Code	Description
0714T (E/I)	Transperineal laser ablation of benign prostatic hyperplasia, including imaging guidance; prostate volume less than 50 mL
0867T (E/I)	Transperineal laser ablation of benign prostatic hyperplasia, including imaging guidance; prostate volume greater or equal to 50 mL
37242	Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; arterial, other than hemorrhage or tumor (eg, congenital or acquired arterial malformations, arteriovenous malformations, arteriovenous fistulas, aneurysms, pseudoaneurysms) (e.g., PAE)
37243	Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for tumors, organ ischemia, or infarction (e.g., PAE)
52284 (E/I)	Cystourethroscopy, with mechanical urethral dilation and urethral therapeutic drug delivery by drug-coated balloon catheter for urethral stricture or stenosis, male, including fluoroscopy, when performed (e.g., Optilume)
52441	Cystourethroscopy, with insertion of permanent adjustable transprostatic implant; single implant (e.g., PUL)

Code	Description
52442	Cystourethroscopy, with insertion of permanent adjustable transprostatic implant; each additional permanent adjustable transprostatic implant (List separately in addition to code for primary procedure) (e.g., PUL)
52443 (E/I) 0619T Termed 12/31/25	Cystourethroscopy with initial transurethral anterior prostate commissurotomy with a nondrug-coated balloon catheter followed by therapeutic drug delivery into the prostate by a drug-coated balloon catheter, including transrectal ultrasound and fluoroscopy, when performed (Effective 01/01/26) (Replacing code 0619T) Cystourethroscopy with transurethral anterior prostate commissurotomy and drug delivery, including transrectal ultrasound and fluoroscopy, when performed
53854	Transurethral destruction of prostate tissue; by radiofrequency generated water vapor thermotherapy (e.g., Rezum)
53865 (E/I)	Cystourethroscopy with insertion of temporary device for ischemic remodeling (ie, pressure necrosis) of bladder neck and prostate (effective 01/01/2025) (e.g., iTIND)
53866 (E/I)	Catheterization with removal of temporary device for ischemic remodeling (ie, pressure necrosis) of bladder neck and prostate (effective 01/01/2025) (e.g., iTIND)
52597 Effective 01/01/26 0421T Termed 12/31/25	Transurethral robotic-assisted waterjet resection of prostate, including intraoperative planning, ultrasound guidance, control of postoperative bleeding, complete, including vasectomy, meatotomy, cystourethroscopy, urethral calibration and/or dilation, and internal urethrotomy, when performed (Effective 01/01/26) (Replacing code 0421T) Transurethral waterjet ablation of prostate, including control of post-operative bleeding, including ultrasound guidance, complete (vasectomy, meatotomy, cystourethroscopy, urethral calibration and/or dilation, and internal urethrotomy are included when performed)

MEDICAL POLICY

Medical Policy Title	**Molecular Testing in the Management of Pulmonary Nodules**
Policy Number	**2.02.58**
Current Effective Date	**January 1, 2027**
Next Review Date	**October 2027**

Our medical policies are based on the assessment of evidence based, peer-reviewed literature, and professional guidelines. Eligibility for reimbursement is based upon the benefits set forth in the member's subscriber contract. (Link to Product Disclaimer)

POLICY STATEMENT(S)

I. Molecular testing in the management of undiagnosed pulmonary nodules by plasma-based proteomic screening, gene expression of bronchial brushings or nasal swab, and flow cytometry of sputum, are considered **investigational** in **ALL** circumstances including, but not limited to, the following tests:

   A. CyPath Lung (0406U)

   B. EarlyCDT Lung (83520)

   C. LungLB (0317U)

   D. Nodify CDT (0360U)

   E. Nodify XL2, (including the following prior generations of this test: Xpresys Lung, Xpresys Lung 2 [BDX-XL2]) (0080U)

   F. OncobiotaLUNG (0395U)

   G. ReVeal Lung Nodule Characterization (0092U)

   H. Protein Assays Utilizing Lung Cancer Analytes (PAULA's Test)

   I. Percepta Genomic Sequencing Classifier

   J. Percepta Nasal Swab

RELATED POLICIES

Corporate Medical Policy

POLICY GUIDELINE(S)

I. The Health Plan and its employees adhere to all State and Federal laws concerning the confidentiality of genetic testing and the results of genetic testing. All records, findings and results of any genetic test performed on any person shall be deemed confidential and shall not be disclosed without the written informed consent of the person to whom such genetic test relates. This information shall not be released to any person or organization not specifically authorized by the individual subject of the test or in compliance with applicable law.

II. Genetic testing is appropriate only when performed by a qualified laboratory certified under the Clinical Laboratory Improvement Amendments of 1988 (CLIA) and offered in a setting with adequately trained health care professionals who are qualified to provide appropriate pre- and post-test counseling.

III. Genetic testing is contract dependent. Coverage only applies to members with a valid contract; coverage is not provided for family members without a valid contract.

DESCRIPTION

Pulmonary nodules are a common clinical problem that may be found incidentally on a chest x-ray or computed tomography (CT) scan or during lung cancer screening studies of smokers. The primary question after the detection of a pulmonary nodule is the probability of malignancy, with subsequent management of the nodule based on a range of factors such as the radiographic characteristics of the nodules (e.g., size, shape, density) and patient factors (e.g., age, smoking history, previous cancer history, family history, environmental/occupational exposures). The key challenge in the diagnostic workup for pulmonary nodules is appropriately ruling in patients for invasive diagnostic procedures and ruling out patients who should forego invasive diagnostic procedures. However, due to the low positive predictive value of pulmonary nodules detected radiographically, many unnecessary invasive diagnostic procedures and/or surgeries are performed to confirm or eliminate the diagnosis of lung cancer.

Plasma-based proteomic screening, gene expression profiling of bronchial brushing or nasal swab, and flow cytometry analysis of sputum are molecular tests available for the diagnostic workup of pulmonary nodules. To rule out malignancy, invasive diagnostic procedures such as computed tomography-guided biopsies, bronchoscopies, or video-assisted thoracoscopic procedures are often required. Invasive procedures carry risk for complications ranging from post-procedure pain to pneumothorax. Molecular diagnostic tests have been proposed to aid in risk-stratifying patients to determine the need for subsequent invasive diagnostic procedures.

<u>CyPath Lung, Precision Pathology</u>

CyPath Lung is a non-invasive, sputum-based test for the early diagnosis of lung cancer. It uses a fully automated flow cytometric platform to analyze the cellular content of sputum for patients whose computed tomography (CT) results in a suspicious finding. Patients collect sputum at home over three days with the assistance of a patient coach. CyPath Lung test results stratify the patient into one of two risk groups. Those patients deemed "likely or very likely" to have cancer may benefit from aggressive intervention. Those "unlikely or very unlikely" to have a malignancy may continue imaging surveillance. CyPath Lung reveals the lung micro-environment by automated analysis of sputum using flow cytometry to characterize cell populations indicative of cancer in the lung. CyPath Lung labels a person's sputum sample with fluorescent antibodies that uniquely identify different cell types and a fluorescent porphyrin called TCPP that preferentially binds to cancer cells and cancer-related cells. TCPP fluoresces a bright red color when attached to cancer cells and cancer-associated cells that are visible when the sample is run through a flow cytometer. CyPath Lung uses automated analysis that looks for pre-set parameters that are predictive of cancer, one of which is the presence of cells that

have taken up greater amounts of the TCPP porphyrin label. This test is intended for use after lung cancer screening to improve early-stage lung cancer diagnosis.

EarlyCDT Lung, Oncimmune

EarlyCDT-Lung is a serum-based test that measures autoantibodies (p53, NY-ESO-1, CAGE, GBU4-5, HuD, MAGE A4, and SOX2) associated with small cell and non-small cell lung cancer (NSCLC). Positive results are reported as 'positive-moderate' if at least one (1) of the seven (7) autoantibodies is elevated above a predetermined 'low' threshold, but all are below the 'high' threshold. If at least one (1) of the seven (7) autoantibodies is elevated above the 'high' predetermined threshold, the test is reported as 'positive-high'. EarlyCDT Lung is proposed as a 'rule-in' test to be used in addition to standard care for the detection of lung cancer. The estimated post-test risk is intended to help clinicians make decisions about further testing or intervention. High-risk individuals with a positive EarlyCDT-Lung would have additional testing such as a CT scan or the test would be used as a follow-up test for indeterminate lung nodules identified by CT.

LungLB, LungLife AI

The LungLB test is a 4-color fluorescence in-situ hybridization (FISH) assay employed to detect early circulating tumor cells (CTCs) from peripheral blood draw. This assay was developed as a FISH-based liquid biopsy test utilizing DNA FISH to validate identification of CTC to assist in the clinical assessment of individuals with indeterminate nodules suspicious for lung cancer. LungLB uses a predictive algorithm to generate an evaluation reported as a decreased or increased risk for lung cancer.

Nodify CDT, Biodesix

Nodify CDT test aims to detect early-stage lung cancer in an individual who is at moderate to high-risk. The test measures seven (7) autoantibodies (CAGE, GBU4-5, HuD, MAGE A4, NY-ESO-1, p53 and SOX-2) that are claimed to be associated with tumor antigens to help detect lung cancer. The test aims to help physicians identify lung nodules that are likely malignant or at higher risk of cancer. Invasive diagnostic procedures would be indicated for patients with a "high level" Nodify CDT test result.

Nodify XL2, Biodesix
(including prior generations of this test: Xpresys Lung, Xpresys Lung 2 [BDX-XL2])

Nodify XL2 test aims to identify those patients whose pulmonary nodules have a high likelihood of being benign, and those who may be better candidates for non-invasive computed tomography (CT) surveillance versus surgical resection. This test utilizes plasma and an integrated classifier that measures the ratio of two (2) proteins (LG3BP and C163A) combined with several clinical and radiological factors (age, smoking status, nodule diameter, nodule-spiculation status and nodule location) to report a categorical probability of malignancy.

The Nodify XL2 and Nodify CDT tests are therefore only used in the management of pulmonary nodules to rule out or rule in, invasive diagnostic procedures; they do not diagnose lung cancer. These tests are offered together as Biodesix's Nodify Lung testing strategy, but physicians may also choose to order each test independently.

OncobiotaLUNG, Micronoma

OncobiotaLUNG is a blood test used to measure microbial DNA by NGS, carcinoembryonic antigen and osteopontin by immunoassay. It is purported to detect malignancy risk for lung nodules in early-stage disease by microbiome-driven, liquid biopsy assay and categorize nodules as being high-risk or low-risk.

ReVeal Lung Nodule Characterization, MagArray

ReVeal Lung Nodule Characterization is a plasma-based protein biomarker test that may aid clinicians in characterizing indeterminate pulmonary nodules (4-30 mm) in current smokers aged 25 years and older. The test uses immunoassay, microarray, and magnetic nanoparticle detection techniques. The ReVeal Lung Nodule Characterization score is presented on a scale from 0 to 100 with a single cut point at 50, and the score is calculated using an algorithm based on the measurement of 3 clinical factors (smoking history, individual age, nodule size) and 3 blood proteins (epidermal growth factor receptor [EGFR], prosurfactant protein B (ProSB), tissue inhibitor of metalloproteinases 1 (TIMP1)) associated with the presence of lung cancer. This result may aid in making the decision to perform a biopsy, or to consider routine monitoring. REVEAL Lung Nodule Characterization is a risk assessment tool, which is to be used only in conjunction with standard clinical assessments. The test is not intended to be a screening or stand-alone diagnostic assay.

Protein Assays Utilizing Lung Cancer Analytes (PAULA's Test), Genesys Biolabs

PAULA's Test is a biomarker blood test for lung cancer. It is for people at high-risk for lung cancer due to a long term smoking history. This test aims to provide a risk score for lung cancer by measuring serum levels of several cancer markers. These marker tests include CEA (carcinoembryonic antigen), CA 125 (carbohydrate antigen 125), CYFRA 21-1 (cytokeratin-19 fragment 21-1) and NY-ESO-1, an autoantibody (New York esophageal cancer-1). A risk calculating algorithm utilizes machine learning technology to combine the tumor biomarker test values with relevant clinical factors (age, smoking history, and prior lung ailments) to generate a composite score categorizing the risk that the patient has LC. This risk score correlates to the likelihood of having cancer as low, medium, and high.

Percepta Genomic Sequencing Classifier, Veracyte

The Percepta Bronchial Genomic Classifier is a 23-gene, gene expression profiling test that analyzes genomic changes in the airways of current of former smokers to assess an individual's risk of having lung cancer, without the direct testing of a pulmonary nodule. The test is performed with the bronchial brushings collected during bronchoscopy for the diagnosis of suspected lung cancer following indeterminate cytology results. The test aim is to stratify the clinical risk for malignancy and eliminate the need for invasive diagnostic procedures.

Percepta Nasal Swab, Veracyte

The Percepta Nasal Swab test is a nasal genomic classifier that aims assess risk of malignancy in current or former smoking individuals with lung nodules found on CT. The test results are reported as low risk for cancer and continue to monitor with LDCT, moderate risk and to consider non-surgical tissue sampling, or high-risk for cancer and to consider sending patients for surgery and/or

treatment. The Percepta Nasal Swab test was built upon foundational "field of injury" science - through which genomic changes associated with lung cancer can be found in the airways of current and former smokers. Veracyte began making the test available to a limited number of medical centers in October 2021.

SUPPORTIVE LITERATURE

Plasma-Based Proteomic Screening

Silvestri et al (2018) reported the validation of the Xpresys Lung version 2/Nodify XL2 (BDX-XL2) in a prospective multicenter observational study (PulmonAry NOdule Plasma proTeomIc Classifier [PANOPTIC]) that enrolled 685 patients with eight (8) to 30 mm lung nodules. After exclusions, 178 patients remained with a low pretest probability of malignancy ≤50% and were included in the study population. There were 149 benign lung nodules and 29 malignant lung nodules in the study. Of these, 66 were classified as "likely benign", 65 of which had a benign nodule, resulting in 44% of benign lung nodules (65 of 149) being correctly labeled "likely benign," while one (1) of 29 malignant nodules (3%) was misclassified as "likely benign". Of the 71 patients who had invasive procedures, 42 had benign nodules. Use of the integrated proteomic classifier would have reduced the number of patients undergoing an invasive procedure to 27, a 36% relative risk reduction, with one (1) malignant nodule misclassified as benign. Of note, 88 patients were reported to be without follow-up CT scan data at one (1) year and the investigators called for a two (2) year follow up.

Tanner et al (2021) performed an extended analysis and 2-year follow-up of the 392 patients included in the PANOPTIC study. Of the 178 patients with a physician pretest probability of malignancy < 50%, 149 (84%) were benign at year one (1). At year two (2), 17 patients who were categorized as benign previously, were lost to follow up and were excluded reducing the number of patients with benign nodules to 132 at the two (2) year interval and leaving a total of 161 patients (90%) with data available for analysis. All nodules designated as benign at year one (1) remained benign by imaging (e.g., stable or resolved) at year two (2) with no change in pathologic diagnoses or nodule size by CT. Additionally, the area under the curve of the integrated classifier was 0.76 (95% CI, 0.69 to 0.82), which outperformed the physician pretest probability for malignancy (0.69; 95% CI, 0.62 to 0.76) and the Mayo (0.69; 95% CI, 0.62 to 0.76), Veterans Administration (0.6; 95% CI, 0.53 to 0.67), and Brock (0.71; 95% CI, 0.63 to 0.77) models in the lower risk pretest probability (≤ 50%) cohort.

Tahvilian et al (2023) conducted a prospective correlational study of 151 participants from Mount Sinai Hospital (n = 83) and MD Anderson Cancer Center (n = 68), who were scheduled for a pulmonary biopsy and then enrolled to have a LungLB blood test. Participants enrolled in this study were followed for nine (9) to 24 months following biopsy to confirm malignant or benign diagnosis using standard of care procedures at each site, including CT-based surveillance, repeat biopsy, and/or surgery. Of these 151 participants, 112 participants were diagnosed with malignant lung lesions and 39 participants with benign lung lesions based on blinded nodule biopsy results. LungLB achieved 77% sensitivity and 72% specificity with an AUC of 0.78 for predicting lung cancer in the associated needle biopsy. The clinical trial was limited due to small sample size and COVID-related diagnostic delays. The researchers noted one of the two study sites, MD Anderson Cancer Center, is

in a region with higher incidence of fungal histoplasmosis infections. In this cohort 11 (28.2%) of 39 participants with benign lesions had infectious etiology. Additional studies of the LungLB test are warranted.

Gene Expression Analysis

Vachani et al (2016) reported on rates of invasive procedures from two multicenter trials of patients undergoing bronchoscopy for suspected lung cancer, Airway Epithelium Gene Expression in the Diagnosis of Lung Cancer cohorts (AEGIS I and II). Of 222 patients with low and intermediate pretest probability of cancer, 188 (85%) had an inconclusive bronchoscopy and follow-up procedure data available for analysis. Seventy-seven (41%) patients underwent an additional 99 invasive procedures, which included surgical lung biopsy in 40 (52%) patients. Benign and malignant diseases were diagnosed in 62 (81%) and 15 (19%) patients, respectively. Among those undergoing surgical biopsy, 20 (50%) were performed in patients with benign disease. If the classifier had been used to guide decision-making, procedures could have been avoided in 21 of 42 (50%) of patients undergoing further invasive testing. Among 35 patients with an inconclusive index bronchoscopy who were diagnosed with lung cancer, the sensitivity of the classifier was 89%, with 4 (11%) patients having a false-negative classifier result and may have experienced a delayed diagnosis. The study was limited to 12 months of follow up after the index bronchoscopy. In addition, physicians were blinded to results of the classifier so the impact of the classifier on their decision making was unable to be evaluated. In some patients with a negative classifier result, physicians may still choose to proceed with further invasive testing.

Mazzone et al (2022) conducted a prospective, multicenter, blinded, clinical validation study of 412 patients who were current or former smokers and were undergoing bronchoscopy for suspected lung cancer from the AEGIS I and II trails and the Percepta Registry. The prevalence of malignancy was 39.6% and the ability of the classifier to decrease unnecessary invasive procedures was estimated. Overall, 29% of intermediate-risk lung lesions were down-classified to low-risk with a 91.0% negative predictive value (NPV) and 12.2% of intermediate-risk lesions were up-classified to high-risk with a 65.4% positive predictive value (PPV). In addition, 54.5% of low-risk lesions were down-classified to very- low-risk with > 99% NPV and 27.3% of high-risk lesions were up-classified to very high risk with a 91.5% PPV. If the classifier results were used in nodule management, 50% of patients with benign lesions and 29% of patients with malignant lesions undergoing additional invasive procedures could have avoided these procedures. The study was limited to patients with a history of smoking and the follow up period was only 12 months to determine benign status. Additional prospective clinical utility studies would be helpful to further establish the benefits and performance of the classifier in real-world settings.

Flow Cytometry Analysis of Sputum

Lemieux et al (2023) conducted a prospective, multicenter clinical trial of CyPath Lung that evaluated sputum of smokers or former smokers enrolled in a cancer cohort and a non-cancer cohort. Initially 171 sputum samples were analyzed but the study only reports on 150 samples that passed quality control. An analysis pipeline combining automated flow cytometry data processing with machine learning was developed to distinguish cancer from non-cancer samples from 150 patients at high risk of whom 28 had lung cancer. Flow data and patient features were evaluated to identify predictors of

lung cancer. The final model was evaluated on a second, independent group of 32 samples, including six (6) samples from patients diagnosed with lung cancer. Automated analysis combined with machine learning resulted in a predictive model that achieved an area under the ROC curve (AUC) of 0.89 (95% CI 0.83–0.89). The sensitivity and specificity were 82% and 88%, respectively, and the negative and positive predictive values 96% and 61%, respectively. Importantly, the test was 92% sensitive and 87% specific in cases when nodules were < 20 mm (AUC of 0.94; 95% CI 0.89–0.99). Testing of the model on an independent second set of samples showed an AUC of 0.85 (95% CI 0.71–0.98) with an 83% sensitivity, 77% specificity, 95% negative predictive value and 45% positive predictive value. This manufacturer's clinical trial is limited by the small, non-diverse sample size and a lack of long term follow up of the non-cancer cohort to confirm they were cancer-free.

Based on the review of the peer reviewed literature, while trial results are promising, further clinical trials are indicated to assess the impact on population health outcomes and clinical decision making. Long-term follow up is needed on these tests to be able to assess their effectiveness in detecting early cancer and risk stratifying indeterminate pulmonary nodules to prevent unnecessary invasive procedures.

PROFESSIONAL GUIDELINE(S)

Currently, professional societies including the American Lung Association, the National Comprehensive Cancer Network (NCCN), and the National Institute for Health and Care Excellence (NICE) do not recommend the use of molecular testing in the management of pulmonary nodules.

U.S. Preventive Service Task Force recommendations (2021) state potential screening modalities that are not recommended because they have not been found to be beneficial include sputum cytology, chest radiography, and measurement of biomarker levels. The paper notes that research is needed to identify biomarkers that can accurately identify persons at high-risk is needed to improve detection and minimize false-positive results.

The American Thoracic Society (ATS) published a position statement on the evaluation of molecular biomarkers for the early detection of lung cancer (Mazzone 2017). They state to support the application of molecular biomarkers in these clinical settings there must be evidence that the molecular biomarker leads to clinical decisions whose benefits outweigh their harms. Although it is tempting to apply novel testing based on promising discovery or validation level studies, the lung cancer community should insist on additional evidence of clinical utility before changing practice. In 2021, ATS published their Core Curriculum adult pulmonary medicine update regarding thoracic oncology which states the use of artificial intelligence with radiomics or integrating artificial intelligence into analysis of genomic, plasma biomarker, biopsy staining pattern, and other patient-derived data are currently under investigation (Garrison 2021). Recent studies have focused on molecular biomarkers to further risk-stratify nodules, but additional clinical utility studies are needed.

REGULATORY STATUS

Clinical laboratories may develop and validate tests in-house and market them as a laboratory service; laboratory-developed tests must meet the general regulatory standards of the Clinical Laboratory Improvement Amendments (CLIA). Xpresys Lung 2, now Nodify XL2 (BDX-XL2; Integrated

Diagnostics [Indi], purchased by Biodesix); Nodify CDT (Biodesix); REVEAL Lung Nodule Characterization (MagArray); and Percepta Genomic Sequencing Classifier (Veracyte) are available under the auspices of the CLIA. Laboratories that offer laboratory-developed tests must be licensed by the CLIA for high-complexity testing. To date, the U.S. Food and Drug Administration (FDA) has chosen not to require any regulatory review of these tests.

POLICY NAME: MOMETASONE FUROATE SINUS IMPLANTS

Policy Effective Date:	8/1/2022
Policy Control #:	1370/20.000501
Next Annual Review:	July, 2027

DISCLAIMER

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgment when deciding the most appropriate care for enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

PROCEDURE CODES

31299 - Unlisted procedure, accessory sinuses (when specified as insertion of drug-eluding implant)

31237 - Nasal/sinus endoscopy, surgical; with biopsy, polypectomy or debridement (separate procedure)

J7402 - Mometasone furoate sinus implant, 10 micrograms (Sinuva™)

C2625, S1091 - Stent, non-coronary, temporary, with delivery system (Propel™)

DESCRIPTION

Sinuva® is a second-generation, bioabsorbable, corticosteroid-releasing sinus implant. It is composed of 1,350 micrograms mometasone furoate that is gradually released over 90 days. It is inserted into the ethmoid sinus by physicians trained in otolaryngology. The insertion procedure is performed during an office visit, and is considered an alternative to revision surgery for the treatment of recurrent nasal polyps in adults who have undergone previous ethmoid sinus surgery. Over time, as the implant softens and polyps decrease, the implant may be expelled out of the nose on its own or with actions such as sneezing or forceful nose blowing. The implant can be removed 90 days after placement, or earlier at the physician's discretion.

Capital District Physicians' Health Plan, Inc.
CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: MOMETASONE FUROATE SINUS IMPLANTS

The Propel sinus implant is composed of a bioabsorbable co-polymer and contains 370 micrograms of mometasone furoate, an anti-inflammatory steroid. The implant is inserted by a physician under endoscopic visualization using a proprietary delivery system to access the frontal or maxillary sinus ostium and deploy the implant. The Propel Contour implant is designed to be self-retaining against the mucosa of the sinus ostium in order to maintain sinus patency. Propel Contour releases mometasone furoate directly to the mucosa; the implant is completely bioabsorbable.

POSITION STATEMENT

CDPHP considers mometasone furoate sinus implant (Sinuva®) medically necessary when *all* of the following criteria are met:

- The member must have a diagnosis of recurrent nasal polyps.
- The member has had ethmoid sinus surgery and has nasal obstruction/congestion symptoms despite use of intranasal steroid irrigations or sprays.
- The member must be 18 years of age or older.
- The member has had previous treatment, contraindication, or intolerance to conventional nasal polyp therapy (such as leukotriene receptor antagonist, steroid taper, and/or intranasal steroids).
- The member has documented nasal allergies, or if allergy testing is negative, evaluation for aspirin-exacerbated respiratory disease (AERD) has been considered.

The use of a mometasone furoate sinus implant (Propel™) is considered medically necessary following functional endoscopic sinus surgery (FESS) when the following criteria are met:

- Patient is ≥ 18 years of age; *and*
- Ethmoid sinus surgery is planned

POLICY CONSIDERATIONS

The mometasone furoate implantation procedure will be covered under the medical portion of the contract.

The Sinuva/Propel sinus implant is loaded into a delivery system and placed under endoscopic visualization by a trained otolaryngologist in an office setting, ambulatory surgery center or hospital setting.

To report endoscopic placement of Sinuva™ in the ethmoid sinus in conjunction with biopsy, polypectomy, or debridement, report CPT code 31237, nasal endoscopy, surgical, with biopsy, polypectomy, or debridement.

EXCLUSIONS

CDPHP considers a mometasone furoate sinus implant experimental and investigational for

POLICY NAME: MOMETASONE FUROATE SINUS IMPLANTS

indications other than those stated in this policy due to insufficient evidence in peer-reviewed literature.

The use of a mometasone furoate nasal implant should be avoided in individuals with a known hypersensitivity to mometasone furoate or with nasal ulcers or trauma**.**

According to the Food and Drug Administration (FDA) approved labeling and Sinuva package insert, repeat administration of Sinuva has not been studied and therefore, is not covered.

CDPHP PRODUCT VARIATIONS

CHILD HEALTH PLUS	Subject to all terms and conditions noted above in the policy.
MEDICARE ADVANTAGE	Subject to all terms and conditions noted above in the policy. The mometasone furoate sinus implant is not Part D-eligible.
SELECT PLAN/HARP	Subject to all terms and conditions noted above in the policy.

POLICY APPROVAL DATES

New: 07/19

Revised: 09/19, 01/20, 7/20, 09/20, 5/21, 7/22

Reviewed: 7/21, 7/23, 7/24, 7/25, 7/26

POLICY HISTORY

This section is intended to provide only highlights of the policy changes. The policy should always be reviewed in its entirety to ensure a comprehensive understanding of coverage.

Effective Date	Update

8/1/2022	Clarified in the exclusions that repeat use of Sinuva is not covered.
	
	Under Propel, removed the following criteria:
	• Patient has one or more of the following conditions:
	  • Mucosal inflammation
	  • Failed prior surgery and/or restenosis
	  • Absolute or relative contraindication to systemic steroids

4/1/21	Removed termed code J7401 and replaced with new code J7402. Removed termed code C9122. Added new code S1091 for Propel®

Capital District Physicians' Health Plan, Inc.
CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: MOMETASONE FUROATE SINUS IMPLANTS

1/1/21	Policy updated to reflect mometasone furoate sinus implant may be performed in an office, ambulatory surgery center, or hospital setting.
7/1/2020	New HCPCS code C9122 (mometasone furoate sinus implant, 10 micrograms, Sinuva®) added to policy.
51/2020	Added statement in Policy Considerations regarding the proper reporting of endoscopic placement of Sinuva™ in conjunction with biopsy, polypectomy, or debridement.
1/1/2020	Propel™ sinus implant added to Description section. Criteria for coverage of Propel™ added to Application section. Statements regarding correct placement and place of service for the Propel™ and Sinuva® sinus implants added to the Policy Considerations section.

Disclaimer Notice

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgment when deciding the most appropriate care to enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

Background

Hemophilia is an X-linked recessive genetic bleeding disorder that decreases the number of clotting factors to decrease the ability of the person to clot during a bleed. Although the majority of the population affected is male passed on from the mother, if she is a carrier of the gene, about 1/3 of all new cases are also caused by a spontaneous mutation or change in gene.

Hemophilia A is associated with a decrease in the production of clotting factor VIII and is the more common of the two types, affecting about 95% of all hemophiliacs. Hemophilia B is associated with a decrease in clotting factor IX that affects only about 5% of hemophiliacs. Hemophilia can vary from mild to severe depending on the amount of decreased factor levels and resulting bleeding complications can lead to long-term morbidity from joint damage due to recurrent bleeds. Standard treatment of hemophilia is usually with an infusion of factor VIII or IX and can either be in response to a bleeding event (episodic) or scheduled to prevent bleeds (prophylactic).

In 30-35% of patients with hemophilia A and in 1-5% of patients with hemophilia B, a neutralizing antibody, known as an inhibitor (against factor VIII in hemophilia A, and factor IX in hemophilia B) forms as an immune-based response to attack the infused factor and puts patients at increased risk of complications and death from uncontrolled bleeding. Testing for inhibitors in patients with hemophilia should always be done at least twice a year or after any treatment with factor replacement that inadequate response.

Treatment Overview

The cornerstone of management for both hemophilia A and B is to replace the deficient coagulation factor either through episodic (on-demand) treatment which is replacement factor given at the time of bleeding or through continuous prophylaxis which is replacement factor given to prevent bleeding. Patients can develop antibodies to factor products, known as inhibitors. Inhibitors render factor inactive (infused factor is seen as a foreign protein). Inhibitor development (both low and high titer inhibitors) can greatly interfere with the ability to treat bleeding and achieve adequate hemostasis. High titer inhibitors bind to exogenously administered replacement factor and prevent it from achieving hemostasis.

According to the 2020 World Federation of Hemophilia (WFH) guidelines for the management of hemophilia, prophylaxis with factor products are considered standard of care for those with severe hemophilia A to prevent bleeding. Hemlibra is noted alongside traditional factor replacement concepts for management, and importantly notes that it is not intended to treat acute bleeding episodes, which do require treatment with factor replacement (as this therapy does not replace the missing coagulation factor). The aforementioned guidelines do also note that caution is required when treating breakthrough bleeding episodes while on Hemlibra, as several patients developed either venous thromboembolism or thrombotic microangiopathy with concomitant administration of activated prothrombin complex concentrate (aPCC), in accordance with the above noted FDA Black Box Warning.

Since the most recent World Federation of Hemophilia guidelines were published, two new non-factor therapies have been approved by the FDA for the prevention of bleeding events in patients with both hemophilia A and hemophilia B.

Episodic versus Prophylactic Therapy

Episodic (on-demand) treatment has been shown to be clinically inferior to prophylactic therapy with respect to bleeding prevention, joint preservation, and long-term outcomes. Clinical trials and observational studies consistently demonstrate higher bleeding rates, progressive joint damage, and worse functional outcomes in patients managed with episodic therapy compared to those receiving routine prophylaxis. Episodic therapy fails to prevent subclinical and micro-bleeding events that drive irreversible joint damage and does not adequately mitigate disease progression. Therefore, prophylactic therapy is the established standard of care for individuals with moderate to severe hemophilia or a high-risk bleeding phenotype. Episodic treatment is not considered an appropriate long-term management strategy or qualifying pathway for coverage under this policy. Routine use of episodic therapy alone suggests a disease course or bleeding phenotype that is inconsistent with the severity and risk profile required for coverage of the treatments addressed in this policy.

Coverage Intent and Scope

This policy applies to monoclonal antibody therapies for the management of hemophilia A and hemophilia B in individuals with moderate to severe disease or a high-risk bleeding phenotype for whom routine prophylaxis is clinically indicated. Coverage is intended for patients who demonstrate a disease course associated with recurrent clinically significant bleeding, elevated risk of spontaneous hemorrhage, or

progressive joint damage. Eligibility for coverage is not based on diagnosis alone and is determined by satisfaction of the clinical criteria described below.

Table 1: Available products per indication and inhibitor status

	Hemlibra (emicizumab-kxwh)	Hympavzi (marstacimab-hncq)	Alhemo (concizumab-mtci)	Qfitlia (fitusiran)
Congenital FVIII deficiency (hemophilia A)				
With Inhibitors	X	X	X	X
Without Inhibitors	X	X	X	X
Congenital FIX deficiency (hemophilia B)				
With Inhibitors		X	X	X
Without Inhibitors		X	X	X
FDA Approved Age Requirement				
All indications	Any Age	≥ 6 years of age	≥ 12 years of age	≥ 12 years of age

Table 2: Sites of Bleeding in Hemophilia

Serious	• Joints (hemarthrosis) • Muscles, especially deep compartments (iliopsoas, calf, forearm) • Mucous membranes of the mouth, nose, and genitourinary tract
Life-threatening	• Intracranial • Neck/throat • Gastrointestinal

Summary	
Effective Date of Policy	7/13/2026
Indications	Severe hemophilia A (congenital factor VIII deficiency) Severe hemophilia B (congenital factor IX deficiency)
ICD10 Diagnosis Codes	D66, D67
Availability	Hemlibra: single-dose vials for injection: 30 mg/mL, 60 mg/0.4 mL, 105 mg/0.7 mL, 150 mg/mL Hympavzi: 150 mg/mL in a single-dose prefilled syringe and a single-dose prefilled pen Alhemo: 60 mg/1.5 mL in a single-patient-use prefilled pen, 150 mg/1.5 mL in a single-patient-use prefilled pen, and 300 mg/3 mL in a single-patient-use prefilled pen Qfitlia: 50 mg/0.5 mL in a single-dose prefilled pen, 20 mg/0.2 mL in a single-dose vial
HCPCS Codes	Hemlibra: J7170 Hympavzi: J7172 Alhemo: J7173 Qfitlia: J7174
Duration	Managed Medicaid/HARP/CHP: • Initial: 6 months • Recertification: 12 months Commercial/Medicare Part B: • Initial and Recertification: 2 years

Required Criteria for Initial Approval

All of the following conditions for the requested indication must be met in order to approve therapy:

1. The prescribed medication must be used for the indication(s) consistent with the population outlined in Table 1 above
2. Must be prescribed by, or in consultation with, a hematologist
3. Must be used for routine prophylaxis to prevent or reduce the frequency of bleeding episodes

4. Inhibitor Status Requirements
    a. For patients WITH inhibitors, there must be documentation of inhibitors (e.g., history of inhibitor titer ≥ 5 Bethesda units per mL)
        i. For Hemophilia A, Bethesda assay must have been completed within 8 weeks of the request
        ii. For Hemophilia B, Bethesda assay must have been completed within 6 months of the request is acceptable unless recent immune-tolerance induction or clinical change that suggest assessment is warranted
    b. For patients WITHOUT inhibitors:
        i. Patients must have severe hemophilia A (factor VIII < 1%) or hemophilia B (IX ≤ 2%) as evidenced by documentation of baseline (untreated) factory activity level AND
    c. Must have documentation of a recent (within 6 months of the request) inhibitor test confirming absence of factor VIII (for hemophilia A) or factor IX (for hemophilia B) inhibitors
5. Bleed History Requirements
    a. Documentation of the patient's baseline annualized bleed rate
        i. Only bleeds requiring medical intervention or treatment should be counted in ABR calculations AND
    b. The patient must have a history of two or more episodes of spontaneous bleeding episodes into joints or muscles consistent with moderate to severe hemophilia AND
    c. There must be documentation of inadequate bleed control despite ≥ 80% adherence (based on refill history or infusion logs) of prophylactic therapy as evidenced by:
        i. Two or more clinically significant spontaneous bleeding events within the past 12 months requiring medical intervention or treatment (e.g., factor infusion, bypassing agent, or clinical evaluation) while adherent to prophylactic factor replacement or bypassing agents OR
        ii. Inability to achieve or maintain appropriate trough factor activity level ≥ 3% as evidenced by at least two pre-dose levels < 3% obtained ≥ 4 weeks apart within a 6-month period, despite appropriate dosing
6. Patients with Hemophilia A must have had a trial and failure of Hemlibra prior to consideration of coverage for another hemophilia monoclonal antibody therapy.
    a. An adequate trial of Hemlibra is defined as the completion of the 4-week loading dose in addition to at least 24 weeks of maintenance therapy at an approved dose with confirmed adherence, unless discontinued earlier due to serious side effects or documentation of neutralizing antibodies
    b. Failure of Hemlibra is defined as any of the following:
        i. An increase in treated spontaneous or joint bleeds compared to pre-treatment baseline (e.g., increase in ABR, return to pre-treatment bleeding frequency) OR
        ii. Bleeding requiring additional factor or bypassing agent therapy (beyond what is typical for minor trauma or surgery) OR
        iii. Failure to prevent target joint bleeds or new joint damage
7. Transition to non-factor therapies may be considered medically necessary when there is documented clinical ineffectiveness associated with factor replacement therapy as described in the criteria above.
    a. Use of these therapies reduce treatment burden (for convenience), in the absence of such clinical factors, does not meet medical necessity criteria and will not be authorized.

Exclusion Criteria

- Hemlibra, Hympavzi, Alhemo, and Qfitlia will not be authorized in combination with another monoclonal antibody used for Hemophilia or, when used for prophylaxis, with factor products or bypassing agents except for intermittent use to manage breakthrough bleeds
- Patient must not have received previous treatment with a gene therapy product for hemophilia, due to insufficient evidence on safety and/or efficacy of subsequent use with non-factor agents
- Use in acquired hemophilia is excluded from coverage, as there is no clinical evidence or guideline support for the safety and/or efficacy of these agents in this population

Continuation Criteria

- Recertification will require documentation that the patient has had a beneficial response to therapy (e.g., reduction in frequency and/or severity in spontaneous bleeding events, decreased need for intermittent factor or bypassing therapy, etc.)

Considerations

- Prior authorization is obtained through the CDPHP pharmacy department
- See Prescribing Information for approved dosing
- Quantity Limits:
  - Alhemo: 1 pen per 28 days
    - Upon each review the requested pen strength and quantity will be reviewed in accordance with FDA-approved weight-based dosing. Approval will be limited to the minimum number of pens needed to obtain the appropriate dose and pen strength that provides the least amount of waste.
  - Hemlibra
    - The most efficient vial and strength combination should be used to minimize drug waste, consistent with the FDA-approved dosing regimen and the patient's prescribed dose.
  - Hympavzi: 4 syringes/pens per 28 days
  - Qfitlia: 0.5 mL/56 days

96116, 96121, 96132, 96133, 96136, 96137, 96138, 96139, 96146

DESCRIPTION

Neuropsychological testing involves using a standardized battery of tests or an individualized approach that focuses on cognitive functions that are specific to a patient's reported problems. It is usually done in connection with neurological diagnoses rather than related to behavioral health conditions. Neuropsychological testing is intended to describe and diagnose the neurocognitive effects of medical disorders that impinge directly or indirectly on the functional integrity of the brain.

POLICY NAME: NEUROPSYCHOLOGICAL TESTING

POSITION STATEMENT

CDPHP administers benefits for neuropsychological testing, under the medical portion of the contract, to include but not limited to the following indications:

- To detect neurologic disease based on quantitative assessment of neurocognitive abilities.
- To differentiate between a psychiatric disorder and a neurological or neuro-endocrine medical condition with cognitive and psychiatric symptoms.
- To rule in or out diagnostic conditions when known or suspected neurological disease is not detected or is not certain following the use of standard psychiatric and medical neurodiagnostic procedures.
- To determine the enrollee's baseline neurocognitive functioning capabilities and/or changes in status/functioning when it is necessary to assist with treatment planning to assess neurocognitive functions for the formulation of rehabilitation and/or management strategies among individuals with neurologic disorders.

Neuropsychological testing is performed by a licensed psychologist, board certified in neuropsychology, neurologist, or psychiatrist with specialized training and expertise in the types of tests/assessment being requested, and who can perform them at a level proficient to interpret testing data.

POLICY CONSIDERATIONS

Neuropsychological testing should be preceded by adequate mental status examination, review of the individual's pertinent history, and appropriate medical and/or neurological consultation. The testing is considered necessary when there has been significant mental status change, cognitive function change, memory loss, or behavior change as a result of suspected organic brain dysfunction resulting from illness or injury.

Examples of neurologic disease/injury in which neuropsychological testing may be indicated are:

- Dementia of various etiologies (i.e., primary neurodegenerative, infectious, etc.)
- Delirium/confusional state
- Hydrocephalus
- Intracranial neoplasm
- Seizure disorders
- Stroke or cerebral vascular injury (e.g., brain aneurysm, subdural hematoma)
- Traumatic brain injury
- Vascular or hereditary disorders
- Multiple sclerosis
- Neurotoxin exposure
- Acquired immunodeficiency syndrome (AIDS) encephalopathy
- Lyme disease encephalopathy including neuroborreliosis
- Extrapyramidal disease (i.e., Parkinson's Disease, Huntington's Disease); or
- Developmental delay (Note: testing for pervasive developmental disorder is addressed in

Capital District Physicians' Health Plan, Inc.
CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: NEUROPSYCHOLOGICAL TESTING

resource coordination policy, Psychological Testing).
- Depression and other psychiatric conditions presenting with neurologic symptomatology making differential diagnosis difficult but imperative to
- formulating a treatment plan
- Dyslexia

EXCLUSIONS

Neuropsychological testing is not considered reasonable and necessary for the following conditions:

- Routine monitoring of chronic disorders such as cerebrovascular disease, HIV infection, etc. unless significant clinical change is documented.
- Evaluation when abnormalities of the brain function are not suspected.
- When a person has been diagnosed previously with brain dysfunction and there is no expectation that the testing would impact the individual's treatment.
- When neuropsychological assessments can be obtained through the clinical evaluation alone.
- When used as a screening test given to the individual or to the general population.
- For periodic re-testing of stable members.
- For members who have had surgery for epilepsy within the last twelve months.
- When required for vocational purposes or ordered by the court or legal system.
- When related to adult or child ADHD hyperactivity, autism spectrum disorder, Tourette's Syndrome, intellectual developmental disorder or school-related services unless secondary to one of the aforementioned indications.
- When related to educational or vocational assessment or training, including to assess improvement of academic functioning, to diagnose specific learning disabilities, reading disorders, developmental disorders of scholastic skills, and alexia.
- When related to assessment or diagnosing of pervasive developmental disorders or other disorders or psychological development.
- When the member has a history of substance abuse, and the member continues to use mood altering substances and/or when the member is < 10 days post-detoxification.
- When a person is on certain medications that may confound interpretation of results, and drug effects have not been ruled out.
- For pre-procedure work-up, unless neuropsychological testing is required to determine if the member is cognitively able to benefit from the procedure and is able to cooperate with all aspects of the treatment plan and the member meets all other criteria for the proposed procedure.
- When administered or scored by technicians not meeting the requirements outlined in the NYS Office of the Professions Education Law.

CDPHP considers computerized neuropsychological testing [96146] (e.g., ImPACT™, CogState Sport®) experimental/investigational for all indications, including sports related injuries, as it

does not require a physician, psychologist or licensed mental health provider to provide interpretation and preparation of the report; and overall impact on health outcomes is unproven at this time.

CDPHP PRODUCT VARIATIONS

CHILD HEALTH PLUS:	Subject to all terms and conditions noted above in the policy.
MEDICARE ADVANTAGE:	Subject to all terms and conditions noted above in the policy.
SELECT PLAN/HARP:	Subject to all terms and conditions noted above in application with the exception that neuropsychological testing is covered when ordered by the court or legal system.

POLICY HISTORY

This section is intended to provide only highlights of the policy changes. The policy should always be reviewed in its entirety to ensure a comprehensive understanding of coverage.

Effective Date	Update
12/25	Added coverage for dyxlexia. Removed from exclusions.
11/1/2021	Hourly limitation removed for neuropsychological testing.
1/1/2020	Application section: • Added requirement that psychologists be board certified in neuropsychology • Increased neuropsych testing hours from 6 to 12. • Clarification on how units should be billed on claims Added additional examples of indications for neuropsych testing in the Policy Considerations section. Updated the Exclusions section.

This Resource Coordination Policy is the exclusive property of Capital District Physicians' Health Plan, Inc. (CDPHP®) and its affiliated companies, CDPHP Universal Benefits,® Inc. (CDPHP UBI) and Capital District Physicians' Healthcare Network, Inc. (CDPHN). The contents and form of this policy are proprietary to CDPHP. Any reproduction or replication of this policy without the express written permission of CDPHP, CDPHP UBI, and CDPHN is strictly prohibited. This policy is subject to contractual limitations and/or parameters established in any Employer sponsored Summary Plan Description (SPD) and/or Benefit Design Document (BDD).

RESOURCE COORDINATION POLICY

Capital District Physicians' Health Plan, Inc.
CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: NON-COVERED TECHNOLOGIES

POLICY EFFECTIVE DATE: 9/1/2026
Policy Control #: 1370/20.000444
Next Annual Review: January, 2027

DISCLAIMER

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgement when deciding the most appropriate care to enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

DESCRIPTION

Non-covered technologies are experimental, investigational, or non-standard services that are not covered under an enrollee's benefit plan. CDPHP specifically excludes benefits for experimental and investigational services. Experimental and investigational means the technology is:

- Not of proven benefit for the particular diagnosis or treatment of a covered enrollee's particular condition; and/or
- Not generally recognized by the medical community, as reflected in the published evidence-based medical literature, as effective or appropriate for the particular diagnosis or treatment.

POSITION STATEMENT

Capital District Physicians' Health Plan, Inc.
CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: NON-COVERED TECHNOLOGIES

In general, CDPHP does not administer benefits for any medical or behavioral health interventions that have been determined to be investigational, experimental, non-standard, or unproven. Benefits are limited to scientifically established procedures in accordance with the criteria outlined in the above referenced CDPHP resource coordination policies.

Services may also be non-covered due to the nature of the service, or if the service is specifically identified as a contract exclusion. The following list is not all-inclusive but contains examples of non-covered technologies as determined by the CDPHP technology assessment team. As such, they are not covered unless specifically addressed in a contract, or when a case-specific review justifies a medical exception as determined by a CDPHP medical director.

Investigational services are often so new that they do not have a procedure code assigned to them yet. Therefore, not all of the services listed below will have CPT or HCPCS codes listed.

A

Ablation, percutaneous, cryoablation of upper and lower extremity distal/peripheral nerve and nerve plexus or other truncal nerve
Air displacement/body plethymography (BOD-POD)
Allogeneic Hematopoietic Stem Cell Transplant for Multiple Myeloma
Anoscopy for fecal incontinence (Secca® procedure)
Antiprothrombin
Axial lumbar interbody fusion system, AxiaLIF
Artificial lumbar intervertebral disc (Charite artificial disc, Prodisc-L)
Autologous Serum Tears
Avise PG
AVISE Lupus

B

Balloon Septoplasty
Baroreflex stimulation implanted device
Bioimpedance spectroscopy (BIS) for assessment of lymphedema
Bronchial thermoplasty for treatment of asthma (e.g., Alair®)

C

Carbon monoxide, expired gas analysis
Cardiac contractility modulation system
Cerebral Embolic Protection Device (CEPD)
Contractility modulation generator
Chemical exfoliation or cryotherapy for treatment of facial wrinkling, pigmentation, or acne
Collagen meniscus implant (e.g., CMI, collagen scaffold, Menaflex™)
ColoSense
Combined electrochemical therapy (CET) for treatment of peripheral
Common carotid intima-media thickness (IMT)

POLICY NAME: NON-COVERED TECHNOLOGIES

Comprehensive computer-based motion analysis by videotaping and 3D kinematics
Computerized dynamic posturography
Coronary artery disease, mRNA, gene expression profiling
Cryoablation of the posterior nasal nerve (i.e., ClariFix).
Cryosurgery for plantar fasciitis

D

Digital Motion X-ray of the spine
Diverticular Peroral Endoscopic Myotomy (D-POEM) for treatment of esophageal diverticula
Drug Coated Balloons (e.g., Optilume)
Dynamic flexion devices (Dynasplint)

E

Electrical water-circulating cold pad with pump (Cryocuff)
Electron beam computed tomography (Ultrafast CT or Cine CT)
Electronic positional OSA treatment (e.g., NightBalance Lunoa System)
Electromagnetic navigation bronchoscopy (e.g., virtual bronchoscopy)
Electronic brachytherapy for the treatment of breast cancer (e.g., IORT, Intrabeam therapy)
EndoPAT to detect coronary artery endothelial dysfunction
Endoscopic or percutaneous spinal surgical techniques (Racz procedure)
Endovenous Ablation Therapy
Exsufflation belt
Extracorporeal shock wave therapy- high energy

F

Focused ultrasound ablation of uterine leiomyomata
Foot, adductus positioning device (e.g., Universal Neonatal Foot Orthotic/UNFO-S)

G

Gastric Peroral Endoscopic
Myotomy (G-POEM) for the treatment of gastroparesis
Gastric electrical stimulation (GES)/gastric pacing (Enterra™ Therapy)
Gastroenterology (Barrett's esophagus), whole slide-digital imaging

H

HART CADhs®
HART CVE®
High-dose-rate brachytherapy for prostate cancer

I

Implantable pulmonary artery pressure measurement system (e.g., CardioMEMS)
Infrared therapy for neuropathy, wound healing, or pain management

InPen Smart Insulin Pen
Insertion of Drug-Eluting Implant into Lacrimal Canaliculus
Interferential stimulation
Interspinous process decompression system (e.g., X-Stop®)
Intravaginal Device (i.e., Flyte)
Intranasal sphenopalatine ganglion (SPG) block
Intravascular Lithotripsy
Iontophoresis

K
KidneyIntelX

L
Latera Absorbable Nasal Implants
Leadless pacemaker (e.g., Micra Transcatheter Pacing System)
Low dose radiation therapy for treatment of osteoarthritis
Lower esophageal sphincter augmentation devices for GERD (LINX® Reflux System)
Low-level or high-level laser therapy
Lumbar pneumatic traction device (Saunders Lumbar HomeTrac)
Lung expansion airway clearance

M
Magnetic Controlled Growing Rods (e.g., MAGEC- Magnetic Expansion Control System)
Magnetic-resonance-guided focused ultrasound (MRgFUS) for essential tremor
Magnetic resonance imaging (MRI) low-field
Magnetic resonance imaging (MRI) cerebral perfusion analysis
Magnetic resonance neurography (MRN)
Magnetic source imaging (MSI)
Manipulation of spine requiring anesthesia (MUA)
Microvas vascular treatment system for peripheral neuropathy
Mobile Cardiovascular Telemetry
MyoPro Orthosis

N
Nerivio Migra for acute migraine episodes
Neurofeedback (Electroencephalograpy (EEG) Biofeedback)
Neuropsychological testing administered by a computer (e.g., ImPACT™, CogState Sport®)
Neutralizing antibody testing: beta interferon
Non-pneumatic compression controller w/o calibrated gradient pressure (e.g., Dayspring Lite)

O
Oncology (breast ductal carcinoma in situ), protein expression profiling
Oral brush biopsy (e.g., Oral CDx) for screening of mouth cancer

Oral Superabsorbent Hydrogel for Weight management (e.g., Plenity)
Oxinium knee implants
Oxygen therapy for headaches (e.g., migraine)

P

Pap Smears for members under 21 years of age
Percutaneous image-guided lumbar decompression for lumbar spinal stenosis
Periurethral transperineal adjustable balloon continence device (e.g., ProAct, ACT)
Platelet-rich plasma (PRP) therapy
PleximarkTM
Positron emission tomography (FDG) for infection/inflammation
Positron emission tomography (PET) imaging, any site not otherwise specified
PET for detection of breast cancer (e.g., Naviscan)
PET whole body imaging; melanoma for non-covered indications.
Positional magnetic resonance imaging (MRI) (e.g., upright MRI)
PrismRA Molecular Test
Prolotherapy for the treatment of musculoskeletal pain
Prometa® therapy for alcohol, cocaine, and methamphetamine dependence
Artery Embolization

Q-R

Qualitative electroencephalography (QEEG) for the treatment of ADHD
Radiofrequency ablation for the treatment of epicondylitis
Radiofrequency ablation of thyroid nodule(s)
Radiofrequency ablation for the treatment of prostate cancer
Radiofrequency ablation/cryotherapy ablation for clinically localized suspected renal malignancy
Radiofrequency generated water vapor thermotherapy for the prostate (i.e., Rezum)
Radiofrequency spectroscopy (e.g., MarginProbe®)
Radiofrequency Tissue Volume Reduction (i.e., Somnoplasty®)
Referenced electroencephalography (rEEG) for predicting pharmacotherapeutic outcomes
Remote Imaging Fundus Photography/Retinal telescreening (i.e., RetinaVue™, Optomap®)
RhinAer

S

Scintimammography (radioimmunoscintigraphy of the breast)
Serum Hepcidin Testing
Skin advanced glycogen end products (AGE) measurement
SNaP® Wound Care System/PICO™ Single Use Negative Pressure Wound Therapy
Static progressive (SP) stretch device (e.g., joint active systems (JAS) devices)
Subchondroplasty/Subchondral Calcium Phosphate (SCP) injections
Subtalar arthroereisis
Suit therapy (Theratogs, TheraSuit, PediaSuit)
Superior capsular reconstruction

Supervised exercise therapy (SET) for symptomatic peripheral artery disease
Sural nerve grafting during radical prostatectomy
Surface electromyography (EMG)

T

Temporary Implantable Nitinol Device (iTIND)
Thermal destruction of intraosseous basivertebral nerve (i.e., intracept system)
Thermography (e.g., BreastCare DTS™/BreastAlert®)
Tinnitus retraining therapy (e.g., Neuromonics Tinnitus Treatment/Oasis device)
Tocolytic infusion therapy; home setting
Tongue neuromuscular stimulation device for mild obstructive sleep apnea (e.g., eXciteOSA)
Transcatheter renal sympathetic nerve denervation
Transcervical uterine fibroid ablation (i.e., Sonata)
Transperineal Laser Ablation (TPLA)
Transurethral, radiofrequency micro-remodeling for stress incontinence (Renessa®)

U

Ultrafiltration system for acute decompensated CHF (e.g., Aquadex Flexflow®)
Ultrasound Therapy for wound healing (e.g., Sanuwave UltraMIST)
Uterine activity monitoring; home setting
Uterine Transplantation

V

Vectra DA Blood Test for Rheumatoid Arthritis
Vertebral body tethering
Vertebral fracture assessment (VFA)
Very–Long Chain Acyl–CoA Dehydrogenase (VLCAD) Enzyme Activity
Virtual bronchoscopy
Viscocanalostomy
ViVaer

W-Z

Whole body CT/MRI screening (Lifescan imaging)
Whole body integumentary photography for early detection of melanoma
Wireless abdominal aortic aneurysm pressure measurement system (e.g., CardioMems Endosure® System)
Zenker-Peroral Endoscopic Myotomy (Z-POEM) for the treatment of Zenker's diverticulum

Procedure Description	Codes	Comments
Ablation, percutaneous, cryoablation (includes imaging guidance) of upper and lower extremity distal/peripheral nerve and	0440T 0441T 0442T	Experimental, investigational, or unproven

Procedure Description	Codes	Comments
nerve plexus or other truncal nerve		
Air displacement/body plethymography for measurement of body composition (BOD-POD)	94726 99199	Experimental, investigational, or unproven
Allogeneic Hematopoietic Stem Cell Transplant for Multiple Myeloma	38205, 38240 when billed with ICD 10 codes: C90.00-C90.02	Experimental, investigational, or unproven For Medicare Advantage, please see Coverage with Evidence Development for Medicare Advantage, 1370/20.000517
Infrared therapy used for the treatment of diabetic and/or non-diabetic peripheral sensory neuropathy, wound healing, or pain management (e.g., Anodyne Therapy System)	97026 A4639, E0221	Experimental, investigational, or unproven *Exception*: Covered for Medicare Advantage members for the destruction of actinic keratoses without restrictions based on lesion or patient characteristics. Experimental, investigational, or unproven
Anoscopy, with delivery of thermal energy to the muscle of the anal canal for fecal incontinence • Secca® procedure	46999	Experimental, investigational, or unproven
Antiprothrombin (phospholipid cofactor) antibody, each Ig class	86849	Experimental, investigational, or unproven
Artificial lumbar intervertebral disc to include, but not limited to, the following: • Charite artificial disc, Prodisc-L	22860 0164T 0165T	Experimental, investigational, or unproven
Autologous Serum Tears		Experimental, investigational, or unproven
Avise PG to measure methotrexate metabolism in rheumatoid arthritis patients	84999	Experimental, investigational, or unproven
AVISE Lupus for the diagnosis of systemic lupus erythematosus (SLE)	0312U	Experimental, investigational, or unproven
Balloon Septoplasty	30999	Experimental, investigational, or

Procedure Description	Codes	Comments
		unproven
Baroreflex stimulation implanted device (i.e., Barostim Neo for resistant hypertension or heart failure)	64654	Experimental, investigational, or unproven
Bioimpedance spectroscopy (BIS) for assessment of lymphedema	93702	
Bronchial thermoplasty for treatment of asthma (e.g., Alair® Bronchial Thermoplasty System)	31660 31661	Experimental, investigational, or unproven
Carbon monoxide, expired gas analysis	84999	Experimental, investigational, or unproven
Cardiac contractility modulation system	0408T 0409T 0410T 0411T 0915T 0916T 0917T 0918T 0919T 0920T 0921T 0922T 0923T 0924T 0925T 0926T 0927T 0928T 0929T 0930T 0931T 0948T 0949T	Experimental, investigational, or unproven For Medicare Advantage, please see Coverage with Evidence Development for Medicare Advantage, 1370/20.000517
Cerebral Embolic Protection Device (CEPD) (i.e., Sentinel)	33370	Experimental, investigational, or unproven
Contractility modulation generator - external recharging system for battery (internal); replacement only	K1030	Experimental, investigational, or unproven
Chemical exfoliation or cryotherapy for treatment of facial wrinkling, pigmentation, or	17340 17360	Scientific evidence does not support the efficacy of peeling regimens for these

Procedure Description	Codes	Comments
acne		indications
Collagen meniscus implant (e.g., CMI, collagen scaffold, Menaflex™)	G0428	Experimental, investigational, or unproven
ColoSense (Oncology (colorectal) screening for colorectal cancer risk)	0421U	Experimental, investigational, or unproven
Combined electrochemical therapy (CET) for treatment of peripheral neuropathy (electronic signal therapy with local anesthetics)		Experimental, investigational, or unproven
Common carotid intima-media thickness (IMT) for evaluation of atherosclerotic burden or coronary heart disease risk-factor assessment	93998	Experimental, investigational, or unproven
Comprehensive computer-based motion analysis by videotaping and 3D kinematics; with dynamic plantar pressure measurements during walking	96000 96001 96002 96003 96004	Experimental, investigational, or unproven *Exception: Covered when performed as part of a preoperative assessment for an individual diagnosed with cerebral palsy, and the results will be used in surgical planning.*
Computerized dynamic posturography	92548	Experimental, investigational, or unproven
Coronary artery disease, mRNA, gene expression profiling by real-time RT-PCR of 23 genes, utilizing whole peripheral blood, algorithm reported as a risk score	81493	Experimental, investigational, or unproven
Cryoablation of the posterior nasal nerve (i.e., ClariFix).	C9771 31242 31243	Experimental, investigational, or unproven
Cryosurgery for plantar fasciitis		Experimental, investigational, or unproven
Digital Motion X-ray of the spine	76120 76125	Experimental, investigational, or unproven
Diverticular Peroral Endoscopic Myotomy (D-POEM) for treatment of esophageal diverticula Gastric Peroral Endoscopic Myotomy (G-	43497 43999	Experimental, investigational, or unproven **Note:** Peroral Endoscopic Myotomy (POEM) for the treatment of achalasia is covered.

Procedure Description	Codes	Comments
POEM) for the treatment of gastroparesis Zenker-Peroral Endoscopic Myotomy (Z-POEM) for the treatment of Zenker's diverticulum		
Dynamic flexion devices • Dynasplint	E1802 E1815, E1820, E1821, *E1822, E1823, E1828, E1829,* E1830 E1840	Experimental, investigational, or unproven for ankle, toe, shoulder, and forearm. *Exception: Dynasplint for fingers, elbow, wrist or knee only (E1800, E1803, E1804, E1805, E1807, E1808, E1810, E1812, E1813, E1814, E1825, E1826, and E1827) may be approved on an individual consideration for up to four months for either of the following:* *• As an adjunct to physical therapy in members with symptoms of significant joint motion stiffness/ loss unresponsive to other therapies in sub-acute injury or post-operative period (i.e., at least 3 weeks after injury or surgery but no more than 4 months after injury or surgery) OR* *• In the acute post-operative period for members who are undergoing additional surgery to improve motion of a previously affected joint.* *CDPHP considers the prophylactic use of dynamic splinting experimental and investigational in the management of chronic contractures (no significant change in motion for a 4-month period) and joint stiffness due to joint trauma, fractures, burns, head and spinal cord injuries, rheumatoid arthritis, multiple sclerosis, muscular dystrophy or cerebral palsy.*
Electrical water-circulating cold pad with pump (Cryocuff)	E0218	Experimental, investigational, or unproven; no significant proven benefit over standard cryotherapy with ice

Procedure Description	Codes	Comments
		bags/packs
Electron beam computed tomography • Ultrafast CT or Cine CT	S8092	Experimental, investigational, or unproven
Electronic positional OSA treatment, with sensor, includes all components and accessories (e.g., NightBalance Lunoa System)	E0530	Experimental, investigational, or unproven, as long-term compliance and effectiveness of these devices is unknown.
Electromagnetic navigation bronchoscopy (ENB) for peripheral lung lesions (e.g., virtual bronchoscopy) • superDimension® Bronchus System	31627, C7509, C7510, C7511, C7567	Experimental, investigational, or unproven *Exception: Covered for Medicare Advantage members or on a case-by-case review for members where there has been consultation with an interventional radiologist and pulmonologist and it is determined that ENB is the safest and most efficient procedure for the member.*
Electronic brachytherapy for the treatment of breast cancer (e.g., IORT, Intrabeam therapy)	77436, 77437, 77438,77439	Experimental, investigational, or unproven
EndoPAT to detect coronary artery endothelial dysfunction	93998	Experimental, investigational, or unproven
Endoscopic or percutaneous spinal surgical techniques (laminectomy/disc decompression, epidural, Racz procedure)	22899 64999 C2614	Experimental, investigational, or unproven
Endovenous ablation therapy for the treatment of vein disease (i.e., varicose veins) • mechanochemical ablation: (i.e., Clarivein) • Polidocanol microfoam: (i.e., Varithena) • Medical adhesive: (i.e., VenaSeal)	36473, 36474 36465, 36466 36482, 36483	Experimental, investigational, or unproven *Exception: Coverage of endovenous ablation therapy is limited to Medicare members who remain symptomatic after a six-week trial of conservative therapy and there is **reflux in a saphenous vein** with:* • *a maximum vein diameter of 12mm and* • *absence of thrombosis or vein tortuosity (except for polidocanol*

Procedure Description	Codes	Comments
		microfoam), which would impair catheter placement. *Coverage is only for devices with FDA approval or clearance consistent with saphenous ablation and used according to its approved instructions for use (IFU).*
Exsufflation belt	A4468	Experimental, investigational, or unproven
Extracorporeal shock wave therapy, high energy, involving the humeral epicondyle	0102T	Experimental, investigational, or unproven *Exception: Covered for Medicare Advantage members.*
Focused ultrasound ablation of uterine leiomyomata, including MR guidance	0071T 0072T	Scientific evidence does not demonstrate this technology improves health outcomes more than established standard therapies
Foot, adductus positioning device (e.g., Universal Neonatal Foot Orthotic/UNFO-S)	L3161	Experimental, investigational, or unproven
Gastroenterology (Barrett's esophagus), whole slide-digital imaging	0108U	Experimental, investigational, or unproven
HART CADhs®, risk score for obstructive coronary heart disease	0308U	Experimental, investigational, or unproven
HART CVE®, risk score for major adverse cardiac event	0309U	Experimental, investigational, or unproven
High-dose-rate brachytherapy for prostate cancer		Scientific evidence does not demonstrate that this technology improves health outcomes more than established standard therapies
Implantable pulmonary artery pressure measurement system for monitoring chronic heart failure (e.g., CardioMEMS)	G0555	Experimental, investigational, or unproven For Medicare Advantage, please see Coverage with Evidence Development for Medicare Advantage, 1370/20.000517
InPen Smart Insulin Pen		Experimental, investigational, or unproven *Exception: Covered for Medicare Advantage members with Part D*
Interferential stimulation	E1399	Experimental, investigational, or

Procedure Description	Codes	Comments
		unproven
Interspinous process decompression system (e.g., X-Stop®) for lumbar spinal stenosis	22868 22870 C1821	Experimental, investigational, or unproven
Intranasal sphenopalatine ganglion (SPG) block for the treatment of migraine headaches		Experimental, investigational, or unproven
Intravaginal device intended to strengthen pelvic floor muscles during Kegel exercises (i.e., Flyte System Controller/and or supplies)	E0715, E0716	Non-Covered as it is considered disposable.
Intravascular Lithotripsy (i.e., Shockwave Intravascular Lithotripsy System)	92972, C1761, C9764 C9765 C9766 C9767 C9772 C9773 C9774 C9775 37262 37279	Experimental, investigational, or unproven
Iontophoresis for primary focal hyperhidrosis	97033	Experimental, investigational, or unproven *Exception:* Covered for Medicare Advantage for primary focal hyperhidrosis when there has not been a response to recognized standard therapy. Good hygiene measures, extra-strength antiperspirants (for axillary hyperhidrosis), and topical aluminum chloride should initially be tried.
Iontophoresis device for home use for hyperhidrosis (i.e., Dermadry, miraDry)	E1399, A9900, A9999	Experimental, investigational or unproven *Exception:* Covered for Medicare Advantage for primary focal hyperhidrosis when there has not been a response to recognized standard therapy. Good hygiene measures, extra-strength antiperspirants (for axillary

Procedure Description	Codes	Comments
		hyperhidrosis), and topical aluminum chloride should initially be tried.
KidneyIntelX	0407U	Experimental, investigational, or unproven *Exception*: Covered for members with type 2 diabetes and Stage 1, 2, or Stage 3 chronic kidney disease (CKD).
Latera Absorbable Nasal Implants	30468	Experimental, investigational, or unproven
Leadless pacemaker (e.g., Micra Transcatheter Pacing System)	33274 C1605 0823T 0824T 0825T 0826T	Experimental, investigational, or unproven For Medicare Advantage, please see Coverage with Evidence Development for Medicare Advantage, 1370/20.000517
Low dose radiation therapy for treatment of osteoarthritis		Experimental, investigational, or unproven
Lower esophageal sphincter augmentation devices for the treatment of gastroesophageal reflux disease (LINX® Reflux System)	43284 43285	Experimental, investigational, or unproven
Low-level or high-level laser therapy performed by a qualified health care professional (i.e., MD, physical therapist)	S8948 97037 97039 0552T	Experimental, investigational, or unproven
Low temperature radiofrequency for treatment of chronic rhinitis (i.e., RhinAer)	30117	Experimental, investigational, or unproven
Lumbar pneumatic traction device • Saunders Lumbar HomeTrac	E1399	Experimental, investigational, or unproven
Lung expansion airway clearance, continuous High Frequency Oscillation and Nebulization Device (i.e., Volera system)	E0469, A7021	Experimental, investigational, or unproven
Magnetic Controlled Growing Rods (e.g., MAGEC- Magnetic Expansion Control System) for scoliosis treatment	22899	Experimental, investigational, or unproven
Magnetic-resonance-guided focused	61715, C9734	Experimental, investigational, or

Procedure Description	Codes	Comments
ultrasound (MRgFUS)		unproven *Exception: Covered for the treatment of idiopathic essential tremor (G25.0) for members with medication refractory tremors. PA is not required when billed with this diagnosis.*
Magnetic resonance imaging (MRI) cerebral perfusion analysis	76498	Experimental, investigational, or unproven
Magnetic resonance neurography (MRN)		Experimental, investigational, or unproven
Magnetic source imaging (MSI)	S8035	Experimental, investigational, or unproven
Manipulation of spine requiring anesthesia (MUA)	22505	Experimental, investigational, or unproven
Microvas vascular treatment system for peripheral neuropathy	97139	Experimental, investigational, or unproven
MyoPro Orthosis	L8701, L8702	Experimental, investigational, or unproven
Neurofeedback (Electroencephalograpy (EEG) Biofeedback) for mental health diagnoses Electroencephalograpy (EEG) for mental health diagnoses	90901 95812, 95816	Experimental, investigational, or unproven Experimental, investigational, or unproven
Nerivio Migra for acute migraine episodes	A4540	Experimental, investigational, or unproven
Neuropsychological testing administered by a computer (e.g., ImPACT™, CogState Sport®)	96146	Experimental, investigational, or unproven
Neutralizing antibody testing: beta interferon		Scientific evidence does not demonstrate this technology improves health outcomes.
Non-pneumatic compression controller without calibrated gradient pressure (e.g., Dayspring Lite) and compression garments	E0677, E0678, E0679, E0680, E0681, E0682	Experimental, investigational, or unproven
Oncology (breast ductal carcinoma in situ), protein expression profiling by immunohistochemistry of 7 proteins i.e.,	0295U	Experimental, investigational, or unproven

POLICY NAME: NON-COVERED TECHNOLOGIES

Procedure Description	Codes	Comments
DCISionRT, PreludeDX		
Oral brush biopsy (e.g., Oral CDx) for screening of mouth cancer	88104 D7288	The sensitivity and specificity of the office- based test compromise ability to reliably direct management of care
Oral Superabsorbent Hydrogel for Weight management (e.g., plenity)		Experimental, investigational, or unproven
Oxinium knee implants		Scientific evidence does not demonstrate that this technology improves health outcomes more than established standard therapies
Oxygen therapy for headaches (e.g., migraine)		Experimental, investigational, or unproven *Exception: covered for cluster headaches*
Pap Smears for members under 21 years of age	88141,88142 88143,88147 88148,88150 88152,88153, 88154, 88164,88165 88166,88167 88174,88175 G0123, G0124 G0141, G0143 G0144, G0145 G0147, G0148 P3000, P3001 Q0091	Considered not medically necessary except in the following circumstances: • HIV-infected women beginning in adolescence • Sexually active immunocompromised adolescent women, including those who have received an organ transplant or those with long-term steroid use • Women beginning in adolescence who have been diagnosed with cervical dysplasia or cervical cancer • Sexually active women beginning in adolescence who have been exposed in utero to diethylstilbestrol (DES)
Percutaneous image-guided lumbar decompression for lumbar spinal stenosis	0275T	Experimental, investigational, or unproven For Medicare Advantage, please see Coverage with Evidence Development for Medicare Advantage, 1370/20.000517
Periurethral transperineal adjustable balloon continence device (e.g., ProAct, ACT	53451 53452	Experimental, investigational, or unproven

Procedure Description	Codes	Comments
therapy systems)	53453 53454	
Platelet-rich plasma (PRP) therapy	0232T	Experimental, investigational, or unproven For Medicare Advantage, please see Coverage with Evidence Development for Medicare Advantage, 1370/20.000517
PleximarkTM®, risk for kidney transplant rejection	0018M	Experimental, investigational, or unproven
Positron emission tomography (FDG) for infection/inflammation (e.g., chronic osteo-myelitis, infection of hip arthroplasty and FUO)	78999	Experimental, investigational, or unproven
PET for detection of breast cancer (e.g., Naviscan)		Experimental, investigational, or unproven
PrismRA Molecular Test	81599	Experimental, investigational, or unproven
Prolotherapy for the treatment of musculoskeletal pain	M0076	Experimental, investigational, or unproven
Prometa® therapy for alcohol, cocaine, and methamphetamine dependence		Experimental, investigational, or unproven
Embolization of the following arteries: • Genicular artery for the treatment of osteoarthritis knee pain • Left gastric artery for the treatment of obesity	37242, 37243 billed with ICD 10 codes: E66.01-E66.9, M17.0-M17.9	Experimental, investigational, or unproven
Qualitative electroencephalography (QEEG) for the treatment of ADHD		Experimental, investigational, or unproven
Radiofrequency ablation for the treatment of epicondylitis		Experimental, investigational, or unproven
Radiofrequency ablation of thyroid nodule(s)	60660/60661	Experimental, investigational, or unproven
Radiofrequency ablation for the treatment of prostate cancer	53852 53854	Experimental, investigational, or unproven
Radiofrequency ablation/cryotherapy ablation for clinically localized suspected renal malignancy	50542 50592 50593	Experimental, investigational, or unproven except under the following condition:

Procedure Description	Codes	Comments
		When used to treat peripheral lesion(s) that are ≤ 4 cm in diameter and meets one or more of the following criteria: • Individual has a single kidney • Individual has renal insufficiency as defined by a glomerular filtration rate of ≤ 60ml/min/m2 • Individual is considered a high-risk surgical candidate
Radiofrequency generated water vapor thermotherapy for the treatment of prostate cancer (i.e., Rezum)	53854	Experimental, investigational, or unproven *Exception: covered for benign prostatic hyperplasia (BPH)
Radiofrequency spectroscopy for intraoperative assessment of surgical margins (e.g., MarginProbe®) following lumpectomy in patients diagnosed with breast cancer	19499	Experimental, investigational, or unproven
Radiofrequency Tissue Volume Reduction (RFTVR)	30801	Experimental, investigational, or unproven Exception: Covered for Hypertrophy of nasal turbinates (J34.3) **Please see Obstructive Sleep Apnea Diagnosis and Treatment/1370/20.000060 policy for additional exclusion.
Referenced electroencephalography (rEEG) for predicting pharmacotherapeutic outcomes		Experimental, investigational, or unproven
Remote Imaging Fundus Photography/Retinal telescreening (i.e., RetinaVue™, Optomap®)	92227 92228 92229	Experimental, investigational, or unproven *Exception: Coverage for retinal telescreening is available only to enrollees diagnosed with diabetes. Refer to CDPHP policy, Vision Care Services by Eye Care Specialists, 1370/20.000059.*
Scintimammography (radioimmunoscintigraphy of the breast)	S8080	Experimental, investigational, or unproven

POLICY NAME: NON-COVERED TECHNOLOGIES

Procedure Description	Codes	Comments
Serum hepcidin testing	0251U	Experimental, investigational, or unproven
Skin advanced glycogen end products (AGE) measurement by multi-wavelength fluorescent spectroscopy	88749	Experimental, investigational, or unproven
Single Use Negative Pressure Wound Therapy i.e., SNaP® Wound Care System/PICO™, Avelle	97607, 97608, A9272	Experimental, investigational, or unproven
Static progressive (SP) stretch device for the treatment of joint stiffness and contractures (e.g., joint active systems (JAS) devices)	E1801 E1806 E1811 E1816 E1818 E1821 E1831, E1832 E1841	Experimental, investigational, or unproven
Subchondroplasty/Subchondral Calcium Phosphate (SCP) injections for any indication	0707T	Experimental, investigational, or unproven
Subtalar arthroereisis for the treatment of any condition including, but not limited to, rigid or flexible pes planus (e.g., flatfoot) or posterior tibial tendon dysfunction	S2117 0335T 28899	Experimental, investigational, or unproven; there is insufficient evidence in the published medical literature to compare the safety, efficacy, and long-term outcomes of subtalar arthroereisis with results of conservative treatment or alternative surgical procedures.
Suit Therapy (i.e., Theratogs, TheraSuit, PediaSuit) for any indication	L1499	Experimental, investigational, or unproven
Superior capsular reconstruction for the treatment of rotator cuff tears	23929, 29999	Experimental, investigational, or unproven
Supervised exercise therapy (SET) for symptomatic peripheral artery disease	93668	Coverage for medical supervision of peripheral vascular rehabilitation programs is not provided, as the value of such supervision is not conclusively documented in the available peer- *Exception: Coverage is provided for Medicare Advantage members with intermittent claudication for the treatment of symptomatic peripheral artery disease in accordance with CMS national coverage determination: NCD for SET for Symptomatic Peripheral*

Procedure Description	Codes	Comments
		Artery Disease (20.35).
Sural nerve grafting during radical prostatectomy		Experimental, investigational, or unproven
Surface electromyography (EMG)	S3900	Experimental, investigational, or unproven
Thermal destruction of intraosseous basivertebral nerve (i.e., intracept system)	64628, 64629	Experimental, investigational, or unproven Covered for Medicare Advantage when criteria in LCD are met: Thermal Destruction of the Intraossious Basivertebal Nerve for Vertebrogenic Lower Back Pain Effective 9/1/2026, covered for Medicaid line of business when criteria is met: https://www.health.ny.gov/health_care/medicaid/program/update/2026/no06_2026-05.htm#BVNA
Thermography	93740	Experimental, investigational, or unproven
Tinnitus retraining therapy (e.g., Neuromonics Tinnitus Treatment/Oasis device)		Experimental, investigational, or unproven
Tocolytic infusion therapy; home setting	S9349	Experimental, investigational, or unproven
Tongue neuromuscular stimulation device for treatment of mild obstructive sleep apnea e.g., eXciteOSA Device	E0492, E0493	Experimental, investigational, or unproven
Transcatheter renal sympathetic nerve denervation	0338T, 0339T	Experimental, investigational, or unproven For Medicare Advantage, please see Coverage with Evidence Development for Medicare Advantage, 1370/20.000517
Transcervical uterine fibroid ablation (i.e., Sonata Sonography-Guided Transcervical Fibroid Ablation System)	58580	Experimental, investigational, or unproven
Transurethral, radiofrequency micro-	53860	Experimental, investigational, or

POLICY NAME: NON-COVERED TECHNOLOGIES

Procedure Description	Codes	Comments
remodeling of the female bladder neck and proximal urethra for the treatment of stress incontinence (Renessa®)		unproven
Ultrasound therapy (including high-frequency and non-contact low-frequency ultrasound devices) for wound healing (i.e., Mist Therapy System, Sanuwave UltraMIST)	97610	Experimental, investigational, or unproven
Ultrafiltration system for acute decompensated congestive heart failure (e.g., Aquadex Flexflow®)		Scientific evidence does not demonstrate use of this technology improves health outcomes
Uterine activity monitoring; home setting	S9001 S9208	Covered when performed during an inpatient hospitalization only
Uterine Transplantation	0664T, 0665T, 0666T, 0667T, 0668T, 0669T, 0670T	Experimental, investigational, or unproven
Vectra DA Blood Test for Rheumatoid Arthritis	81490	Experimental, investigational, or unproven
Vertebral body tethering	22836, 22837, 22838, 0656T, 0657T, 0790T	Experimental, investigational, or unproven
Vertebral fracture assessment (VFA)	77085 77086	Screening for vertebral fractures using dual X-ray absorptiometry (DXA) as a stand-alone procedure or in addition to standard bone mineral density studies is considered a non-covered service; current scientific evidence does not demonstrate that treatment decisions based on vertebral fracture assessment, in combination with bone mineral density, result in better patient outcomes than the standard method of utilizing clinical risk factors and measurement of bone mineral density. *Exception: Medicare provides coverage for vertebral fracture assessment when performed as part of bone mass measurement screening (77085). Code 77086 does not represent a bone density study and should not be billed for screening. This code may be billed only*

POLICY NAME: NON-COVERED TECHNOLOGIES

Procedure Description	Codes	Comments
		when a vertebral fracture assessment is medically necessary and it is anticipated the results of the test will be used in the medical management of the patient.
Very–Long Chain Acyl–CoA Dehydrogenase (VLCAD) Enzyme Activity to measure the levels of VLCAD enzyme activity in leukocytes to aid in diagnosis and treatment planning for VLCAD deficiency	0257U	Experimental, investigational, or unproven
Virtual bronchoscopy	76497	Experimental, investigational, or unproven
Viscocanalostomy	66999	Experimental, investigational, or unproven
Radiofrequency for the ablation of septal wall (e.g., VivAer) for treatment of nasal airway obstruction: • Ablation of the septal swell body • Nasal valve collapse remodeling	30117 30469	Experimental, investigational, or unproven
Whole body integumentary photography for early detection of melanoma	96904	Experimental, investigational, or unproven

POLICY CONSIDERATIONS

If CDPHP has identified a specific indication for a particular technology, or if the procedure is already addressed in a resource coordination policy, it will not appear in this document. Specific resource coordination/payment policies can be accessed through the CDPHP secure physician interface at www.cdphp.com. Examples include:

- Allergy Testing and Treatment, 2.01.10.
- Cosmetic & Reconstructive Surgery, 1370/20.000071.
- AssistedReproductiveTechnologies,4.01.05
- Obstructive Sleep Apnea: Diagnosis & Treatments, 1370/20.000060.

Pursuant to the applicable participating provider agreement, providers ordering or performing the non-covered service must inform the enrollee of the non-covered status before rendering the service. CDPHP requires a written waiver specific to the service being performed; a generic waiver is not considered an acceptable form of enrollee consent.

- If a provider informs the enrollee prior to performing a specific service that it is not covered, and the enrollee consents to accept liabilities for the services by signing a waiver specific to that service, the provider ***may bill*** the enrollee.
- If a provider performs a specific service without notifying the enrollee that the service is

not covered, or the enrollee does not consent to accept liability for the specific service, the provider ***may not bill*** the enrollee.

- If a provider sends the enrollee or enrollee's specimen to a participating outside provider or vendor, it is the responsibility of the servicing provider or vendor to obtain a copy of the signed waiver (indicating the services is non-covered) from the ordering provider before performing and billing the services. If the provider sends the enrollee or enrollee's specimen to a non-participating outside provider or vendor, it is the responsibility of the ordering physician to inform the enrollee that the provider or vendor does not participate with CDPHP.

Additions and deletions to the list of non-covered services will be made as new issues arise or the investigational status of a service changes.

Services and supplies related to a non-covered procedure are considered non-covered.

Services for personal convenience or considered not primarily medical in nature are non-covered.

CDPHP considers above services, including those represented by category III codes, as excluded from coverage since clinical safety and efficacy or applicability to clinical practice has not been established.

- Providers are encouraged to contact the resource coordination department prior to providing a service or technology that may not be covered under the enrollee's benefit plan.

Re-review of denied technologies will be considered by a CDPHP medical director pending submission of updated evidence-based medical literature by the requesting physician.

CDPHP PRODUCT VARIATIONS

CHILD HEALTH PLUS	Subject to all terms and conditions noted above in the policy.
MEDICARE ADVANTAGE	Subject to all terms and conditions noted above in the policy unless specifically addressed by traditional Medicare as a covered benefit.
SELECT PLAN/HARP	Subject to all terms and conditions noted above in the policy.

Reviewed: 12/25

POLICY HISTORY

This section is intended to provide only highlights of the policy changes. The policy should always be reviewed in its entirety to ensure a comprehensive understanding of coverage.

Effective Date	Update
9/1/2026	Removed laser therapy for acne treatment from policy as it is now housed in the Light and Laser Therapies for Dermatologic Conditions policy, 8.01.21. Removed diagnoses for which cpt code 64590 does not require a PA. Code will now require PA for all indications. Removed Injectable bulking agents for treatment of fecal incontinence (e.g., Solesta) as it is now housed in the Bulking Agents for Treatment of Urinary or Fecal Incontinence policy, 7.01.22. Removed Vagus Nerve Stimulation (VNS) from policy as it is now housed in Vagus Nerve Stimulation and Vagus Nerve Blocking Therapy policy, 7.01.05. Removed Gastric electrical stimulation (GES)/gastric pacing (Enterra™ Therapy) as it is now housed in Gastric Electrical Stimulation policy, 7.01.64. Removed Endoscopic treatment for gastroesophageal reflux disease from policy as it is now housed in the Transendoscopic Therapies for Gastroesophageal Reflux Disease (GERD) policy,

	7.01.45.
8/1/2026 * No change to effective date of policy	Added link to BVN/code 64628, 64629 effective 7/15/2026 for Medicare due to a new LCD and Medicaid update effective 9/1/2026.
8/1/2026	Removed codes E0721, E0732, E0733 and E0735 as these are now addressed in new policy Cranial and Auricular Neuromodulation, 1.01.58
7/1/2026 *No change to policy effective date	Removed codes 90901, 95812, 95816 from policy.
7/1/2026	Removed lantrida info from this policy as it is now housed in the Pancreas Transplant, 07.02.01 policy
4/1/2026	Added laser therapy for acne treatment as experimental.
1/1/2026 No change needed to effective date for this update	Removed scalp cooling device. Removed embolization of the prostate artery for treatment of BPH. This will now be housed in the Minimally Invasive Treatments for Benign Prostatic Hyperplasia (BPH), 7.01.104 policy. Updated coverage for MRgFUS to include all LOBs for essential tremor. Under Electromagnetic navigation bronchoscopy added new code C7567. Removed the following codes from the policy as they will be reviewed by HealthHelp: 22586 22865 22857 22862 22865 0274T 0275T 33289 C2624 22867

	22869 33275 93264 Added Cerebral Embolic Protection Device (CEPD) to policy Removed deleted codes 0266T-0273T, 0394T, 0395T and replaced with new codes. Under intravascular lithotripsy added new codes 37262 and 37279. Removed MRI/TRUS for diagnosis of prostate cancer from policy. Removed codes 52284, 0714T, 0867T, 53865 and 53866 from policy as they are now in the Minimally Invasive Treatments for Benign Prostatic Hyperplasia (BPH), 7.01.104 policy
1/1/2026	Added transcatheter renal sympathetic nerve denervation to policy. Added PrismRA (81599) to policy as experimental/ investigational.
11/1/2025 Policy update did not require a date change	Added codes 0823T, 0824T, 0825T, 0826T to leadless pacemaker section. Removed Positional magnetic resonance imaging (MRI) (e.g., upright MRI) and Whole-body CT/MRI screening (76498) from policy.
11/1/2025	Added the following treatments for BPH as experimental/investigational: • Transperineal Laser Ablation (TPLA); • Temporary Implantable Nitinol Device (iTIND) • Drug coated balloons (e.g., Optilume) Added code 0108U as E/I.
9/1/2025	Under code 0407U added additional diagnosis of stage 1 kidney disease, effective 1/1/25.

POLICY NAME: NON-COVERED TECHNOLOGIES

7/1/2025	Added code 0295U as experimental/investigational Added new codes 0948T & 0949T to cardiac contractility modulation system.
5/1/2025* *No change to effective date for this update	Removed elastography from grid.
5/1/2025	Added exception under vagus nerve stimulators for treatment resistant depression for Medicare LOB. Removed code 68841 as this is now in the Vision Services By Eye Care Specialists, 1370/20.000059 policy Added Intravaginal device intended to strengthen pelvic floor muscles during Kegel exercises as non-covered. Added codes G0341, G0432, G0343 to islet cell transplant. Added Radiofrequency ablation of thyroid nodule(s) as experimental. Under Iontophoresis, added "for primary focal hyperhidrosis" and Iontophoresis device for home use as experimental and exception for Medicare Advantage members. Added new code E1832 to static progressive stretch devices effective 4/1/2025. Added exception coverage for Medicare Advantage for dx of actinic keratosis under infrared therapy.
3/1/2025	Added new codes that were effective 1/1/2025 Removed cervical traction devices as they are addressed in the Durable Medical Equipment, Prosthetics/Orthotics, & Medical Supplies policy.
3/1/2025	Added exception coverage criteria for MRI/TRUS fusion biopsy.
2/1/2025	Removed Iluvien from grid as this is no longer considered experimental.

POLICY NAME: NON-COVERED TECHNOLOGIES

1/1/2025 *No change to effective date of policy	Added new codes effective 10/1/24: E0469, E0721, A4543, A7021 Removed peripheral nerve stimulator (E0734) from grid as this is now located in the Durable Medical Equipment, Prosthetics/Prosthetics and Medical Supplies,1370/20.000509 policy.
1/1/2025	Added embolization of the prostate, left gastric and genicular arteries as experimental. Added Low dose radiation therapy for treatment of osteoarthritis.
10/1/2024	Added insertion of a drug-implant eluting into lacrimal canaliculus (68841). Added Allogeneic Hematopoietic Stem Cell Transplant for Multiple Myeloma. Added ColoSense (0421U) as experimental/investigational
9/1/2024 *No change to effective date of policy	Added Radiofrequency generated water vapor thermotherapy to policy. Removed codes S8042, G0219, and G0235 from policy since of 9/9/24, they will be managed by HealthHelp per Elective Outpatient High Tech Imagining Services policy 1370/20.000518.
9/1/2024	Removed Percutaneous and non-percutaneous left atrial appendage closure devices as these are now located in new policy, Procedures for Occlusion of The Left Atrial Appendage, 1370/20.000515 Removed Medicare exceptions for items that are now identified in Coverage with Evidence Development for Medicare Advantage, 1370/20.000517.
8/1/2024	Added additional information and removed code 0105U under KidneyIntelX
7/1/2024	Added new code C1605 to leadless pacemakers as experimental. Added testing for Covid 19.

	Added 0407U under KidneyIntelX
6/1/2024 * No change to effective date of policy for this update	Added Vertebral body tethering as experimental. Added Neurofeedback and EEG for mental health conditions as experimental. Removed V-Go from experimental category (see External Ambulatory Insulin Infusion Pump, 1370/20.000457 policy for coverage details) Removed Stomaphyx from grid as this information is also housed in the Bariatric Surgery policy. Removed A9586 from experimental services (please see Radiopharmaceutical policy 1550/20.000151 for coverage guidelines)
6/1/2024	Added superior capsular reconstruction as experimental.
3/1/2024* No change to effective date of policy for this update	Added intravascular lithotripsy as experimental. Removed Genicular Nerve Branch Injections/Radiofrequency Ablation as this is addressed in the RC policy Pain Management Services, 1370/20.000105.
3/1/2024* No change to effective date of policy for this update	Added allogeneic islet cell transplant as experimental. Removed termed code K1015 and replaced with new code L3161(effective 1/1/24). Removed termed codes K1028 and K1029 and replaced them with new codes E0492 and E0493 (effective 1/1/24). Removed termed code K1001 and replaced with new code E0530 (effective 1/1/24). Removed termed codes K1031, K1032, and K1033 and replaced them with new codes E0678-E0682 (effective 1/1/24).

	Removed termed code K1002 and replaced it with new code E0732 (effective 1/1/24). Removed termed code K1016 and replaced it with new code E0733 (effective 1/1/24). Removed termed code K1018 and replaced it with new code E0734 (effective 1/1/24). Removed termed code K1020 and replaced it with new code E0735 (effective 1/1/24). Removed termed code K1023 and replaced it with new code A4540 (effective 1/1/24). Removed termed code 0404T and replaced it with new code 58580 (effective 1/1/24). Added new code 97037 for low-level laser therapy (effective 1/1/24). Added new codes 31242 and 31243 to Cryoablation of the posterior nasal nerve (effective 1/1/24). Added new code A4468 (Exsufflation belt) to policy (effective 1/1/24)
3/1/2024	Added autologous serum tears as experimental/investigational Added PLA codes 0251U, 0257U, 0308U, 0309U, 0312U, 0316U, 0018M as experimental/investigational Added RFTVR as experimental with one exception
11/1/2023* No change to effective date of policy	Added Viscocanalostomy and Elastography ultrasound to policy. Removed canaloplasty from policy.
11/1/2023	Added Low temperature radiofrequency for treatment of chronic rhinitis (RhinAer) to grid. Added Suit Therapy to grid. Added ultrasound therapy for wound healing.

	Added VivAer (for specific conditions). Removed eustachian tube balloon dilation from policy.
7/1/2023* No change to effective date of policy	Added exception to electromagnetic navigation bronchoscopy. Added Vectra DA to grid as experimental. Added Medicaid coverage indications for VNS.
7/1/2023	Added Endovenous ablation therapy to grid. Removed Vagus Nerve Blocking Therapy (VBLOC) from grid as it is already addressed in the Bariatric Surgery policy.
4/1/2023	Added new HCPCS code E0677 to the Non-pneumatic compression section.
1/1/2023 *No change to effective date	Added new codes C7509, C7510, C7511 to navigational bronchoscopy.
1/1/2023 *No change to effective date	Clarified that CPT code 64590 requires PA for indications other than urinary/fecal incontinence, urinary retention, and overactive bladder. Added coverage criteria for vagus nerve stimulation for the treatment of epilepsy. Removed topical oxygen therapy as it is already addressed in RC policy Hyperbaric Oxygen Therapy 1370/20.000203. Removed Procel (Gore-Tex) cast liner as it is already addressed in the Cast Application, and Supplies and Fracture Care payment policy, 1550/20.000153. Removed termed code 0163T and replaced with new code 22860 under artificial lumbar intervertebral disc. Under Air displacement/body plethymography Removed termed code 94750.
1/1/2023	Added code 97039 and 0552T to low-level or high-level laser therapy. Added D-POEM, G-POEM, and Z-POEM as experimental/investigational.

	Removed E1700, E1701, and E1702 for jaw rehabilitation systems as these are already addressed in the *Temporomandibular Joint Disorders policy 1370/20.000062*. Removed the following items as they are already addressed as non-covered in the RC Policy *Obstructive Sleep Apnea 1370/20.000060:* • Injection snoreplasty (42299) • Laser-assisted uvulopalatoplasty (LAUP) (S2080) • Pillar® Palatal Implant System (C9727) • Radiofrequency tissue volume reduction of the tongue base (41530), uvula or soft palate, or for tonsillar hypertrophy (e.g., Somnoplasty®) • Tongue base suspension (AIRVance Tongue and Hyoid Suspension System, 41512) • Hyoid myotomy and suspension (21685)
11/1/2022	Added code 92229 to Retinal telescreening for diabetic retinopathy section. Removed Implantable interstitial glucose sensors as all information is in the Diabetic Services policy *1370/20.000047*.
10/1/2022	Added Baroreflex stimulation implanted device i.e., Barostim Neo as experimental/investigational. Added new HCPCS code A4596 (system supplies and accessories, per month) to cranial electrotherapy stimulation device.
7/1/2022 *No change to effective date	Relocated coronary artery calcium scoring to the Adjunct and Non-Standard Technology payment policy. Added exception coverage criteria for Dynasplint. Added oxygen therapy for headaches as experimental/investigational with an exception of cluster headaches. Added thermal destruction of intraosseous basivertebral nerve as experimental/investigational. Added MyoPro Orthosis as experimental/investigational.

POLICY NAME: NON-COVERED TECHNOLOGIES

	Added new codes effective 7/1/2022, G0309 & G0309, to Implantable interstitial glucose sensors and added Medicare as an exception.
7/1/2022 *No change to effective date	Added the below items as experimental, investigational/unproven. • Subchondroplasty/Subchondral Calcium Phosphate (SCP) injections • Cardiac contractility modulation system and generator • Oral Superabsorbent Hydrogel for Weight management Added new codes that were effective 4/1/22 (K1028, K1029-Tongue neuromuscular stimulation device, K1030, K1031, K1032, K1033) as experimental, investigational/unproven.
7/1/2022	Updated verbiage for Anodyne therapy (97026) to be consistent with language in Occupational and Physical Therapy policies. New Code, 43497, effective 1/1/2022 for Peroral endoscopic myotomy (POEM) for the treatment of achalasia. Removed Peroral endoscopic myotomy (POEM) for the treatment of achalasia from policy as this is no longer considered experimental. Latera Absorbable Nasal Implants (30468) added to policy as experimental/investigational.
5/1/2022	Added "Atriclip" to grid as experimental, investigational, or unproven. Added language for "watchman" device.
31/2022	Added balloon septoplasty to grid as considered experimental/investigational.
1/1/2022* No change to effective date	Added new CPT codes that are effective 1/1/22, 53451-53454, Periurethral transperineal adjustable balloon continence devices as experimental. Updated code for Clarifix from 30117 to C9771
1/1/2022* No change to effective date	SNaP® Wound Care System/PICO™ Single Use Negative Pressure Wound Therapy added as experimental. This was previously housed in Vacuum Assisted Wound Therapy policy. Removed SEPT9 (Septin9) (e.g., colorectal cancer) promoter

	methylation analysis as this is now in the DNA Based Testing for Colorectal Cancer policy.
1/1/2022	Removed A4305/A4306 (Drug delivery system) from grid as they have been moved to the Adjunct and Non-Standard payment policy. Added Nerivio Migra for acute migraine episodes.
11/1/21	Added magnetic controlled growing rods and genicular nerve branch injections to grid as these are considered experimental/investigational. Updated entry on grid for InPen Smart Insulin Pen to include exception that it is covered for Medicare Advantage members with Part D.
7/1/2021	Added new CPT codes that are effective 7/1/2021 as experimental/investigational: Scalp cooling device: 0662T & 0663T Uterine transplant: 0064T, 0065T, 0066T, 0067T, 0068T, 0069T, 06670T
6/1/21	Added Stage 2 CKD to the exceptions for coverage of 0105U (KidneyIntelX). Added InPen Smart Insulin Pen to grid as experimental/investigational. Added new HCPCS codes K1015, K1016, K1018, K1020 as experimental/investigational.
5/1/21* (No change to effective date)	Added codes 81493 and 81327 to grid as experimental/ investigational. Replaced miscellaneous code 69799 with new codes 69705 and 69706 for eustachian tube balloon dilation.
5/1/21	Coding updates: Removed termed codes and replaced with new codes where applicable throughout policy. Removed left atrial appendage closure devices (e.g., Watchman device, LARIAT® suture delivery system) from grid. Added entry for pap smears performed on members under 21 years of age with exceptions.

	Removed termed code 0126T and replaced with 93998.
11/11/20	Removed codes for the insertion of drug-eluting implant (0356T) into lacrimal canaliculus and the drug Dextenza (J1096).
11/1/20	Endobronchial valve system (e.g., Zephyr®) for treatment of severe emphysema removed from policy (coverage criteria now contained in Lung Volume Reduction Surgery policy). Transcervical uterine fibroid ablation (i.e., Sonata Sonography-Guided Transcervical Fibroid Ablation System) is added to policy. Cryoablation of the posterior nasal nerve (i.e., ClariFix) is added to policy.
7/1/2020	Added code J1096 for Dextenza insert to policy. Replaced unlisted code (E1399) for cranial electrotherapy stimulation with newly created CPT code K1002. Added electronic positional sleep apnea treatment (K1001) to policy as experimental/investigational.
5/1/2020	Removed 0042T as it has been transitioned to the Adjunct and Non-Standard Technology payment policy, 1550/20.000187. Removed reference to Transcranial Magnetic Stimulation as there is specific policy to address coverage criteria for this procedure. Revised entry for comprehensive computer-based motion analysis to add additional codes and exception for dx of cerebral palsy. Added drug-inducing ocular implants (i.e., Dextenza®, 0356T). Replaced deleted code 0233T with new code 88749. Added transoral incisionless fundoplication surgery (TIF) for treating gastroesophageal reflux disease (EsophyX® Device, EsophyX-Z® Device) (43210) as E/I except for Medicare Advantage members. Added supervised exercise therapy (SET) for symptomatic

	peripheral artery disease as non-covered **except** for Medicare Advantage members. Removed reference to obsolete payment policy Cervical Cytopathology, Computer-Assisted. Removed code 55874.
1/1/2020	• Removed Sinuva and Propel as new policy was created with coverage criteria, *Mometasone Furoate Sinus Implants, 1550/20.000501*. • Added KidneyIntelX (0105U). • Removed collagen cross linking of cornea as it has been moved to the Refractive Surgery-Keratoplasty, 1370/20.000257 policy with coverage criteria.

MEDICAL POLICY

Medical Policy Title	**Non-Invasive Surface Electrical Stimulation for Pain and Rehabilitation**
Policy Number	**1.01.61**
Current Effective Date	**August 1, 2026**
Next Review Date	**May 2027**

Our medical policies are guides to evaluate technologies or services for medical necessity. Criteria are established through the assessment of evidence based, peer-reviewed scientific literature, and national professional guidelines. Federal and state law(s), regulatory mandates and the member's subscriber contract language are considered first in the determination of a covered service. (Link to Product Disclaimer)

POLICY STATEMENT(S)

Transcutaneous Electrical Nerve Stimulation (TENS)

I. TENS devices are considered **medically necessary** when **ALL** of the following criteria are met:
   A. The device is U.S. Food and Drug Administration (FDA) approved;
   B. The device is utilized for the treatment of pain;
   C. Symptoms persist for more than three (3) months;
   D. There has been a failure of physical therapy, osteopathic manipulative therapy, or chiropractic therapy;
   E. Failure of medications (e.g., simple analgesics, nonsteroidal anti-inflammatory drugs (NSAIDS), or opioids); **and**
   F. A 30-day trial period has demonstrated efficacy of the treatment.

II. Form-fitting TENS conductive conducting garments utilized for the delivery of TENS therapy are considered **medically necessary** when **ALL** of the following criteria are met:
   A. The criteria in policy statement I are met;
   B. The nerve supply to the stimulated area is intact; **and**
   C. At least **ONE** of the following criteria apply:
      1. Treatment includes a large stimulation area or considerable number of stimulation sites, and the member cannot reasonably manage the treatment without the use of the garment;
      2. The stimulation site is not accessible with standard electrodes, adhesive tape, or lead wires; **or**
      3. Skin or other medical conditions exist that would prevent the adherence of standard electrodes, tapes, or lead wires.

III. TENS is considered **not medically necessary** for the following indications:

A. The relief of pain in labor and vaginal delivery;
B. Treatment of headaches and/or migraines;
C. Visceral abdominal pain;
D. Temporomandibular joint (TMJ) disorder;
E. Cancer pain;
F. Essential tremor;
G. Low back pain;
H. Neck pain.

Neuromuscular Electrical Stimulation (NMES)

IV. NMES is considered **medically necessary** for disuse muscle atrophy when **BOTH** of the following criteria are met:
    A. Nerve supply to the muscle is intact (including brain, spinal cord, and peripheral nerves); **and**
    B. For non-neurological reasons (e.g., casting or splinting of a limb, contracture due to scarring of soft tissue as in burn lesions, and hip or knee replacement surgery) (until orthotic training begins).

V. NMES is considered **not medically necessary** for **ALL** other indications.

Functional Electrical Stimulation (FES)

VI. FES is considered **not medically necessary** for **ANY** of the following indications, including but not limited to:
    A. For ambulation in patients with spinal cord injury;
    B. For stroke rehabilitation;
    C. Gait training.

Investigational

VII. The following forms of stimulation are considered **investigational**:
    A. Interferential Stimulation; (e.g., RS 4i Sequential Stimulator, Empi IF 3Wave);
    B. Transcutaneous Electrical Joint Stimulation (TEJSD) for the treatment of joint pain associated with arthritis;
    C. Multiple Modality Delivery Stimulation (e.g., RS-4i Plus).

Durable Medical Equipment (DME) Repair

VIII. Repair and/or replacement of medically necessary electrical stimulation devices or components not under warranty will be considered **medically appropriate** when the following criteria are

met:

A. Physician documentation includes **ALL** of the following:
   1. date of DME initiation;
   2. manufacturer warranty information, if applicable;
   3. attestation that the patient has been compliant with the use of the DME and will continue to benefit from the use of device;

B. The DME is no longer functioning adequately; and **BOTH** of the following criteria are met:
   1. inadequate function interferes with activities of daily living; **and**
   2. repair is expected to make the equipment fully functional (as defined by manufacturer).

IX. Repair of equipment damaged due to patient neglect, theft, abuse, or when another available coverage source is an option (e.g., homeowners, rental, auto, liability insurance, etc.) is **ineligible for coverage**.

DME Replacement

X. Replacement of a medically necessary electrical stimulator or components not under warranty will be considered **medically appropriate** when **EITHER** of the following criteria are met:
   A. The DME is no longer functioning adequately and has been determined to be non-repairable, or the cost of the repair is in excess of the replacement cost;
   B. There is documentation that a change in the patient's condition makes the present unit non-functional and improvement is expected with a replacement unit.

XI. The replacement of a properly functioning electrical stimulator, its components or accessories, is considered **not medically necessary**. This includes, but is not limited to, replacement desired due to advanced technology or to make the DME more aesthetically pleasing;

XII. The replacement of equipment damaged or lost due to patient neglect, theft, abuse, or when another available coverage source is an option (e.g., homeowners, rental, auto, liability insurance, etc.) is **ineligible for coverage**.

XIII. Accessories or components for electrical stimulation devices that are considered not medically necessary or investigational by peer-reviewed literature will also be considered as **not medically necessary or investigational** by the Health Plan.

11.01.03 Experimental or Investigational Services

POLICY GUIDELINE(S)

I. The use of TENS therapy is a relative contraindication in patients with a pacemaker or an implantable cardioverter defibrillator (ICD). Electrical interference from the TENS unit has been reported and may interfere with the proper functioning of these devices.

DESCRIPTION

Electrical stimulation (Estim) is a technique that uses low level electrical currents to stimulate muscles or nerves for therapeutic purposes. These devices and treatments are used in various medical and physical therapy applications. The FDA has approved many stimulation devices based on their substantial equivalence to predicate devices. There are devices for both home and clinic use. Altering the frequency, intensity, location, and pulse duration of the devices allows them to be marketed individually.

Transcutaneous Electrical Nerve Stimulation (TENS)

TENS is the application of an electrical current through the skin to stimulate the nervous system. The first device was patented by Medtronic Inc. and is utilized to relieve pain in a portable, non-invasive way. The device delivers mild pulsed electrical currents through electrode pads placed on the surface of the skin. Users can change the frequency, intensity, and pulse duration of the TENS based upon the patient's comfort and response. The intensity of the TENS device can be altered to a comfortable sensation without motor contraction, to the highest level of motor contractions (noxious). Traditional TENS is delivered utilizing high-frequency, low intensities and small pulse durations. Noxious level TENS have been investigated for patients with chronic pain.

TENS for the Treatment of Arthritis

The BioniCare Bio-1000 stimulator (VQ OrthoCare) delivers pulsed electrical stimulation for adjunctive treatment of osteoarthritis of the knee and was then later approved for rheumatoid arthritis of the hand. The FDA originally determined that this device was equivalent to TENS devices. In 2006, the FDA reclassified the device as a transcutaneous electrical stimulator for arthritis upon the manufacturer's request given that the target tissue is not nerve, but rather joint tissue.

The OrthoCor Active Knee System (OrthoCor Medical; acquired by Caerus Corp) uses pulsed electromagnetic field energy at a radiofrequency of 27.12 MHz to treat pain. The OrthoCor Knee System is classified as a short-wave diathermy device for use other than applying therapeutic deep heat. It is indicated for adjunctive use in the palliative treatment of postoperative pain and edema in superficial soft tissue and for the treatment of muscle and joint aches and pain associated with overexertion, strains, sprains, and arthritis. the SofPulse (also called Torino II, 912-M10, and Roma;

Ivivi Health Sciences, renamed Amp Orthopedics) was cleared for marketing as a short-wave diathermy device that applies electromagnetic energy at a radiofrequency of 27.12 MHz. The device is indicated for adjunctive use in the palliative treatment of postoperative pain and edema in superficial soft tissue.

H-wave Stimulation is a form of electrical stimulation that differs from others given its waveform. It emits prolonged pulse width/duration and can produce effective anesthesia/analgesia without weakness or tetany with extended use such as that which is seen with neuromuscular electrical stimulation. H -wave devices are available for home use as durable medical equipment. H-wave stimulation has been used for pain control, treatment of diabetic neuropathy, muscle sprains, TMJ dysfunctions or reflex sympathetic dystrophy. It has also been used to accelerate healing of wounds (e.g., diabetic ulcers).

Neuromuscular Electrical Stimulation (NMES) /Functional Electrical Stimulation (FES)

NMES is a form of treatment that uses a device that transmits an electrical impulse to activate muscle groups by way of electrodes. NMES is proposed to promote neuromuscular re-education, improve motor unit recruitment, and prevent or diminish muscle atrophy. NMES is typically used as a component of a comprehensive rehabilitation program. Compared to TENS, NMES delivers a stronger current with a wider pulse width. The stimulator device is classified as durable medical equipment. NMES can be referred to as functional electrical stimulation (FES), functional neuromuscular stimulation (FNMS), or electromyography (EMG) triggered neuromuscular stimulation.

Functional electrical stimulation involves the use of an orthotic device or exercise equipment with microprocessor controlled electrical muscular stimulation. FES devices are being developed to restore function and improve health in individuals with damaged or destroyed nerve pathways (e.g., spinal cord injury [SCI], stroke, multiple sclerosis, cerebral palsy). It attempts to replace stimuli from destroyed nerve pathways with computer-controlled sequential electrical stimulation of muscles through surface or implanted electrodes. The goal is to enable patients with spinal cord injury (SCI) or stroke to function independently or at least maintain muscle tone and strength.

Surface or percutaneous devices for upper extremity FES (e.g., H200 Wireless Hand Rehabilitation System) combine a wrist/hand orthosis with integrated surface electrodes to activate muscles of the paralyzed forearm and hand. Upper extremity surface FES devices may be most effective when used soon after spinal cord injury, during the acute phase of rehabilitation.

Threshold electrical stimulation (TES) uses surface electrodes to stimulate the muscle when the patient is in a resting state. It is intended to increase muscle strength and joint mobility, leading to improved voluntary motor function.

Parastep I is a surface FES device intended to allow patients with lower extremity paralysis to stand and walk short distances.

The WalkAide system is a FES device that improves the walking ability of people suffering from foot drop. WalkAide uses sensor technology to analyze the movement of the leg and foot, sending electrical signals to the peroneal nerve which activates the muscles to raise the foot at the appropriate time during the step cycle.

Implanted FES devices (e.g., the Freehand System) incorporate surgically implanted stimulation electrodes, an implanted stimulator, and an external power supply. A shoulder position sensor mounted on the chest and shoulder translates small shoulder movements into a control signal. Use of these devices requires intensive and lengthy training by rehabilitation specialists.

MicroVas is a noninvasive electrical stimulator that causes muscles contraction and relaxation cycles. It is used to treat small vessel disease and neuropathy in the feet and ankles. The MicroVas stimulator is supposed to increase blood flow, tissue oxygenation, promote lymphatic drainage, and induce involuntary exercise. However, it has not been proven for this purpose. MicroVas therapy was developed originally by the U.S. Military to treat hypothermia in Navy Seals.

VitalStim Therapy is a type of neuromuscular electrical stimulation in which a small current is passed through external electrodes placed on the neck to stimulate inactive or atrophied swallowing muscles. With repeated therapy, throat muscles are reported to be re-trained, and the patient progresses to an optimum level of swallow function.

Interferential Stimulation (IFS)

IFS is an anti-inflammatory based treatment modality. The interferential stimulator crosses two medium frequency alternating currents, which penetrate deep into soft tissue. It is intended for use in the treatment of circulation disorders, range of motion issues, edema, and muscle spasms. It is reported to stimulate bone healing, inhibit pain and promote soft tissue healing. A number of interferential stimulator devices have received FDA approval including the Medstar 100 (Mednet Services and the RS-4V (RS Medical).

Multimodal Electrotherapy Stimulation Devices

Combination transcutaneous electrical nerve stimulation, interferential stimulation and neuromuscular electrical stimulation devices are TENS devices capable of delivering any of the three modalities depending on electrode arrangement on the body and programming options. This type of device is intended to treat a wide variety of symptoms especially for acute and chronic pain relief. TruWave Plus, NexWave, and Empi Continuum are examples of combination devices.

SUPPORTIVE LITERATURE

Transcutaneous Electrical Nerve Stimulation and H-Wave Stimulation

TENS and H-Wave Muscle Stimulators have a treatment effect beyond that of a credible placebo. Their use may be justified in those individuals with mild acute or chronic pain who wish to use a nonpharmacological form of analgesia. The FDA classified this device as a TENS unit; however, the manufacturer has indicated that it is a new category of device, as it uses a different array of proprietary electrical amplitudes than a TENS unit and does not function to stimulate nerves. Instead, the BioniCare device is purported to stimulate chondrogenesis. However, no studies have been performed to evaluate whether chondrogenesis occurs with use of this device.

Johnson et al (2022) conducted a systematic review and meta-analysis that evaluated the effectiveness and safety of TENS for pain relief in adults. Researchers analyzed data from 381 randomized controlled trials involving 24,532 participants. The findings showed that TENS

significantly reduced pain intensity during or immediately after treatment compared to placebo, with moderate-certainty evidence. It also showed benefits over standard pharmacological and non-pharmacological treatments, though with low-certainty evidence due to small sample sizes and imprecision. The type of pain and study methodology did not significantly affect outcomes. Adverse events were infrequently reported, generally mild, and similar to those in comparison groups. Overall, TENS appears to be a safe and moderately effective method for short-term pain relief.

Neuromuscular and Functional Electrical Stimulation

Sajiki-Ito et al (2024) conducted a retrospective study to investigate the effects of inpatient rehabilitation on muscle mass and physical performance in older adults following hip fracture surgery. Seventeen patients with a mean age of 85 years underwent a rehabilitation program that included exercises for joint mobility, muscle strengthening, gait training, early mobilization, and neuromuscular electrical stimulation. Over six weeks, lower limb muscle mass significantly increased, while upper limb muscle mass and body weight decreased. Total muscle and fat mass remained stable. Grip strength was maintained, and knee extension strength improved on both the healthy and affected sides. All patients showed better ability to perform daily activities, though only about half regained their pre-injury walking ability. The findings suggest that targeted rehabilitation can effectively enhance lower limb muscle mass and functional recovery after hip fracture surgery.

Conley et al (2021) conducted a systematic review aimed to evaluate how different neuromuscular electrical stimulation (NMES) parameters affect quadriceps strength recovery following knee surgery. Researchers searched four major databases and included eight randomized controlled trials (RCTs) that met strict criteria, such as reporting specific NMES parameters and quadriceps strength outcomes. The study consisted of 17 patients with a mean age of 84 years. Postoperative factors measured after one and six weeks were: muscle mass, body weight, fat mass, grip strength, bilateral knew extension strength, ability to walk and ability to perform activities of daily living (ADLs). Results showed lower limbs skeletal muscle mass increased (median 4.8 kg to 4.9 kg), while upper limbs skeletal muscle mass and body weight decreased (median 1.2 kg to 1.1 kg), (median 46.8 kg to 45.5 kg). Total skeletal muscle mass and fat mass remained unchanged. Grip strength was maintained, and knee extension muscle strength on the healthy and affected sides increased (healthy side median 10.7 kgf to 13.7 kgf; affected side median 5.5 kgf to 9.5 kgf). Ability to perform ADLs improved amongst all patients. Patients regained their pre-injury walking ability (52.9%). Optimal outcomes were associated with NMES applied within the first two weeks post-surgery, using a frequency of ≥ 50 Hz, maximum tolerable intensity, biphasic current, large electrodes, and a duty cycle ratio of 1:2 to 1:3 with a 2–3 second ramp time.

There is insufficient data to demonstrate that FES results in improved net health outcomes. Data is insufficient regarding whether patients remain compliant and committed with long-term use of the devices (Parastep I, the Neuro Control Freehand System, the Ness H200 Hand Rehabilitation System, the Ness L300 Foot Drop System, G. Estim FES, and the WalkAide System).

No published studies of the MicroVas device were identified. Micro Vas therapy has been around since the late 1980s. It was originally used to treat hypothermia in Navy Seals who experienced the negative effects of extreme temperatures. Over time, Micro Vas therapy evolved into a treatment for

neuropathy and other painful conditions, especially those that affect the extremities.

To date, there have been very few studies of surface electrical stimulation to the neck for swallowing that support the efficacy of VitalStim. These studies have small sample sizes and report mixed results. There is insufficient evidence in the peer reviewed literature to conclude that electrical stimulation is effective in the treatment of dysphagia. Stimulators have not been studied in pregnant women or patients with seizures and balance disorders.

Interferential Stimulation

Hussien et al (2022) conducted a meta-analysis including 19 trials, (N=1167) to analyze the efficacy of IFS in alleviating musculoskeletal pain. Two trials compared IFS with placebo and the pooled mean difference in pain was significantly reduced with IFS versus a placebo (-0.98; 95% confidence interval [CI], -1.42 to -0.54; p<.0001), but this was not demonstrated in the six (6) trials comparing IFS to other interventions (-0.04; 95% CI, -0.20 to 0.12; p<.65). When used as an adjunct to other pain interventions, IFS did not significantly improve pain compared with placebo in four (4) studies (-0.06; 95% CI, -0.6 to0.48; p=.82) or compared with active treatment in eight (8) studies (0.02; 95% CI, -0.88 to 0.92; p=not reported). The authors concluded that IFS reduced musculoskeletal pain when used as a single agent compared with placebo, but this is limited by the small number of trials (n=2) and patients enrolled.

PROFESSIONAL GUIDELINE(S)

According to the Agency for Healthcare Research and Quality (AHRQ) Comparative Effectiveness publication on Non-Invasive Treatments for Low Back Pain (2016), additional evidence demonstrates that TENS is not effective versus sham TENS. Effectiveness of TENS was previously classified as insufficient, and the strength of evidence remains low because of methodological limitations in the trials and imprecision. Evidence on harms associated with TENS was limited but suggests an increased risk of skin site irritation without an increased risk of serious adverse events (AHRQ 2016).

The American College of Physician's Noninvasive Treatments for Acute, Subacute, and Chronic Low Back Pain Clinical Practice Guideline (2017), stated that evidence was insufficient to determine the effectiveness of transcutaneous electrical nerve stimulation (TENS).

REGULATORY STATUS

The United States Food and Drug Administration (FDA) regulates electrical stimulation devices as medical devices. All electrical stimulation devices including related components require FDA approval before marketing and use in the United States to ensure they are safe and effective for human use. Refer to the FDA Medical Device website. Available from: https://www.fda.gov/medical-devices [accessed 2026 Mar 20]

The FDA lists the most serious type of medical device recalls as well as early alert communications about corrective actions being taken by companies that the FDA believes are likely to be the most serious type of recalls. Available from: Medical Device Recalls | FDA [accessed 2026 Mar 20]

CODE(S)

- Codes may not be covered under all circumstances.
- Code list may not be all inclusive (AMA and CMS code updates may occur more frequently than policy updates)
- (E/I)=Experimental/Investigational
- (NMN)=Not medically necessary/appropriate

Not Applicable	

Copyright © 2026 American Medical Association, Chicago, IL

HCPCS Codes

Code	Description
A4595	Electrical stimulation supplies, 2 lead, per month, (e.g., TENS, NMES)
A4630	Replacement batteries, medically necessary, transcutaneous electrical stimulator, owned by patient
E0720	TENS, two lead, localized stimulation
E0730	TENS, four or more leads, for multiple nerve stimulation
E0731	Form-fitting conductive garment for delivery of TENS or NMES (with conductive fibers separated from the patient's skin by layers of fabric).
E0744	Neuromuscular stimulator for scoliosis
E0745	Neuromuscular stimulator, electronic shock unit
E0762 (E/I)	Transcutaneous electrical joint stimulation device system, includes all accessories
E0764 (NMN)	Functional neuromuscular stimulation, transcutaneous stimulation of sequential muscle groups of ambulation with computer control, used for walking by spinal cord injured, entire system, after completion of training program
E0770 (NMN)	Functional neuromuscular stimulator, transcutaneous stimulation of nerve and/or muscle groups, any type, complete system, not otherwise specified
G0283 (NMN)	Electrical stimulation (unattended), to one or more areas for indication(s) other than wound care, as part of a therapy plan of care
S8130 (E/I)	Interferential current stimulator, 2 channel
S8131 (E/I)	Interferential current stimulator, 4 channel

ICD10 Codes

Code	Description
E08.40-E08.42	Diabetes mellitus due to underlying condition with diabetic neuropathy (code range)
E09.40-E09.42	Drug or chemical induced diabetes mellitus with neurological complications with diabetic neuropathy (code range)
E10.40-E10.42	Type 1 diabetes mellitus with diabetic neuropathy (code range)
E11.40-E11.42	Type 2 diabetes mellitus with diabetic neuropathy (code range)
E13.40-E13.42	Other specified diabetes mellitus with diabetic neuropathy (code range)
G43.101-G43.419	Polyneuropathy in diseases classified elsewhere
G43.701-G43.719	Sequelae of inflammatory polyneuropathy (code range)
G43.B0-G43.B1	Chronic pain, not elsewhere classified (code range)
G43.801-G43.919	Chronic pain syndrome
G44.1	Complex regional pain syndrome I (code range)
G44.201-G44.209	Polyosteoarthritis (code range)
G44.211-G44.219	Osteoarthritis of hip (code range)
G44.221-G44.229	Osteoarthritis of knee (code range)
G44.301-G44.309	Osteoarthritis of first carpometacarpal joint (code range)
G44.321-G44.329	Osteoarthritis, shoulder, arm and hand (code range)
G46.0-G46.8 (NMN)	Pain in joint (code range)
G50.0-G50.9	Systemic sclerosis with polyneuropathy

Code	Description
G51.2-G51.9	Fusion of spine, lumbosacral region
G56.00-G56.03	Fusion of spine, sacral and sacrococcygeal region
M15.0-M15.9	Polyosteoarthritis (code range)
M16.0-M16.9	Osteoarthritis of hip (code range)
M17.0-M17.9	Osteoarthritis of knee (code range)
M18.0-M18.9	Osteoarthritis of first carpometacarpal joint (code range)
M19.011-M19.079	Primary osteoarthritis (code range)
M19.111-M19.179	Post-traumatic osteoarthritis (code range)
M19.211-M19.279	Secondary osteoarthritis (code range)
M19.90-M19.93	Osteoarthritis, unspecified site (code range)
M25.50-M25.579	Pain in joint (code range)
M26.621-M26.629	Arthralgia of temporomandibular joint (code range)
M43.26-M43.28	Fusion of spine (code range)
M43.8x6-M43.8x9	Other specified deforming dorsopathies (code range)
M51.16-M51.17	Intervertebral disc disorders with radiculopathy (code range)
M53.1	Cervicobrachial syndrome
M53.2x7	Spinal instabilities, lumbosacral region
M53.2x8	Spinal instabilities, sacral and sacrococcygeal region

Code	Description
M53.3	Sacrococcygeal disorders, not elsewhere classified
M53.86-M53.88	Other specified dorsopathies (code range)
M53.9	Dorsopathy, unspecified
M54.06-M54.09	Panniculitis affecting regions of neck and back (code range)
M54.16-M54.18	Radiculopathy (code range)
M54.30-M54.32	Sciatica (code range)
M54.40-M54.42	Lumbago with sciatica (code range)
M54.5	Low back pain
M60.80-M60.9	Other myositis (code range)
M62.830	Muscle spasm of back
M77.10-M77.12	Lateral epicondylitis (code range)
M79.0	Rheumatism, unspecified
M79.10-M79.18	Myalgia (code range)
M79.2	Neuralgia and neuritis, unspecified
M79.601-M79.676	Pain in limb, hand, foot, fingers and toes (code range)
R10.0-R10.9	Abdominal and pelvic pain (code range)
R51.0-R51.9	Headache (code range)
R52	Pain, unspecified

MEDICAL POLICY

Medical Policy Title	**Non-Surgical Management of Sleep Disorders**
Policy Number	**1.01.63**
Current Effective Date	**February 15, 2027**
Next Review Date	**October 2027**

Our medical policies are guides to evaluate technologies or services for medical necessity. Criteria are established through the assessment of evidence based, peer-reviewed scientific literature, and national professional guidelines. Federal and state law(s), regulatory mandates and the member's subscriber contract language are considered first in the determination of a covered service. (Link to Product Disclaimer)

POLICY STATEMENT(S)

Positive Airway Pressure Devices (Continuous [CPAP] and Auto-Adjusting [APAP])

Initial 90-day Trial

I. CPAP and APAP are considered **medically appropriate** for **ANY** of the following indications:
   A. Adults with obstructive sleep apnea (OSA) who meet **ONE** of the following indications:
      1. Polysomnography (PSG) or home sleep testing (HST) results documenting an apnea-hypopnea index (AHI) or respiratory disturbance index (RDI) of >5 (five), and <15 respiratory events per hour and ONE of the following associated symptoms:
         a. Symptoms of OSA (e.g., excessive daytime sleepiness, impaired cognition, insomnia); **or**
         b. Documented cardiovascular diseases, including hypertension, ischemic heart disease, or history of stroke; **or**
      2. PSG or HST results document an AHI or RDI of ≥15 respiratory events per hour;
   B. Children <18 years with OSA who meet **ALL** of the following indications: (90-day continuation review is **not** required for pediatric members.)
      1. **Any** of the following indications:
         a. Failure of adenotonsillectomy to relieve OSA symptoms;
         b. A contraindication to surgical intervention;
         c. Nonsurgical approach is strongly preferred; **and**
      2. PSG results document **Either** of the following:
         a. AHI or RDI of ≥5 and exhibits OSA symptoms;
         b. AHI or RDI within normal ranges and the individual exhibits OSA symptoms (e.g., excessive daytime sleepiness, impaired cognition, insomnia) and **any** of the following:
            i. Child exhibits episodes of hypercarbia based on end-tidal CO_2 measurements

>53 mm Hg;

ii. End-tidal CO_2 is >50 mmHg for 10 to 24% of the sleep time.

Continuation of Use (Past 90-day Trial)

II. Continuation of coverage after the 90-day trial is **medically appropriate** when **BOTH** of the following have been demonstrated. (See Policy Guidelines for Failure of Compliance)

A. Improved AHI and symptom resolution during trial;

B. Compliance has been demonstrated (e.g., defined by using the device for 70% of the nights, for four (4) or more hours per 24-hour period, during a consecutive 30-day period).

III. CPAP is **not medically necessary** for the treatment of snoring without accompanying OSA.

Oral Appliances (OAs)

IV. OAs are **medically appropriate** for the treatment of OSA when **ALL** of the following are met:

A. Individual meets **one** of the following:

1. The individual cannot tolerate or refuse CPAP therapy; **or**
2. The physician determines that the use of PAP therapy is contraindicated;

B. Individual meets **one** of the following indication severity specific criteria:

1. Mild OSA diagnosis documented with a AHI or RDI ≥ 5 and ≤ 14, confirmed by a sleep study (e.g., PSG or home sleep study) with at least **any** of the following indications:
   a. Hypertension;
   b. Heart disease;
   c. Stroke;
   d. Excessive daytime sleepiness;
   e. Impaired cognition;
   f. Mood disorders; **or**
   g. Insomnia;
2. Moderate OSA diagnosis documented with a AHI or RDI ≥ 15 and < 30 confirmed by a sleep study; **or**
3. Severe OSA diagnosis documented with a AHI or RDI ≥ 30, confirmed by a sleep study.

V. Oral Appliances (OAs) are considered **not medically necessary** for **ANY** of the following indications, including but are not limited to:

A. Upper Airway Resistance Syndrome (UARS) with or without snoring and without a diagnosis of OSA;

B. Primary snoring;

C. Temporomandibular joint disorders (TMJD);

D. Central sleep apnea;

E. Prefabricated or non-custom OAs

VI. Non-surgical management for sleep disorders are considered **investigational**, including but not limited to **EITHER** of the following:

A. Daytime neuromuscular electrical stimulation devices (e.g., eXciteOSA);

B. Sleep positioning trainer with or without vibration.

VII. Replacement of a medically necessary OA is **eligible for coverage** after five (5) years, unless there is documented evidence of device failure or a clinically significant change in the patient's condition that necessitates earlier replacement (e.g., tooth loss or major dental reconstruction).

Durable Medical Equipment (DME) Repair

VIII. Repair of a medically necessary non-surgical sleep disorder DME or components not under warranty will be considered **medically appropriate** when the following criteria are met:

A. Physician documentation includes **ALL** the following:

1. date of DME initiation;
2. manufacturer warranty information, if applicable;
3. attestation that the patient has been compliant with the use of the DME and will continue to benefit from the use of the DME;

B. The DME is no longer functioning adequately; and **BOTH** of the following criteria are met:

1. inadequate function interferes with activities of daily living; and
2. repair is expected to make the equipment fully functional (as defined by manufacturer).

IX. Repair of equipment damaged due to patient neglect, theft, abuse, or when another available coverage source is an option (e.g., homeowners, rental, auto, liability insurance, etc.) is **ineligible for coverage**.

DME Replacement

X. Replacement of a medically necessary non-surgical sleep disorder DME or components not under warranty will be considered **medically appropriate** when **EITHER** of the following criteria are met:

A. The DME is no longer functioning adequately and has been determined to be non-repairable, or the cost of the repair is in excess of the replacement cost;

B. There is documentation that a change in the patient's condition makes the present unit non-functional and improvement is expected with a replacement unit.

XI. The replacement of a properly functioning non-surgical sleep disorder DME, its components or accessories are considered **not medically necessary**. This includes, but is not limited to,

replacement desired due to advanced technology or to make the DME more aesthetically pleasing;

XII. The replacement of equipment damaged or lost due to patient neglect, theft, abuse, or when another available coverage source is an option (e.g., homeowners, rental, auto, liability insurance, etc.) is **ineligible for coverage**.

XIII. Accessories or components for non-surgical sleep disorder DME that are considered not medically necessary or investigational by peer-reviewed literature will also be considered as **not medically necessary or investigational** by the Health Plan.

Device Repair

XIV. Repair of a medically necessary non-surgical sleep disorder device or components not under warranty will be considered **medically appropriate** when the following criteria are met:

A. Physician documentation includes **ALL** of the following:

1. date of device implantation/initiation;
2. manufacturer warranty information, if applicable;
3. attestation that the patient has been compliant with the use of device and will continue to benefit from the use of device;

B. The device is no longer functioning adequately; and **BOTH** of the following criteria are met:

1. inadequate function interferes with activities of daily living; **and**
2. repair is expected to make the equipment fully functional (as defined by manufacturer).

XV. Repair of equipment damaged due to patient neglect, theft, abuse, or when another available coverage source is an option (e.g., homeowners, rental, auto, liability insurance, etc.) is **ineligible for coverage**.

Device Replacement

XVI. Replacement of a medically necessary non-surgical sleep disorder device or components not under warranty will be considered **medically appropriate** when **EITHER** of the following criteria are met:

A. The device is no longer functioning adequately and has been determined to be non-repairable, or the cost of the repair is in excess of the replacement cost;

B. There is documentation that a change in the patient's condition makes the present unit non-functional and improvement is expected with a replacement unit.

XVII. The replacement of a properly functioning non-surgical sleep disorder device, its components or accessories are considered **not medically necessary**. This includes, but is not limited to, replacement desired due to advanced technology or in order to make the device more aesthetically pleasing;

XVIII. The replacement of equipment damaged or lost due to patient neglect, theft, abuse, or when

another available coverage source is an option (e.g., homeowners, rental, auto, liability insurance, etc.) is **ineligible for coverage**.

XIX. Accessories or components for non-surgical sleep disorder devices that are considered not medically necessary or investigational by peer-reviewed literature will also be considered as **not medically necessary or investigational** by the Health Plan.

POLICY GUIDELINE(S)

CPAP

I. Individuals who do not meet the criteria for continuation of coverage during the initial 90 day trial are eligible to re-qualify for a CPAP device, but must have a clinical re-evaluation by the treating physician to determine the etiology of the failure to respond to CPAP therapy (e.g., documentation of failure of symptoms to resolve or improper fit of device, and re-education of the individuals regarding proper use of the equipment or re-fitting of masks).

I. CPAP with expiratory relief or APAP are options for patients who cannot tolerate the high constant air pressure associated with CPAP but wish to continue treatment for OSA.

II. Supplemental oxygen or humidification can be added to positive pressure devices to increase oxygen saturation and decrease vasomotor rhinitis.

III. Coverage is allowed for a one-month rental when the CPAP device is malfunctioning and out of warranty, (and not associated with a manufacturer recall) while the device is being repaired.

IV. The monitoring feature/device, stand-alone or integrated, any type, including all accessories, components, and electronics, not otherwise classified (HCPCS: A9279) is considered inclusive to the positive airway pressure device.

V. Devices used to clean or sanitize CPAP devices are considered a convenience item and are ineligible for coverage (e.g., SoClean, SoClean 2 Go).

Oral Appliances

I. Attempts at behavioral modifications and lifestyle changes (e.g., good sleep hygiene, weight loss, avoidance of alcohol consumption in evening, smoking cessation, sleep position change, treatment of nasal congestion) for individuals with UARS and sleep apnea should be an integral part of the treatment regimen for sleep-disordered breathing.

II. The decision for the use and fabrication of an OA should be made by a sleep medicine physician (e.g., somnologist or sleep specialist; ear, nose, and throat [ENT] specialist) or by an experienced dentist/orthodontist in collaboration with a sleep specialist.

III. All impressions, try-ins, and adjustments and repairs are inclusive to the lifetime of the appliance after approval of the device.

DESCRIPTION

Sleep related breathing disorders are characterized by abnormal respiration during sleep, which may or may not also occur during wakefulness. These abnormalities can include pauses in breathing, shallow breathing, or reduced airflow, often leading to fragmented sleep and reduced oxygen levels. Other symptoms can include loud snoring, gasping, choking during sleep, morning headaches, dry mouth, daytime fatigue, sleepiness, mood changes, and cognitive issues.

Primary Snoring

Primary snoring (also called simple snoring or non-apneic snoring) is defined as habitual snoring in the absence of obstructive sleep apnea — specifically, an apnea-hypopnea index (AHI) <5 events per hour on polysomnography, without significant oxygen desaturation, frequent arousals, or gas exchange abnormalities.

Sleep Apnea

Sleep apnea is a common sleep disorder characterized by repeated interruptions in breathing during sleep. These interruptions called apnea can occur hundreds of times per night which can lead to fragmented sleep and decreased oxygen levels resulting in daytime fatigue, cardiovascular problems, and other health issues.

Obstructive Sleep Apnea (OSA)

Obstructive sleep apnea (OSA) is a sleep-related breathing disorder (the most common type) caused by upper-airway obstruction, most often from relaxed throat muscles during sleep. In adults, OSA involves recurrent episodes of complete or partial upper airway blockage lasting more than 10 seconds and is commonly linked to obesity, male sex, aging, and anatomical factors. Symptoms include loud snoring, witnessed apneas, gasping, excessive daytime sleepiness, and hypertension, and diagnosis requires polysomnography or home sleep testing with evidence of clinical impairment. Untreated adult OSA increases the risk of hypertension, heart failure, atrial fibrillation, other arrhythmias, and nonalcoholic fatty liver disease.

Pediatric OSA, typically caused by enlarged tonsils and adenoids, is defined by prolonged partial obstruction or intermittent complete obstruction lasting at least two respiratory cycles and may present with snoring, breathing pauses, restless sleep, behavioral issues, or poor growth. If left untreated, children may experience growth abnormalities, neurologic problems, or cor pulmonale. Polysomnography (PSG) is the preferred diagnostic tool, although normative AHI/RDI values for children are not well established. Adenotonsillectomy is first-line therapy for pediatric OSA, while persistent cases or those with contraindications may require CPAP, observation, medications, or additional airway surgery. Obstructive hypoventilation (OH), a related condition in children, may

present with normal AHI but episodes of hypercarbia indicated by elevated end-tidal CO_2.

Central Apneas

Central sleep apnea is defined as the cessation of airflow through the nose and mouth for at least 10 seconds with no respiratory effort noted. Central sleep apnea occurs when the brainstem, which regulates breathing, does not respond appropriately to changes in carbon dioxide levels in the blood. This results in reduced or absent respiratory effort, leading to pauses in breathing during sleep. Central apneas are often linked to heart failure or neurological conditions. The central apneas occur without any airway obstruction. Approximately 4% of individuals undergoing PSG in a sleep laboratory are diagnosed with central sleep apnea, making this an uncommon condition.

Mixed Apneas

Mixed sleep apnea is a combination of obstructive and central sleep apnea. Not only does the patient have an obstruction in the airway, but the patient may have a neurological dysfunction or cardiopulmonary as well that contributes to the central apnea component.

Continuous Positive Airway Pressure (CPAP)

CPAP is the gold standard treatment option for adults with documented OSA. The symptoms associated with OSA, such as excessive daytime sleepiness, impaired cognition, and mood disorders are reduced or eliminated with the consistent use of CPAP. CPAP is not indicated in individuals with simple snoring that is not associated with pauses in respirations. Treatment recommendations for OSA are based primarily on the RDI or the AHI, the severity of the presenting symptoms, and the existence and severity of co-morbid conditions.

CPAP provides constant pressure throughout the respiratory cycle by raising the intraluminal upper airway pressure above the positive critical transmural pressure of the pharynx or hypopharynx. The pressure is delivered by a flow generator through either nasal mask or modified nasal prongs to keep the upper airway patent resulting in adequate ventilation and arterial oxygenation. The pressure used is determined individually, with a range of 3 to 20 cm. water.

Auto- or Self-Titrating Positive Airway Pressure (APAP)

Auto- or self-titrating positive airway pressure, or APAP, systems utilize an algorithm that uses a pressure transducer and microprocessor to monitor the airway for vibration patterns and then makes air pressure adjustments based on the incidence of apnea or absence of vibration. APAP devices are also referred to as demand positive airway pressure devices (DPAP).

CPAP with expiratory relief (e.g., C- Flex technology Respironics, Inc., Murrysville, PA) is designed to provide pressure relief during expiration, while maintaining optimal pneumatic splinting for effective therapy. CPAP with expiratory relief technology monitors the patient's airflow during expiration and reduces expiratory pressure proportional to expiratory flow. CPAP with C-Flex technology can increase compliance in those patients who find it difficult or uncomfortable to breathe out against the continuous positive pressure. This technology can be applied to CPAP, BPAP and APAP devices.

Most PAP machines now contain a data card that can record and transmit daily use rates of the device. In addition, most PAP machines can also be equipped with a modem (either wired or

wireless) that is capable of transmitting data daily to a manufacturer-owned database. The ability to detect disturbances in a variety of measures, including air flow, amount of time used, and mask leak, is also included in most commercially available PAP machines.

Upper Airway Resistance Syndrome (UARS)

UARS is a milder form of obstructive sleep related breathing. The airway narrows but does not fully close. This can cause sleep fragmentation and fatigue.

Hypoventilation Disorders

Sleep related hypoventilation disorders causes inadequate breathing during sleep which can lead to high carbon dioxide levels. Hypoventilation disorders are common in obesity, neuromuscular disorders, or medication use.

Hypoxemia

Sleep related hypoxemia is sustained low oxygen levels during sleep without elevated carbon dioxide. Often due to lung diseases or other medical conditions.

Oral Appliances (OAs)

OAs can be prefabricated, ready-made, or custom fitted device worn in the mouth during sleep to treat OSA and snoring. They work by repositioning the jaw, tongue, or soft tissues to keep the airway open, allowing for uninterrupted breathing throughout the night. The most common type of oral appliance is the mandibular advancement device (MAD), which is custom made for each individual and adjustable to allow a dentist to modify the degree of jaw advancement as needed. The goal is to achieve the most comfortable and effective position for the individual. Examples of custom oral appliances include tongue-retaining devices, non-adjustable mandibular repositioning devices (MRDs), and adjustable MRDs. These appliances may be used as an alternative to other medical (e.g., CPAP and surgical (e.g., Uvulopalatopharyngoplasty) interventions.

AIO BREATHE (AIOMEGA LLC, Texas) is a lightweight MAD that increases airway size and repositions the jaw to keep the airway more open during sleep. It is recommended for mild to moderate sleep apnea and snoring.

ProSomnus EVO PH (ProSomnus Sleep Technologies), sleep and snore devices use medical grade polymers and hinge components to reposition and stabilize the jaw during sleep. The OA causes an increase in the pharyngeal space, reducing the risk of upper airway collapse. The device is recommended for snoring and to treat mild to moderate OSA.

iNAP (Somnics Health, Inc.) uses gentle suction to move the tongue forward. No mask or headgear is required.

Vivos (Vivos Therapeutics, Inc) OAs are noninvasive, custom-made devices designed to treat OSA and snoring. They function by repositioning the hard and soft tissues of the airway to enhance airflow and improve upper airway function. The Vivos System gradually remodels the upper airway and jaw structure over time to address the underlying anatomical causes of OSA. Recently, the United States Food and Drug Administration (FDA) approved Vivos OAs the treatment of severe OSA.

Neurostimulators

eXciteOSA is an FDA approved daytime therapy designed to treat snoring and mild OSA by strengthening tongue muscles through neuromuscular electrical stimulation (NMES). It is intended for adults aged 18 and older with an AHI less than 15. The device consists of a mouthpiece with four electrodes, two above and two below the tongue that are connected to a control unit via USB. It delivers electrical pulses to stimulate both intrinsic and extrinsic tongue muscles. This stimulation strengthens the muscles, helping to prevent the tongue from collapsing backward during sleep. As a result, it supports airway patency and contributes to the reduction of snoring and apnea events.

Positional Sleep Aids

Positional sleep aids encourage sleeping positions that may help with snoring, sleep apnea, back pain, and acid reflux. There are many different types of positional sleep aid devices such as pillows or noodles or devices that can be placed on the body that vibrate or inflate when in the supine sleep.

SUPPORTIVE LITERATURE

CPAP

Figard et al (2025) conducted an umbrella review of meta-analysis of randomized controlled trials that evaluated the effectiveness, adherence, and safety of treatments for OSA by synthesizing evidence from 34 meta-analyses of 230 randomized controlled trials involving 36,353 participants. The review found that CPAP remains the most effective treatment for reducing the AHI and improving daytime sleepiness. Other interventions, including glucagon-like peptide-1 (GLP-1) receptor agonists such as tirzepatide and MADs, also significantly reduced OSA severity, although to a lesser extent than CPAP. Daytime sleepiness improved with CPAP, hypoglossal nerve stimulation (HNS), wake-promoting medications, and myofunctional therapy. Physical activity produced the greatest improvements in quality of life, while CPAP provided more modest benefits. Overall, most of the evidence was of low to moderate certainty, with only one meta-analysis providing high-certainty evidence. The authors concluded that CPAP remains the most effective therapy for OSA, but alternative treatments may offer meaningful benefits for selected patients. However, limited data on long-term adherence, safety, and combination therapies highlight the need for further comparative and long-term research to support individualized treatment approaches. The findings should also be interpreted cautiously because of limitations related to the quality of the included meta-analyses and their selection criteria.

Sanchez-de la-Torre et al (2023) conducted a systematic review and meta-analysis of individual participant data (IPD) from three RCT, Sleep Apnea Cardiovascular Endpoints (SAVE), Impact of Sleep Apnea Syndrome in Acute Coronary Syndrome (ISAACC) and Randomized Intervention with CPAP in Coronary Artery Disease and Sleep Apnea (RICCADSAO) to assess whether adherence to CPAP therapy reduces the risk of major adverse cardiac and cerebrovascular events (MACCEs) in individuals with OSA and established cardiovascular disease. The study included 4186 adults with cardiovascular disease and OSA. The primary outcome was the first MACCEs. Statistical analysis included one stage and two stage IPD meta-analysis as well as on treatment analysis using marginal structural models to assess the effects of CPAP adherence. A total of 691 MACCEs (16.5%) were observed, the CPAP group had 349 and the no CPAP group 342. The main outcome intention- to-treat analysis did not show a significant difference in MACCEs between the CPAP and the no CPAP

group. The on-treatment analysis revealed good adherence to CPAP (≥4 hours per day) was associated with a reduced risk of MAACEs reoccurrence. Adherence to CPAP was associated with reduced MACCE recurrent risks suggesting that treatment adherence is a key factor in secondary cardiovascular prevention in individuals with OSA.

Patil et al (2019) conducted a systematic review and meta-analysis of 184 studies to evaluate the effectiveness of PAP therapy for adults with OSA. CPAP significantly reduced AHI by 23 events/hour versus no treatment—an 86% reduction from 32.7 to 4.1 events/hour. CPAP also improved daytime sleepiness by 2.4 points in symptomatic patients and showed clinically meaningful benefits for sleep-related quality of life, blood pressure, and motor vehicle crash risk. Observational evidence suggested reductions in cardiovascular events and mortality, though RCTs did not confirm these outcomes. No major differences were found among CPAP, APAP, and BiPAP for individual clinical outcomes, supporting CPAP as first-line therapy unless not tolerated. Home-based versus in-lab APAP initiation showed comparable results. Education, behavioral interventions, and telemonitoring improved adherence. Nasal masks enhanced adherence and reduced AHI more effectively than oronasal masks. Humidification reduced side effects without improving adherence or outcomes. Overall, CPAP reliably reduces OSA severity, improves sleepiness, and lowers blood pressure, particularly in symptomatic or hypertensive adults. Benefits for asymptomatic individuals and long-term cardiovascular outcomes remain uncertain.

Wang et al (2019) conducted a systematic review to assess the effectiveness of home noninvasive NIPPV (home mechanical ventilation (HMV), BiPAP, or CPAP devices) in adults with chronic respiratory failure. 68 studies evaluating 53,733 patients were included. In patients with COPD, home BiPAP (compared to no device) was associated with lower mortality, decreased need for intubations and hospital admissions, but no change in quality of life. In patients with COPD, HMV (compared individually with BiPAP, CPAP, or no device) was associated with fewer hospital admissions. In patients with thoracic restrictive diseases, HMV (compared to no device) was associated with lower mortality. In patients with neuromuscular diseases, home BiPAP (compared to no device) was associated with lower mortality and better quality of life. In patients with obesity hypoventilation syndrome, home HMV/BiPAP (compared to no device) was associated with lower mortality. Current evidence was not available to assess the comparative effectiveness of many device capabilities on patient outcomes. Criteria to initiate home NIPPV and home respiratory services varied and were not validated in comparative studies.

Oral Appliances (OAs)

Gupta et al (2026) conducted a systematic review and meta-analysis evaluating the effectiveness of mandibular advancement devices (MADs) compared with continuous positive airway pressure (CPAP) and sham/control interventions in adults with obstructive sleep apnea (OSA). Eight randomized controlled trials involving 642 participants were included. The analysis found that CPAP was significantly more effective than MAD therapy in reducing the AHI, with patients using MADs demonstrating higher residual AHI values (mean difference [MD] = 11.83 events/hour; 95% CI: 6.61-17.04). In comparison with sham or control devices, MAD therapy significantly improved AHI (MD = 15.78 events/hour; 95% CI: 8.43-23.13), although heterogeneity remained high (I^2 = 86.47%). Secondary outcomes were variable but generally favored MAD treatment. Overall, the

findings indicate that CPAP remains the most effective treatment for reducing respiratory events in OSA, while MADs provide a beneficial alternative for patients who are unable to tolerate or consistently adhere to CPAP therapy. The results should be interpreted with caution due to the considerable heterogeneity among studies and the limited amount of sham-controlled evidence available.

Hamoda et al (2025) conducted a multicenter, double-randomized trial comparing CPAP and mandibular advancement splints (MAS) in treatment-naïve adults with mild-to-severe OSA to evaluate adherence, effectiveness, and long-term treatment patterns. A total of 81 participants were enrolled, with 73 completing the crossover phase and included in the intention-to-treat analysis. During the crossover phase, objective adherence was significantly higher with MAS than with CPAP, averaging 6.0 versus 5.3 hours per night, respectively, a difference of 0.7 hours per night. However, CPAP demonstrated superior efficacy in reducing respiratory events, with a mean difference in AHI reduction of 10.4 events per hour favoring CPAP. Both therapies produced substantial improvements in patient-centered outcomes, including symptoms and quality of life measures, resulting in comparable overall clinical effectiveness. During the six-month observational phase, more than half of participants (55%) chose to alternate between CPAP and MAS therapy, suggesting that access to both treatment options may enhance long-term disease management. The findings indicate that while CPAP remains the most efficacious treatment for reducing OSA severity, the higher adherence observed with MAS may offset some of this advantage, making both therapies similarly effective from a patient-centered perspective and supporting the use of combined treatment strategies to improve long-term OSA management.

Beri et al (2023) evaluated the effectiveness of OA therapy in treating OSA, focusing on the use of MADs and tongue retaining devices (TRDs). The study used the AHI as the primary outcome measure. The inclusion criteria focused on adults with an AHI greater than 5, treated with MAD or TRD, and compared it to CPAP therapy. The analysis was based on a systematic review and meta-analysis of six randomized controlled trials conducted between 1998 and 2021. OA significantly improves AHI compared to baseline (Mean Difference = 13.40; 95% CI). CPAP outperformed OA in reducing AHI (Mean Difference = 8.40; 95% CI). TRDs showed comparable results to MADs in some studies. Researchers concluded that MADs are effective alternatives for patients with mild to moderate OSA, especially those that are intolerant to CPAP.

Rossi et al (2021) conducted a systematic review of 17 randomized controlled trials (RCTs) to assess the clinical effectiveness of OAs in treating OSA. The review included RCTs with at least 50 participants, comparing OAs to CPAP, placebo, surgery, or other interventions. Findings showed that OAs significantly reduced both the AHI and the Oxygen Desaturation Index (ODI), including some individuals with severe OSA. Custom-fitted, titratable devices were found to be more effective than non-custom or non-titratable alternatives. While CPAP generally achieved greater reductions in AHI, OAs were associated with higher patient compliance and better tolerability. In cases of mild to moderate OSA, some studies showed that OAs were non-inferior to CPAP. Additionally, improvements in daytime sleepiness (Epworth Sleepiness Scale), snoring, and quality of life were observed, although these outcomes varied across studies.

<u>Electrical Stimulation Appliances</u>

The current body of evidence supporting non-surgical neuromuscular electrical stimulation for OSA remains limited. High-quality data demonstrating its safety and clinical efficacy are lacking. Well-designed, controlled studies are needed to evaluate its therapeutic effectiveness, safety profile, and long-term outcomes. Two cohort studies (Kotecha et al (2021) and Baptista et al (2021)) studied habitual snorers who were treated with eXciteOSA. Both studies reported a reduction in snoring time measured by the Watch-PAT device and bed-partner-reported snorting was also decreased. A reduction in AHI was noted in those participants with mild OSA in the Kotecha study but there was no clinically significant reduction in AHI reported in the Baptista study. Both the Epworth Sleepiness Scale (ESS) and Pittsburgh Sleep Quality Index (PSQI) test showed improvements as reported by the participants as well as the bed partners. These studies suggest that daytime tongue stimulation may improve snoring, but the effect on OSA is uncertain.

PROFESSIONAL GUIDELINE(S)

The 2015 clinical practice guidelines jointly issued by the American Academy of Sleep Medicine (AASM) and the American Academy of Dental Sleep Medicine (AADSM) (Ramar et al) reported new guidelines to update and replace previous recommendations for the use of OAs in the treatment of OSA and snoring. The recommendations are as follows:

- "Sleep physicians should prescribe oral appliances instead of offering no treatment for adults seeking help for primary snoring without obstructive sleep apnea."
- "When treating adults with OSA sleep physicians should recommend that a qualified dentist provide a custom, adjustable OAs rather than a non-custom device."
- "For adults with obstructive sleep apnea who cannot tolerate CPAP or prefer another option, sleep physicians should consider prescribing OA instead of leaving the condition untreated."
- "Qualified dentists should monitor patients using OAs for OSA to detect and minimize dental side effects or bite changes, rather than providing no follow-up."
- "Sleep physicians should conduct follow-up sleep studies to confirm or improve the effectiveness of OA therapy, rather than relying on follow-up without testing."

The American Academy of Dental Sleep Medicine (AADSM) released an updated position statement in October 2022, on the use of OAT for the treatment of OSA. Some of the recommendations include:

- "OAT is an effective treatment for both OSA and snoring, and should be considered a first-line therapy, particularly for patients who are intolerant of CPAP therapy."
- "Patient evaluation and appliance fitting should be conducted by qualified dentists trained in dental sleep medicine."
- "Patients should be offered a trial of OA or PAP therapy prior to considering surgical interventions for OSA."

The 2021 National Institute for Health and Care Excellence (NICE) Clinical Guidelines for Diagnosis and Management of Obstructive Sleep Apnea/Hypopnea Syndrome (OASAHS), Obesity Hypoventilation Syndrome (OHS) and Chronic Obstructive Pulmonary Disease with OSAHS (COPD-

OSAHS overlap syndrome) in people over 16 years of age recommends:

- "Offering fixed-level CPAP in those with mild OSA when symptoms affect quality of life (QOL) and usual daytime activities if lifestyle changes alone have been unsuccessful or are considered inappropriate."
- "APAP as an alternative to fixed-level CPAP in those unable to tolerate CPAP."
- "In individuals who cannot tolerate or refuse CPAP, they recommend offering a customized mandibular advancement device."
- "In individuals with moderate to severe OSA, CPAP is recommended as a treatment option, with APAP offered as an alternative in those unable to tolerate CPAP."
- "A customized mandibular advancement device may be used if an individual refuses PAP or is unable to tolerate PAP."
- "A positional modifier may be considered for those with mild to moderate positional OSA if other treatments are unsuitable or not tolerated, but this should not be a first-line treatment option."

The 2015 clinical practice guidelines that was jointly issued by the American Academy of Sleep Medicine (AASM) and the American Academy of Dental Sleep Medicine (AADSM) (Ramar et al), aimed to update and replace previous recommendations for the use of oral appliance therapy for adults with OSA. Recommendations are as follows:

- "Sleep physicians should prescribe oral appliances instead of offering no treatment for adults seeking help for primary snoring without obstructive sleep apnea."
- "When treating adults with OSA sleep physicians should recommend that a qualified dentist provide a custom, adjustable OAs rather than a non-custom device."
- "For adults with obstructive sleep apnea who cannot tolerate CPAP or prefer another option, sleep physicians should consider prescribing OA instead of leaving the condition untreated."
- "Qualified dentists should monitor patients using OAs for OSA to detect and minimize dental side effects or bite changes, rather than providing no follow-up."
- "Sleep physicians should conduct follow-up sleep studies to confirm or improve the effectiveness of OA therapy, rather than relying on follow-up without testing."

The 2012 American Academy of Pediatrics Clinical Guidelines (Marcus et al) for the Diagnosis and Management of Childhood Obstructive Sleep Apnea Syndrome (OSAS), focusing on uncomplicated OSAS (OSAS associated with adenotonsillar hypertrophy and/or obesity in otherwise healthy children). The recommendations are as follows:

- "All children/adolescents should be screened for snoring."
- "Polysomnography should be performed in children/adolescents with snoring and symptoms/signs of OSAS; if polysomnography is not available, then alternative diagnostic tests or referral to a specialist for more extensive evaluation may be considered. "
- "Adenotonsillectomy is recommended as the first-line treatment of patients with adenotonsillar

hypertrophy.

- High-risk patients should be monitored as inpatients postoperatively.
- Patients should be reevaluated postoperatively to determine whether further treatment is required. Objective testing should be performed in patients who are high risk or have persistent symptoms/signs of OSAS after therapy.
- Continuous positive airway pressure is recommended as treatment if adenotonsillectomy is not performed or if OSAS persists postoperatively."

- "Weight loss is recommended in addition to other therapy in patients who are overweight or obese. "
- "Intranasal corticosteroids are an option for children with mild OSAS in whom adenotonsillectomy is contraindicated or for mild postoperative OSAS."

The 2019 AASM clinical practice guidelines for the Treatment of Adult OSA with PAP (Patil et al) state the following recommendations:

- "Clinicians use PAP, compared to no therapy, to treat OSA in adults with excessive sleepiness. (strong)"
- "Clinicians use PAP, compared to no therapy, to treat OSA in adults with impaired sleep-related quality of life. (conditional)"
- Clinicians use PAP, compared to no therapy, to treat OSA in adults with comorbid hypertension. (conditional)
- "PAP therapy be initiated using either APAP at home or in-laboratory PAP titration in adults with OSA and no significant comorbidities. (strong)"
- "Clinicians use either CPAP or APAP for ongoing treatment of OSA in adults. (strong)"
- "Clinicians use CPAP or APAP over BPAP in the routine treatment of OSA in adults. (conditional)"
- "Educational interventions be given with initiation of PAP therapy in adults with OSA. (strong)"
- "Suggest that behavioral and/or troubleshooting interventions be given during the initial period of PAP therapy in adults with OSA. (conditional)"
- "Clinicians use telemonitoring-guided interventions during the initial period of PAP therapy in adults with OSA. (conditional)"

REGULATORY STATUS

The United States Food and Drug Administration (FDA) regulates oral appliances as medical devices. All oral appliances including related components require FDA approval before marketing and use in the United States to ensure they are safe and effective for human use. Refer to the FDA Medical Device website. Available from: https://www.fda.gov/medical-devices [accessed 2026 Jul 17]

The FDA lists the most serious type of medical device recalls as well as early alert communications about corrective actions being taken by companies that the FDA believes are likely to be the most

serious type of recalls. Available from: Medical Device Recalls | FDA [accessed 2026 Jul 17]

CODE(S)

- Codes may not be covered under all circumstances.
- Code list may not be all inclusive (AMA and CMS code updates may occur more frequently than policy updates).
- (E/I)=Experimental/Investigational
- (NMN)=Not medically necessary/appropriate

DESCRIPTIONS

Specialized nutritional support is often required for patients who have chronic disease or for those undergoing long-term rehabilitation who are at risk for malnutrition. Nutritional support can be provided orally, enterally (through a tube into the stomach or small intestine), and intravenously. Malnutrition is commonly defined in the medical literature as a non-edematous or post-dialysis weight loss of at least 10 percent of ideal body weight over a three-month period or a serum albumin of less than 3.4 grams/dL. Malnutrition can occur in otherwise healthy individuals when they are deprived of adequate nutrients for an extended period of time.

Oral and Enteral Nutrition: Nutritional support provided via the gastrointestinal tract can be taken by mouth or provided enterally. Oral nutrition refers to nutrition taken through the mouth. Enteral nutrition is commonly defined as the provision of nutritional requirements through a tube in the stomach or small intestine. Enteral feeding provides nutritional support for patients who lack the ability for the body to properly digest essential nutrients contained in everyday foods. Examples of feeding tubes are:

- Nasogastric (NG): nose to stomach
- Gastrostomy (G-tube): surgically placed into the stomach through the abdominal wall
- Jejunostomy (J-tube): surgically placed into the small bowel through the abdominal wall

POLICY NAME: NUTRITIONAL THERAPY: ORAL/ ENTERAL/ PARENTERAL & MODIFIED SOLID FOOD PRODUCTS

Modified solid food products are everyday solid foods with essential nutrients removed in order to avoid allergic or other adverse reactions the foods might otherwise cause.

Parenteral nutrition refers to the intravenous provision of micro- or macro-nutrients through catheters in central and peripheral veins to prevent or correct nutritional deficiency. It is typically reserved for situations when there is inadequate or insufficient absorption of nutrients through the gastrointestinal tract.

RELATED POLICIES/DOCUMENTS

Resource Coordination Policy:

Durable Medical Equipment, Prosthetics, Orthotics and Medical Supplies, 1370/20.000509

POSITION STATEMENT

CDPHP administers benefits for home use of oral/enteral/parenteral nutrition, and modified solid food products when medically necessary and proven effective as a disease-specific regimen as follows:

The following general requirements will apply:

- The enrollee must have a prescription drug benefit for products obtained at a participating pharmacy for products taken by oral route of administration. Products obtained from a home care agency that are administered via nasogastric feeding tube (a prosthetic device), gastrostomy/jejunostomy or needle catheter (a prosthetic device) jejunostomy will be covered under the medical benefit and no prescription drug benefit is necessary.

- Enteral formulas for home use are covered when a physician issues a written order stating the formula is medically necessary and has been proven effective as a disease-specific treatment regimen.

Oral and Enteral Nutrition

Enteral nutritional support provided via the gastrointestinal tract can be taken by mouth or provided enterally via a tube in the stomach or small intestine. The enteral formula diet consists of amino acids, simple carbohydrates, and/or complex protein and carbohydrate sources. Enteral formula diets are considered medically necessary when used in the treatment of objectively diagnosed conditions where caloric and dietary nutrients from food cannot be absorbed or metabolized.

CDPHP considers oral and enteral formula medically necessary when the following criteria are met:

POLICY NAME: NUTRITIONAL THERAPY: ORAL/ ENTERAL/ PARENTERAL & MODIFIED SOLID FOOD PRODUCTS

1. Ordered by a physician or other licensed health care provider
2. The enteral formula is clearly medically necessary and has been proven effective as a disease-specific treatment regiment.

Modified Solid Food Products

CDPHP considers modified solid food products medically necessary for certain inherited diseases of amino acids or organic acid metabolism, as well as severe protein allergic conditions. Modified solid food products are only those products that are low protein or which contain modified protein, or are amino acid based.

Parenteral/Total Parenteral Nutrition (TPN)

Also known as parenteral hyperalimentation, involves the delivery of micronutrients and macronutrients through catheters in central or peripheral veins. In most instances, the central venous route is utilized; for long-term total parenteral nutrition, a central catheter (e.g., Hickman, Broviac, PIC) is burrowed through a subcutaneous tunnel on the anterior chest.
CDPHP considers TPN therapy medically necessary only if adequate nutritional intake is not possible via the oral or tube-feeding route and any of the following criteria is met:

- Documentation of a failure of enteral (i.e., oral or tube feeding) nutrition, as defined by *either* of the following:
  - A non-edematous or post-dialysis documented loss of greater than 10 percent of body weight over a three-month period; *or*
  - Total protein less than 6 g/dL or serum albumin less than 3.4 g/dL
  - A condition in which it is necessary for the gastrointestinal tract to be totally non-functioning for a period of time.
  - Evidence of structural or functional bowel disease that makes oral and tube feedings inappropriate.
  - Hyperemesis gravidarum (only in cases of failed medical management or when used in a step-therapy program).

Parenteral nutrition is not considered medically necessary for members with a functioning gastrointestinal tract whose need for parenteral nutrition is only due to:

- A physical disorder impairing food intake such as the dyspnea of severe pulmonary or cardiac disease;
- A psychological disorder impairing food intake such as depression
- A side effect of a medication
- A swallowing disorder
- A temporary defect in gastric emptying such as a metabolic or electrolyte disorder
- Disorders inducing anorexia such as cancer

POLICY NAME: NUTRITIONAL THERAPY: ORAL/ ENTERAL/ PARENTERAL & MODIFIED SOLID FOOD PRODUCTS

- Renal failure and/or dialysis
- Patient preference (refusal for feeding tube placement)

Intra-dialytic parenteral nutrition (IDPN)

IDPN is the infusion of an intravenous nutritional formula of hyperalimentation, such as amino acids, glucose, and lipids during dialysis, to treat protein calorie malnutrition in an effort to decrease the associated morbidity and mortality experienced in patients with renal failure.

CDPHP administers benefits for IDPN for members who are currently receiving dialysis and meet the criteria for total parenteral nutrition as stated above.

POLICY CONSIDERATIONS

New York State Law mandates coverage for enteral formulas for all contracts that cover prescription drugs. The mandate requires coverage for home use of enteral formulas pursuant to a written order by the patient's physician or other licensed health care provider stating the enteral formula is medically necessary and proven effective as a disease-specific treatment regimen. The mandate also requires coverage of modified solid food products to treat inherited diseases of amino acid and organic acid metabolism and severe protein allergic conditions.

CDPHP covers the outpatient use of pasteurized donor human milk, which may include fortifiers, for an infant who is medically or physically unable to receive maternal breast milk, participate in breast feeding, or whose mother is medically or physically unable to produce maternal breast milk at all or in sufficient quantities or participate in breast feeding despite optimal lactation support. Such infant must have a documented birth weight of less than one thousand five hundred grams, or a congenital or acquired condition that places the infant at a high risk for development of necrotizing enterocolitis. This benefit is contract dependent. Please refer to member-specific contracts to determine benefit availability.

EXCLUSIONS

The following exclusions will apply regarding nutritional support:

- Enteral nutrition therapy for supplementation of daily protein-caloric intake where there is not documented medical necessity by a physician's order as defined in this policy.
- In patients with a stable nutritional status, in whom only short-term parenteral nutrition might be required (e.g., less than two weeks).
- Coverage is not intended for patients requiring specialized diets (e.g., gluten free foods, lactose
- Lactose free products or products to aid in lactose digestion.
- Supplemental enteral formulas/modified solid food products associated with weight-loss programs.
- Specialized infant formulas that are not disease-specific treatment.
- Enteral therapy used as a convenient food source.

POLICY NAME: NUTRITIONAL THERAPY: ORAL/ ENTERAL/ PARENTERAL & MODIFIED SOLID FOOD PRODUCTS

- Baby food, or other regular shelf food products (e.g., Ensure®, Similac®) that can be blenderized for use with an enteral feeding system
- Dietary or food supplements
- For routine pre- and/or postoperative care
- Food thickeners (B4100)
- Standard infant milk or soy products
- Intra-peritoneal nutrition therapy (for members on peritoneal dialysis)
- Nutritional therapy as a side effect of a medication

CDPHP PRODUCT VARIATIONS

CHILD HEALTH PLUS: Subject to all terms and conditions noted in the above application. However, a prescription drug rider is not required. Prescription drugs are part of the benefit plan. These products are covered only when ordered by a practitioner.

MEDICARE ADVANTAGE: Subject to all terms and conditions noted in the above application with the following exceptions:

- This benefit is covered under the medical portion of the contract as a supply necessary to use a prosthetic device. A prescription drug benefit is not necessary.
- Medicare Advantage provides coverage only for enteral products that are administered via nasogastric feeding tube (a prosthetic device) gastrostomy/jejunostomy; or via needle catheter (a prosthetic device) jejunostomy, when the condition is deemed permanent (at least three months).
- The Medicare Advantage benefit plan does not cover enteral feeding products that are not delivered through a feeding tube.

POLICY HISTORY

This section is intended to provide only highlights of the policy changes. The policy should always be reviewed in its entirety to ensure a comprehensive understanding of coverage.

Effective Date	Update
1/1/2026	Added information regarding pasteurized breast milk
10/1/2024 *No change to effective date of policy	Under the Medicare section, added link for parenteral nutrition guidelines.
10/1/24	Under Medicaid updated link for enteral therapy.
8/1/2024	Under Medicaid, removed B4105 as being billed to CDPHP as this is now covered under FFS.
4/1/2023	Medicaid section updated to reflect the changes for the Medicaid RX/DME Carveout.
10/1/2022	Removed examples of conditions for when considered medically necessary.
* 1/1/2022 *No change in effective date	Added statement to Medicaid regarding Women, Infants and Children (WIC) benefit: **Members with WIC eligibility, that meet the below criteria, may obtain oral formulas/nutrition through the WIC program.
1/1/2022	Added to exclusions: • Nutritional therapy as a side effect of a medication

POLICY EFFECTIVE DATE:	10/1/2025
Policy Control #:	1370/20.000060
Next Annual Review:	September, 2027

DISCLAIMER

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgement when deciding the most appropriate care to enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

PROCEDURE CODES

- Attended (facility-based) polysomnography: 95782, 95783, 95807, 95808, 95810, 95811
- Unattended (home-based) sleep testing: 95800, 95801, 95806, G0398, G0399, G0400
- CPAP/BiPAP/APAP equipment: E0561, E0562, E0601, E0470, E0471, E0472
- Multiple Sleep Latency Test (MSLT): 95805
- Oral Appliances: E0485, E0486, K1027, D9947, D9948, D9949
- Surgical treatments: 42145, 64582-64584

DESCRIPTIONS

Sleep studies and polysomnography refer to the continuous and simultaneous monitoring and recording of various physiological parameters of sleep for six or more hours with physician review, interpretation, and report. The studies are performed to diagnose a variety of sleep disorders, including obstructive sleep apnea, and to evaluate a patient's response to therapies such as continuous positive airway pressure (CPAP).

Obstructive sleep apnea (OSA) is defined as repeated periods of complete airway obstruction (apnea) lasting at least 10 seconds, which occur only during sleep. **Apneas** are characterized as obstructive if the respiratory effort is present throughout the entire event, central if respiratory effort is absent throughout the entire event, or mixed if respiratory effort is initially absent but resumes during the latter portion of the event. **Hypopnea**, a respiratory event characterized by partial airway obstruction with at least 30-percent reduction in airflow for 10 seconds or more

and fall of oxygen saturation of at least three to four percent, may also be present. Respiratory-effort-related arousals are identified when there is a sequence of breaths lasting at least 10 seconds, characterized by increasing respiratory effort or flattening of the nasal pressure waveform, leading to an arousal from sleep; and the sequence of breaths does not meet criteria for apnea or hypopnea.

Polysomnography (PSG) utilizes the continuous and simultaneous monitoring and recording of physiological phenomena, including at least electroencephalography, electrooculography, electromyography, oximetry, electrocardiography, respiratory effort, and airflow. These are monitored during sleep for six or more hours with review, interpretation, and report by a physician. PSG (in contradistinction from home [portable] sleep tests) permits identification of: duration of sleep; duration of each of the stages of sleep; presence of respiratory-effort-related arousals (RERAs) as well as apneas and hypopneas; and frequency of respiratory events per hour of measured sleep across the entire period of sleep and in each of the sleep stages.

Home/Portable Sleep Studies (HST): Tests that utilize the continuous and simultaneous monitoring and recording of various physiological and pathophysiological parameters of sleep. They are performed with a portable machine that usually has four leads to measure chest and abdominal wall movement, oxygen saturation (oximetry), and cardiac activity (EKG). HSTs do not permit objective identification of sleep duration, identification of presence and duration of all sleep stages, frequency of arousals per hour of objectively measured sleep, or frequency of apneas, hypopneas, and RERAs per hour of objectively measured sleep.

RELATED POLICIES/DOCUMENTS

Payment Policies:

- APAP, BiPAP, and CPAP Rental and Purchase, 1550/20.000142

Resource Coordination Policies:

- Durable Medical Equipment, Prosthetics/Orthotics, and Medical Supplies, 1370/20.000509

POSITION STATEMENT

CDPHP provides coverage of sleep studies for the diagnosis and treatment of obstructive sleep apnea only when such services are performed by a participating CDPHP provider meeting the following credentialing standards in accordance with credentialing policy, *Credentialing & Recredentialing: Sleep Disorder Centers/Laboratories, 1315/20.000039* as follows:

- Physicians who conduct sleep studies must be board-certified in sleep medicine by the American Board of Medical Specialties (ABMS), American Board of Sleep Specialists (pertains to providers previously credentialed by CDPHP to practice sleep medicine under this board certification), or the American Osteopathic Association

(AOA), and must be affiliated with a credentialed sleep medicine program.
- Sleep medicine entities (office or facility) providing attended sleep studies must be accredited by the American Academy of Sleep Medicine (AASM).
- An out-of-center sleep testing supplier (e.g., drop and ship) must be accredited by the Joint Commission on Accreditation of Healthcare Organizations (JCAHO).

Diagnostic Testing - Medical Necessity Criteria

CDPHP considers diagnostic sleep studies medically necessary for the diagnosis of suspected obstructive sleep apnea in an adult (age 18 or older) when *both* of the following criteria are met:

- Comprehensive clinical evaluation is performed by, or under the direction of, a board-certified sleep medicine specialist or subspecialist in neurology, otolaryngology, or pulmonary medicine
- Documentation must include counseling regarding potential treatment options.

And

- Patient demonstrates three or more of the following symptoms or risk factors:
  - Documented excessive daytime sleepiness as evidenced by an Epworth sleepiness scale > 10.
  - Witnessed apneas
  - Gasping or choking at night
  - Disruptive loud snoring
  - Hypertension that is uncontrolled despite three-drug regimen that includes a diuretic
  - Obesity (i.e., body mass index ≥ 35)
  - Increased neck circumference (i.e., > 17 inches in men, > 16 inches in women).

CDPHP considers diagnostic sleep study medically necessary for the diagnosis of suspected obstructive sleep apnea in a pediatric patient (age 17 and under) when the following criteria are met:

Patient demonstrates any of the following symptoms or risk factors in association with habitual snoring/disturbed breathing:

- Restless or disturbed sleep
- Behavior disturbances, or learning disorders including deterioration in academic performance, hyperactivity, or attention deficit disorder
- Unexplained enuresis
- Frequent awakenings
- Failure to thrive, or growth impairment
- Witnessed apnea

- Excessive daytime somnolence, or altered mental status unexplained by other conditions or etiologies
- Polycythemia unexplained by other conditions or etiologies
- Cor pulmonale unexplained by other conditions or etiologies
- Hypertrophy of tonsils and adenoids associated with noisy daytime respirations where surgical removal poses a significant risk and would be avoided in the absence of sleep-disordered breathing.

Types of Sleep Studies

Diagnostic tests for obstructive sleep apnea (OSA) are classified into four types based on the number of physiologic signals measured. Type I is a full-channel polysomnography (PSG) with minimum of 12 monitored parameters performed, attended, in a sleep laboratory facility. Three categories of portable monitors (Type II, III, IV) are utilized in both attended and unattended settings and measure less than 12 physiologic parameters.

CDPHP utilizes the criteria outlined below to determine whether attended facility or office-based PSG or unattended home sleep testing is indicated. Prior authorization is required for attended (facility or office-based) sleep studies only.

Attended Polysomnography – Adults (95807, 95808, 95810, 95811)

CDPHP considers diagnostic, attended PSG medically necessary to confirm a diagnosis of sleep-related breathing disorder in an adult (age 18 and older) when the following criteria are met:

1. Medically necessary criteria for a diagnostic sleep study for suspected obstructive sleep outlined above have been met and when there is presence of any of the following conditions:
    - Significant comorbid conditions that would be expected to degrade the accuracy of a home/portable study, including, but not limited to:
        - Moderate to severe pulmonary disease (e.g., COPD).
        - Moderate to severe neuromuscular or neurodegenerative disorder causing restrictive lung diseases (examples include, but are not limited to: kyphoscoliosis, myasthenia gravis, amyotropic lateral sclerosis (ALS), polio, polymyositis, Guillian Barre syndrome)
        - Moderate to severe congestive heart failure classified by New York Heart Association as level III or IV
        - Moderate to severe pulmonary hypertension (> 40 mmHg)
        - Awake or obesity hypoventilation syndrome or suspicion of sleep-related hypoventilation
        - Chronic opioid medication use
        - History of stroke

- Severe insomnia

Or

2. In patients without suspected OSA, having one or more of the following indications corroborated by the clinical documentation:
   - Severe chronic periodic limb movement disorder (PLMD) (not leg movements associated with another disorder such as sleep-disordered breathing).
   - Parasomnia with documented disruptive, violent, or potentially injurious sleep behavior, suggesting rapid eye movement (REM) sleep-behavior disorder (RBD), not otherwise explained by concurrent medical therapy (sleep-inducing agents) with known side effects.
   - Narcolepsy, once other causes of excessive sleepiness have been ruled out.
   - History of central sleep apnea related to a significant comorbid condition to include, but not limited to, severe congestive heart failure, chronic kidney disease (Stage 3 or greater), advanced neurological disorder (e.g., Parkinson's disease, ALS), damage to brain stem (e.g., encephalitis).

Or

3. Recent home/portable testing proved to be technically inadequate or failed to establish the diagnosis of OSA in an individual with high pretest likelihood of OSA (i.e., meets medical necessity criteria for diagnostic testing as stated above in policy).

Or

4. Patient and/or caregiver are incapable of operating home testing equipment.

Or

5. For initial titration of a hypoglossal nerve stimulator (home sleep study can be used for subsequent adjustments and monitoring)

Repeat Attended Polysomnography (PSG) or Home Sleep Test (HST)– Adult

Repeat testing is considered medically necessary when any of the following conditions are present*:

*Note: A repeat attended PSG will be allowed only if the member met the criteria initially for an attended PSG.

6. Follow-up PSG or HST is recommended to assess response to treatment with non-PAP interventions.
7. Follow-up PSG or HST may be used if clinically significant weight gain or loss has occurred since diagnosis of OSA or initiation of its treatment.
8. Follow-up PSG may be used for reassessment of sleep-related hypoxemia and/or sleep-related hypoventilation following initiation of treatment for OSA.
9. Follow-up PSG or HST may be used in patients being treated for OSA who develop or have a change in cardiovascular disease.
10. Follow-up PSG may be used in patients with unexplained PAP device-generated data.

Split-Night Study/Attended PSG for PAP Titration (95811)

CDPHP considers a split-night study, in which the initial diagnostic portion of the PSG is followed by positive airway pressure (PAP) titration, medically necessary for patients who have met criteria for an attended PSG study and meet the following:

- An Apnea Hypopnea Index (AHI) of at least 40 is documented during a minimum of two hours of diagnostic PSG. Split-night studies should be considered at an AHI of 20-40, if supported by clinical factors (e.g., if there are also repetitive long obstructions and major desaturations).
- CPAP titration is carried out for more than three hours.
- PSG documents that CPAP eliminates or nearly eliminates the respiratory events during REM and non-REM sleep.

CDPHP expects a split-night study be performed as first-line testing for individuals who meet clinical criteria above and have a high pre-test probability of moderate to severe OSA. When authorizing initial in lab sleep studies, authorizations will be put up for 95811. If a titration was not needed, 95810 should be billed. If titration was required but not able to be completed, a new authorization request should be submitted indicating reason for incompletion and if medically necessary a new authorization will be entered with code 95811-52.

CDPHP considers an attended full-night study with positive airway pressure (PAP) titration medically necessary in patients who have met criteria for an attended PSG study and for whom diagnosis of OSA has been confirmed but did not meet criteria for a split-night study, or the split-night study was unsuccessful.

Multiple Sleep Latency Test (MSLT) (95805)

A MSLT may be indicated in the evaluation of patients with suspected narcolepsy (often characterized by cataplexy, sleep paralysis, and hypnagogic/hypnopomic hallucinations) to confirm the diagnosis or to differentiate between suspected idiopathic hypersomnia and

narcolepsy.

CDPHP considers MSLT's medically necessary for either of the following two indications:

1. For evaluation of symptoms of narcolepsy, to confirm the diagnosis; *or*
2. For evaluation of persons with suspected idiopathic hypersomnia to help differentiate idiopathic hypersomnia from narcolepsy.

Narcolepsy and OSA can co-occur. As it is not possible to differentiate between the excessive sleepiness caused by OSA and by narcolepsy, if symptoms of OSA are present, OSA should be ruled out and, if positive, treated before confirming a diagnosis of narcolepsy with the MSLT.

Unattended Home Sleep Test (HST) (95800, 95801, 95806, G0398, G0399, G0400)

CDPHP considers unattended home sleep studies using a minimum of three recording channels, including oxygen saturation, respiratory effort, and airflow medically necessary for the diagnosis of obstructive sleep apnea in an adult (age 18 and older) when *all* of the following criteria are met:

- Medical necessity criteria for a sleep study for suspected obstructive sleep apnea (OSA) as outlined above have been met.
- A high pre-test probability of moderate to severe OSA as determined by the comprehensive sleep evaluation.
- No sleep disorder other than OSA is suspected (e.g., central sleep apnea, insomnia, parasomnias, circadian rhythm disorders, narcolepsy, periodic limb movement disorder).
- Patient and/or caregiver are capable of operating home testing equipment and undergo a face-to-face demonstration of how to properly apply a portable sleep monitoring device before having the test. This education must be provided by the entity performing the home sleep test.

<u>Other Considerations for HST:</u>

- Unattended sleep-testing devices that use less than three channels are considered experimental/investigational when used in screening, diagnosing, or treating OSA and other respiratory conditions.

- CDPHP does not cover home/portable sleep study for the diagnosis of OSA in a child age 17 years and younger, as it is considered experimental, investigational, or unproven.

Attended Polysomnography – Pediatric (95782, 95783, 95808, 95810, 95811)

CDPHP considers diagnostic, attended PSG medically necessary to confirm a diagnosis of sleep-related breathing disorder in a pediatric patient (age 17 and under) when both of the following criteria are met:

- Medically necessary criteria for an attended sleep study for suspected obstructive sleep outlined above have been met; AND

Any of the following conditions:

- Suspected sleep apnea, including obstructive sleep apnea (OSA) and upper-airway resistance syndrome based on clinical assessment.
- Congenital central alveolar hypoventilation syndrome or sleep-related hypoventilation due to neuromuscular disorders or chest wall deformities:
- Nocturnal seizure disorder
- REM behavior disorder (rare in childhood)
- Repeat PSG following adenotonsillectomy if there are residual symptoms of OSA or to assess for residual OSA.
- Polysomnography of primary sleep apnea of infancy (when other medical disorders have been ruled out)
- Primary sleep apnea of infancy when other medical disorders have been ruled out.
- Clinical evidence of a sleep-related breathing disorder in infant who has experienced an apparent life-threatening event (ALTE).

Repeat Attended Polysomnography (PSG) – Pediatric

A repeat attended PSG is considered medically necessary in any of the following circumstances:

- Initial polysomnography is inadequate or non-diagnostic and the accompanying caregiver reports that the child's sleep and breathing patterns during the testing were not representative of the child's sleep at home.
- A child with previously diagnosed and treated obstructive sleep apnea continues to exhibit persistent snoring or other symptoms of sleep-disordered breathing.
- Following adenotonsillectomy, if there are residual symptoms of OSA or to assess for residual OSA.
    - To reevaluate the appropriateness of continuous positive airway pressure (CPAP) setting based on the child's growth pattern or the presence of recurrent symptoms while on CPAP
    - If obesity was a major contributing factor, and significant weight loss has been achieved, repeat testing may be indicated to determine the need for continued therapy.

Medical Management for Obstructive Sleep Apnea

Non-Surgical Treatments

Continuous positive airway pressure (CPAP) is a non-invasive technique for providing single levels of air pressure from a flow generator, via a nose or facial mask, through the nares. The purpose is to prevent the collapse of the oropharyngeal walls and the obstruction of airflow during sleep.

POLICY NAME: OBSTRUCTIVE SLEEP APNEA: DIAGNOSIS & TREATMENT

Bi-level positive airway pressure (BiPAP) devices are used in the treatment of OSA for an individual with coexisting central hypoventilation or for an individual who requires, but proves intolerant to, high pressures of CPAP or APAP.

Auto-titrating continuous positive airway pressure (APAP) *devices* are used to maintain a patent oropharynx to treat patients with obstructive sleep apnea. In contrast to CPAP, which maintains a fixed pressure titrated manually in a sleep center by a sleep technician, APAP devices titrate effective airway pressure throughout the night using an algorithm that responds to physiologic signals. AutoPap may be used as an alternative therapy for patients who are intolerant of pressures in conventional CPAP therapy, may be used for an unattended in-home CPAP titration after a positive sleep study or when follow-up indicates a need for CPAP pressure changes.

CDPHP administers benefits for Positive Airway Pressure (PAP) therapy, under the durable medical equipment benefit, in the treatment of symptomatic obstructive sleep apnea as confirmed by supervised polysomnography or an unattended home portable sleep study as follows:

CPAP (E0601):

Member has a sleep test that meets either of the following criteria (1 or 2):

1. The apnea-hypopnea index (AHI) or Respiratory Disturbance Index (RDI) is greater than or equal to 15 events per hour with a minimum of 30 events; or,
2. The AHI or RDI is greater than or equal to five events and less than or equal to 14 events per hour with a minimum of 10 events and documentation of:
    a. Excessive daytime sleepiness, impaired cognition, mood disorders, or insomnia; or,
    b. Hypertension, ischemic heart disease, or history of stroke.

BiPAP (E0470)

Member meets the criteria above, in addition to the below:

1. A CPAP device has been tried and proven ineffective based on a therapeutic trial conducted in either a facility or in a home setting. (Exception: BiPAP therapy is available as a first-line treatment for individuals with appropriate associated medical conditions i.e., obesity hypoventilation or neuromuscular disease).

An initial three-month rental of CPAP/BiPAP/APAP equipment will be allowed for home use.

- If CPAP titration is medically necessary, it is expected that APAP be used for in-home titration following a positive unattended home sleep study.

POLICY NAME: OBSTRUCTIVE SLEEP APNEA: DIAGNOSIS & TREATMENT

Patients must undergo objective CPAP/BiPAP/APAP monitoring and demonstrate compliance and effectiveness prior to purchasing the equipment. Compliance is defined as use of PAP ≥ four hours per night on 70 percent of nights during a consecutive 30-day period anytime during the first three months of initial usage.

- Requests for the initial purchase of CPAP/BiPAP/APAP equipment will be allowed only after the enrollee has completed two months of rental and compliance is well-documented.

Prior authorization is not required for non-heated (E0561) or heated humidifiers (E0562) when dispensed for use with covered positive airway pressure devices.

- Humidifiers are to be rented during the initial three-month period for use with CPAP/BiPAP devices. CDPHP will not provide reimbursement for the purchase of a humidifier while the equipment is being rented. If the rental period for the CPAP/BiPAP is extended, the humidifier rental may be extended as well.

Oral Appliances (E0485, E0486, K1027, D9947, D9948, D9949)

Oral appliances for the treatment of sleep-disordered breathing are devices worn in the mouth during sleep to maintain a patient's airway by raising the uvula, depressing the tongue, and/or advancing the mandible.

CDPHP considers a custom-fabricated mandibular-advancement oral appliance (E0486) used to treat obstructive sleep apnea (OSA) medically necessary when all of the following criteria are met:

- A face-to-face clinical evaluation is performed by, or under the direction of, a board-certified sleep medicine specialist or subspecialist in neurology, otolaryngology, or pulmonary medicine prior to the sleep test to assess the beneficiary for obstructive sleep apnea testing.
    - Documentation must include counseling regarding potential treatment options.
- The enrollee has a covered sleep test that meets *one* of the following three criteria:
    - The apnea-hypopnea index (AHI) or respiratory disturbance index (RDI) is greater than or equal to 15 events per hour with a minimum of 30 events; **or**
    - The AHI or RDI is greater than or equal to five and less than or equal to 14 events per hour with a minimum of 10 events and documentation of:
        - Excessive daytime sleepiness, impaired cognition, mood disorders, or insomnia; **or**
        - Hypertension, ischemic heart disease, or history of stroke
    - If the AHI > 30 or the RDI > 30 and meets either of the following:
        - The beneficiary is not able to tolerate a positive airway pressure (PAP) device; **or**
        - The treating physician determines that the use of a PAP device is contraindicated.

- The device is ordered by the treating physician following a review of the report of the sleep test. (The physician who provides the order for the oral appliance could be different from the one who performed the clinical evaluation).
- The device is provided and billed for by a licensed dentist (DDS or DMD).

Benefit is limited to one appliance every five years (reasonable useful lifetime).

All follow-up care, including fitting, adjustments, modifications, and professional services required during the first 90 days after the provision of the oral appliance are considered to be included in the payment for the device.

Benefit is limited to either an oral appliance or CPAP. Coverage for both would require documentation from a physician stating the medical necessity for both types of treatment to be administered at the same time.

Casts and study molds for an oral appliance or device are considered global to the device.

Benefits for oral appliances are not available under the following conditions:

- Oral appliances that are available over the counter without a prescription.
- Oral appliances used to treat snoring without a diagnosis of obstructive sleep apnea.
- Oral appliances used to treat temporomandibular joint (TMJ) disorders that are dental in nature.

Surgical Treatments

Uvulopalatopharyngoplasty (UPPP) (42145)

Uvulopalatopharyngoplasty is used to treat OSA by the removal of excess tissue in the upper airway, including tonsils and uvula, to widen the area to increase airflow. It is considered medically necessary for individuals who do not respond to CPAP, are not appropriate candidates for CPAP, or who fail treatment attempts with CPAP or treatment with behavioral measures such as weight loss or sleep-position change.

Hypoglossal Nerve Stimulation (64582-64584, 64568, 64569, 64570)

Hypoglossal nerve stimulation, also known as upper airway stimulation, is an alternative treatment for the correction of moderate to severe obstructive sleep apnea for individuals who have failed or are intolerant to positive airway pressure. The treatment works by stimulating the hypoglossal nerve to restore the tone to (or stiffen) the key tongue muscles that, when relaxed, can block the airway, causing an obstruction that reduces or stops breathing during the night. The Inspire Upper Airway Stimulator is a fully implanted system consisting of three components: a small generator, a sensing lead, and a stimulation lead. The single external component is a small handheld sleep remote used to turn the therapy on before bed and off upon waking. The pacemaker-like implant in the chest sends a mild electrical jolt down a lead to the hypoglossal nerve at the base of the tongue, moving the tongue to clear the airway. A lead in the chest

senses when to send the pulse in the breathing cycle. When activated, Inspire therapy senses breathing patterns and delivers mild stimulation to key airway muscles, which keeps the airway open during sleep.

CDPHP administers benefits for hypoglossal nerve stimulation for the treatment of moderate to severe obstructive sleep apnea when *all* of the following criteria are met:

- Member is 22 years of age or older.
- Body mass index (BMI) is less than or equal to 35.
- Apnea-hypopnea index (AHI) is 15 to 65 events per hour, and they are predominantly obstructive events (defined as central and mixed apneas less than 25 percent of the total AHI).
- Member has a minimum of one month of CPAP monitoring documentation that demonstrates CPAP failure (defined as AHI greater than 20 despite CPAP usage) or intolerance (defined as less than four hours per night, five nights per week).
- Absence of complete concentric collapse at the soft palate level as evidenced on a drug-induced sleep endoscopy procedure.
- No other anatomical finding that would compromise the performance of upper airway stimulation (e.g., tonsillar hypertrophy, tumors, polyps, or nasal obstruction) or intrinsic neuromuscular disease or other neurologic deficits.
- Procedure is performed with a Food and Drug Administration (FDA) approved hypoglossal nerve neurostimulator.

OR

For pediatric patients (aged 13-18 years) with Down Syndrome and all of the following criteria:

- AHI greater than 10 and less than 50;
- Less than 25% central apneas after prior adenotonsillectomy;
- Absence of a complete concentric collapse at the soft palate level on drug induced sleep endoscopy;
- Body mass index ≤ 95th percentile for age;
- Have either a tracheotomy or have been confirmed to fail, or cannot tolerate, PAP therapy despite attempts to improve compliance;
- Have followed standard of care in considering all other alternative/adjunct therapies.

Additional Procedures/Services

CDPHP considers the following procedures experimental/investigational for the treatment of obstructive sleep apnea, as efficacy has not been established in published scientific literature.

- Injection snoreplasty (42299)
- Laser-assisted uvulopalatoplasty (LAUP) (S2080)
- Pillar® Palatal Implant System (C9727)
- Radiofrequency tissue volume reduction of the tongue base (41530), uvula or soft

palate, or for tonsillar hypertrophy (e.g., Somnoplasty®)
- Tongue base suspension (AIRVance Tongue and Hyoid Suspension System, 41512)
- Hyoid myotomy and suspension (21685)

EXCLUSIONS

Prefabricated oral appliance (E0485) as there is insufficient evidence to show that these items are effective therapy for OSA.

Expiratory positive airway pressure intranasal resistance valve; (i.e., the ULTepap system-A7049)

Polysomnography and home sleep tests to evaluate OSA are not covered in any of the following situations:

- For the evaluation of snoring, in the absence of criteria for obstructive sleep apnea.
- When performed as a screening tool or as part of a preoperative evaluation in asymptomatic patients.

CDPHP considers actigraphy testing (95803) experimental/investigational. This technique, when used alone (single-channel study), has not been validated as a method of diagnosing OSA or other sleep disorders.

CDPHP does not cover an abbreviated cardiorespiratory sleep study to acclimate an individual to PAP (e.g., PAP-Nap study, CPT code 95807-52) because it is considered experimental, investigational, or unproven.

NightOwl Home Sleep Test

Impression And Custom Preparation of Jaw Expansion Oral Prosthesis (0964T, 0965T,0966T).

CDPHP PRODUCT VARIATIONS

CHILD HEALTH PLUS	Subject to all terms and conditions noted above in the policy.
MEDICARE ADVANTAGE	Subject to all terms and conditions noted above in the policy. CPAP based on clinical diagnosis alone or using a diagnostic procedure other than polysomnography or Type II, III, or IV portable/home test measuring at least three channels is covered only when provided in the context of a clinical trial.
SELECT PLAN/HARP	Subject to all terms and conditions noted above in the policy with

	the below exception: Hypoglossal Nerve Stimulators are available for: • Individuals 13 years of age through 17 years of age with Down Syndrome and a diagnosis of moderate to severe OSA with inability to tolerate PAP therapy or has failed PAP therapy. • Individuals 18 years of age and over with a diagnosis of moderate to severe OSA and inability to tolerate PAP therapy or has failed PAP therapy.

POLICY HISTORY

This section is intended to provide only highlights of the policy changes. The policy should always be reviewed in its entirety to ensure a comprehensive understanding of coverage.

Effective Date	Update
10/1/2025	Added allowance/criteria for hypoglossal nerve stimulator for pediatric members with down syndrome.
7/1/2025	Added codes 64568-64570 to hypoglossal nerve stimulation section

POLICY NAME: OBSTRUCTIVE SLEEP APNEA: DIAGNOSIS & TREATMENT

	Added new codes 0964T-0966T to exclusions.
3/1/2025 *No change to effective date of policy	Clarification added for split night studies.
3/1/2025	Under Medicaid section, added hypoglossal nerve stimulators guidelines.
2/1/2025	Added another indication for a in lab sleep study.
11/1/2024	Added NightOwl Home Sleep Test to the exclusion section.
8/1/2024	Under Diagnostic testing, updated criteria to state that only a person that is board certified in sleep medicine can perform an OSA evaluation.
3/1/2024	Removed section on Radiofrequency Tissue Volume Reduction for hypertrophy of nasal turbinates and moved to the Non-Covered Technology policy.
4/1/2023 *No change to effective date of policy	Removed below statement as replacement of DME source is identified in the Durable Medical Equipment, 1370/20.000509 policy: CDPHP will allow for the purchase of CPAP, BiPAP, APAP equipment (one unit), per enrollee, every five years, when the above criteria are met.
4/1/2023	Added new HCPCS code A7049 to the exclusions section.
5/1/2022* No change to effective date of policy	Updated verbiage under the Medical Management of OSA section as current verbiage implies that prior authorization is required for CPAP, BiPAP, or APAP machines.
5/1/2022	Updated criteria in the following sections: • Attended Polysomnography- Adults • Repeat PSG or HST- Adults • Medical Management for Obstructive Sleep Apnea Added Prefabricated Oral Appliance (E0485) to exclusions. Effective 01/01/2022: Removed deleted codes 0466T-04668T and updated with replacement codes 64582-64584. Also removed code 64568.
10/01/21	Added new codes for oral sleep appliances: K1027 (effective 10/1/21) and D9947, D9948, D9949 (effective 1/1/2022).

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: OBSTRUCTIVE SLEEP APNEA: DIAGNOSIS & TREATMENT

7/1/2020	Updated criteria for oral appliances to include a face-to-face clinical evaluation is performed by, or under the direction of, a board-certified sleep medicine specialist or subspecialist in neurology, otolaryngology, or pulmonary medicine prior to the sleep test to assess the beneficiary for obstructive sleep apnea testing and that documentation must include counseling regarding potential treatment options.
5/1/2020	Updated criteria for oral appliances in the Application section in accordance with Medicare coverage criteria. Added additional sources of information (45 and 46)
1/1/2020	Added information and criteria for Multiple Sleep Latency Test (MSLT) to the Application section.

POLICY NAME: OCCUPATIONAL THERAPY

POLICY EFFECTIVE DATE:	3/1/2025
Policy Control #:	1370/20.000104
Next Annual Review:	March 2027

DISCLAIMER

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgement when deciding the most appropriate care to enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

PROCEDURE CODES

Modalities: 97010-97039, G0281, G0283, G0329
Therapeutic Procedures: 97110-97546
Tests & Measurements: 97750, 97755
Orthotic & Prosthetic Management: 97760-97763

DESCRIPTIONS

The primary purpose of occupational therapy is to increase the strength of muscles and the range of motion in joints with special attention to fine motor activity.

Occupational therapy services must be specific, effective, and reasonable treatment for the patient's diagnosis and condition relative to the information gathered on the care plan/progress note. Services must be performed to achieve a specific diagnosis related goal for a patient who has reasonable expectation of achieving measurable improvement in a reasonable time.

Occupational therapy services must be performed by a qualified occupational therapist who is licensed where required and who is performing within the scope of the license. These services must require the judgment, knowledge, and skills of a qualified provider because of the

complexity and sophistication of the therapy and/or the physical condition of the patient.

Occupational therapy services may be habilitative or rehabilitative in nature.

- **Rehabilitation services** are health care services that help a person keep, get back, or improve skills and functioning for daily living that have been lost or impaired because a person was sick, hurt, or disabled.
- **Habilitation Services** are health care services that help a person keep, learn, or improve skills and functioning for daily living. They include the management of limitations and disabilities, including services or program that help maintain or prevent deterioration in physical, cognitive, or behavioral function.
  - *Refer to specific member contracts for availability of benefits, if any, relating to habilitative services*.

POSITION STATEMENT

CDPHP administers benefits for medically necessary occupational therapy as outlined below.

Outpatient Occupational Therapy

CDPHP administers benefits for medically necessary occupational therapy that can result in clinical improvement in the enrollee's condition when all the following conditions are met:

1. Occupational therapy services are medically necessary, are recommended by the ordering practitioner, and are related to the treatment or diagnosis of a physical illness or injury (includes medically diagnosed congenital defect of a covered child).

2. Services are ordered by a primary care physician, neurologist, pediatric neurologist, neurosurgeon**,** orthopedic surgeon, physiatrist, rheumatologist, hand surgeon, vascular surgeon, or pulmonologist.

3. A plan to ensure the successful transition to a home exercise program will be initiated early in the course of therapy.

4. Services must be performed by a qualified occupational therapist who is performing within the scope of their license.

5. Occupational therapy services are subject to all applicable contract limitations.

Autism Spectrum Disorder

Benefits are provided for covered therapeutic services, to include those for habilitative services, necessary to develop, maintain, or restore, to the greatest extent practicable, functioning of an individual when such services are provided by a licensed occupational therapist for the treatment of autism spectrum disorder. Such benefits will apply only to those plans to which the mandate applies.

Vestibular Rehabilitation Therapy

Benefits may be provided for vestibular rehabilitation therapy for enrollees who meet the following criteria:

- Documentation of vestibular hypofunction with continuous presenting symptoms for at least two months and;
- Unresponsive to conventional therapy.

POLICY CONSIDERATIONS

Benefits for occupational therapy services are subject to all contract limitations and appropriate visit cost share as stated in the enrollee's contract.

CDPHP will reimburse occupational therapy services as a global payment based upon first service billed, per date of service, per practitioner, per contractual agreement.

A treatment plan will be developed in conjunction with the physician, enrollee, and other consultation as necessary.

All patients participating in occupational therapy are expected to actively participate in a daily home exercise program, outlined by the occupational therapist, to meet expected goals.

Capital District Physicians' Health Plan, Inc.
CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: OCCUPATIONAL THERAPY

A session is defined as a treatment, and/or evaluation provided on any given day.

The patient must exhibit significant and progressive improvements and compliance with home exercise programs.

Benefits are provided for medically necessary occupational therapy services in the home setting as follows:

- Services are rendered by a participating home health agency and;

- Required criteria for home health care services are met in accordance with resource coordination policy, *Home Care Services: Home Health Care/Telehomecare/Personal Care/Personal Emergency Response System.*

Coverage will be provided for establishment/re-evaluation of a home maintenance program, up to a maximum of six visits per calendar year. However, no coverage will be provided for the continuation of maintenance programs (i.e., activities which preserve the patient's present level of function or when no additional functional progress is apparent or expected to occur).

CDPHP does not provide benefits for massage therapy as a stand-alone treatment. Massage therapy (97124) is considered an acceptable treatment when it is part of a comprehensive treatment plan consisting of a combination of other covered procedures and modalities and performed by a practitioner who is licensed and is performing within the scope of the license**.**

Medically necessary occupational therapy conducted on two non-adjacent body parts (e.g., shoulder and wrist) will be reimbursed at one and a half times standard therapy when billed using modifier 59.

Medically necessary occupational therapy conducted on two or more co-linear and adjacent body parts (e.g., cervical and thoracic spine or a shoulder, elbow, and wrist) will be reimbursed as a single standard therapy.

Benefits will be provided for covered durable medical equipment required as part of a home program when in compliance with the requirements outlined in the CDPHP resource coordination policy: *Durable Medical Equipment, Prosthetics/Orthotics & Medical Supplies 1370/20.000509.*

When a service or procedure that may be either habilitative or rehabilitative in nature is provided for **habilitative purposes**, the use of modifier 96 is required to indicate that the service or procedure provided was a habilitative service.

Services or procedures provided for rehabilitative purposes do not require the use of a modifier.

Capital District Physicians' Health Plan, Inc.
CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: OCCUPATIONAL THERAPY

All occupational therapy services are subject to retrospective review for medical appropriateness as defined by this policy and for compliance with the enrollee's contract.

Coverage will no longer be provided once the allowable maximum benefit is exhausted, even if the medical necessity criteria stated above is met.

EXCLUSIONS

Occupational therapy that duplicates services already being provided as part of another therapy program through another therapy discipline (i.e., physical therapy). When multiple therapies are used, each must have separate written treatment plans and must provide significantly different treatments.

Occupational therapy that duplicates services being provided by a federal or state governmental agency (i.e., Early Intervention Program), by a school district (Individualized Educational Program) or by a developmental learning center that are sufficient in meeting the needs of an individual.

Chronic conditions which will require maintenance therapy (S8990) to prevent regression.

Iontophoresis (97033), used for administration of non-steroidal anti-inflammatory drugs or corticosteroids for treating musculoskeletal disorders, as scientific evidence does not support the use of this procedure as an effective therapy modality.

Infrared therapy (97026) used for the treatment of diabetic and/or non-diabetic peripheral sensory neuropathy, wound healing, or pain management (e.g., Anodyne Therapy System) as scientific evidence does not support the use of this procedure as an effective therapy modality.

Prolotherapy (M0076), for the treatment of joint or ligament instability, as scientific evidence does not support the use of this procedure as an effective physical therapy modality.

Hippotherapy (S8940), as scientific evidence is insufficient to determine the effects of this technology on health outcomes for any indication, including autism spectrum disorder, cerebral palsy, or other motor dysfunctions.

Music therapy/therapeutic listening.

Orthotic and prosthetic training, fitting, and checkout (97760, 97761, 97763) are considered global to the dispensing of the device.

Services for the purpose of athletic training evaluation (97169, 97170, 97171, 97172),

enhancing athletic performance or for recreation.

Sensory integrative techniques (97533), as currently the scientific evidence does not support the use of these services as an occupational therapy modality.

Self-care/home management training, community/work reintegration training, physical performance test or measurement and assistive technology assessment (97535, 97537, 97750, 97755).

Work hardening programs (97545, 97546), as such programs are not considered a medical necessity but rather a requirement of employment.

Benefits are not provided when a session consists of modalities alone, i.e., hot packs, whirlpool, paraffin baths, Hubbard tank, cold packs/ice packs and contrast baths. These alone are not considered a skilled level of treatment.

No coverage will be provided when maximum physical benefit has been achieved (i.e., the goals of achieving functional improvement have been met and the patient no longer requires skilled occupational therapy intervention).

Concurrent treatment for the same condition by both a chiropractor and occupational therapist will not be allowed.

CDPHP PRODUCT VARIATIONS

CHILD HEALTH PLUS	Subject to all terms and conditions noted above in the policy. Benefits are provided for a condition amenable to significant clinical improvement within a period of 60 days or less from the date of the initial treatment.
MEDICARE ADVANTAGE	Subject to all terms and conditions noted above in the policy Benefit coverage to include unlimited medically necessary occupational therapy visits. Includes therapy that would otherwise be covered as an inpatient and is provided under the care of a physician pursuant to a written plan of treatment. The following occupational therapy codes are covered: • Evaluation: 97165, 97166, 97167, 97168 • Modalities: 97010-97032, 97033-97039, G0281, G0283, G0329 (97026 is non-covered). G0281 and G0329 are only

	covered for chronic stage III and stage IV pressure ulcers, arterial ulcers, diabetic ulcers, and venous stasis ulcers not demonstrating measurable signs of healing after 30 days of conventional care as part of a therapy plan of care. • Therapeutic procedures: 97110-97130, 97139-97542, 97750-97755, 97760-97763 (97545, 97546 are non-covered).
SELECT PLAN/HARP	Subject to all terms and conditions noted above in the policy. Benefit coverage includes unlimited medically necessary occupational therapy visits.
SMALL GROUP/ COMMERCIAL INDIVIDUAL	Covered rehabilitative occupational therapy services must begin within six months of the later to occur: • The date of the injury or illness that caused the need for the therapy; • The date of discharged from the hospital where the surgical treatment was rendered; or • The date outpatient surgical care is rendered. Habilitation services consisting of occupational therapy are covered in the outpatient department of a facility or in a health care professional's office.

POLICY HISTORY

This section is intended to provide only highlights of the policy changes. The policy should always be reviewed in its entirety to ensure a comprehensive understanding of coverage.

Effective Date	Update
3/1/2025 *No change to effective date of policy	Under Medicare section, removed information on iontophoresis for hyperhidrosis as this listed in the Non-Covered Technologies policy with an exception for Medicare Advantage.
3/1/2025	Removed Pneumatic cervical traction devices (E0856) from Exclusions as it is addressed in the Durable Medical Equipment, Orthotics/Prosthetics and Medical Supplies policy.
6/1/2023 *No change to effective date of policy	Removed verbiage under the Small Group Commercial/Individual section to mirror contract language.
6/1/2023	Removed specific diagnoses from the exclusion section.
4/1/2022 *No change to policy effective date	Clarified coverage in Medicare section and removed deleted codes 97005 and 97006. Removed visit limitations under product variations as contracts are the best source for identifying limits.
4/1/2022	Updated Medicare section to include coverage of iontophoresis for treatment of intractable, disabling primary focal hyperhidrosis per LCD L33631
1/1/2021	Updated the Select Plan/Harp section as coverage now includes unlimited medically necessary occupational therapy visits.

Disclaimer Notice

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgment when deciding the most appropriate care to enrollees. The CDPHP coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

Background

Omisirge (omidubicel-onlv) is an ex-vivo expanded cell therapy derived from umbilical cord blood, engineered to enhance hematopoietic recovery following stem cell transplantation. Omisirge is manufactured using proprietary nicotinamide (NAM) technology, which modifies the stem cells to improve their functionality and speed up recovery. Ex-vivo expansion of cord blood derived hematopoietic progenitor cells (HPCs) in the presence of NAM leads to preservation of their stemness, supports bone marrow (BM) engraftment, and enables rapid neutrophil and multilineage immune recovery as demonstrated in clinical trials. Omisirge is FDA-approved for:

- Adults and pediatric patients 12 years and older with hematologic malignancies who are planned for umbilical cord blood transplantation following myeloablative conditioning to reduce the time to neutrophil recovery and the incidence of infection.
- Adults and pediatric patients 6 years and older with severe aplastic anemia (SAA) following reduced intensity conditioning.

Umbilical cord blood (UCB) is a well-established alternative graft source for patients requiring hematopoietic cell transplantation (HCT) who lack a suitable human leukocyte antigen (HLA)-matched related or unrelated donor.[2] Unfortunately, the relatively low number of hematopoietic progenitor cells and mature T cells in a single UCB unit often results in inadequate or delayed engraftment. To address this limitation, transplantation with two UCB units has become standard practice in adults. Despite this, hematopoietic recovery remains slower compared to HCT from related or unrelated donors and is associated with higher treatment-related morbidity and mortality.[3] Consequently, UCB transplantation typically leads to longer hospital stays, increased resource utilization—such as blood product transfusions—and higher overall costs, particularly during the early post-transplant period.[4,5,6]

On April 17, 2023, the FDA approved Omisirge for adults and pediatric patients 12 years and older with hematologic malignancies who are planned for umbilical cord blood transplantation following myeloablative conditioning to reduce the time to neutrophil recovery and the incidence of infection. This approval was supported by data from an open-label, Phase III, multicenter, randomized trial (Study P0501 [NCT02730299]) involving 125 patients eligible for allogenic transplant without a suitable human leukocyte antigen (HLA)-matched related or unrelated donor. In the trial, 62 patients were randomized to receive Omisirge and 63 patients were scheduled to undergo standard umbilical cord blood transplantation. Omisirge (omiduvicel-onlv) met its primary endpoint of faster neutrophil recovery compared to UCB. In addition, the Omisirge treatment arm demonstrated faster platelet recovery, a reduced rate of infections, and shorter hospital length of stay compared with UCB.[7]

Severe aplastic anemia is a rare, life-threatening hematologic disease characterized by bone marrow failure and low circulating blood cells. Although long term survival for SAA patients can be achieved with immunosuppressive therapy (IST), one quarter to one third will fail to respond and about half of responders will relapse. Hematopoietic stem cell transplant may be curative for SAA, but many refractory SAA pts lack an HLA matched donor for salvage allogeneic stem cell transplantation. Although umbilical cord blood transplantation (UCBT) offers an alternative treatment option for patients with severe aplastic anemia (SAA), it is associated with delayed engraftment and elevated rejection rates. Additionally, many UCB units contain insufficient total nucleated cells (TNCs) and CD34+ cells to achieve optimal transplant outcomes.[8]

On December 5, 2025, the FDA expanded the approval of Omisirge to include the treatment of severe aplastic anemia (SAA) in adults and pediatric patients 6 years and older following reduced intensity conditioning. The efficacy of Omisirge in patients with SAA was evaluated in an open-label, single-center study (17-H-0091 [NCT03173937]) consisting of patients with SAA who had intolerance or failure to respond to immunosuppressive therapy and the availability of at least one ≥ 4/8 human leukocyte antigen (HLA)-matched (HLA-A, B, C, and DR loci) cord blood unit. A total of 14 patients were treated with Omisirge, with 86% of patients experiencing early and sustained neutrophil recovery at 100 days, red blood cell transfusion independence, and platelet recovery ≥ 20,000/μL within a year. In addition, 79% of patients demonstrated platelet transfusion independence.

Summary	
Effective Date of Policy:	4/17/2026
Indications	• Adults and pediatric patients 12 years and older with hematologic malignancies who are planned for umbilical cord blood transplantation following myeloablative conditioning to reduce the time to neutrophil recovery and the incidence of infections • Adults and pediatric patients 6 years and older with severe aplastic anemia (SAA) following reduced intensity conditioning
HCPCS Code	J3590 (unclassified)
Availability	Two cryopreserved cell fractions and two infusion solutions
Duration	6 months to allow sufficient time for administration

Required Criteria for Approval

1. Must be prescribed by a hematologist, oncologist, or physician experienced in the treatment of hematologic malignancies and/or severe aplastic anemia AND
2. The patient must be eligible for an allogeneic hematopoietic (stem) cell transplant AND
3. The prescriber must attest that the patient does not have a readily available, matched related donor, matched unrelated donor, mismatched unrelated donor, or a haploidentical related donor
    a. If a more appropriately matched umbilical cord blood unit is available, a mismatched unrelated donor or haploidentical related donor would not be required AND
4. The patient must receive therapy at an authorized treatment center AND
5. The patient must meet ONE of the following (a or b):
    a. The patient must have a hematologic malignancy AND
        i. The patient must be 12 years of age or older AND
        ii. The prescriber must attest that the umbilical cord unit used will be HLA-matched at a minimum of 4 loci (including HLA-A, B at the antigen-level, and DRB1 at the allele level) AND
        iii. The requested treatment must be used to reduce the time to neutrophil recovery and the incidence of infection AND
        iv. The requested treatment must be used following myeloablative conditioning
    b. The patient must have severe aplastic anemia (SAA) as documented by the following:
        i. Bone marrow aspiration (BMA) cellularity of < 30% AND at least two of the following:
            1. Absolute neutrophil count (ANC) < 500 cells/mm^3
            2. Platelet count < 20,000/mm^3
            3. Reticulocyte count < 60,000/mm^3
        ii. The patient must be 6 years of age or older AND
        iii. The patient has tried and failed to respond to or had an intolerance to standard immunosuppressive therapy AND
        iv. The prescriber must attest that the umbilical cord unit used will be HLA-matched at a minimum of ≥ 4/8 loci (HLA-A, B, C and DR loci) AND
        v. The requested treatment must be used following reduced intensity conditioning AND
6. Omisirge is indicated for one-time intravenous administration only and therefore will not be authorized for retreatment. Retreatment will be considered experimental/investigational when any FDA approved gene or cellular therapy, or any other gene or cellular therapy under investigation, has been previously administered.
7. Please refer to the Omisirge FDA-approved prescribing information for complete dosage and administration instructions.
8. Omisirge (omidubicel-onlv) is considered investigational for all other non-FDA approved indications.
9. Authorization will be for 6 months to allow sufficient time for administration.

Considerations

- Patient must have medical drug coverage administered by CDPHP.
- Prior authorization is obtained through the CDPHP pharmacy department.
- Doses and frequency should be in accordance with the FDA label or recognized compendia (for off label uses). When services are performed in excess of established parameters, they may be subject to review for medical necessity

Administration, Retreatment, and Treatment with Additional or Other Gene/Cellular Therapies

a. One-Time Administration
    i. Most gene and cellular therapies, whether autologous, allogeneic ("off-the-shelf"), or in vivo gene-transfer therapies, are designed and studied as one-time treatments.
    ii. Repeat dosing, reinfusion, or sequential therapy with other gene or cellular products has not been established as safe, effective, or clinically appropriate.

b. Retreatment/Repeat Administration
    i. Retreatment with the same gene or cellular therapy product is considered experimental and investigational because:
        1. Clinical trials evaluated these therapies as single-administration interventions
        2. Safety, efficacy, and durability of a second administration have not been established
        3. Risks of immune activation, insertional mutagenesis, or vector immunity may be increased with repeat dosing

c. Treatment with an Additional or Other Gene/Cellular Therapy
    i. Treatment with an additional or different gene or cellular therapy after prior exposure to any gene or cellular therapy is also considered experimental and investigational, unless supported by evidence demonstrating (1-4):
        1. Anticipated clinical benefit beyond available standard therapies
        2. Safety of sequential administration
        3. Justification for selecting a second gene/cellular intervention after a prior one
        4. Meets the criteria established in the Off-Label Use of FDA Approved Pharmacy Management Drug Policy (Pharmacy-32)
    ii. This includes, but is not limited to:
        1. Switching between CAR-T products (e.g., CD19 → CD19 or CD19 → BCMA)
        2. Switching between autologous and allogeneic cellular therapies
        3. Sequential use of CAR-T, TCR-T, NK-cell therapies, or other genetically engineered cell therapies
        4. Receiving a gene therapy after previous gene or cellular therapy exposure
        5. Receiving an in vivo gene therapy following any prior vector-based therapy

d. Prior Gene/Cell Therapy Exposure
    i. An individual is generally not eligible for additional gene or cellular therapy if they have previously received:
        1. Any autologous cellular therapy (e.g., CAR-T, TCR-T, TIL),
        2. Any allogeneic genetically modified cellular therapy,
        3. Any in vivo gene therapy (e.g., AAV, lentiviral vector)
        4. Any ex vivo gene-modified cell product
        5. Are being considered for any other gene or cellular therapy without documented evidence supporting safety and anticipated benefit.

e. Coverage Determination
    i. Absent peer-reviewed evidence demonstrating safety and benefit, retreatment or sequential therapy is considered investigational and will not be covered.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgment when deciding the most appropriate care to enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

Background

Bispecific antibodies (BsAbs) have two distinct binding domains that can bind to two antigens or two epitopes (an antigen part) of the same antigen simultaneously. Most bsAbs are bispecific T-cell-engagers (BiTEs), designed to redirect and/or activate CD3-expressing cytotoxic T cells (CTLs) against a specific tumor target on malignant cells. Other bsAb classes include therapies that target immune checkpoints, oncogenic signaling pathways and cytokines. Bifunctional fusion proteins are a subset of bsAbs that are typically devoid of an Fc region.

Because the FDA has been encouraging drug development in this area, there are now over 100 BsAbs in clinical development, most of which are in the early stages. In 2021, the FDA finalized guidance on BsAb development programs, which discusses aspects for chemistry, manufacturing, and controls (CMCs) as well as nonclinical and clinical development programs. It also describes the challenges, such as immunogenicity related to the novel structures. In addition, the guidance recommends types of data to support BsAb approvals.

The majority of BsAbs to-date target different types of cancer these agents are often reserved for relapsed or refractory stages of cancer. Other BsAbs are focused on chronic inflammatory, autoimmune, and neurodegenerative diseases; vascular ocular, and hematologic disorders; and infections. There have been many FDA-approved bispecific antibodies over the years, most of which approved under the accelerated approval based on response rate and durability of response. Continued approval for these indications may be contingent upon verification and description of clinical benefit in a confirmatory trial(s).

FDA-approved bispecific antibodies for oncology indications include:

Trade name	Year Approved	Mechanism	Indication(s)
Blincyto® (blinatumomab)	2014	CD19-directed CD3 T-cell engager	CD19-positive B-cell precursor acute lymphoblastic leukemia (ALL) in first or second complete remission with minimal residual disease Or Relapsed or refractory CD19-positive B-cell precursor ALL Or CD19-positive Philadelphia chromosome-negative B-cell precursor ALL in the consolidation phase of multiphase chemotherapy
Columvi™ (glofitamab-gxbm)	2023	CD20-directed CD3 T-cell engager	Relapsed or refractory diffuse large B-cell lymphoma, not otherwise specified (DLBCL, NOS) or large B-cell lymphoma (LBCL) arising from follicular lymphoma, after two or more lines of systemic therapy
Epkinly™ (epcoritamab-bysp)	2023	CD20-directed CD3 T-cell engager	Relapsed or refractory DLBCL, not otherwise specified, including DLBCL arising from indolent lymphoma, and high-grade B-cell lymphoma after two or more lines of systemic therapy Or Relapsed or refractory follicular lymphoma (FL) after two or more lines of systemic therapy
Lunsumio™ (mosunetuzumab-axgb)	2022	CD20-directed CD3 T-cell engager	Relapsed or refractory follicular lymphoma after two or more lines of systemic therapy
Lynozyfic™ (linvoseltamab-gcpt)	2025	B-cell maturation antigen (BCMA)-directed CD3 T-cell engager	Relapsed or refractory multiple myeloma who have received at least four prior lines of therapy, including a proteasome inhibitor, an immunomodulatory agent, and an anti-CD38 monoclonal antibody
Rybrevant® (amivantamab-vmjw)	2021	EGF receptor-directed and MET receptor-directed antibody	Locally advanced or metastatic non-small cell lung cancer (NSCLC) with epidermal growth factor receptor (EGFR) exon 19 deletions or exon 21 L858R substitution mutations in combination with lazertinib Or Locally advanced or metastatic NSCLC with EGFR exon 19 deletions

			or exon 21 L858R substitution mutations, whose disease has progressed on or after treatment with an EGFR tyrosine kinase inhibitor, in combination with carboplatin and pemetrexed Or Locally advanced or metastatic NSCLC with EGFR exon 20 insertion mutations, in combination with carboplatin and pemetrexed Or Locally advanced or metastatic NSCLC with EGFR exon 20 insertion mutations, whose disease has progressed on or after platinum-based chemotherapy
Imdelltra™ (tarlatamab-dlle)	2024	Delta-like ligand 3 (DLL3)-directed CD3 T-cell engager	Extensive stage small cell lung cancer (ES-SCLC) with disease progression on or after platinum-based chemotherapy
Talvey™ (talquetamab-tgvs)	2023	GPRC5D-directed CD3 T-cell engager	Relapsed or refractory multiple myeloma who have received at least four prior lines of therapy
Tecvayli® (teclistamab-cqyv)	2022	BCMA-directed CD3 T-cell engager	Relapsed or refractory multiple myeloma who have received at least four prior lines of therapy
Elrexfio™ (elranatamab-bcmm)	2023	B-cell maturation antigen (BCMA)-directed CD3 T-cell engager	Relapsed or refractory multiple myeloma who have received at least four prior lines of therapy
Ziihera® (zanidatamab-hrii)	2024	Bispecific HER2-directed antibody	Previously treated, unresectable or metastatic HER2-positive (IHC 3+) biliary tract cancer (BTC), as detected by an FDA-approved test

Due to the possibility of cytokine release syndrome and immune effector cell-associated neurotoxicity syndrome (ICANS), most BsAbs have specific step-up dosing protocols where patients should be hospitalized and monitored for potential reactions. Due to the risk of CRS and neurologic toxicity, including ICANS, some BsAbs have REMS programs where prescribers, pharmacies, healthcare settings, and wholesalers and distributers must be certified. Additionally, all BsAbs have a warning for embryo-fetal toxicity, and most have warnings for infections and other toxicities.

Summary	
Effective Date of Policy:	9/10/2025
Applicable Agents	Blincyto® (blinatumomab), Columvi™ (glofitamab-gxbm), Epkinly™ (epcoritamab-bysp), Lunsumio™ (mosunetuzumab-axgb), Rybrevant® (amivantamab-vmjw), Imdelltra™ (tarlatamab-dlle), Talvey™ (talquetamab-tgvs), Tecvayli® (teclistamab-cqyv), Elrexfio™ (elranatamab-bcmm), Lynozyfic™ (linvoseltamab-gcpt)
Duration	Initial: three months Continuation: three months

This policy applies to all bispecific antibodies for oncologic indications, including new to market agents not listed above.

Required Criteria for Initial Approval		
All of the following conditions for the requested indication must be met in order to approve therapy:		
Indication	**Inclusion Criteria**	**Recommended Dosing Regimen**
Refer to specific product for indication	1. Documented FDA approved indication per prescribing information or supported evidence per NCCN guidelines 2. Eastern Cooperative Oncology Group (ECOG) performance status of 0 or 1 3. For enrollees of childbearing age: a. If female, documentation of negative pregnancy test	• Refer to FDA prescribing information

	b. If male, documentation enrollee has been counseled on reproductive risk and need for appropriate contraception for any female partners during treatment and for 90 days after last dose 4. Must be administered at an authorized treatment center where dosing protocols and hospital stay requirements are followed according to the FDA label	

Exclusion Criteria

Therapy will not be covered if any of the below criteria are met:

- Use as first-line therapy (except for blinatumomab)
- Indication not approved by the FDA or supported by NCCN guidelines

Continuation Criteria

- Requests will be reviewed per criteria every three months
- Member has not had unacceptable toxicities
- Member has not had disease progression while receiving therapy

Considerations

- Please refer to the package insert for detailed dosing information.
- Prior authorization is obtained through the CDPHP pharmacy department.
- Some products require failure to systemic therapies. Some of the commonly used agents are listed below for reference in Table 1.

Table 1.

Proteasome inhibitors	Immunomodulatory agents	Anti-CD38 monoclonal antibodies
Kyprolis (carfilzomib)	Thalomide (thalidomide)	Darzalex (daratumumab)
Velcade (bortezomib)	Revlimid (lenalidomide)	Sarclisa (isatuximab)
Ninlaro (ixazomib)	Pomalyst (pomalidomide)

Next Annual Review:	8/2026

DISCLAIMER

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgement when deciding the most appropriate care to enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice

PROCEDURE CODES

DESCRIPTION

Methadone, buprenorphine and naltrexone are FDA approved Medications for Addiction Treatment (MAT) for the treatment of opioid use disorder (OUD). Buprenorphine and naltrexone are available in long acting injectable (LAI) formulations. Methadone is full agonist at the mu opioid receptor subtype, buprenorphine is a partial agonist at the mu opioid receptor subtype and naltrexone is an antagonist at the mu receptor subtype. The goal of MAT for OUD is to prevent and/or treat opioid withdrawal (methadone and buprenorphine only), reduce opioid cravings, and to reduce the risk of opioid overdose in the context of OUD.

In the United States, the treatment of OUD with medications is governed by the Certification of Opioid Treatment Programs, 42 Code of Federal Regulations (CFR) 8. This regulation created a system to accredit and certify opioid treatment programs (OTPs). OTPs can provide medication for addiction treatment (MAT) and/or therapy for people diagnosed with OUD.

POLICY NAME: OPIOID TREATMENT PROGRAMS (OTP)

N/A

POSITION STATEMENT

CDPHP administers benefits for outpatient MAT therapy, at OTPs to include both induction and maintenance phases of treatment, when all of the following criteria are met:

- Enrollee has a substance use benefit administered through CDPHP.
- Enrollee is an adult (or adolescent 16 years of age or older for buprenorphine)
- The enrollee's diagnosis of OUD is consistent with the criteria for OUD found in the Diagnostic and Statistical Manual of Mental Disorders (DSM-5).
- The enrollee meets the required patient placement criteria outlined in the New York State Level of Care for Alcohol and Drug Treatment Referral 3.0 (LOCADTR 3.0)
- Services are provided only by a participating CDPHP OTP, including methadone maintenance programs, that are certified by the New York State Office Addiction Services and Supports and licensed by the federal government (OASAS) and in accordance with medical treatment protocols and program standards as defined by regulation 14 NYCRR Part 822 & 828. In other states, those facilities accredited by the J.C.A.H.O. as alcoholism or substance abuse treatment programs.

POLICY CONSIDERATIONS

Opioid treatment programs (OTP) offer medical and support services including counseling, educational, and vocational rehabilitation. OTP includes the Narcotic Treatment Program (NTP) as defined by the federal Drug Enforcement Agency (DEA) in 21 CFR Section 13. A physician serves as medical director and physician and nursing staff assess each individual and approve the plan of care. Clinical staff provide individual, family and group counseling. Patients are prescribed and delivered medication assisted treatment which is expected to be long term medication management of their chronic opioid use disorder.

For those OTP and methadone maintenance programs with a state-issued waiver to prescribe extended supplies of methadone, benefit for the methadone will be administered for those enrollees who have prescription drug benefits when the following criteria are met:

- The enrollee will obtain approved methadone at an OTP or methadone
- Maintenance clinic authorized to dispense such methadone supplies under
- OASAS regulations.
- Other narcotic medications will not be administered during the approval period for methadone unless authorization is requested by the methadone prescribing practitioner and approved by a Plan medical director.

Benefits for methadone therapy, and other medications used by OTP, are subject to limitations, as well as applicable cost share, as stated in the enrollee's contract.

EXCLUSIONS

Capital District Physicians' Health Plan, Inc.
CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: OPIOID TREATMENT PROGRAMS (OTP)

Injectable methadone (J1230) products are not approved for the outpatient treatment of opioid dependence.

Treatment rendered by a provider in New York state that is not certified by the OASAS; in other states, those that are not accredited by the J.C.A.H.O. as alcoholism or substance abuse treatment programs.

POLICY HISTORY

This section is intended to provide only highlights of the policy changes. The policy should always be reviewed in its entirety to ensure a comprehensive understanding of coverage.

Effective Date	Update
9/1/24	Updated description of medications used to treat opioid use disorder.
8/1/23	- Updated description of opioid use disorder medications and Opioid Treatment Programs - Updated position statement to reflect appropriate medications based on age
1/1/2020	Removed age limitation from the Select Plan/HARP section. Changed name of policy to "Opioid Treatment Programs" and expanded language to broaden the scope of medications permitted for long term treatment of opioid dependence, including several new G codes billable per CMS guidelines.

This Resource Coordination Policy is the exclusive property of Capital District Physicians' Health Plan, Inc. (CDPHP®) and its affiliated companies, CDPHP Universal Benefits,® Inc. (CDPHP UBI) and Capital District Physicians' Healthcare Network, Inc. (CDPHN). The contents and form of this policy are proprietary to CDPHP. This policy is subject to contractual limitations and/or parameters established in any Employer sponsored Summary Plan Description (SPD) and/or Benefit Design Document (BDD).

MEDICAL POLICY

Medical Policy Title	**Out-of-Network Services**
Policy Number	**11.01.14**
Current Effective Date	**August 1, 2026**
Next Review Date	**January 2027**

Our medical policies are guides to evaluate technologies or services for medical necessity. Criteria are established through the assessment of evidence based, peer-reviewed scientific literature, and national professional guidelines. Federal and state law(s), regulatory mandates and the member's subscriber contract language are considered first in the determination of a covered service. (Link to Product Disclaimer)

POLICY STATEMENT(S)

I. For the purposes of this policy, "in-network" is determined based on the member's subscriber contract and whether the member's subscriber contract is included under the health care provider's participation agreement. To make a coverage decision with respect to a service that is out-of-network for a member, the member's subscriber contract and any required network adequacy standards must be applied.

II. The following definitions and clarifications are also relevant in making coverage decisions:

A. Emergency Condition

An Emergency Condition is a medical or behavioral condition that manifests itself by acute symptoms of sufficient severity, including severe pain, such that a prudent layperson, possessing an average knowledge of medicine and health, could reasonably expect the absence of immediate medical attention to result in **ANY** of the following conditions:

1. Placing the health of the person afflicted with such condition or, with respect to a pregnant woman, the health of the woman or her unborn child, in serious jeopardy or, in the case of a behavioral condition, placing the health of the person or others in serious jeopardy;
2. Serious impairment to such person's bodily functions;
3. Serious dysfunction of any bodily organ or part of such person;
4. Serious disfigurement of such person.

B. Emergency Services

Emergency Services, with respect to an Emergency Condition, are:

1. A medical screening examination that is within the capability of the emergency department of a hospital, including ancillary services routinely available to the emergency department to evaluate the Emergency Condition; **AND**
2. Within the capabilities of the staff and facilities available at the hospital, such further medical examination and treatment as are required to stabilize the patient, i.e., with

respect to an Emergency Condition, to provide such medical treatment of the condition as may be necessary to assure, within reasonable medical probability, that no material deterioration of the condition is likely to result from or occur during the transfer of the patient from a facility or, in the case of a pregnant woman, to deliver a newborn child (including the placenta).

C. In-Network Services

Covered services provided by a Participating Provider and, if required by the member's subscriber contract, provided, arranged or authorized in advance by the member's primary care provider. In-Network Services are covered at the in-network benefit level, which generally has the lowest cost-sharing obligation for the member.

D. Network Adequacy Standards

Network Adequacy Standards are the requirements, set forth in the New York Insurance and Public Health Laws, regarding the Health Plan's obligation to ensure that its provider network is adequate to meet the health needs of its members and provide an appropriate choice of providers sufficient to render the services covered under the member's subscriber contract. Network adequacy standards apply to all insurance products, including health maintenance organization (HMO), point-of-service (POS), preferred provider organization (PPO), exclusive provider organization (EPO), and indemnity contracts and certificates, including stand-alone dental and vision policies and student health insurance policies; and to Article 47 self-funded municipal cooperative plans. Similar standards apply to Medicare Advantage products. Network Adequacy Standards do not apply to self-funded health plans other than Article 47 plans, unless their plan documents include such standards.

E. Non-Participating Provider (Out-of-Network Provider)

A facility, professional provider, or ancillary provider (e.g., laboratory, pharmacy, or durable medical equipment supplier) that does not have a contract with the Health Plan to provide health services under a member's subscriber contract is a Non-Participating (or Out-of-Network) Provider. Some providers may have a contract with the Health Plan for only particular products and are Non-Participating Providers for all other products. Members generally have a higher cost-share when they receive services from a Non-Participating Provider.

F. Out-of-Network Services

Covered services that are provided by a Non-Participating Provider are Out-of-Network Services. Not all products include coverage for non-emergent Out-of-Network Services. When a member's subscriber contract includes coverage for Out-of-Network Services, and the member chooses to receive a non-emergent covered service from a Non-Participating Provider, benefits are generally provided at the out-of-network benefit level.

G. Out-of-Network Referral

If there is no Participating Provider with the appropriate training and experience to treat a member, or when Network Adequacy Standards require it, the Health Plan must authorize a referral to a Non-Participating Provider, and the Non-Participating Provider's services must be covered at the member's in-network benefit level. An Out-of-Network Referral must be made available to any member covered under an HMO, POS, PPO, EPO, or indemnity contract or certificate, including a stand-alone dental or vision policy, a student health insurance policy, or under an Article 47 self-funded municipal cooperative plan. Similar Out-of-Network Referral requirements are applicable to Medicare Advantage plans. Out-of-Network Referral requirements do not apply to self-funded health plans other than Article 47 plans, with the exception of referrals for preventive care services under the Affordable Care Act that are unavailable in-network.

H. Participating Provider (In-Network Provider)

A facility, professional provider, or ancillary provider (e.g., laboratory, pharmacy, or durable medical equipment supplier) that has a contract with the Health Plan to provide health services under a member's subscriber contract is a Participating Provider (or In-Network Provider). Some providers may have a contract with the Health Plan for only particular products and are Participating Providers for only those products. A list of Participating Providers and their locations is available on our website or upon your request to the Health Plan. The list will be revised from time to time by the Health Plan.

I. Service Area

The geographic area, designated by the Health Plan and, if required, approved by the New York State Department of Health, in which we will arrange and/or provide benefits to our members, as described in the member's subscriber contract.

J. Surprise Bill

A bill for covered health care services, other than emergency services, received by a member for services provided under **EITHER** of the following circumstances:

1. The services are performed by a non-participating physician at a participating hospital or ambulatory surgical center, where a participating physician is unavailable; or are performed by a non-participating physician without the member's knowledge or when unforeseen medical services arise at the time the health care services are provided. A bill received for health care services when a participating physician is available, but the member has elected to obtain services from a non-participating physician, is not a Surprise Bill.
2. The services are performed by a Non-Participating Provider, where the services were referred by a participating physician to the Non-Participating Provider without the explicit written consent of the member acknowledging that the participating physician is referring the member to a Non-Participating provider and that the referral may result in costs not covered by the Health Plan. For purposes of a Surprise Bill, a referral to a Non-Participating Provider occurs when:

a. health care covered services are performed by a Non-Participating Provider in the participating physician's office or practice during the course of the same visit;

b. the participating physician sends a specimen taken from the member in the participating physician's office to a non-participating laboratory or pathologist; **OR**

c. for any other covered service performed when a Participating Provider refers the member to a Non-Participating Provider when a referral is required under the member's subscriber contract.

K. Urgent Care

Medical care for an illness, injury or condition serious enough that a reasonable person would seek care right away, but not so severe as to require Emergency Services. Urgent Care is typically available after normal business hours, including evenings and weekends. Urgent Care is covered within or outside our Service Area, when rendered by a participating or non-participating physician or free-standing Urgent Care facility, subject to the provisions of the subscriber member contract. Please refer to the Schedule of Benefits section of the member's contract for cost-sharing requirements, day or visit limits, and any preauthorization, referral, or notification requirements that apply to these benefits.

III. In-Network Benefits for Contracts Covering In-Network and Out-of-Network Services

A. Services are medically necessary for coverage at the In-network benefit level under ANY of the following circumstances:

1. The member receives an Out-of-Network Referral authorizing medically necessary Non-Participating Provider Services at the in-network benefit level (Refer to Policy Statement II.G. Out-of-Network Referral);

2. The member receives Emergency Services from a Non-Participating Provider to stabilize and treat an Emergency Condition. This does not include follow-up or routine care provided in a hospital emergency department;

3. The member's subscriber contract specifically includes language which covers specific care/treatment at the in-network benefit level for the services received from a Non-Participating Provider;

4. For members with a positive or negative diagnosis of malignancy, coverage may be provided for a second medical/surgical opinion received from a Non-Participating Provider, in the event of a positive or negative diagnosis of cancer or a recurrence of cancer or a recommendation of a course of treatment for cancer, upon referral of a Participating Provider. (Refer to Corporate Medical Policy #10.01.10 Second Medical and Surgical Opinions);

5. Coverage may be available for a Surprise Bill (as defined in Policy Statement II. J.), when all of the requirements for reimbursement are met (e.g., benefits are assigned to the Non-Participating Provider in writing).

IV. In-Network Benefits for Contracts Not Providing Out-of-Network Benefits:

A. In-network benefits may also be available for care or services received from a Non-Participating Provider under **ANY** of the following circumstances:

1. Coverage may be provided for compassionate reasons, for covered, medically necessary care or services, including office visits and associated treatment (e.g., chemotherapy), received outside the Health Plan's Service Area, for a member with life-threatening disease (e.g., malignancy, end-stage renal disease requiring hemodialysis) for up to four (4) weeks per contract year;
2. Coverage may be provided for monitoring and/or care, received while a member is outside the Health Plan's Service Area, who is required to assure the stability of a member with a high-risk condition and active treatment issues (e.g., severe heart failure, complicated hypertension) for up to four (4) weeks per contract year;
3. Coverage may be provided for Emergency Services or Urgent Care;
4. For members with a positive or negative diagnosis of malignancy, coverage may be provided for a second medical/surgical opinion received from a Non-Participating Provider, in the event of a positive or negative diagnosis of cancer or a recurrence of cancer or a recommendation of a course of treatment for cancer, upon referral of a Participating Provider (Refer to Corporate Medical Policy #10.01.10 Second Medical and Surgical Opinions);
5. The member has an Out-of-Network Referral authorizing medically necessary Non-Participating Provider Services at the in-network benefit level (Refer to II.G. Out of Network Referral);
6. Coverage may be available for a Surprise Bill (as defined in Policy Statement II. J.) when all of the requirements for reimbursement are met (e.g., benefits bare assigned to the Non-Participating Provider in writing);
7. Except under the above circumstances, the following services are generally not covered when rendered by a Non-Participating Provider: Routine care or services the need for which could reasonably be foreseen (e.g., physical examinations, screening tests, regularly scheduled laboratory tests such as routine monitoring of anticoagulation therapy); services provided to a member or dependent living away from home, such as a college student; and therapies/treatments or subsequent visits when a member began treatment with a Participating Provider (e.g., continuation of physical therapy).

V. Continuing Care

A. For a member in an ongoing, medically necessary course of treatment with a Participating Provider who leaves the network, coverage is available for continued, ongoing treatment from this now Non-Participating Provider for up to 90 days, or, if a member is pregnant, through postpartum care. If the provider was terminated by the Health Plan due to fraud, imminent harm to patients, or final disciplinary action by a state board or agency that

impairs the provider's ability to practice, continued treatment by this now Non-Participating Provider will not be covered.*

B. For members new to the Health Plan and engaged in an ongoing, medically necessary course of treatment with a Non-Participating Provider, coverage is available for services performed by the Non-Participating Provider for up to 60 days from the effective date of the member's subscriber contract. The ongoing course of treatment must be for a life-threatening disease or condition or a degenerative and disabling condition or disease. The ongoing course of treatment may also be pregnancy. For members in their second or third trimester of pregnancy, in-network benefits may be applied through delivery and postpartum care related to delivery. Members are responsible for any in-network cost sharing applicable to these services.*

*Please refer to the following website for Medicaid Managed Care Postpartum Care timeframes: [accessed 2025 Dec 15]. Available from: https://health.ny.gov/health_care/medicaid/program/update/2023/no06_2023-03.htm#postpartum

VI. Behavioral Health Episode of Continuing Care for Managed Medicaid, Health and Recovery Plan, and Dual-Special Needs Plan Members:

For a member in an ongoing, medically necessary course of ambulatory mental health treatment, other than ambulatory detoxification and withdrawal services, with a New York State Office of Mental Health (OMH) Licensed Provider who is a Non-Participating Provider or with a OMH Licensed Provider who leaves the network, coverage will be available for services performed by the Non-Participating Provider for 24 months after a member product change or 24 months after the change in the network status of the provider when **ALL** of the following criteria are met:

A. The services were provided in the same geographic area;

B. The services were provided at least twice during the six (6) months preceding January 1, 2023, by the same provider; and

C. The services are for the treatment of the same or related behavioral health condition.

POLICY GUIDELINE(S)

I. Preauthorization requirements do not apply to Emergency Services.

II. Coverage is not provided at the in-network benefit level for services rendered by Non-Participating Providers for variations of surgical methods, adjunct procedures or enhancements (e.g., computerized or robotic components), including less-invasive techniques, that are not utilized by Participating Providers qualified to treat a member's health condition, unless there is published scientific evidence that the variation or additional technology results in incrementally improved results over the surgical methods available in-network or as directed by an external appeal agent.

III. If there is a request for OON Referral and Health Plan can find a qualified and available par provider, Health Plan will deny the request for OON referral.

DESCRIPTION

In general, HMO and EPO products cover only services rendered by Participating Providers. POS and PPO contracts provide different levels of benefits, depending on whether the provider is a Participating Provider or Non-Participating Provider.

In-network benefits are provided for covered services that a member receives from a Non-Participating Provider when the member has an Out-of-Network Referral, or services were rendered under a Surprise Bill. In-network benefits may also be provided, under specific conditions, for covered services received from a Non-Participating Provider when a member is traveling or temporarily residing outside of our Service Area for work, recreation, or education (for example, college students). Coverage of services other than Emergency Services is subject to applicable preauthorization requirements.

Members covered under comprehensive products (i.e., products that provide major medical-type benefits, rather than limited benefits) may request review of the denial of a request for a referral to a Non-Participating Provider through the grievance review process by submitting specific information from a physician regarding the lack of training and experience of available Participating Providers. Medical Review staff will review the information submitted and identify Participating Providers, if any, with the appropriate training and experience to treat the member's condition. A Medical Director will make the determination to uphold or overturn a denial of a request for referral to a Non-Participating Provider.

For Emergency Services and Surprise Bills, members are only responsible for applicable in-network cost-sharing. Balance billing for Emergency Services and Surprise Bills is subject to review by an independent dispute resolution entity.

CENTERS FOR MEDICARE AND MEDICAID SERVICES (CMS)

Out-of-Network Services are not addressed in National or Regional Medicare coverage determinations or policies. However, the Medicare Benefit Policy Manual Chapter 16_General Exclusions from Coverage addresses Services Not Provided within the United States (Section 60) [accessed 2025 Dec 15].

COVERAGE FOR NYS MEDICAID MANAGED CARE/HARP PRODUCT MEMBERS

Coverage is not provided for services that are not urgent or emergent outside of New York State when services are available in New York State. The Plan contracts with a network of health care practitioners and providers to provide health care services for Medicaid Managed Care members. Care must be received by contracted network providers to be covered by the Plan. Exceptions to this requirement are based on medical necessity, outlined in the above policy, and must be approved by a Health Plan Medical Director.

PRODUCT DISCLAIMER

- Services are contract dependent; if a product does not cover a service, medical policy criteria do not apply.
- If a commercial product (including an Essential Plan or Child Health Plus product) covers a specific service, medical policy criteria apply to the benefit.
- If a Medicaid product covers a specific service, and there are no New York State Medicaid guidelines (eMedNY) criteria, medical policy criteria apply to the benefit.
- If a Medicare product covers a specific service, and there is no national or local Medicare coverage decision for the service, medical policy criteria apply to the benefit.

DISCLAIMER

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgement when deciding the most appropriate care to enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

DESCRIPTION

Pelvic Congestion Syndrome (PCS) is most commonly described as continuous or intermittent noncyclic pain, localized to the pelvic region, which lasts for six or more months in the absence of known pelvic pathology. Although this condition is primarily found in women it can also be found in men. The syndrome occurs during the reproductive years, is commonly associated with pain, including during or after menses or intercourse, and is often aggravated by prolonged standing. The underlying etiology is thought to be related to varices of the ovarian veins, leading to pelvic vascular congestion. Because there are many etiologies of chronic pelvic pain, PCS is often a diagnosis of exclusion, with the identification of varices using a variety of imaging methods, such as magnetic resonance imaging, computed tomography, or contrast venography.

There is no standard treatment approach for PCS, and the optimum treatment is unknown. Instead, therapy is individualized and based on symptoms. Medical therapy is generally the first line of treatment, as it is low risk and non-invasive. Other methods, such as embolization has been proposed as an alternative to surgical treatment for patients who fail medical therapy with analgesics. Embolization therapy involves the occlusion of blood flow through the ovarian and internal iliac veins with coils, glue, or chemical sclerosants.

PROCEDURE CODES

37241

Capital District Physicians' Health Plan, Inc.
CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: OVARIAN AND INTERNAL ILIAC VEIN EMBOLIZATION FOR PELVIC CONGESTION SYNDROME

POSITION STATEMENT

CDPHP considers embolization of ovarian veins, with or without the internal iliac veins, medically necessary for the treatment of pelvic congestion syndrome when all of the following criteria is met:

- Pelvic region pain has persisted for six or more months.
- The enrollee has had a definitive diagnostic venography, CT, or MRI.
- The enrollee is refractory to medical management, including analgesics and hormonal therapy (unless contraindicated).

POLICY CONSIDERATIONS

The evaluation of women with chronic pelvic pain starts by taking a complete history that includes urinary, gastrointestinal, gynecologic, musculoskeletal, sexual, and psychosocial symptoms.

Diagnosis of PCS is based upon a combination of characteristic symptoms, tenderness on physical exam, and documentation of pelvic vein dilation or incompetence, after exclusion of other causes for these nonspecific findings.

The embolization procedure may be performed with the use of metallic coils or foam/gel sclerotherapy.

EXCLUSIONS

CDPHP considers ovarian and iliac embolization for PCS experimental and/or investigational when criteria stated above is not met.

CDPHP PRODUCT VARIATIONS

CHILD HEALTH PLUS	Subject to all terms and conditions noted above in the policy.
MEDICARE ADVANTAGE	Subject to all terms and conditions noted above in the policy.

DESCRIPTION

The American College of Obstetricians and Gynecologists (ACOG) defines chronic pelvic pain as "pain symptoms perceived to originate from pelvic organs/structures typically lasting more than six months. It is often associated with negative cognitive, behavioral, sexual and emotional consequences as well as with symptoms suggestive of lower urinary tract, sexual, bowel, pelvic floor, myofascial, or gynecological dysfunction." Therefore, diagnostic criteria may be difficult to discern, as well as multifactorial in nature.

Pelvic congestion syndrome (PCS) has also been known as pelvic venous disorder, pelvic venous insufficiency, pelvic venous incompetence, or pelvic venous reflux, with the nomenclature often being used interchangeably. PCS is proposed to be a cause of chronic pelvic pain, deriving from varicosities in the ovarian or internal iliac veins. It is described as a syndrome of variable pain location and intensity, associated with dyspareunia and postcoital pain, is aggravated by standing or exercise and typically occurs during the reproductive years. It is estimated that up to 47% of women have pelvic varicosities, and although common, not all women with pelvic varicosities experience chronic pelvic pain, and conversely, chronic pelvic pain is reported by women without evidence of pelvic congestion. The diagnosis of PCS is typically one of exclusion, utilizing different imaging methods such as

magnetic resonance imaging (MRI), computed tomography (CT), laparoscopy or contrast venography.

Conservative treatment options for PCS include psychotherapy, non-steroidal anti-inflammatories, and hormonal therapy. For patients who do not respond to these initial therapies, surgical ligation of the ovarian vein may be considered. Embolization and sclerotherapy are two treatments that have been proposed as less- invasive alternatives which consist of accessing the vasculature via catheter through the jugular or femoral arteries. Under imaging guidance, the catheter is directed through the femoral vein to the veins in question. Once in place, the vein will either be injected with medication (sclerotherapy), and/or coils, plugs, glue, liquid embolic agents, gelatin sponge or powder (Gelfoam) will be inserted to occlude the impacted veins (embolization). The procedure is typically performed on an outpatient basis.

Surgical procedures are not subject to regulation by the United States Food and Drug Administration (FDA); however, various products used in vein embolization (e.g., coils, vascular plugs, glue, liquid embolic agents, Gelfoam) and their delivery assist devices are subject to regulation. Several products have been cleared through the 510 (k) process for uterine fibroid embolization and/or embolization of hypervascular tumors and arteriovenous malformations (e.g., Embosphere Microspheres, Cook Incorporated Polyvinyl Alcohol Foam Embolization Particles, Contour Emboli PVA).

SUPPORTIVE LITERATURE

The literature regarding outcomes of individuals with PCS who receive pelvic vein embolization consists of randomized studies, comparative studies, case series, and systematic reviews. However, the literature has been described by the Journal of Vascular and Interventional Radiology (Black et al 2010) as, and still remains, "limited due to non-standardized reporting, incomplete follow-up, and the use of variable measures of outcome".

In a systematic review by Daniels et al (2016) with a search of databases dating from inception to November of 2013, authors aimed to critically review the effectiveness of embolization of incompetent pelvic veins. No language or study design restrictions were applied in the search criteria. Of the studies identified, 140 full texts were retrieved, and 22 articles were included in the final review. Of those included, 20 were case series, one study was unable to be reliably assessed after translation, and only one was a randomized trial, which was deemed poor quality by the authors (Chung and Huh, 2003), as it compared embolization to hysterectomy and was likely subject to several biases. Authors state that all estimates of effectiveness come from what they believe to be prospective case series of 1,308 women, with early relief of pain noted in approximately 75% of 162 women in six case series, which was sustained. One-third of the studies that were selected did not clearly describe intended outcome measures or the collection process, had no report of symptoms at two time points, and few stated the impacts on menstruation and fertility. Although the data supported the safety and efficacy of embolization, the quality of the evidence is poor.

In a retrospective study of 617 patients diagnosed with pelvic venous disorders, DeGregorio et al (2020) aimed to determine the efficacy and safety of pelvic vein embolization. A total of 520 women were included in the analysis. Inclusion criteria involved a diagnosis of varicose veins in the pelvis

with a diameter of 6 mm or more based on doppler ultrasound (US), and symptoms greater than six months. Patients underwent embolization of the four main pelvic veins when possible, and follow-up consisted of VAS survey and doppler US. Technical success was defined as embolization of the four main pelvic veins and occurred in 84.4% of patients. Of the total patients treated, 261 women underwent embolization using coils and 259 with Amplatzer vascular plugs (AVP). The average follow-up time frame was 58.7 months and a total of 484 patients (93.07%) completed five years of follow-up. VAS improved from 7.63 to 0.91 at the five-year mark. Results showed 26 patients (5%) experienced symptom recurrence. There were nine cases of coil migration (1.9 %). The authors state late migration of metallic devices to the lung can be seen in routine chest radiographs and could be an important concern. Discussion remains as to the homogeneity of endovascular therapeutic modalities, the selection of the embolic agents, and the number of veins needed to be treated.

A systematic review conducted by Hanna et al (2024) evaluated the efficacy of embolotherapy, primarily coil and plug embolization, for the treatment of PCS. A total of 25 studies were included with a combined total of 2038 patients. Across the included studies, technical success rates exceeded 95%, indicating that embolization procedures were reliably performed. Symptom improvement was reported in 70–90% of patients, with many experiencing significant reductions in chronic pelvic pain within three to six months post-procedure. The review also noted low complication rates, typically under 5%, with most adverse events being minor and self-limiting. Follow-up durations ranged from six months to two years, and long-term data suggested sustained symptom relief in the majority of treated patients. The authors emphasized the need for standardized outcome measures and larger randomized trials to strengthen the evidence base.

To date, no randomized controlled trials have been published comparing endovascular occlusion for PCS with a relevant comparator or sham/placebo treatment. Hindering the development of clinical trials with sound methodology are the varying definitions of pelvic pain, as well as the lack of specified explicit diagnostic criteria for PCS. Several consensus panels have been funded over time attempting to identify research priorities (Black et al, 2010; Champaneria et al, 2016; Khilnani et al, 2019) to address these limitations. International panels have met to create a discriminative classification instrument for PCS, but to date, the tools have not been validated or widely accepted.

There is insufficient evidence to conclude that there is a cause-effect relationship between venous congestion and chronic pelvic pain. Randomized controlled trials using well-defined eligibility criteria and relevant comparators or sham/placebo treatments are needed to determine the effects of the treatment on health outcomes.

PROFESSIONAL GUIDELINE(S)

In a 2020 practice bulletin on chronic pelvic pain, the American College of Obstetricians and Gynecologists (ACOG) does not address embolization for treating chronic pelvic pain. ACOG states that PCS is a proposed cause of chronic pelvic pain related to pelvic venous insufficiency, and although venous congestion appears to be associated with chronic pelvic pain, evidence is insufficient to conclude that there is a cause-and-effect relationship. Furthermore, there is no consensus on the

definition of this condition, and the diagnostic criteria are variable. Further research is needed to establish consistency in diagnosis and homogeneity of studies.

The Society for Vascular Surgery and American Venous Forum published a clinical practice guideline for the care of patients with varicose veins and related chronic venous disorders in 2011; reaffirmed in 2023. The guidelines include the recommendations related to treatment of pelvic congestion syndrome. Medical management is not included among recommendations; the guideline states that "Pharmacologic agents to suppress ovarian function, such as medroxyprogesterone or gonadotropin-releasing hormone, may offer short-term pain relief, but their long-term effectiveness has not been proven." Additionally, the guidelines recommend:

- Treatment of pelvic congestion syndrome and pelvic varices with coil embolization, plugs, or transcatheter sclerotherapy, used alone or together (grade 2B: weak recommendation, moderate quality of evidence).
- If less invasive treatment is not available or has failed, surgical ligation and excision of ovarian veins to treat reflux is recommended (grade 2B: weak recommendation, moderate quality of evidence).

REGULATORY STATUS

Various products (e.g., coils, vascular plugs, glue, liquid embolic agents, Gelfoam) and/or delivery-assist devices could be used to embolize the vein(s) and therefore could be subject to FDA regulation.

The United States Food and Drug Administration (FDA) regulates medical devices. All products and/or delivery-assist devices that could be used to embolize the vein(s), including related components require FDA approval before marketing and use in the United States to ensure they are safe and effective for human use. Refer to the FDA Medical Device website. Available from: https://www.fda.gov/medical-devices [accessed 2025 Aug 5]

The FDA lists the most serious type of medical device recalls as well as early alert communications about corrective actions being taken by companies that the FDA believes are likely to be the most serious type of recalls. Available from: Medical Device Recalls | FDA [accessed 2025 Aug 5]

Background

Primary hyperoxaluria type 1 (PH1) is a rare, inherited disorder of the liver characterized by the overproduction of oxalate. PH1 occurs via an autosomal recessive mutation in the gene AGXT that codes for the liver enzyme alanine: glyoxylate aminotransferase (AGT) which is responsible for glyoxylate metabolism. In people with PH1, excess oxalate accumulates in the kidneys and urinary tract. Oxalate deposits then combine with calcium, to form calcium oxalate, the main component of kidney and bladder stones. Signs and symptoms of PH1 vary in severity and may begin any time from infancy to early adulthood. Symptoms usually include recurrent kidney stones, blood in the urine, and urinary tract infections. Left untreated, PH1 can result in end-stage renal disease (ESRD).

PH1 affects approximately four individuals per million in the United States and Europe, with an estimated 1,300 to 2,100 diagnosed cases. 24-hour urine collection can be used to demonstrate markedly increased urinary excretion of oxalate (i.e., greater than 1 mmol/1.73 m^2 per day [90 mg/1.73 m^2 per day]). A urinary oxalate to creatinine ratio from a spot urine sample may also be used to determine increased oxalate excretion in patients where 24-hour urine collection is difficult, such as infants and small children. Genetic testing is used to confirm the presence of the AGXT mutation and differentiate PH1 from other types of primary hyperoxaluria. A liver biopsy may also be used to demonstrate AGT enzyme deficiency. The only curative treatment for PH1 is liver transplantation. Because many patients with PH1 will progress to ESRD by adolescence or early adulthood if untreated or disease is undetected, the best outcomes to date for PH1 have included combined liver and kidney transplantation.

Oxlumo (lumasiran) is the first FDA-approved treatment specifically for PH1 and is indicated to lower urinary and plasma oxalate levels in pediatric and adult patients with PH1. Oxlumo reduces the amount of available glyoxylate, a substrate for oxalate production, by targeting hydroxyacid oxidase 1 (HAO1) messenger RNA in hepatocytes through RNA interference, subsequently decreasing glycolate oxidase enzyme levels. Oxlumo is available in a single-dose vial and is intended to be administered as a subcutaneous injection by a healthcare professional. Adverse events in clinical trials included injection site reactions (> 20%), abdominal pain, and the formation of anti-lumasiran antibodies – although these antibodies are not currently thought to be clinically significant.

Rivfloza (nedosiran) is the second FDA-approved treatment for PH1 and is indicated for the lowering of urinary oxalate levels in children nine years of age and older and adults with primary hyperoxaluria type 1 (PH1) and relatively preserved kidney function. Rivfloza, like Oxlumo, works via RNA interference, but with a different target: hepatic lactate dehydrogenase (LDH) which is thought to be responsible for the final step in oxalate synthesis. Rivfloza can be self-administered or administered by caregivers. The most significant adverse event seen in clinical trials was injection site reactions.

While both Oxlumo and Rivfloza have proven efficacious in reducing urinary oxalate levels, the long-term impact on renal function is not well defined. Secondary and exploratory analyses of the ILLUMINATE trials for Oxlumo have shown stabilization or improvement in kidney stone event rates and eGFR, however analysis following the full 54 weeks of treatment are needed to confirm the results. For Rivfloza, no significant differences were detected between groups in the rate of change for eGFR. Further data are needed to evaluate the impact of treatment on renal function and transplantation outcomes.

Summary

Effective Date of Policy:	7/13/2026
Indications	Primary Hyperoxaluria Type 1 (PH1)
ICD10 Diagnosis Codes	E72.53
Availability	Oxlumo: 94.5 mg/0.5 mL solution for subcutaneous injection, single-dose vial Rivlfoza: 80 mg/0.5 mL single-dose vial; 128 mg/0.6 mL and 160 mg/1 mL single-dose pre-filled syringe
HCPCS Code	Oxlumo: J0224 Rivfloza: no specific code as can also be self-administered
Duration	Initial: 6 months Continuation: 12 months

Required Criteria for Initial Approval		
All of the following conditions for the requested indication must be met in order to approve therapy.		
Indication	**Inclusion**	**Recommended Dosing**

Oxlumo (lumasiran)
 	
Primary Hyperoxaluria Type 1 (PH1)
(FDA approval)
ICD10: E72.53
 	
Medical benefit
	• Medication is prescribed by or in consultation with a specialist knowledgeable in the management of primary hyperoxaluria type 1 (e.g., nephrologist, urologist)
	• Enrollee has a diagnosis of PH1 confirmed by genetic testing that detects mutations of the alanine: glyoxylate aminotransferase (AGT) gene **OR** Liver biopsy confirming deficiency in AGT
	• Enrollee has had metabolic screening that demonstrates with increased urinary oxalate levels through one of the following:
	  ○ 24-hour urinary excretion of oxalate > 1 mmol/1.73 m^2 (> 90 mg/1.73 m^2) **OR**
	  ○ Elevated oxalate: creatinine ratio in spot urine samples greater than normative value for age (see Table A below) **OR**
	  ○ Plasma oxalate levels greater than or equal to 20 umol/L
	  ▪ For individuals on hemodialysis, this improvement must reflect a pre-dialysis level
	• Documentation that the patient has made efforts to increase fluid intake to at least 3 L/m^2 BSA per day
	• Concurrent use of pyridoxine (vitamin B6) OR previous trial of at least 3 months of pyridoxine with no significant improvement observed (e.g., < 30% reduction in urine oxalate concentration after at least 3 months of therapy)
	• Enrollee has not previously received a kidney or liver transplant (curative treatment of PH1)
	• Must not be receiving peritoneal dialysis or combined peritoneal/hemodialysis
	• Current body weight and requested dose regimen must be submitted for initial review and each recertification request
		Dosing is body weight based:
		• Less than 10 kg
		  ○ Loading Dose: 6 mg/kg once monthly for 3 doses
		  ○ Maintenance Dose: 3 mg/kg once monthly, beginning 1 month after the last loading dose
		• 10 kg to less than 20 kg
		  ○ Loading Dose: 6 mg/kg once monthly for 3 doses
		  ○ Maintenance Dose: 6 mg/kg once every 3 months (quarterly), beginning 1 month after the last loading dose
		• 20 kg and above
		  ○ Loading Dose: 3 mg/kg once monthly for 3 doses
		  ○ Maintenance Dose: 3 mg/kg once every 3 months (quarterly), beginning 1 month after the last loading dose
		• For patients on hemodialysis: Administer Oxlumo after hemodialysis if administered on dialysis days

Rivfloza (nedosiran)
 	
Primary Hyperoxaluria Type 1 (PH1)
(FDA approval)
ICD10: E72.53
 	
Medical or Rx benefit
	• Medication is prescribed by or in consultation with a specialist (e.g., nephrologist, urologist) knowledgeable in the management of primary hyperoxaluria type 1
	• Must be ≥ 2 years of age
	• Enrollee has a diagnosis of PH1 confirmed by genetic testing that detects mutations of the alanine: glyoxylate aminotransferase (AGT) gene **OR** Liver biopsy confirming absent or significantly reduced AGT activity
	• Enrollee has had metabolic screening that demonstrates with increased urinary oxalate levels through one of the following:
	  ○ 24-hour urinary excretion of oxalate > 1 mmol/1.73 m^2 (> 90 mg/1.73 m^2) **OR** elevated oxalate: creatinine ratio in spot urine samples greater than normative value for age (see Table A below) **AND**
	  ○ Urinary excretion of glycolate
	• Documentation that the patient has made efforts to increase fluid intake to at least 3 L/m^2 BSA per day
	• Concurrent use of pyridoxine (vitamin B6) **OR** previous trial of at least 3 months of pyridoxine with no significant improvement observed
	• Must have an eGFR ≥ 30 mL/min/1.73 m^2
	• Enrollee has not previously received a kidney or liver transplant (curative treatment of PH1)
	• Must not have clinical evidence of systemic oxalosis
		Dosing is age and body weight based:
		• Adults and adolescents 12 years and older
		  ○ Greater than or equal to 50 kg: 160 mg once monthly (Pre-filled syringe, 1 mL)
		  ○ Less than 50 kg: 128 mg once monthly (Pre-filled syringe, 0.8 mL)
		• Children 9 to 11 years
		  ○ Greater than or equal to 50 kg: 160 mg once monthly (Pre-filled syringe, 1 mL)
		  ○ Less than 50 kg: 3.3 mg/kg once monthly, not to exceed 128 mg (Vial, dose volume rounded to nearest 0.1 mL)

	• **For new starts and recertification requests for all lines of business except Medicare; Does NOT apply to Medicare B (Medicare Advantage):** Requests for Rivfloza (medical benefit only) will require documentation of an inability to self-inject. Does NOT apply to Medicare B (Medicare Advantage) ○ For pediatric patients < 18 years of age, documentation must also include the inability of a caregiver to administer the medication • Current body weight and requested dose regimen must be submitted for initial review and each recertification request	

Exclusion Criteria

Therapy will not be covered if any of the following exist:

- Oxlumo or Rivfloza will not be approved for the treatment of other primary hyperoxalurias (i.e., Type 2, Type 3) or hyperoxaluria caused by increased dietary consumption of oxalate, bowel resection, or fat malabsorption due to small bowel disease or cystic fibrosis
- Oxlumo or Rivfloza will not be considered for coverage after kidney or liver transplantation
- Rivfloza will not be approved in combination with Oxlumo

Continuation Criteria

- Recertification will be every 12 months and require documentation that the patient is tolerating therapy AND
  - There was a reduction in urinary excretion of oxalate from baseline (improvement is reaching near normal (< 1 mmol/1.73 m^2 per day) urinary oxalate excretion) OR
  - There was a reduction in plasma oxalate from baseline
    - For individuals on hemodialysis, this improvement must reflect a pre-dialysis level.
- Current body weight and requested dose regimen must be submitted for each recertification request
- For new starts and recertification requests for all lines of business except Medicare: Requests for Rivfloza (medical benefit only) will require documentation of an inability to self-inject. Does NOT apply to Medicare B (Medicare Advantage)

Considerations

- Prior authorization is obtained through the CDPHP pharmacy department
- Rivfloza: Quantity limit: 2 vials per 30 days / 1 prefilled syringe per 30 days

Table A.

Normative values for molar oxalate to creatinine ratio (mmol/mmol) from spot urine sample	
Infants ≤ 6 months	< 0.32 to 0.36
Children between 7 months and 24 months	< 0.13 to 0.17
Children between 2 and 5 years	< 0.098 to 0.1
Children between 6 and 14 years	< 0.07 to 0.08
Patients > 16 years	< 0.04

GOVERNMENT PROGRAMS

CHILD HEALTH PLUS: Subject to all terms and conditions noted in above application.

MEDICARE CHOICES: Oxlumo and Rivlfoza: Subject to all terms and conditions noted in above application.
Rivfloza: Not applicable if requested under Part D.

SELECT/HARP PLAN: For requests under medical benefit: Subject to all terms and conditions noted in above application.

Effective April 1, 2023, the pharmacy benefit for Medicaid is administered by NYRx, the Medicaid Pharmacy Program.

CDPHP Pharmacy Services 7/13/2026

New: 2/2021

Date	Notes
02/2022, 02/2023, 2/2024	Reviewed with no changes
4/2024	Addition of Rivfloza to policy with specific criteria for coverage
2/2025	Revised Oxlumo. Included full dosing recommendations. Added trial of concurrent use of pyridoxine (vitamin B6). Removed trial of Oxlumo from Rivloza criteria.

2/2026	• Revised Rivfloza
	  ○ Added age requirement and eGFR requirement
	  ○ Added documentation of an inability to self-inject for all lines of business except Medicare
	• Added Current body weight and requested dose regimen must be submitted for initial review and each recertification request for both agents
	• Clarified specialist must be knowledgeable in the management of primary hyperoxaluria type 1 for both agents
	• Added documentation that the patient has made efforts to increase fluid intake to at least 3 L/m^2 BSA per day for both agents
	• Updated transplant to kidney and liver transplant for both agents

7/2026	• Added not receiving peritoneal dialysis for Oxlumo • Clarified current body weight should be submitted for initial Rivfloza requests

POLICY NAME: PAIN MANAGEMENT SERVICES

POLICY EFFECTIVE DATE:	8/1/2026
Policy Control #:	1370/20.000105
Next Annual Review:	September, 2027

DISCLAIMER

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgment when deciding the most appropriate care for enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

DESCRIPTION

Pain management services include procedures and/or modalities utilized to enhance the functional abilities and physical and psychological well-being of a patient with chronic pain.

According to the Practice Guidelines for Chronic Pain Management: A Report by the American Society of Anesthesiologists Task Force on Chronic Pain Management, chronic pain is defined as *pain of any etiology not directly related to neoplastic involvement, associated with a chronic medical condition, or extending in duration beyond the expected temporal boundary of tissue injury and normal healing, and adversely affecting the function or well-being of the individual.* In addition, the pain has been refractory to repeated attempts at medical management and usually has been present for at least three to six months.

Conditions that cause chronic pain include: cancer and various degenerative disorders of the spine, such as spinal stenosis, spondylolysis, spondylolisthesis, degenerative scoliosis, idiopathic vertebrogenic sclerosis, diffuse idiopathic spinal hyperostosis, and segmental instability.

The goal of chronic pain management is to achieve optimal pain control, recognizing that a pain-free state may not be achievable; minimize adverse outcomes; enhance functional abilities and

physical and psychological well-being; and enhance the quality of life for patients with chronic pain.

- Mandated Benefits for State Funded Programs, 1550/20.000188

POSITION STATEMENT

Outpatient Pain Management Services for Chronic Pain
CDPHP administers benefits for outpatient pain management meeting the criteria outlined below.

General Requirements

- Services are recommended by a primary care or attending physician.
- Patient has experienced chronic pain for three months or more.
- Patient has failed to respond to more conservative methods of treatment including physical therapy modalities, chiropractic treatments, cognitive-behavioral techniques, administration of pharmacological agents (e.g., non-steroidal anti-inflammatory agents, narcotic agents) unless such methods are contraindicated.
- Upon request, member has undergone a mental health evaluation by a mental health provider, and any primary psychiatric conditions have been treated, where indicated.
- A pain relief and rehabilitation treatment plan must be established. Pain management services should be tailored to the needs of the individual patient with differentiated treatment for acute and chronic pain.

General Documentation Requirements

The medical record* must contain documentation that fully supports the medical necessity for services outlined within this policy. Such documentation includes, but is not limited to, the following:

- Relevant medical history
- Physical examination
- Results of pertinent diagnostic tests or procedures
- Procedure notes must be legible and include sufficient detail to allow reconstruction of the procedure.

Required elements of the note include:

- Description of the techniques employed
- Site(s) of injections
- Drugs and doses with volumes and concentrations as well as pre- and post-procedural pain assessments

*Refer to the individual sections of injection therapies in the policy for specific documentation requirements.

The following services are covered when performed in accordance with criteria outlined below. Only one invasive modality or procedure will be considered medically necessary at a time.

Injection Therapies

Injections for the treatment of acute, subacute, and chronic back pain may be given for either diagnostic purposes or therapeutically (to treat the pain), and may include trigger point injections, epidural steroid injections, facet joint injections, sacroiliac joint injections, and/or peripheral nerve blocks. Although the evidence for the efficacy of these diagnostic and therapeutic injections discussed below is not strong, several have gained widespread use as alternatives to more invasive interventions and are often included as part of a comprehensive pain management program.

CDPHP administers benefits for injection therapies for managing chronic pain in accordance with Medicare national coverage determinations and the American Society for International Pain Physicians (ASIPP) Guidelines for Interventional Techniques in Chronic Spinal Pain (2013).

Trigger Point Injections (20552, 20553)

Trigger point injection is one of the many modalities utilized in the management of chronic pain. Trigger point injections are injections of a local anesthetic, with or without a steroid medication, into a painful area of a muscle that contains the trigger point. The purpose of a trigger point injection is to relax the area of intense muscle spasm, effectively inactivate the trigger point, and provide prompt symptomatic relief.

Initial Trigger Point Injection

POLICY NAME: PAIN MANAGEMENT SERVICES

Trigger point injections (TPI) will be considered medically reasonable and necessary to treat myofascial pain caused by trigger points when all the following requirements are met:

1. There is a focal area of pain in the skeletal muscle.
2. There is clinical evidence of a trigger point defined as pain in a skeletal muscle that is associated with at least two of the following findings: the presence of a hyperirritable spot and/or taut band identified by palpation and possible referred pain AND
3. The physical examination identifies a focal hypersensitive bundle or nodule of muscle fiber harder than normal consistency with or without a local twitch response and referred pain AND
4. Non-invasive conservative therapy is not successful as first line treatment OR movement of a joint or limb is limited or blocked OR the TPI is necessary for diagnostic confirmation

Subsequent TPI
Repeat trigger point injections in previously injected trigger points will be considered medically reasonable and necessary to treat myofascial pain syndrome when all the following requirements are met:

1. There is a positive pain response from the most recent TPI defined as providing consistent minimum of 50% relief of primary (index) pain after the TPI measured by the SAME pain scale* at baseline and post-injection **AND**
2. Consistent pain relief from the most recent previous TPI lasting at least six weeks **AND**
3. The myofascial pain has reoccurred and is causing objective functional limitations measured by a functional scale obtained at baseline and after TPI which demonstrated at least 50% improvement from the previous TPI.

*Note: The scales used to measure pain and/or disability must be documented in the medical record. Acceptable scales include but are not limited to verbal rating scales, Numerical Rating Scale (NRS) and Visual Analog Scale (VAS) for pain assessment, and Pain Disability Assessment Scale (PDAS), Oswestry Disability Index (ODI), Oswestry Low Back Pain Disability Questionnaire (OSW), Quebec Back Pain Disability Scale (QUE), Roland Morris Pain Scale, Back Pain Functional Scale (BPFS), and the PROMIS profile domains to assess function.

Limitations: No more than three (3) TPI sessions will be reimbursed per rolling 12 months.

Requirements:

1. Patients should be part of an ongoing conservative treatment program and documentation to support the patient is actively participating in a rehabilitation program, home exercise program, or functional restoration program is in the medical record.
2. Trigger point primary index pain must be measured prior to the injection at the beginning of the session.
3. The post procedure pain level must be measured after the TPI at the conclusion of the

session using the same scale* utilized at baseline.

4. When documenting the percentage of pain relief from the primary (index) pain compared to the post-injection pain levels, it is insufficient to report only a percentage of pain relief and/or a nonspecific statement of the duration of pain relief. The documentation should include a specific assessment of the duration of relief being consistent or inconsistent with the agent used for the injection and the specific dates the measurements were obtained using the SAME pain scale* used at baseline.
5. When documenting the ability to perform previously painful movements and activities of daily living (ADLs) it is insufficient to provide a vague or nonspecific statement regarding the improvement of previously painful movements and activities of daily living (ADLs). The documentation should include a functional assessment to show clinically meaningful improvement with painful movements and ADLs, if this metric is used to justify the efficacy of the TPI Providers should use established and measurable goals and objective scales to assess functionality and ADLs measures.

Limitations:

1. A TPI involves the use of a local anesthetic and does not include injections of biologics (e.g., platelet rich plasma, stem cells, amniotic fluid, etc.) and/or any other injectates.
2. It is not considered medically reasonable and necessary to perform TPI into multiple muscle groups in different anatomical regions during the same session.
3. It is not considered medically reasonable and necessary to perform multiple blocks (ESI, sympathetic blocks, facet blocks etc.) during the same session as TPI.
4. Trigger points injections for treatment of headache, neck pain, or low back pain in absence of actual trigger points, diffuse muscle pain, a chronic pain syndrome, lumbosacral canal stenosis, fibromyalgia, non-malignant multifocal musculoskeletal pain, complex regional pain syndrome, sexual dysfunction/pelvic pain, whiplash, neuropathic pain, and hemiplegic shoulder pain are considered investigational and therefore are not considered medically reasonable and necessary.
5. Use of fluoroscopy or MRI guidance for performance of TPI is not considered reasonable and necessary.
6. The use of ultrasound guidance for the performance of TPI is considered investigational.
7. Trigger point injections used on a routine basis, e.g., on a regular periodic and continuous basis, for patients with chronic non-malignant pain syndromes are not considered medically necessary.

Other Considerations:

Medical record must clearly document the evaluation leading to the diagnosis of the trigger point in an individual muscle, identification of the affected muscle(s), reason for selecting the trigger point injection as a therapeutic option, and whether it is being used as an initial or subsequent treatment.

Only one trigger point injection procedure (20552 or 20553) can be reported per date of service, no matter how many sites or regions are injected.

"Dry needling" (20560, 20561) of trigger points is considered experimental, investigational, or unproven due to insufficient scientific evidence to support clinical efficacy and/or effects on health outcomes.

Trigger point injection using botulinum toxin (Botox) is considered experimental/investigational/unproven due to insufficient scientific evidence to support clinical efficacy and/or effects on health outcomes.

Tendon Sheath, Ligament, Ganglion Cysts, Carpal and Tarsal Tunnel Injections (20526, 20550, 20551, 20612, 28899)

Injection into tendon sheaths, their origins or insertions, ligaments, or ganglion cysts is indicated to relieve substantial pain and/or significant functional disability that results from inflammation or other pathological changes in those structures.

CDPHP considers tendon sheath, ligament, ganglion cysts, and carpal and tarsal tunnel injections medically necessary when:

- Other conservative therapy has not provided acceptable relief; is contraindicated, or not appropriate; and
- There is a reasonable likelihood that injection will significantly improve the patient's pain and/or functional disability.
- Proper use of this modality should be part of an overall management plan including diagnostic evaluation in order to clearly identify and properly treat the primary cause.

Diagnostic Phase

A maximum of two injections will be covered at minimum intervals of one week, preferably two, to diagnose the origin of pain and achieve a therapeutic effect. Additional injections are not considered medically necessary if no clinical response is achieved.

Therapeutic Phase

In the treatment or therapeutic phase, injections should be repeated only as medically necessary. No more than four injections are considered medically necessary in a consecutive 12-month period.

- Frequency should be two months or longer between each injection provided that there is initial pain relief with diagnostic injections of greater than or equal to 75-100 percent with

the ability to perform previously painful maneuvers, and a persistent pain relief of greater than or equal to 50 percent is maintained for at least six weeks with the continued ability to perform previously painful maneuvers.

Other Considerations:

Medical record must include a procedural note documenting reason for the injection at any particular site. If multiple sites are injected, documentation to substantiate that all the injections are reasonable and necessary must be present.

In general, most conditions that require injections into the tendon sheaths, ligaments, or ganglion cysts should be resolved with one to three injections.

When a given specific tendon, ligament, tunnel, or cyst is injected, it will be considered one injection service regardless of the number of injections administered at that specific anatomical location on a single date of service.

Modifier 50 should not be reported with CPT codes 20551, 20552, 20553, or 20612, but may be reported, when appropriate, with CPT codes 20550 and 20526.

Epidural Steroid Injections (ESI): 64480, 64484

Epidural steroid injections (ESIs) have been used as a non-surgical modality to treat low back and neck pain. These procedures typically involve the injection of a solution containing corticosteroids and/or anesthetic into the epidural space, although saline may be included at times.

The ESI can be performed in three ways. Interlaminar (IESI) approaches the epidural space from the posterior spine between the two vertebral laminae near the midline. In the transforaminal approach (TFESI), the injectant is delivered through the neuroforamen dorsal to the nerve root within the intervertebral foramen. The caudal approach (CESI) enters through the sacral hiatus at the sacral canal to access the epidural space.

The treatment of individuals with spinal disorders, including pain, can be complex, and it is recommended that all individuals being considered for interventional spinal procedures undergo a thorough evaluation and be treated following development of a comprehensive care plan.

A "session" is defined as all epidural or spinal procedures performed on a single day.

CDPHP considers epidural steroid injections (ESIs) medically necessary when the following three criteria are met:

POLICY NAME: PAIN MANAGEMENT SERVICES

1. History, physical examination, and concordant radiological image-based diagnostic testing supporting one of the following:

- Lumbar, cervical, or thoracic radiculopathy, radicular pain and/or neurogenic claudication due to disc herniation, osteophyte or osteophyte complexes, severe degenerative disc disease, producing foraminal or central spinal stenosis **OR**
- Post-laminectomy syndrome; **OR**
- Acute herpes zoster associated pain

AND

2. Radiculopathy, radicular pain and/or neurogenic claudication is severe enough to greatly impact quality of life or function. An objective pain scale or functional assessment must be performed at baseline (prior to interventions). The same scale* must be repeated at each follow-up for assessment of response.

AND

3. Pain duration of at least four (4) weeks, and the inability to tolerate noninvasive conservative care or medical documentation of failure to respond to four (4) weeks of noninvasive conservative care **or** acute herpes zoster refractory to conservative management where a four (4) week wait is not required.

*Note: The scales used to measure pain and/or disability must be documented in the medical record. Acceptable scales include but are not limited to verbal rating scales, Numerical Rating Scale (NRS) and Visual Analog Scale (VAS) for pain assessment, and Pain Disability Assessment Scale (PDAS), Oswestry Disability Index (ODI), Oswestry Low Back Pain Disability Questionnaire (OSW), Quebec Back Pain Disability Scale (QUE), Roland Morris Pain Scale, Back Pain Functional Scale (BPFS), and the PROMIS profile domains to assess function.

Diagnostic/Therapeutic Injections

No more than four (4) epidural injection sessions (CPT codes 64480 or 64484) may be reported per spinal region in a rolling 12-month period regardless of the number of levels involved.

Transforaminal epidural steroid injections (TFESIs) involving a maximum of two (2) levels in one spinal region are considered medically reasonable and necessary. It is important to recognize that most conditions would not ordinarily require ESI at two (2) levels in one spinal region.

Capital District Physicians' Health Plan, Inc.
CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: PAIN MANAGEMENT SERVICES

Caudal epidural steroid injections (CESIs) and interlaminar epidural steroid injections (ILESIs) involving a maximum of one level are considered medically reasonable and necessary.

Repeat ESI when the first injection directly and significantly provided improvement of the condition being treated may be considered medically reasonable and necessary when the medical record documents at least 50% of sustained improvement in pain relief and/or improvement in function measured from baseline using the same scale* for at least three months. If a patient fails to respond well to the initial ESI, a repeat ESI after 14 days can be performed, using a different approach, level and/or medication if appropriate, with the rationale and medical necessity for the second ESI documented in the medical record.

Limitations of Coverage:

It is not considered medically reasonable and necessary to perform multiple blocks (ESI, sympathetic blocks, facet blocks, trigger point injections, etc.) during the same session as ESIs, with the exception of a facet synovial cyst and ESI performed in the same session.

Use of Moderate or Deep Sedation, General Anesthesia, and Monitored Anesthesia Care (MAC) is usually unnecessary or rarely indicated for these procedures and therefore not considered medically reasonable and necessary. Even in patients with a needle phobia and anxiety, typically oral anxiolytics suffice. In exceptional and unique cases, documentation must clearly establish the need for such sedation in the specific patient.

ESIs to treat non-specific low back pain (LBP), axial spine pain, complex regional pain syndrome, widespread diffuse pain, pain from neuropathy from other causes, cervicogenic headaches are considered investigational and therefore are not considered medically reasonable and necessary.

It is not considered medically reasonable and necessary for more than one spinal region to be injected in the same session.

It is not medically reasonable and necessary to perform CESIs or ILESIs bilaterally.

It is not medically reasonable and necessary to prescribe a predetermined series of ESIs.

Steroid dosing should be the lowest effective amount.

It generally would not be considered medically reasonable and necessary for treatment with ESI to extend beyond 12 months. Frequent continuation of epidural steroid injections over 12 months may trigger a focused medical review. Use beyond twelve months requires the following:

a. Pain is severe enough to cause a significant degree of functional disability or vocational disability.
b. ESI provides at least 50% sustained improvement of pain and/or 50% objective improvement in function (using same scale as baseline).
c. Rationale for the continuation of ESIs including but not limited to patient is high-risk surgical candidates, the patient does not desire surgery, recurrence of pain in the same location relieved with ESIs for at least three months.
d. The primary care provider must be notified regarding continuation of procedures and prolonged repeat steroid use.

ESIs should not be performed when contraindicated including but not limited to suspected or active localized spinal infection, significant systemic infection, compressive lesions of the spinal cord, conus medullaris or cauda equina, suspicion or major risk factors for cancer.

Facet Joint Interventions (64491, 64492, 64494, 64495) (64634, 64636)

Facet Joint Interventions generally consist of four types of procedures: Intraarticular (IA) Facet Joint Injections, Medial Branch Blocks (MBB), Radiofrequency Ablations (RFA) or Facet Joint Denervation and Facet cyst rupture/aspiration.

A facet joint injection is an injection of a long-acting local anesthetic agent and/or steroid into the paravertebral facet joint, medial branch nerve or facet joint nerve under fluoroscopic guidance. Facet joints, also called zygapophysial joints, are located on the posterior spine on each side of the vertebrae where it overlaps the neighboring vertebrae. The facet joints provide stability and give the spine the ability to bend and twist.

Medial Branch Blocks (MBB) involve the placement of local anesthetic and possibly a corticosteroid near the medial branch nerve which supplies the sensory innervation to a specific facet joint.

Facet Joint Denervation or Radiofrequency Ablation (RFA) is a general term used to describe the minimally invasive procedure that uses thermal energy generated by the radiofrequency current to deprive the facet joint of its nerve supply. The procedure is also known as a Medial Branch Radiofrequency Neurotomy (Ablation) because it is used to thermally remove the medial branch nerve by using electrical current to create thermal energy to coagulate the adjacent tissues around the targeted medial branch nerve.

Facet cyst rupture/aspiration is an intra-articular facet joint injection performed with synovial cyst aspiration.

POLICY NAME: PAIN MANAGEMENT SERVICES

Definitions:

A zygapophyseal (aka facet) joint "level" refers to the zygapophyseal joint or the two medial branch (MB) nerves that innervate that zygapophyseal joint.

A "session" is defined as all injections/blocks/RF procedures performed on one day and includes medial branch blocks (MBB), intraarticular injections (IA), facet cyst ruptures, and RFA ablations.

A "region" is all injections performed in cervical/thoracic or all injections performed in lumbar/sacral regions.

CDPHP considers facet joint interventions medically necessary for the diagnosis and treatment of chronic pain in patients who meet ALL the following criteria:

- There is no non-facet pathology per clinical assessment or radiology studies that could explain the source of the patient's pain, such as fracture, tumor, infection, or significant deformity.
- Moderate to severe chronic neck or low back pain, predominantly axial, that causes functional deficit measured on pain or disability scale.*
- Pain present for minimum of 3 months with documented failure to respond to noninvasive conservative management (as tolerated).
- Absence of untreated radiculopathy or neurogenic claudication (except for radiculopathy caused by facet joint synovial cyst).

  *Pain assessment must be performed and documented at baseline, after each diagnostic procedure using the same pain scale for each assessment. A disability scale must also be obtained at baseline to be used for functional assessment (if patient qualifies for treatment).

Diagnostic Facet Joint Procedures (IA or MBB) (64491-64495):

The primary indication of a diagnostic facet joint procedure is to diagnose whether the patient has facet syndrome. Intraarticular (IA) facet block(s) are considered reasonable and necessary as a diagnostic test only if medial branch blocks (MMB) cannot be performed due to specific documented anatomic restrictions or there is an indication to proceed with therapeutic intraarticular injections. These restrictions must be clearly documented in the medical record and made available upon request.

Diagnostic procedures should be performed with the intent that if successful, radiofrequency

ablation (RFA) procedure would be considered the primary treatment goal at the diagnosed level(s).

A second diagnostic facet procedure is considered medically necessary to confirm validity of the initial diagnostic facet procedure when administered at the same level. The second diagnostic procedure may only be performed a minimum of two weeks after the initial diagnostic procedure. Clinical circumstances that necessitate an exception to the two-week duration may be considered on an individual basis and must be clearly documented in the medical record.

For the first diagnostic facet joint procedure to be considered medically reasonable and necessary, the patient must meet the criteria outlined under indications for facet joint interventions.

A second confirmatory diagnostic facet joint procedure is considered medically reasonable and necessary in patients who meet ALL the following criteria:

- The patient meets the criteria for the first diagnostic procedure; AND
- After the first diagnostic facet joint procedure, there must be a consistent positive response of at least 80% relief of primary (index) pain (with the duration of relief being consistent with the agent used)

Frequency limitation: For each covered spinal region no more than four (4) diagnostic joint sessions will be reimbursed per rolling 12 months, in recognition that the pain generator cannot always be identified with the initial and confirmatory diagnostic procedure.

Therapeutic Facet Joint Procedures (IA) (64491-64495):

Therapeutic facet joint procedures are considered medically reasonable and necessary for patients who meet ALL the following criteria:

- The patient has had two (2) medically reasonable and necessary diagnostic facet joint procedures with each one providing a consistent minimum of 80 percent relief of primary (index) pain (with the duration of relief being consistent with the agent used); AND
- Subsequent therapeutic facet joint procedures at the same anatomic site results in at least consistent 50 percent pain relief for at least three (3) months from the prior therapeutic procedure or at least 50 percent consistent improvement in the ability to perform previously painful movements and ADLs as compared to baseline measurement using the same scale; AND

- Documentation of why the patient is not a candidate for radiofrequency ablation (such as established spinal pseudarthrosis, implanted electrical device)

Frequency limitation: For each covered spinal region no more than four (4) therapeutic facet joint (IA) sessions will be reimbursed per rolling 12 months.

Facet Cyst Aspiration/Rupture (64999):

Intra-articular facet joint injection performed with synovial cyst aspiration is considered medically necessary when both of the following criteria are met:

- Advanced diagnostic imaging study (e.g., MRI/CT/myelogram) confirm compression or displacement of the corresponding nerve root by a facet joint synovial cyst; AND
- Clinical and physical symptoms related to synovial facet cyst are documented

Frequency limitation: Cyst aspiration/rupture may be repeated once and only if there is 50% or more consistent improvement in pain for at least three (3) months.

Limitations of Coverage:

Facet joint interventions done without CT or fluoroscopic guidance are considered not reasonable and necessary. This includes facet joint interventions done without any guidance, performed under ultrasound guidance, or with magnetic resonance imaging (MRI).

Use of Moderate or Deep Sedation, General Anesthesia, and Monitored Anesthesia Care (MAC) is not considered medically reasonable and necessary during facet procedures of IA, MBB, and facet cyst aspiration/rupture.

The use of Moderate Anesthesia for RFA will be considered in individual cases with documentation of medical necessity such as a longstanding well-documented history of inability to cooperate, medical conditions that would prohibit performance of the procedure, or inability to remain motionless. Patient anxiety or preference alone is not sufficient justification. Routine use of Moderate Sedation or Monitored Anesthesia Care (MAC) or use of General Anesthesia or Deep Sedation for RFA is not considered reasonable and necessary.

It is not expected that patients will routinely present with pain in both cervical/thoracic and

lumbar spinal regions. Therefore, facet joint interventions (both diagnostic and therapeutic) are limited to one spinal region per session.

It is not routinely necessary for multiple blocks (e.g., epidural injections, sympathetic blocks, trigger point injections, etc.) to be provided to a patient on the same day as facet joint procedures. Multiple blocks on the same day could lead to improper or lack of diagnosis. If performed, the medical necessity of each injection (at the same or a different level[s]) must be clearly documented in the medical record. For example, the performance of both paravertebral facet joint procedures(s) and a transforaminal epidural injection (TFESI) at the same or close spinal level at the same encounter would not be expected unless a synovial cyst is compressing the nerve root. In this situation, TFESI may provide relief for the radicular pain, while the facet cyst rupture allows nerve root decompression. Frequent reporting of multiple blocks on the same day may trigger a focused medical review.

Facet joint intraarticular injections and medial branch blocks may involve the use of anesthetic, corticosteroids, anti-inflammatories and/or contrast agents, and does not include injections of biologicals or other substances not FDA designated for this use.

One to two levels, either unilateral or bilateral, are allowed per session per spine region. The need for a three or four-level procedure bilaterally may be considered under unique circumstances and with sufficient documentation of medical necessity on appeal. A session is a time period, which includes all procedures (i.e., medial branch block (MBB), intraarticular injections (IA), facet cyst ruptures, and RFA ablations that are performed during the same day.

If there is an extended time, two years or more, since the last RFA and/or there is a question as to the source of the recurrent pain then diagnostic procedures must be repeated.

Therapeutic intraarticular facet injections are not covered unless there is justification in the medical documentation on why RFA cannot be performed. Facet joint procedures in patients for the indication of generalized pain conditions (such as fibromyalgia) or chronic centralized pain syndromes are considered not reasonable and necessary. Individual consideration may be considered under unique circumstances and with sufficient documentation of medical necessity on appeal.

In patients with implanted electrical devices, providers must follow manufacturer instructions and extra planning as indicated to ensure safety of procedure.

Peripheral Nerve Blocks (64400, 64405, 64415, 64416, 64417, 64418, 64420, 64421, 64425, 64430, 64445, 64446, 64447, 64448, 64449, 64450, 64455, 64999)

Peripheral nerves can be the cause of pain in a variety of conditions. Sometimes the nerves are the source of the pain and sometimes the nerves merely are carrying impulses from painful

tissues. Examples may include: postherniorrhaphy pain (ilioinguinal/iliohypogastric/ genitofemoral), iliac crest harvest syndromes (cluneal nerve, lateral femoral cutaneous nerve), carpal tunnel syndrome (median nerve), Morton's neuroma, facial pain, and headaches (trigeminal and occipital nerve).

Peripheral nerve blocks may be used for both diagnostic and therapeutic purposes. Diagnostically, a peripheral nerve block allows the clinician to isolate the specific cause of pain in an individual patient. The injection of local anesthetic, with or without steroid, may also provide an extended therapeutic benefit. If the patient does not achieve sustained relief, a denervation procedure via chemical, cryoneurolysis, or radiofrequency may not be effective at providing long-term relief.

CDPHP considers peripheral nerve blocks medically reasonable and necessary for normally temporary conditions, such as the following indications, for diagnostic and therapeutic purposes:

- When pain appears to be due to a classic mononeuritis, but neuro-diagnostic studies have failed to provide a structural explanation. In this scenario, selective peripheral nerve blockade can usually clarify the situation (for diagnostic purposes and not long-term treatment).
- When peripheral nerve injuries/entrapment or other extremity trauma leads to complex regional pain syndrome.
- When selective peripheral nerve blockade is used diagnostically in those cases in which the clinical picture is unclear (for diagnostic purposes and not long-term treatment).
- When an occipital nerve block is used to confirm the clinical impression of the presence of occipital neuralgia. Chronic headache/occipital neuralgia can result from chronic spasm of the neck muscles as the result of either myofascial syndrome or underlying cervical spinal disease. It may be unilateral or bilateral, constant, or intermittent. Nerve injury secondary to localized head trauma or trauma to the nerve from a scalp laceration can also cause this condition. Most commonly it is caused by an entrapment of the occipital nerve in its course from its origin from the C2 nerve root to its entrance into the scalp through the mid portion of the superior nuchal line. Blockage of the occipital nerve can confirm the clinical impression of occipital neuralgia particularly if the clinical picture is not entirely typical. If only temporary relief of symptoms is obtained, neurolysis of the greater occipital nerve may be considered via multiple techniques including radiofrequency and cryoanalgesia. In addition, the lesser and third occipital nerves can be involved in the pathology of headaches and can be treated in a similar manner.
- When the suprascapular nerve block is used to confirm the diagnosis of suspected entrapment of the nerve. Entrapment of the suprascapular nerve as it passes through the suprascapular notch can produce a syndrome of pain within the shoulder with weakness of supraspinatus and infraspinatus muscles. When the history and

examination point to the diagnosis, a suprascapular nerve block leading to relief of pain can confirm it. This may be followed by injection of depository steroids that sometime provide lasting relief.

- When the trigeminal nerve is blocked centrally at the trigeminal ganglion, or along one of the three divisions or at one of the many peripheral terminal branches (i.e., supraorbital nerve).
- Nerve blocks as preemptive analgesia:

A. When a single injection peripheral nerve block provides post-surgical pain control

1. During the transition to oral analgesics.

2. In those procedures which cause severe pain normally uncontrolled by oral analgesics.

3. In cases otherwise requiring control with intravenous or parenteral narcotics.

4. In cases where the patient cannot tolerate treatment with narcotics due to allergy or side effects, etc.

B. When a continuous peripheral nerve block provides the same as above, and furthermore may provide extended (i.e., one to five or more days) relief as a result of chronic administration of anesthetic.

Limitations of Coverage:

In general, signs and symptoms that justify peripheral nerve blocks should be resolved after one to three injections. Up to three peripheral nerve blocks per anatomic site (e.g., specific nerve, plexus or branch as defined by the CPT code description) may be performed in a six-month period of time.

More than two anatomic sites (e.g., specific nerve, plexus or branch as defined by the CPT code description) injected at any one session will be denied. If the member does not achieve progressively sustained relief after receiving two to three repeat peripheral nerve block injections on the same anatomical site, then alternative therapeutic options should be explored.

There is insufficient evidence to support the use of peripheral nerve blocks in the treatment of diabetic peripheral neuropathy, peripheral neuropathies caused by other underlying systemic diseases or peripheral neuropathies causes such as degenerative or idiopathic reasons. Medical management using systemic medications is clinically indicated for the treatment of these conditions.

POLICY NAME: PAIN MANAGEMENT SERVICES

"Dry needling" of ganglion cysts, ligaments, neuromas, peripheral nerves, tendon sheaths and their origins/insertions, or any tissue are non-covered procedures.

Other Considerations:

Additional management using medications, behavioral therapy, and physical therapy should be used (when appropriate) in conjunction with peripheral nerve block.

Spinal Cord (Dorsal Column) Stimulator (63650, 63655, 63661, 63662, 63663, 63664, 63685, 63688)

A device (L8680-L8683, L8685-L8689) that is used to electrically stimulate a member's spinal cord to relieve severe intractable pain. The stimulator consists of an implanted receiver with electrodes that are placed on the member's spinal cord, and an external transmitter for transmitting the stimulating pulses across the member's skin to the implanted receiver. Spinal cord (dorsal column) stimulation involves the surgical implantation of neurostimulator electrodes within the dura mater (via laminectomy) or the percutaneous insertion of electrodes in the epidural space.

CDPHP considers implantation of spinal cord (dorsal column) stimulators medically necessary for the treatment of chronic, intractable pain secondary to the following indications:

- Failed back surgery syndrome (FBS) with predominant low back pain and significant radicular pain.
- Complex regional pain syndrome affecting a limb (i.e., reflex sympathetic dystrophy)
- Inoperable chronic ischemic limb pain secondary to peripheral vascular disease
- Last resort treatment of moderate to severe (documented 5 or more on a 10-point VAS scale) chronic neuropathic pain of the following origins that has been present for 12 or more months:
    - Lumbosacral arachnoiditis
    - Radiculopathies
    - Phantom limb/stump pain
    - Peripheral neuropathy (including diabetic peripheral neuropathy-DPN*)
    - Post-herpetic neuralgia
    - Intercostal neuralgia
    - Cauda equina injury
    - Incomplete spinal cord injury
    - Plexopathy

A. A trial of percutaneous spinal cord (dorsal column) stimulation to predict whether a spinal

cord (dorsal column) stimulator will induce significant pain relief in members with chronic pain will be considered medically necessary when all of the criteria listed below are met:

- Services must be recommended by the physician after consultation with a pain management specialist.
- Psychological evaluation has been completed to exclude any major mental disability or drug habituation that would negatively influence the outcome of the treatment.
- The implantation of the stimulator is a late resort (the patient is not considered a candidate for further surgical intervention).
- Other more conservative treatment modalities (pharmacological, surgical, physical, or psychological therapies) have been tried unsuccessfully for a minimum of 6 months or are contraindicated.

  *The following additional criteria applies to coverage for the indication of diabetic peripheral neuropathy-DPN only:

- Demonstrated glycemic control (HA1c of < 8) for a minimum of 6 months.

B. Placement of a permanent spinal cord stimulator (dorsal column) stimulator may be considered medically necessary and eligible for coverage when the above medical necessity criteria for a trial treatment of spinal cord stimulation (dorsal column) stimulation are met, the trial is performed, and the individual has demonstrated pain relief of at least 50% for a minimum of 48 hours (documented on VAS scale) with the temporarily implanted electrode as documented in the medical record.

CDPHP considers spinal cord (dorsal column) stimulation experimental and investigational for all indications other than those listed above, including but not limiting to, cervical disease-causing neck, upper extremity pain, and/or headache.

The implantation of a spinal cord (dorsal column) stimulator is covered under the medical/surgical benefit. Any external components used to control the device and to recharge the transmitter are considered DME and will be subject to the terms and conditions of the enrollee's contract.

Based upon our criteria and assessment of the peer-reviewed literature, the replacement of an existing high frequency or non-high-frequency dorsal column SCS and dorsal root ganglion (DRG) stimulator for individuals who have had a positive pain relief response from the existing DCS is considered medically appropriate when **EITHER** of the following criteria are met:

A. The existing stimulator and/or battery/generator is malfunctioning, cannot be repaired,

and is no longer under warranty; or

B. Revision of the electrode percutaneous array(s) or electrode plate/paddle(s) is required.

Based upon our criteria and assessment of the peer-reviewed literature, replacement of a functioning non-high frequency dorsal column SCS with a high-frequency SCS is considered not medically necessary.

Other considerations for outpatient pain management services

In general, it is not considered appropriate to provide an interlaminar epidural/intrathecal injection, a transforaminal selective epidural, facet joint/nerve block, sacroiliac joint injection, lumbar sympathetic block, or other nerve block on the same day. Therefore, only one invasive procedure per date of service is considered reasonable and necessary.

Fluoroscopic guidance (77003) is considered an integral part of the injection procedure 62324, 62326, 62327) and therefore, is not separately reimbursed.

Administration of local anesthetics is considered an integral part of the injection procedure and therefore, are not separately reimbursed.

HCPCS drug codes may be allowed in addition to the procedure when in conjunction with an office-based pain management program.

The application of physical, noninvasive modalities (i.e., electrical stimulation, ultrasound, and others) is considered global to the office visit.

EXCLUSIONS

The following are considered experimental/investigational:

- Biofeedback
- Cognitive behavioral techniques when provided as a stand-alone service
- Cryotherapy (e.g., iovera° cryoneurolysis) for treatment of any indication including, but not limited to, knee osteoarthritis or before/during/after total knee replacement surgery (64640, C9808, C9809)
- Decompression procedure, percutaneous, of nucleus pulposus of intervertebral disk (62287, S2348)
- Endoscopic epidural adhesiolysis (64999)
- Intraarticular and extraarticular facet joint prolotherapy
- Intradiscal radiofrequency thermomodulation (22899)

POLICY NAME: PAIN MANAGEMENT SERVICES

- Intradiscal steroid injection (22899)
- Intra-facet implants
- Nerve blocks or injections for the treatment of multiple neuropathies or peripheral neuropathies caused by underlying systemic disease
- Non-thermal modalities for facet joint denervation including chemical, low-grade thermal energy (less than 80 degrees Celsius), laser neurolysis, and cryoablation
- Percutaneous intradiscal electrothermal annuloplasty [IDET] (22527)
- Percutaneous lysis of epidural adhesions, Racz procedure (62263, 62264)
- Peripheral nerve blocks for conditions other than those stated within this policy, to include treatment of chronic conditions (e.g., chronic knee pain, osteoarthritis (i.e., genicular nerve branches 64454, 64624) **Exception**: Genicular nerve branches (64454 and 64624) are covered for Medicare Advantage LOB. See Medicare Advantage section below for coverage criteria.
- Prolotherapy (M0076)
- Radiofrequency denervation (ablation) of the nerves that innervate the sacroiliac joint (L5, S1, S2, S3) whether performed using traditional or cooled radiofrequency (< 80 degrees Celsius) (64625) or pulsed radiofrequency (64999).
- Ultrasound guidance for facet joint injection(s) and epidural steroid injection(s) (0213T-0218T, 64999).

CDPHP PRODUCT VARIATIONS

CHILD HEALTH PLUS	Subject to all terms and conditions noted above in the policy.
MEDICARE ADVANTAGE	Subject to all terms and conditions noted above in the policy to include the following: Coverage is available for percutaneous image guided lumbar decompression (PILD) for individuals with lumbar spinal stenosis when criteria in the Coverage with Evidence Development for Medicare Advantage, 1370/20.000517 policy are met. • Genicular nerve blocks (64454, 64624) are covered to include treatment of chronic conditions (e.g., chronic knee pain, osteoarthritis, post-surgical pain management, based on the criteria outlined above in the Peripheral Nerve Block section of this policy. • Dry needling (20560, 20561) is covered for chronic low

POLICY NAME: PAIN MANAGEMENT SERVICES

	back pain (cLBP). • Peripheral nerve stimulator: (64555, 64575, 64590, 64595, 64999, 64567) to treat chronic intractable pain.
SELECT PLAN/HARP	Subject to all terms and conditions noted above in the policy with the following exceptions: The following treatments for chronic low back pain are not eligible for reimbursement as they are considered ineffective, or experimental and investigational: • Prolotherapy (M0076) • Systemic corticosteroids for **chronic** low back pain • **Therapeutic** facet joint steroid injections in the lumbar and sacral regions with or without CT or fluoroscopic image guidance (up to two **diagnostic** facet steroid injections will continue to be covered for codes 64494, 64495) • Injections of steroids into intervertebral discs; and • Continuous or intermittent traction (97012) • 0216T, 0217T, and 0218T are not covered for therapeutic or diagnostic facet steroid injections Functional electrical stimulators (63650, 63655, 63685, 63688, 64555, 64575, 64580, 64585, 64590, 64595, L8680-L8689), when used in the treatment of spinal cord and head injury, cerebral palsy, and upper motor neuron disease. Coverage of FES is available for indications other than those listed above when medically necessary. Implantable infusion pumps (62350-62370, 95990, 95991) are covered for: - Delivery of an opioid for pain management purposes only when there is a diagnosis of cancer. - Delivery of other substances when medically necessary. Note: For individuals who had infusion pumps implanted for **any diagnosis** prior to November 1, 2013, CDPHP will continue to cover the pumps, related supplies, and drugs.

POLICY HISTORY

This section is intended to provide only highlights of the policy changes. The policy should always be reviewed in its entirety to ensure a comprehensive understanding of coverage.

Effective Date	Update
8/1/2026	Policy updated to remove Percutaneous peripheral nerve stimulation (PNS), Peripheral nerve field stimulation (PNFS) under exclusions as these services are now addressed in new policy, Implantable and Invasive Neuromodulation Systems, 1.01.60
1/1/2026	Updated exclusions section to remove items that are no longer experimental. Remove the following codes from the policy as Healthhelp will be reviewing: 62320 62321 62322 27096 62323 64451 64479 64483 64490 64493 64633 64634 64635 64636

	0274T 0275T 22526 G0260 Removed deleted code 0720T and updated with replacement code 64567.
12/1/2025	Under exclusions, removed RFA of the occipital nerve and added guidance for RFA of occipital nerve under nerve blocks.
9/1/2025* *No change to effective date for this update	Clarified coverage criteria under Facet Joint Denervation per updated LCD L35936 effective 7/17/25.
9/1/2025	Added PNS/PNFS as experimental for any indication with exception under Medicare Advantage.
3/1/2025 *No change to effective date of policy	Added new codes that were effective 1/1/2025 C9808 and C9809 to Exclusions section.
3/1/2025	Added Exclusion for peripheral nerve field stimulation (PNS/PNFS) to relieve pain and improve function in patients with refractory chronic lower back pain. Added exclusion for radiofrequency ablation of the occipital nerve for occipital neuralgia/headache. Added criteria for replacement of spinal cord (dorsal column) stimulator.
1/1/2025	Revised all criteria in Trigger Point Injections section. Revised this statement in the Epidural Steroid Injections section: Steroid dosing should be the lowest effective amount. Revised the criteria for anesthesia in the Facet Joint Interventions section.
3/1/2024* *No change to effective date for this update	Added coverage information for genicular nerve blocks (64454, 64624) to the Medicare Advantage section. Added additional criteria for nerve blocks as preemptive analgesia under the Peripheral Nerve Blocks section.
3/1/2024	Added additional criteria and indications for spinal cord (dorsal column) stimulator.
1/1/2024	Completely revised the Sacroiliac Joint Injection section.

POLICY NAME: PAIN MANAGEMENT SERVICES

9/1/2023	Added Cryotherapy (e.g., iovera° cryoneurolysis) to the exclusions section. Under exclusions, clarified Radiofrequency denervation (ablation) of the sacroiliac joint.
1/1/2023	Completely revised the Epidural Injections section. Removed section on termed code 72275.
5/1/2022	No content change. Under Medicaid section, clarified coverage/noncoverage for implantable infusion pumps.
1/1/2022	Completely revised the section for Facet Joint Injections, Medical Branch Nerve Blocks, and Facet Joint Radiofrequency Neurotomy which are now collectively referred to in the policy as Facet Joint Interventions. Added additional Exclusions for Facets Joint Interventions.
1/1/21	Updated coding for dry needling, sacroiliac joint injections, and peripheral nerve blocks. Added section on Epidurography (72275). Updated coding and verbiage for radiofrequency denervation (ablation) in the Exclusions section.
1/1/2020	Termed code removed from policy.

MEDICAL POLICY

Medical Policy Title	**Pain Management Techniques for Knee Pain**
Policy Number	**7.01.100**
Current Effective Date	**January 1, 2027**
Next Review Date	**July 2027**

Our medical policies are guides to evaluate technologies or services for medical necessity. Criteria are established through the assessment of evidence based, peer-reviewed scientific literature, and national professional guidelines. Federal and state law(s), regulatory mandates and the member's subscriber contract language are considered first in the determination of a covered service. (Link to Product Disclaimer)

POLICY STATEMENT(S)

Ablation or Denervation Techniques

I. Radiofrequency ablation (RFA)/denervation (including cooled and pulsed) of genicular nerves to treat pain is considered **investigational** for all indications, including, but not limited to, knee pain/osteoarthritis (OA).

II. Cryoneurolysis/cryoablation to treat pain associated with knee OA or total knee arthroplasty (TKA) is considered **investigational**.

Injection Treatments for Knee Pain

III. The addition of an IPACK block to multimodal analgesia regimens to reduce post-operative pain or improve functional performance is considered **investigational**.

11.01.03 Experimental or Investigational Services

POLICY GUIDELINE(S)

Not Applicable

DESCRIPTION

Radiofrequency Ablation

Nerve RFA is a minimally invasive treatment method that involves the use of heat and coagulation necrosis to destroy tissue. A needle electrode is inserted through the skin and into the tissue to be ablated. A high-frequency electrical current is applied to the target tissue, causing a small sphere of tissue to coagulate around the needle by the heat generated. It is theorized that the thermal lesioning of the nerve destroys peripheral sensory nerve endings, resulting in the alleviation of pain.

Cooled radiofrequency (RF) treatment is a variation of nerve RFA, using a special device that applies

more energy at the desired location without excessive heat diffusing beyond the area, causing less tissue damage away from the nerve. The goal of ablating the nerve is the same. COOLIEF (Haylard Health, Inc.) cooled RF treatment is a minimally invasive outpatient procedure that uses cooled radiofrequency energy to target the sensory nerves causing pain. COOLIEF circulates water through the device while heating nervous tissue, to create a treatment area that is larger than conventional RF treatments. This combination targets the pain-causing nerves without excessive heating and is proposed to relieve hip and knee pain associated with OA.

Nerve RFA is different from pulsed RF treatment, which has been investigated for different types of pain. The mechanism of action of pulsed RF treatment is uncertain, but it is thought not to destroy the nerve, or, if it does produce some degree of nerve destruction, to cause less damage than standard RFA. Some studies refer to pulsed RF treatment as ablation.

Cryoneurolysis

Cryoneurolysis is being investigated to alleviate pain in knee OA and to manage pain following TKA. Temperatures of -20° to -100°C applied to a nerve cause Wallerian (anterograde axonal) degeneration, with disruption of nerve structure and conduction. However, maintenance of the perineural and epineural elements of the nerve bundle purportedly allows near complete regeneration and recovery of nerve function in about three to five months. The iovera cryoablation system is a portable handheld device that applies percutaneous and targeted delivery of cold to superficial peripheral nerves.

IPACK

The IPACK block (infiltration between the popliteal artery and capsule of the posterior knee) is a regional anesthesia technique used to manage posterior knee pain especially after a total knee replacement (TKR) or other knee surgery. It is a relatively recent innovation that provides anesthesia without causing motor weakness particularly of the tibial or common peroneal nerve. The purpose is to provide posterior knee analgesia by targeting the articular branches of nerves in innervating the posterior capsule of the knee. It is used as a supplement to abductor canal blocks (which covers anterior and medial pain) for comprehensive motor sparing analgesia. IPACK is performed under guided ultrasound with the individual in a supine or lateral position. A linear or curved transducer is used to identify the femoral condyles, popliteal artery, and the posterior capsule. A needle is inserted in-plane from medial to lateral, or lateral to medial depending on the preference. Local anesthetic (typically 15-20 ml of ropivcacine or bupivacaine) is injected into the interspace between the popliteal artery and posterior capsule of the femur.

SUPPORTIVE LITERATURE

Radiofrequency Ablation

Gupta and colleagues (2017) completed a systematic review aimed at analyzing published studies on RFA (conventional, pulsed, or cooled radiofrequency) for patients suffering from OA of the knee, as well as patients post-TKA who have developed refractory disabling chronic knee pain. The systematic review was intended to provide an overview of the current knowledge regarding variations in procedures, nerve targets, adverse events, and temporal extent of clinical benefit. Seventeen

publications were identified in the search, including articles investigating conventional, pulsed, or cooled RFA. These studies primarily targeted either the genicular nerves or used an intra-articular approach. Of the studies, five were small-sized, randomized, controlled trials, although one involved diathermy radiofrequency ablation. There were eight retrospective or prospective case series and four case reports. Utilizing the strength of evidence grading, the study identified a low level of certainty to suggest a superior benefit between targeting the genicular nerve, an intra-articular approach, or targeting the larger nerves such as femoral and tibial nerves. It also identified a low level of certainty supporting the superiority of any specific RFA procedure modality. The majority of the studies reported positive patient outcomes, but the inconsistent procedural methodology, inconsistent patient assessment measures, and small study sizes limit the applicability of any specific study to clinical practice. The authors concluded that, overall, the studies showed promising results for the treatment of severe chronic knee pain by RFA at up to one year, with minimal complications. Numerous studies, however, yielded concerns about procedural protocols, study quality, and patient follow-up. RFA can offer substantial clinical and functional benefit to patients with chronic knee pain due to OA or post-TKA.

Qudsi-Sinclair and colleagues (2017) published the results of a double-blinded, randomized, controlled trial comparing traditional RF neurolysis (n=14) to local anesthetic and corticosteroid block (n=14) of the genicular nerves for treatment of persistent pain following TKA. Subjects were followed for one year after treatment and evaluated for pain evolution, knee functionality, quality of life, and degree of patient satisfaction. At three and six months, both groups demonstrated a reduction in pain and significant joint function improvement, with similar results in both groups, including improvement in quality of life and disability and a reduced need for analgesics. The authors could not recommend one treatment option over another and suggested that further clinical trials are needed to establish safety and efficacy. The study is limited by small sample population and short-term outcomes.

While there are a few studies in the published peer-reviewed literature which lend support to improvement in pain after ablative treatment, these studies are limited by variability in RF technique, small sample populations, and differences in patient selection criteria. At present, there is insufficient evidence in the peer-reviewed scientific literature evaluating RF ablative treatment for chronic knee pain. Strong, evidence-based conclusions regarding the effects of this technology on health outcomes cannot be made. Additional well-designed studies involving larger populations and long-term outcomes are needed, to support safety and efficacy and to determine how this treatment compares to other medical and surgical treatments for knee pain.

In 2018, Davis and colleagues completed a prospective, multicenter, randomized, crossover clinical trial comparing the safety and effectiveness of cooled RF with corticosteroid injection in the management of knee pain from OA in 151 subjects with chronic knee pain lasting six months or more that was unresponsive to conservative modalities. Knee pain (Numeric Rating Scale [NRS]), Oxford Knee Score, overall treatment effect (Global Perceived Effect), analgesic drug use, and adverse events were compared between cooled RFA and intra-articular steroid (IAS) cohorts at one, three, and six months after intervention. At six months, the cooled RF group had more favorable outcomes in NRS with pain reduction of 50% or greater in 74.1% versus 16.2% of IAS cases. Non-responders consisted of 25.9% in the cooled RFA group and 83.8% in the steroid group. At six months, mean Oxford Knee Score was 35.7 in the cooled RFA group versus 22.4 in the steroid group, and mean

improved Global Perceived Effect was 91.4% versus 23.9%, respectively. There was no change in the average daily dose of opioids at six months between the groups. No procedure-related serious adverse events were identified. While the authors concluded that the findings of this study indicated that cooled RFA for genicular nerve ablation is superior to a single corticosteroid injection in osteoarthritic subjects for managing knee pain, the limitations of this study included the following: the comparison group (IAS subjects) underwent a singular injection rather than multiple injections, and the six-month time point at which the primary outcome was assessed is not consistent with the expected duration of effectiveness of a steroid injection; this was an open label trial, and so, not all study site observers were blinded to procedures; medication diaries were not used to record medication usage in this study, which introduced potential for error and/or inability to identify acute changes in medication dosage during the study; and the effect of each treatment on opioid use for OA-related knee pain could not be specifically measured because patients in both study groups used opioids for medical indications other than OA-related knee pain.

In a single, blind, randomized, controlled trial, El-Hakeim and colleagues (2018) studied the efficacy of fluoroscopic-guided radiofrequency neurotomy of the genicular nerves for alleviation of chronic pain and improvement of function in patients with knee OA. A total of 60 patients with chronic knee OA received either radiofrequency neurotomy of the genicular nerves (n=30), considered Group A, or conventional analgesics only (n=30), identified as Group C. For Group C, the following treatments were prescribed: oral paracetamol (max of 1 gram in six hours), Diclofenac sodium 75mg BID, and physiotherapy, if needed. The outcomes measures included visual analog scale (VAS), Western Ontario and McMaster Universities Index (WOMAC), and Likert scale for patient satisfaction in the second week, third week, and sixth month. The authors found significant differences in the VAS in the second week, third week, and sixth month between the two groups, and a significant difference in total WOMAC index in the sixth month only. A high percentage ratio of the patients (63.3%) in the conventional Group C received physiotherapy during the follow-up period. No diagnostic block was done prior to radiofrequency, which is a limitation in the study. The authors concluded that RF could ameliorate pain and disability in chronic knee OA in a safe and effective manner.

In 2019, Davis and colleagues published a follow-up study investigating the longer-term durability of analgesic effects of cooled RFA for knee pain from OA. A total of 58 patients (82%) from the original IAS cohort who were dissatisfied with their IAS treatment after six months were allowed to crossover to receive cooled RFA treatment. In addition, 58 patients who received cooled RFA were followed for an additional six months, for a total of 12 months' follow-up. At 12 months, 52 patients (78%) in the originally treated cooled RFA group contributed data to the primary endpoint. Diminished pain relative to baseline greater than or equal to 50% was reported as 65% (34/52) after 12 months, and the OKS mean score was 34.3, an increase in baseline by 17.3 points after 12 months. In the crossover group, 49% (18/37) of patients experienced a 50% or more decrease in pain from baseline at six months. No serious adverse events identified were related to cooled RFA. Opioid use stayed consistent with baseline during the trial. The authors are unclear why a difference in analgesic response was seen in the originally treated group (65% at 12 months) and the crossover group (49% at six months); however, the study was not powered or designed to draw conclusions from the crossover group. The authors concluded that statistically significant and clinically relevant pain relief and functional improvements were sustained 12 months following cooled RFA treatment of OA-

related knee pain and dysfunction. This study was partially funded by Halyard Health.

Almeida et al (2025) conducted a systematic review and meta-analysis of the efficacy and safety of minimally invasive treatments (RFA, genicular nerve blocks (GNB), and cryoneurolysis) targeting the genicular nerves for management of knee OA pain. The primary outcome were pain intensity, physical function, and serious adverse events. Analysis was conducted on 25 randomized control trial (RFA n=16, GNB n=8, and cyroneurolysis n=1) involving 2049 participants. Secondary outcomes included quality of life, global perceived effect, general adverse events, and withdrawal due to side effects. Key results showed the certainty of evidence was consistently low to very low across all comparisons. RFA may provide some short-term relief at 4 weeks compared to the sham group 4 weeks (Mean difference -1.70, on a 0-10 scale). There was little to no difference in pain at 24-48 weeks, or improvement in function observed at any time and no serious adverse events reported. GNB showed limited and very uncertain evidence. Only one trial suggests small reduction in pain and moderate functional improvements at 4 weeks. For cryoneurolysis very low certainty of evidence was found. Only one trial showed small improvement in pain at 4 weeks and no significant effects at 12 or 24 weeks. This study had a high risk of bias. Lack of blinding, and inadequate outcome measurement protocols were found in 17 out of 25 studies included. Most trials had small sample sizes with short follow up duration. The authors concluded that RFA and other genicular nerve targeting procedures provide at best a modest, short-term benefit in knee OA pain management. There was no reliable evidence that these treatments improve function or quality of lifelong terms.

Cryoneurolysis

A randomized, controlled trial with 180 patients (Radnovich 2017) compared cryoneurolysis with sham treatment in patients who had knee OA. Cryoneurolysis resulted in a greater decrease in WOMAC pain, WOMAC total, and VAS score at 30 days, compared with sham-treated controls. Subsequent measurements showed no significant benefit of cryoneurolysis on WOMAC score at 60 days or in VAS scores at 60 or 90 days. As the trial progressed, patients were able to more accurately guess their treatment group assignment, which may have biased results in favor of active treatment. Several technical issues, including the optimal number of applications for each nerve, the duration of treatment, and the duration of thawing before moving the cannula, have yet to be resolved. Perioperative cryoneurolysis has shown mixed results in reducing opioid prescriptions/use in patients undergoing TKA (Dasa 2016; Mihalko 2021). Larger, well-designed trials are needed to determine the effects on health outcomes.

IPACK

In a 2020 double-blinded randomized controlled trial, Vichainarong and colleagues evaluated the efficacy of an IPACK block added to local infiltration analgesia and continuous adductor canal block after TKA. A total of 72 patients were randomized to receive either LIA with CACB (control group) or IPACK block with LIA and CACB (intervention group). The primary outcome measure was cumulative intravenous morphine consumption in the first 24 hours post-operatively, as well as secondary outcomes of numerical pain scores, incidence of posterior knee pain, performance test results, patient satisfaction, LOS, and adverse effects. The results indicated no significant intergroup difference in terms of morphine consumption within 24 hours post-operatively (LIA+CACB; 1.31±1.85 mg versus iPACK+LIA+CACB; 0.61±1.25 mg, p=0.08). There were no clinically significant differences

in the overall pain scores between the groups, however, the lower Timed Up and Go test scores on postoperative days one and two, along with a shorter LOS, were found in the iPACK+LIA+CACB group ($p<0.05$). Researchers concluded that the addition of the IPACK to the LIA and CACB does not reduce postoperative opioid consumption nor improve analgesia, but it may improve immediate functional performance and reduce the LOS following TKA.

A systematic review and meta-analysis (Mou 2021) evaluated level one evidence to determine whether the IPACK block offered analgesic benefits to existing multimodal analgesia regimens. Data on a total of 467 patients who underwent total replacement (TKA) from five randomized controlled studies were included in the analysis. While four studies compared the difference between ACB+IPACK and ACB alone, only one assessed the difference between ACB+LIA+IPACK and ACB+LIA. The primary outcome of pain scores with rest and activity, as well as secondary outcomes of cumulative opioid consumption, cumulative distance ambulated, and length of stay (LOS) were compared between intervention and control groups. While the results indicated significantly improved pain scores with rest or activity at 12 hours post-operatively, no such benefit was observed at subsequent time points throughout the postoperative period. Additionally, IPACK supplementation did not reduced opioid consumption, especially in the first 24 hours after procedure, nor did it improve other secondary outcomes of distance ambulated or LOS. Authors noted heterogeneity among included studies as a limiting factor in conducting meta-analysis of additional secondary outcomes. Researchers concluded that the addition of IPACK block to multimodal analgesic regiments does not improve post-operative opioid consumption nor improve functional performance but may offer immediate analgesic benefit after TKR.

Guo et al (2022) conducted a systematic review and met analysis of the effectiveness of combining iPACK block (infiltration between the popliteal artery and capsule of the posterior knee) with adductor canal block (ACB) in managing postoperative pain after total knee arthroplasty (TKA). Included in this analysis were fourteen studies with a total of 758 patients. Primary outcome measures included the visual analog scale (VAS) for pain score, post operative pain measured at 8-hour phase, 12-hour phase, 24-hour phase, 48-hour phase, at discharge, including at rest and with activity. Postoperative morphine consumption, postoperative quadriceps strength, postoperative range of motion, postoperative walking distance, time up and go to (TUG) test, hospital stay, and the incidents of postoperative nausea and vomiting (PONV) were measured. VAS at rest and with activity were significantly lower in the ACB+iPACK group compared to ACB alone (at rest SMD=−0.75, 95%CI, with activity, SMD=−0.61). Postoperative cumulative morphine consumption was significantly reduced in the ACB+iPACK group (SMD: −0.33, 95%CI:95%. Range of motion improved at all measure time points (SMD: 7.69, 95%CI). Walking distance was better in ACB+iPACK group (SMD: 0.28, 95%CI. Overall TUG score improve performance was noted on post operative day1 and post operative day 2. Hospital stays were shorter in the ACB +iPACK group and there was no significant difference between group on quadricep muscle strength and incidence of postoperative nausea and vomiting. There were significant clinical and methodological heterogeneity in this study. Some experiments used general anesthesia while others used spinal anesthesia. There was discrepancy in the timing of nerve block administration. Some researchers performed nerve blocks prior to surgery while other performed after the surgery. The Egger test suggested some degree of publication bias in VAS scores at certain time points. Overall researchers concluded that adding iPACK to ACB improves

pain control, reduced opioid use, enhances functional recovery, and shortens hospital stays without increasing adverse effects in the management of pain after TKA.

PROFESSIONAL GUIDELINE(S)

American Academy of Orthopaedic Surgeons (AAOS) 2021 evidence-based clinical practice guideline for the management of osteoarthritis of the knee (Non-Arthroplasty) states denervation therapy may reduce pain and improve function in patients with symptomatic osteoarthritis of the knee (strength of recommendation: limited). The Denervation Therapy recommendation has been downgraded two levels because of inconsistent evidence and bias.

REGULATORY STATUS

Radiofrequency Ablation

The United States Food and Drug Administration (FDA) regulates radiofrequency ablative devices as medical devices. All radiofrequency ablative devices including related components require FDA approval before marketing and use in the United States to ensure they are safe and effective for human use. Refer to the FDA Medical Device website. Available from: https://www.fda.gov/medical-devices [accessed 2026 Jun 11]

The FDA lists the most serious type of medical device recalls as well as early alert communications about corrective actions being taken by companies that the FDA believes are likely to be the most serious type of recalls on our website by the date that the FDA posts the information on our website. Available from: Medical Device Recalls | FDA [accessed 2026 Jun 11]

There are several RF generators and probes that have been cleared for marketing by the U.S. Food and Drug Administration (FDA) through the Section 510(k) process. In 2005, the SInergy (Kimberly-Clark/Baylis), a water-cooled single-use probe, was cleared by the FDA, listing the Baylis Pain Management Probe as a predicate device. It is intended for use with an RF generator, to create RF lesions in nervous tissue.

In 2011, the NeuroTherm NT 2000 (NeuroTherm) was cleared for marketing by the FDA through the Section 510(k) process. The FDA determined that this device was substantially equivalent to existing devices for use in lesioning neural tissue. Existing predicate devices included the NeuroTherm NT 1000, Stryker Multi-Gen, and Cosman G4 RF Generator.

In 2013, the Cryo-Touch IV (iovera; Myoscience) was cleared for marketing by the FDA through the Section 510(k) process. Predicate devices were the Cryo-Touch II and Cryo-Touch III.

In December 2016, the COOLIEF Cooled Radiofrequency Kit (Halyard Health Inc., Alpharetta, GA) was cleared by the FDA through the Section 510(k) process for the creation of RF heat lesions in nervous tissue for the relief of pain. The kit includes a fluid delivery system for commonly used fluid agents, limited to contrast medium, saline, and/or anesthetic solution delivery at the target site.

CODE(S)

POLICY STATEMENT(S)

Pancreatic Transplant Alone (PTA)

I. Pancreas transplant alone (PTA) is considered **medically appropriate** for candidates who meet **ALL** the following indications:

   A. Insulin dependent diabetes mellitus (IDDM) that is difficult to manage (e.g., labile);

   B. A history of frequent, acute, and severe metabolic complications (e.g., hypoglycemia, hyperglycemia, ketoacidosis) requiring medical attention;

   C. Consistent failure of insulin-based management to prevent acute complications; **and**

   D. Do not have advanced kidney disease (stage IV or V).

Pancreas After Kidney Transplant (PAK)

II. Pancreas transplant after kidney transplant (PAK) is considered **medically appropriate** for candidates who meet **ALL** the following indications:

   A. Diagnosis of IDDM;

   B. Have had a previous successful kidney transplantation for uremia or kidney failure;

   C. A history of frequent, acute, and severe metabolic complications (e.g., hypoglycemia, hyperglycemia, ketoacidosis) requiring medical attention;

   D. Consistent failure of insulin-based management to prevent acute complications; **and**

   E. Does not have advanced kidney disease (stage IV or stage V).

Simultaneous Pancreas-Kidney Transplantation (SPK)

III. Simultaneous transplant of the pancreas is considered **medically appropriate** for candidates who meet **ALL** the following indications:

   A. For uremic IDDM individuals who have no immediate life-threatening conditions;

B. A history of frequent, acute, and severe metabolic complications (e.g., hypoglycemia, hyperglycemia, ketoacidosis) requiring medical attention; **and**

C. Consistent failure of insulin-based management to prevent acute complications.

IV. A second pancreas transplant after a failed primary transplant is considered **medically appropriate** in individuals who still meet transplant criteria.

V. Autologous islet cell transplantation is considered **medically appropriate** as an adjunct to a total or near-total pancreatectomy in individuals with chronic pancreatitis.

VI. Allogeneic pancreatic islet cell transplantation of a U.S. Food & Drug Administration (FDA) approved cellular therapy product i.e., donislecel-jujn, (Lantidra) is considered **investigational** for the treatment of type 1 diabetes.

VII. Recipient Selection Guidelines

A. Each individual considered for pancreas transplantation will have an evaluation completed by the transplant center for potential difficulties that would complicate and diminish the success of transplantation. Consideration will be given to the individual's risk of death without transplantation, along with the presence and severity of potential contraindications to transplantation. Candidates considered for transplant must be psychologically stable, demonstrate motivation and compliance, and have no ongoing problems with drug or alcohol abuse.

B. The following conditions are absolute contraindications to PTA, PAK, SPK and islet cell transplantation:

1. Presence of malignancy (other than non-melanomatous skin cancers), unless malignancy has been completely resected or unless (upon medical review) it is determined that malignancy has been treated, there is a small likelihood of recurrence, and acceptable future risks;
2. Ongoing or recurring infections that are not effectively treated;
3. Serious cardiac or other insufficiencies and an inability to tolerate transplant surgery;
4. Demonstrated non-compliance, which places the organ at risk by not adhering to medical recommendations;

C. Pancreas transplant is considered a relative contraindication in human immunodeficiency virus (HIV) positive individuals, unless **ALL** of the following criteria are met:

1. CD4 count is greater than 200 cells/mm3;
2. HIV-1 ribonucleic acid RNA is undetectable;
3. Stable anti-retroviral therapy for greater than three (3) months;
4. No other complications from AIDS (e.g., opportunistic infection, including aspergillus, tuberculosis, coccidioidomycosis; resistant fungal infections, Kaposi's sarcoma, or other

neoplasm);

5. Meets all other criteria for transplantation.

RELATED POLICIES

Corporate Medical Policy

07.02.04 Kidney Transplantation

11.01.03 Experimental or Investigational Services

POLICY GUIDELINE(S)

I. Segmental Living Donation Guidelines

A. Any person who gives consent to be a live organ donor should be competent, willing to donate, free from coercion, medically and psychologically suitable, fully informed of the risks and benefits as a donor, and fully informed of the risks, benefits, and alternative treatment available to the recipient. The benefits to both donor and recipient must outweigh the risks associated with the donation and transplantation of the living donor organ.

B. Prior authorization is contract dependent. Approval for all transplants, including arrangements with an approved transplant center, may be required.

C. The benefits of glycemic control must be weighed against the risks associated with transplant surgery and subsequent chronic immunosuppression. The individual must demonstrate motivation and ability for self-care and have failed to obtain diabetic control.

D. A pre-emptive cadaveric or living kidney transplant should be carefully considered when the measured (actual urinary collection) creatinine clearance level or calculated glomerular filtration rate (GFR) (or other reliable formula) is less than 30 ml/min and with a rapid rate of decline.

II. Pre-transplant evaluation documentation must include the following clinical information, and, if testing cannot be performed, the rationale for not performing the testing must be included in the documentation:

A. Clinical Evaluation:

1. Confirmation of diagnosis;
2. Identification of comorbidities;
3. Current assessment of co-morbidities;
4. Management of co-morbidities; **and**
5. Consult notes (if applicable);

B. Psycho-Social Evaluation:

1. Identification of stressors (e.g., family support, noncompliance issues, motivational issues, alcohol, or smoking/substance abuse).

C. Performance Status:

1. Karnofsky performance score;
2. Palliative Performance Scale (PPS) score;
3. Eastern Cooperative Oncology Group (ECOG) performance status; **or**
4. Lansky Play-Performance Scale (for age 1 to 16 years).

D. Oral Health Evaluation;

E. Lab Tests:

1. CBC, metabolic profile;
2. Serologies: CMV; Hepatitis B and C; **and**
3. HIV Testing.

F. Cardiac Assessment:

1. 12 Lead EKG;
2. Stress test (exercise, nuclear, or dobutamine); **and**
3. Echo or Muga Scan.

G. Pulmonary Assessment:

1. Chest X-ray;
2. Pulmonary function tests (PFTs); for high-risk of respiratory failure (COPD, emphysema, alpha-1 antitrypsin deficiency, hepatopulmonary syndrome, or significant smoking history).

H. Age-Appropriate Screening Tests: Please refer to the U.S Preventive Services Task Force (USPSTF) [Internet] for a list of age-appropriate screening guidelines (e.g., colorectal cancer screening, cervical cancer screening for guidance). [accessed 2025 Feb 18]. Available from: https://uspreventiveservicestaskforce.org/uspstf/

III. Re-Authorization

A. Transplant re-authorization must be completed annually while actively waiting for a transplant. Re-authorization documentation must be within the past 11 months (unless specified) and include the following clinical information (if testing is unable to be performed, the rationale must be included in the documentation). If the individual's health condition has not changed from the previous year some testing may not be applicable.

B. Clinical Evaluation:

1. Updated list of diagnoses to include identification of comorbidities, current assessment, and treatment plan;
2. Specialty consultation notes (if applicable);

C. Current functional ability as evidenced by current Karnofsky performance score (KPS), Palliative Performance Scale (PPS) score, ECOG, or Lansky Play-Performance Scale.

D. Follow- up Oral Health Evaluation

E. Lab Tests:

1. CBC, metabolic profile;
2. Serologies: CMV Hepatitis B and C; **and**
3. HIV testing (If applicable);

F. Cardiac Assessment:

1. 12 Lead EKG (If applicable);
2. Stress (exercise, nuclear, or dobutamine) (If applicable); and Echo or Muga scan (If applicable);

G. Pulmonary Assessment:

1. Chest X-ray (If applicable);
2. Pulmonary function tests (PFTs) for high-risk for respiratory failure (COPD, emphysema, alpha-1-antritrypsin deficiency, hepatopulmonary syndrome, or significant smoking history) (If applicable); **and**

H. Age-appropriate Screening Tests: Please refer to the USPSTF website for a list of age-appropriate screening guidelines (e.g., colorectal cancer screening, cervical cancer screening for guidance). [accessed 2026 Feb 25]. Available from: https://uspreventiveservicestaskforce.org/uspstf/

DESCRIPTION

Pancreas Transplant Alone (PTA)

A pancreas transplant is a surgical procedure that involves replacing a diseased or nonfunctioning pancreas with a healthy pancreas from a deceased or living donor. This procedure is primarily performed on individuals with IDDM who have had severe complications or are experiencing significant challenges in managing their blood sugar level. The benefits of a pancreas transplant can be not only lifesaving but can improve quality of life. A pancreas transplant can eliminate the need for insulin therapy, reduce the risk of diabetes related complications (neuropathy, retinopathy, and cardiovascular issues), and can help better manage blood sugar levels.

Pancreas after Kidney Transplant (PAK)

Pancreas transplant after a kidney transplant is a surgical procedure where a healthy pancreas is transplanted into an individual who has already received a kidney transplant. This approach is primarily aimed at individuals with IDDM who have undergone kidney transplantation and still struggle with severe diabetes management. The pancreas is usually transplanted in a separate surgical procedure after a kidney transplant has taken place.

Simultaneous Pancreas and Kidney Transplant (SPK)

A SPK is a surgical procedure that involves the transplantation of both a kidney and a pancreas during the same surgical session. This approach is primarily intended for individuals with IDDM and chronic kidney disease, or end stage renal failure. The goal is to restore kidney function, insulin production, reduce or eliminate the need for insulin therapy, improve blood glucose control and overall metabolic health. The surgeon connects the donor pancreas and kidneys to the recipient's blood vessels and urinary system. Often times, both transplanted organs may come from one deceased donor. It is also possible for the kidneys to come from a living donor (a family member or friend) and the pancreas from a deceased donor.

SPK is intended for individuals who have already developed end-stage diabetic nephropathy. The renal transplant is meant to be lifesaving, while the transplanted pancreas is indicated to slow, arrest, or reverse retinopathy or neuropathy. Additionally, the new pancreas may help the transplanted kidney function longer than if it had been transplanted without an accompanying pancreas.

Islet Cell Transplantation

Allogeneic pancreatic islet cell transplantation is a medical procedure in which islet cells (also called islets of Langerhans) are extracted from a deceased donor's pancreas using a specialized process. The extracted cells are then injected into the recipient's liver through the portal vein. The goal is for the transplanted islet cells to function in the liver and produce insulin. This procedure is primarily aimed at individuals with type 1 diabetes who have severe blood sugar control issues and cannot manage their condition with conventional therapies. The success of islet cell transplantation varies, with many recipients requiring insulin again within a few years after the transplantation.

There are inherent risks with all transplant surgeries, which include rejection of the new organ, infection, and complications from surgery. The individuals must take lifelong immunosuppressive medications to prevent organ rejection which can have side effects and increase the risk of infection. Transplant surgeries require careful medical management and continuous follow up to ensure the success of the transplant and overall health of the individual.

SUPPORTIVE LITERATURE

Pancreas Transplant

Parajuli et al (2019) described a single center's experience with 635 pancreas and kidney transplant individuals (611 SPK, 24 PAK). Transplants were performed between 2000 and 2016. The mean length of time between kidney transplant and pancreas transplant was 23.8 months in the PAK

group. Pancreas rejection rates at 1-year post-transplant were 4% and 9% with PAK and SPK, respectively. During the entire study period, PAK individuals were more likely to experience pancreas rejection (38% vs. 16%; p=.005). Kidney and pancreas graft survival rates did not differ between groups at 1 year or at last follow-up. Pancreas graft survival rates for PAK and SPK at 1 year were 100% and 89%, respectively. Death censored pancreas graft failure rates for PAK and SPK at last follow-up were 13% and 25%, respectively. Individual survival at last follow-up was similar between groups (71% with PAK vs. 68% with SPK; p=.79).

The FDA (2023) approved donislecel-jujn for the treatment of adults with type 1 diabetes who are unable to approach target HbA1C because of repeated episodes of severe hypoglycemia despite intensive diabetes management and education. The FDA approval was based on a phase 1/2 trial in individuals with brittle type 1 diabetes complicated by hypoglycemic unawareness, metabolic lability with documented severe hypoglycemia, or ketoacidosis despite intensive insulin therapy (N=10); a single-arm, open-label phase 3 trial with similar eligibility criteria (N=20); and an expanded access protocol with similar eligibility criteria.

In the FDA analysis of these trials (as described in the product labeling), median participant age was 46.5 years (range, 21 to 67 years); 80% of participants were female, 100% were White, and 97% were of non-Hispanic ethnicity. Individuals received up to 3 islet cell infusions; among 30 participants in the approval trials, 11 received 1 islet cell infusion, 12 received 2 infusions, and 7 received 3 infusions. Twenty-five participants (83%) achieved exogenous insulin independence (defined as not requiring exogenous insulin to achieve adequate glycemic control) of any duration, including 4 individuals (13.3%) with independence for less than 1 year, 12 individuals (36.7%) with independence for 1 to 5 years, and 9 individuals (33.3%) with independence for more than 5 years. Mean duration of exogenous insulin dependence in the phase 1/2 and phase 3 studies were 5.1 years and 3.2 years, respectively.

Serious adverse reactions were reported in 90%, including 2 deaths (7%) from multiorgan failure with sepsis (1.6 years after first infusion) and progressive confusion, global atrophy, and micro-ischemic disease (9.7 years after first infusion); most serious adverse reactions were attributed to immunosuppression. Infections were reported in 26 individuals (87%), totaling 211 episodes, one of which was classified as life-threatening and 22 as severe. Malignancy was reported in 11 subjects (37%), including 12 skin cancers and one each of post-transplant lymphoproliferative disease, breast cancer, and thyroid cancer. Common adverse events included, but were not limited to nausea, fatigue, anemia, diarrhea, abdominal pain, asthenia, headache, and hyponatremia. Most adverse reactions were low-grade by Common Terminology Criteria for Adverse Events, version 5; the most common grade ≥ 3 adverse events included low density lipoprotein elevations (37%), anemia (27%), and pneumonia (17%).

The FDA Biologics License Application Clinical Review Memorandum states numerous protocol deviations across the above studies that could impair the interpretation of both efficacy and safety data, as well as providing examples of missing and incongruent data and insufficient data monitoring during the study. The fact that the studies were conducted at a single site raises concern and other factors that might have affected occurrence or duration of insulin independence were not able to be

elucidated from the existing studies, including cell product factors (number of cells, viability, purity, and potency) and delivery device (e.g., type of catheter). Available from: https://www.fda.gov/vaccines-blood-biologics/lantidra [accessed 2026 Mar 19].

PROFESSIONAL GUIDELINE(S)

Current Organ Procurement and Transplantation Network (OPTN) policy permits HIV positive transplant candidates. The American Society of Transplantation (2019) published a guideline on solid organ transplantation in HIV-infected individuals for kidney-pancreas transplants, the following criteria for transplantation are suggested:

- Cluster of differentiation 4 count > 200 cells/mL for at least 3 months (insufficient data to recommend for or against transplantation in individuals with counts > 100 cells/mL and no history of opportunistic infection);
- undetectable HIV viral load while receiving antiretroviral therapy; documented compliance with a stable antiretroviral therapy regimen;
- absence of active opportunistic infection and malignancy;
- absence of chronic wasting or severe malnutrition; and appropriate follow-up with providers experienced in HIV management and ready access to immunosuppressive medication therapeutic drug monitoring (Blumberg et al 2019).

Effective March 15, 2021, the Organ Procurement and Transplantation Network (OPTN) has launched a new policy for matching kidney and pancreas transplant candidates with organs from deceased donors. The new policy is projected to increase equity in transplant access for candidates nationwide. It replaces distribution based on donation service area (DSA) and OPTN region with a more consistent measure of distance between the donor hospital and the transplant hospital for each candidate.

According to the 2021 American Diabetes Association (ADA) and the European Association for the Study of Diabetes (EASD) consensus report, β-cell replacement may serve as a therapeutic option for individuals who experience severe metabolic complications including severe hypoglycemia and hypoglycemia unawareness. Whole pancreas transplant and pancreatic islet transplantation both require lifelong immunosuppression. The ADA/EASD suggests carefully considering the risks versus benefit of β-cell replacement because of the need for chronic immunosuppression. The consensus report does note that these approaches have not been compared to newer closed-loop technology, which could avoid immunosuppression altogether.

The ADA addresses pancreas and islet transplantation in the Pharmacologic Approaches to Glycemic Treatment section of the 2026 Standards of Care in Diabetes stating that "successful pancreas and islet transplantation can normalize glucose levels and mitigate microvascular complications of type 1 diabetes, however, people receiving these treatments require lifelong immunosuppression to prevent graft rejection and/or recurrence of autoimmune islet destruction, and given the potential adverse effects of immunosuppressive therapy, pancreas transplant should be reserved for people with type 1

diabetes undergoing simultaneous kidney transplant, following kidney transplantation or for those with recurrent ketoacidosis or severe hypoglycemia despite optimized glycemic management."

REGULATORY STATUS

Organ transplants, as surgical procedures, do not require U.S. Food and Drug Administration (FDA) approval. The Health Resources Services Administration (HRSA) oversees the transplantation of vascularized human organs through the Organ Procurement and Transplantation Network (OPTN). For more information view the OPTN: https://www.hrsa.gov/optn [accessed 2026 February 27].

On June 28, 2023, the FDA approved Lantidra (donislecel-jujn), an allogeneic (donor) pancreatic islet cellular therapy. Lantidra was approved for the treatment of adults with type 1 diabetes who are unable to approach target glycosylated hemoglobin (average blood glucose levels) because of repeated episodes of severe hypoglycemia (low blood sugar) despite intensive diabetes management and education. The primary mechanism of action of Lantidra is the secretion of insulin by the infused allogeneic islet beta cells. In some individuals with type 1 diabetes, these infused cells can produce enough insulin, so the individual no longer needs to take insulin to control their blood sugar levels. Lantidra is administered as a single infusion into the hepatic (liver) portal vein. An additional infusion of Lantidra may be performed depending on the individual's response to the initial dose. A total of three infusions may be performed based on the individual's response. Lifelong immunosuppression is required to maintain islet cell viability.

CODE(S)

- Codes may not be covered under all circumstances.
- Code list may not be all inclusive (AMA and CMS code updates may occur more frequently than policy updates).
- (E/I)=Experimental/Investigational
- (NMN)=Not medically necessary/appropriate

CPT Codes

Code	Description
48160	Pancreatectomy, total or subtotal, with autologous transplantation of pancreas or pancreatic islet cells
48552	Backbench reconstruction of cadaver donor pancreas allograft prior to transplantation, venous anastomosis, each
48554	Transplantation of pancreatic allograft
48556	Removal of transplanted pancreatic allograft
50340	Recipient nephrectomy (separate procedure)

Code	Description
50360	Renal allotransplantation, implantation of graft; without recipient nephrectomy
50365	with recipient nephrectomy
50370	Removal of transplanted renal allograft
0584T*	Islet cell transplant, includes portal vein catheterization and infusion, including all imaging, including guidance, and radiological supervision and interpretation, when performed; percutaneous (*E/I for Lantidra use)
0585T*	Islet cell transplant, includes portal vein catheterization and infusion, including all imaging, including guidance, and radiological supervision and interpretation, when performed; laparoscopic (*E/I for Lantidra use)
0586T*	Islet cell transplant, includes portal vein catheterization and infusion, including all imaging, including guidance, and radiological supervision and interpretation, when performed; open (*E/I for Lantidra use)

Disclaimer Notice

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgment when deciding the most appropriate care to enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

Background

Recurrent respiratory papillomatosis (RRP) is a rare disease caused by chronic human papillomavirus (HPV) infection that is characterized by wart-like growths (papillomas) in the respiratory tract that grows back after they have been removed. HPV is a common virus where 90% of infections clear or become undetectable within 2 years. HPV can be categorized into high-risk (HPV 16, 18, etc.) and low-risk (6, 11, etc.) subtypes. Persistent infection with high-risk HPV can result in malignant tumors. In RRP, approximately 90% of cases are caused by HPV 6 and 11 with HPV 16 and 18 causing the remaining.

RRP affects both adults and children and is transmitted through sexual contact or vaginal childbirth. RRP can be categorized as juvenile-onset or adult-onset. Juvenile-onset RRP (JORRP) is often diagnosed before 5 years of age and considered more aggressive and recurring while adult-onset RRP (AORRP) is diagnosed around 30-40 years of age. With the approval and increased utilization of the Gardasil-9 vaccine, the JORRP incidence rate decreased from 4 to 0.5 per 100,000 children. However, the vaccine has not made a significant impact in the adult population due to lack of utilization.

There are no guidelines addressing RRP and there are no approved therapies for RRP prior to Papzimeos (zopapogene imadenovec-drba). Standard of care is surgical debulking and debridement of papillomas. However, surgery does not address the underlying chronic HPV infection, resulting in the recurrence of papillomas. Disease severity varies significantly, with some cases resolving without treatment, other cases requiring only periodic intervention (e.g., a few surgeries throughout the patient's lifetime), and some aggressive cases requiring frequent medical intervention (e.g., multiple surgeries per year). The most common symptom is hoarseness, although patients can also experience difficulties speaking and breathing due to airway obstruction. Adjuvant therapies that decrease the size and growth of papillomas include intralesional cidofovir and intravenous (IV) bevacizumab.

Papzimeos is a nonreplicating adenoviral vector-based immunotherapy designed to express a fusion antigen of selected regions of human papillomavirus (HPV) proteins expressed in HPV 6- and 11-infected cells. Papzimeos stimulates an immune response to HPV 6 and HPV 11 proteins.

Papzimeos (zopapogene imadenovec-drba) was approved by the FDA as the first treatment option for RRP in adults on August 14, 2025. Approval was based on the results of phase 1/2 PRGN-2012-201, an open-label, single-arm study where patients received Papzimeos. Eighteen out of 35 patients (51%) in the efficacy population achieved a complete response (CR), defined as requiring no surgical intervention in the 12 months after treatment. Among the patients who achieved a CR, 15 maintained a CR at 24 months, for an overall CR rate of 43% at 24 months. Although HPV type was not noted as part of the trial inclusion or exclusion criteria, all patients in the PRGN-2012-201 trial had HPV type 6 or 11. Overall, fewer clinically indicated interventions were observed in the 12 months after treatment compared with the 12 months before treatment in 30 of 35 patients (86%); however, 34% of patients failed to achieve a complete response (CR) or partial response (PR).

Summary

Effective Date of Policy:	12/3/2025
Indications	Treatment of adults with recurrent respiratory papillomatosis
ICD10 Diagnosis Codes	There is currently no ICD-10 code for RRP
Availability	*Injection – 5 x 10^{11} particle unit/1 mL in a single dose vial*
Duration	12 weeks

Required Criteria for Initial Approval		
All of the following conditions for the requested indication must be met in order to approve therapy		
Indication	**Inclusion Criteria**	**Recommended Dosing Regimen**
Indication Recurrent respiratory papillomatosis (RRP)	1. Patient must be ≥ 18 years of age **AND** 2. Must be prescribed by, or in consultation with, a board-certified otolaryngologist (ENT), laryngologist, or head and neck surgical oncologist experienced in the management of recurrent respiratory papillomatosis (RRP) **AND** 3. Must have a diagnosis of histologically confirmed laryngotracheal recurrent respiratory papillomatosis (RRP) **AND** 4. Must have HPV serotype 6 or 11 positivity documented by PCR/ISH from airway lesions a. Archival tissue obtained from prior surgical debulking procedures is acceptable provided that the sample is representative of the current disease site and histology. Additionally, there must be no indication of a non-HPV-driven or transformed malignancy. 5. Documentation of eligible disease severity and prior treatment history must meet ONE of the following (a or b): a. ≥3 surgical interventions in the prior 12 months OR b. ≥2 surgical interventions in the prior 12 months with at least one of the following: i. Extensive anatomic involvement, such as multi-site laryngotracheal disease, pulmonary spread, or a Derkay total score ≥ 20 (or equivalent qualitative description of high burden) ii. Rapid recurrence requiring repeat surgery or visible regrowth within ≤ 12 weeks of prior debulking iii. Documentation of clinically significant functional impairment, confirmed by the treating ENT, as evidenced by: a) Airway compromise, such as, stridor, dyspnea, respiratory distress, or direct visualization of airway obstruction on laryngoscopy or bronchoscopy b) Severe dysphonia or voice dysfunction, supported by Voice Handicap Index (VHI-10) score in the severe range or equivalent	5×10^{11} particle unit (PU) per injection administered subcutaneously four times over a 12-week interval (initial dose, then 2, 6, and 12 weeks after the initial dose)

Exclusion Criteria

- Papzimeos will not be authorized for patients:
  - Currently receiving another investigational or systemic immunotherapy for RRP
  - With prior or concurrent use of investigational gene, cell, or immunotherapy for RRP
  - With a history of severe adverse reaction to adenoviral or other viral vector-based therapies (e.g., anaphylaxis, cytokine release syndrome, severe systemic inflammatory response)

Continuation Criteria
• Papzimeos is indicated for a one-time treatment cycle of 4 doses and therefore will not be authorized for retreatment. Retreatment will be considered experimental/investigational when any FDA approved gene therapy, or any other gene therapy under investigation, has been previously administered.

Considerations
• Prior authorization is obtained through the CDPHP pharmacy department.

Health care practitioners shall exercise their own medical judgement when deciding the most appropriate care to enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

PROCEDURE CODES

H0015, H0035, S9480

DESCRIPTION

Partial hospitalization is a non-residential treatment program for individuals diagnosed with a psychiatric disorder who require comprehensive, structured, multidisciplinary treatment in a medically-supervised environment. Clinical diagnostic and treatment services are provided at a level of intensity equal to an inpatient setting, but on a less than 24-hour basis. Partial hospitalization is used as a time-limited service to stabilize acute symptoms and may, therefore, be used as a transitional level of care (step-down from inpatient) or as a standalone service to stabilize a deteriorating condition to avert hospitalization.

An intensive outpatient program (IOPs) is a time-limited, non-residential, facility-based program that provides treatment to persons diagnosed with a psychiatric disorder. Such programs focus on building skills and developing community supports to assist an individual in obtaining a specific residential, learning, working, or social goal(s), and require more intensive services than those available in traditional outpatient settings. These programs are appropriate when the individual's clinical condition improves or stabilizes and a structured, comprehensive, multidisciplinary program is no longer required. Intensive outpatient programs are considered to

Capital District Physicians' Health Plan, Inc.
CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

be an intermediate level of care between individual outpatient and partial hospitalization. Intensive outpatient programs are used as a time-limited service to stabilize acute symptoms and may, therefore, be used as a transitional level of care (step-down from partial hospital programs) or as a standalone service to stabilize a deteriorating condition to avert hospitalization.

RELATED POLICIES/DOCUMENTS

N/A

POSITION STATEMENT

CDPHP administers benefits for partial hospitalization/intensive outpatient programs when used as an alternative to inpatient psychiatric treatment and/or alcohol/substance treatment in accordance with criteria outlined below.

Partial Hospital Programs

The partial hospitalization program (PHP) is primarily considered to be an alternative to an admission or continued stay for inpatient psychiatric and/or alcohol/substance care. The partial hospitalization program may also be used for a transitional period to facilitate re-entry into the community from an inpatient psychiatric and/or alcohol/substance facility. This level of care is only used for a transitional period when a lower level of care would be inappropriate due to the patient's dysfunction or potential for becoming a danger to self or to others.

All of the following criteria must be met:

- The enrollee is not a resident at the program.
- Enrollees are seen at least weekly by a psychiatrist.
- Services are provided on a daily basis, four to eight hours per day, five days a week.
- Services offered are designed to address a mental health and/or alcohol/substance related disorder through an individualized treatment plan provided by a coordinated multidisciplinary treatment team.
- The enrollee has the capacity for reliable attendance and active participation in the treatment plan.

Intensive Outpatient Programs

The intensive outpatient program (IOP) is primarily considered to be an alternative to an admission or continued stay for inpatient psychiatric and/or alcohol/substance care. The intensive outpatient program may also be used for a transitional period to facilitate re-entry into the community from an inpatient psychiatric and/or alcohol/substance facility. This level of care

Capital District Physicians' Health Plan, Inc.
CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

is only used for a transitional period when a lower level of care would be inappropriate due to the patient's dysfunction or potential for becoming a danger to self or to others.

All of the following criteria must be met:

- Services are provided on a daily basis, three to four hours per day, three days per week. Services offered include medication evaluation and management; individual, group, and family psychotherapy and psycho-education and adjunctive services such as medical monitoring.

EXCLUSIONS

N/A

CDPHP PRODUCT VARIATIONS

CHILD HEALTH PLUS:	Benefits are provided for intensive outpatient programs relating to substance abuse. Benefits for intensive outpatient and partial hospital programs relating to mental health are not available under the Child Health Plus benefit package. Benefits for partial hospital programs relating to substance abuse are not available under the Child Health Plus benefit package.
MEDICARE ADVANTAGE:	Subject to all terms and conditions noted above in the policy.
SELECT PLAN/HARP:	Benefits are provided for partial hospitalization programs relating to mental health. • Services are provided on a daily basis, four to seven hours per day. Benefits for intensive outpatient programs for mental health are not available. Benefits for intensive outpatient and partial hospital programs relating to alcohol and substance use disorder are available.

MEDICAL POLICY

Medical Policy Title	**Patient Lifts**
Policy Number	**1.01.08**
Current Effective Date	**January 1, 2027**
Next Review Date	**July 2027**

Our medical policies are guides to evaluate technologies or services for medical necessity. Criteria are established through the assessment of evidence based, peer-reviewed scientific literature, and national professional guidelines. Federal and state law(s), regulatory mandates and the member's subscriber contract language are considered first in the determination of a covered service.

(Link to Product Disclaimer)

POLICY STATEMENT(S)

I. Patient lifts are considered **medically appropriate** as durable medical equipment (DME) when **ALL criteria in both A and B** are met:

   A. Periodic movement is necessary to effect improvement, or to stop, or delay deterioration in the individual's condition;

   B. **ALL** the following criteria are met:

      1. Transfer between bed and chair, wheelchair or commode requires the assistance of more than one (1) person;
      2. Without the use of the lift, the individual would be confined to bed;
      3. An adequately trained person, other than the individual, is available to help operate the lift; **and**
      4. A motorized lift (e.g., Sara lift) is appropriate for coverage only if a hydraulic lift (e.g., Hoyer lift) is inadequate to meet the special medical needs of the individual.

II. Seat lift chair mechanisms are considered **medically appropriate** as DME for:

   A. The individual who has either of the following conditions:

      1. severe arthritis of the hip or knee; **or**
      2. severe neuromuscular disease; **AND**

   B. Meets **ALL** of the following criteria:

      1. All appropriate therapeutic modalities to enable the individual to transfer from a chair to a standing position (e.g., medication, physical therapy) have been tried and failed;
      2. The individual is completely incapable of standing up from a regular armchair or any chair in his/her home; **and**
      3. Once standing the individual is able to ambulate.

III. Patient lifts/seat lift chair mechanisms containing nonstandard features (e.g., convenience or luxury features such as combination scale and lift) where there exists a reasonably feasible and

medically appropriate alternative standard care are considered **not medically necessary or ineligible for coverage** based upon the member's subscriber contract.

DME Repair

IV. Repair of a medically necessary patient lift or its components not under warranty will be considered **medically appropriate** when the following criteria are met:
    A. Physician documentation includes **ALL** of the following:
        1. Date of DME initiation;
        2. Manufacturer warranty information, if applicable;
        3. Attestation that the individual has been compliant with the use of the DME and will continue to benefit from the use of the DME;
    B. The DME is no longer functioning adequately; and **BOTH** of the following criteria are met:
        1. Inadequate function interferes with activities of daily living; **and**
        2. Repair is expected to make the equipment fully functional (as defined by manufacturer).
    C. Repair of equipment damaged due to individual neglect, theft, abuse, or when another available coverage source is an option (e.g., homeowners, rental, auto, liability insurance, etc.) is **ineligible for coverage**.

DME Replacement

V. Replacement of a medically necessary patient lift or its components not under warranty will be considered **medically appropriate** when **EITHER** of the following criteria are met:
    A. The DME is no longer functioning adequately and has been determined to be non-repairable or the cost of the repair is in excess of the replacement cost; **or**
    B. There is documentation that a change in the individual's condition makes the present unit non-functional and improvement is expected with a replacement unit.

VI. The replacement of a properly functioning patient lift, its components or accessories is considered **not medically necessary**. This includes, but is not limited to, replacement desired due to advanced technology or to make the DME more aesthetically pleasing;

VII. The replacement of equipment damaged or lost due to individual neglect, theft, abuse, or when another available coverage source is an option (e.g., homeowners, rental, auto, liability insurance, etc.) is **ineligible for coverage**.

VIII. Accessories or components for patient lifts that are considered not medically necessary or investigational by peer-reviewed literature will also be considered as **not medically necessary or investigational** by the Health Plan.

RELATED POLICIES

Corporate Medical Policy

1.01.00 Durable Medical Equipment (DME) and Devices, –Standard and Non-Standard

POLICY GUIDELINE(S)

I. Nonstandard features that are presumptively nonmedical in nature and used primarily and customarily for a nonmedical purpose, even though the item may have some remote medically related use, will not be considered "medical equipment" and are **ineligible for coverage**.

II. The following patient lifts are **ineligible for coverage** because the devices do not meet the criteria for durable medical equipment:

   A. Bath lifts (bathroom or toilet);

   B. Ceiling lifts (patient lifts mounted on tracks attached to the ceiling);

   C. Platform lifts;

   D. Stair gliders;

   E. Stairway chair/stair lifts;

   F. Powered wheelchair lifts (provides access to stairways or car trunks);

   G. Van lifts (used to a lift wheelchair into a truck or van).

DESCRIPTION

Patient Lifts

Patient lifts or similar transfer devices are assistive devices that enable the movement and positioning of an immobilized Individual to and from a sitting and/or supine position. The Hoyer lift is a manual device that uses hydraulics. The Sara lift is motorized and portable.

Seat Lift Chair Mechanisms

A seat lift chair is a lounge chair that has a motorized seat mechanism which, when activated, lifts the body from a sitting to a standing position. The seat also can lower the body from a standing to sitting position. It is an assistive device for individuals who are able to ambulate once they are in a standing position.

Bathroom Lifts

A bathroom lift is a device with which the individual can be transferred from the toilet/tub to another seat. Some items may be placed in a tub for lifting the individual in and out of the tub but may not necessarily be attached to the toilet, ceiling, floor, or wall of the bathroom.

Ceiling Lifts

A ceiling lift (Zero Lifting) is a device that incorporates a lift or walking sling mounted on tracks that are installed into the ceiling of the home/facility and allow for transfer of an individual.

REGULATORY STATUS

The United States Food and Drug Administration (FDA) regulates patient lifts as medical devices. All patient lifts including related components require FDA approval before marketing and use in the United States to ensure they are safe and effective for human use. Refer to the FDA Medical Device website. Available from: https://www.fda.gov/medical-devices [accessed 2026 Jun 11]

The FDA lists the most serious type of medical device recalls as well as early alert communications about corrective actions being taken by companies that the FDA believes are likely to be the most serious type of recalls on our website by the date that the FDA posts the information on our website. Available from: Medical Device Recalls | FDA [accessed 2026 Jun 11]

PRODUCT DISCLAIMER

- Services are contract dependent; if a product does not cover a service, medical policy criteria do not apply.
- If a commercial product (including an Essential Plan or Child Health Plus product) covers a specific service, medical policy criteria apply to the benefit.
- If a Medicaid product covers a specific service, and there are no New York State Medicaid guidelines (eMedNY) criteria, medical policy criteria apply to the benefit.
- If a Medicare product covers a specific service, and there is no national or local Medicare coverage decision for the service, medical policy criteria apply to the benefit.

Disclaimer Notice

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgment when deciding the most appropriate care to enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

Background

Pompe Disease is a rare, hereditary (autosomal-recessive), progressive neuromuscular disorder characterized by acid alpha-glucosidase (GAA) enzyme deficiency and therefore glycogen accumulation in muscle cells. It was initially thought of as a muscular disorder, as the glycogen accumulation leads to progressive muscle weakness. Other organs and body systems can be affected, including the heart, liver, and nervous system, pinning it a multisystem disorder.

Infantile-onset Pompe Disease (IOPD) typically presents before the age of 12 months, usually within a few months of birth. There are two types of IOPD, Classic and Non-classic. Classic presentation occurs in the first few months of life (median four months) with cardiomyopathy, hypotonia, myopathy, hepatomegaly, and heart defects. Non-classical usually appears by age 1-2, and has the same symptoms as noted above. They may experience cardiomegaly, but affected individuals usually do not experience heart failure. In totality, clinical findings for IOPD include cardiomegaly, respiratory distress, and can include muscle weakness, feeding difficulties, and failure to thrive. The pharmacotherapeutic approach includes enzyme replacement therapies (ERT) to help improve and manage this disease.

Late-onset Pompe Disease (LOPD) may present at any age and do not develop cardiomyopathy. Symptoms of LOPD usually present as muscle weakness more pronounced in the proximal muscles of the lower extremities, back pain, fatigue, and muscle cramps. LOPD is diagnosed either through gene sequencing or assessment of GAA enzyme activity. Clinical findings include abnormally high creatinine kinase (CK), alanine aminotransferase (ALT), aspartate aminotransferase (AST), and lactate dehydrogenase levels alongside reduced leukocyte GAA activity. Urine tests can also be done to test for elevated urine Hex4. A tissue biopsy showing vacuolar myopathy with excessive glycogen accumulation and increased acid phosphatase staining can also be used. GAA enzyme activity assays or mutation analyses must be done as a confirmatory diagnosis procedure. Typical treatment for LOPD includes ERT, and studies have shown that ERT improves muscle strength, pulmonary function, and other symptoms.

Lumizyme was approved in 2010 for LOPD and in 2014 had a label expansion to include IOPD. It is a recombinant formulation of the human enzyme GAA and is considered ERT as it is thought to be replacing the deficient GAA therefore reducing accumulated glycogen in heart and skeletal muscles to ultimately reduce the manifestations of the disease. The safety and efficacy of alglucosidase alfa was assessed in 57 treatment-naive IOPD patients, aged 0.2 month to 3.5 years at first infusion, in three separate clinical trials.

One of the trials studied a primary endpoint of death or need for invasive ventilatory support and found 83% of those treated with alglucosidase were alive without ventilatory support at 18 months versus 2% in the historical comparator cohort. The third IOPD study was an open-label, single-center trial in 18 IOPD patients who had a confirmed diagnosis of Pompe disease as identified through a newborn screening program. All patients were CRIM-positive (residual GAA enzyme activity of at least 1%). Patients were treated with alglucosidase alfa prior to six months of age. Sixteen patients reached 18 months of age at the time of analysis, and all (100%) were alive without invasive ventilator support. Alglucosidase alfa therapy was studied in LOPD and did have some modestly positive findings in terms of stability of FVC (versus reductions in placebo) and 6MWT improvements. There are several warnings associated with therapy and they include anaphylaxis and hypersensitivity reactions, immune-mediated reactions, risk of acute cardiorespiratory failure, cardiac arrhythmias, and risk of antibody development.

Nexviazyme is an enzyme replacement therapy and hence is responsible for replacing deficient enzymes. Avalglucosidase alfa is an exogenous source of the deficient enzyme GAA that is responsible for glycogen cleavage. Avalglucosidase alfa contains mannose-6-phosphate (M6P), which are able to bind to M6P receptors on the cell surface, which then allows avalglucosidase alfa to be internalized and transported to lysosomes for glycogen cleavage. Therapy was studied in 100 participants who were randomly allocated to receive either avalglucosidase alfa (n-51) or alglucosidase alfa (n-49). Importantly non-inferiority was shown between treatment with avalglucosidase alfa compared with alglucosidase alfa at week 49 for the primary outcome (Change From Baseline in Percent Predicted Forced Vital Capacity [FVC] in Upright Position at Week 49). Secondary endpoints did show a difference in treatment with avalglucosidase such as improvements in the 6MWT over treatment with alglucosidase. In terms of safety concerns in the trial, there were 5 trial withdrawals subjects, all in the alglucosidase alfa group, four were due to adverse events, including two infusion-associated reactions. Serious treatment-emergent adverse events were reported in eight participants who received avalglucosidase alfa and in 12 who received alglucosidase alfa. One participant treated with alglucosidase alfa died because of acute myocardial infarction determined to be unrelated to treatment. Antidrug antibody responses were similar in both groups. High and persistent titres (≥ 12 800) and neutralizing antibodies were more common with

alglucosidase alfa (in 16 [33%] participants) than with avalglucosidase alfa (ten [20%]).

Pombiliti (cipaglucosidase alfa-atga) and Opfolda (miglustat) were approved in 2023, to be used only in combination, for the treatment of adults with LOPD who weigh ≥ 40 kg and are not improving on their current ERT. Opfolda is an oral enzyme stabilizer that is given 1 hour before the Pombiliti infusion. The PROPEL trial studied a total of 123 patients (77% ERT-experienced and 23% ERT-naïve) who were randomized to receive Pombiliti and Opfolda or alglucosidase alfa plus oral placebo. Patients were considered ERT-experienced if they were previously receiving alglucosidase alfa at 20 mg/kg every 2 weeks for ≥ 24 months. Patients treated with Pombiliti and Opfolda in the overall trial population walked on average 21 meters farther from baseline as compared to those treated with alglucosidase alfa product and placebo, who walked 8 meters farther from baseline. The estimated treatment difference of 14 meters was not statistically significant (95% CI: −1, 28). For the secondary outcome, patients treated with Pombiliti and Opfolda in the overall population showed a mean change in sitting forced vital capacity (FVC) from baseline at Week 52 of −1.1% as compared with patients treated with alglucosidase alfa and placebo of −3.3%. The estimated treatment difference of 2.3% was statistically significant (95% CI: 0.02, 4.62). In both the primary and secondary outcomes, when the populations were analyzed separately, the ERT-experienced patients treated with Pombiliti and Opfolda showed favorable changes at Week 52 compared with ERT-naïve patients. Based on this data, the FDA indication is for patients who are ERT-experienced.

Summary	
Effective Date of Policy:	2/12/2026
Indications	Early-onset Pompe Disease, Late-onset Pompe Disease
ICD10 Diagnosis Codes	E74.02
Availability	Lumizyme (J0220 & J0221): 50mg alglucosidase alfa as lyophilized powder in single dose vial Nexviazyme (J0219): 100mg vial for reconstitution Opfolda (miglustat): 65 mg oral capsule Pombiliti (J1203): 105 mg cipaglucosidase alfa-atga as lyophilized powder in single dose vial
Duration	Initial and Continuation: 12 months

Required Criteria for Initial Approval

All of the following conditions for the requested indication must be met in order to approve therapy.

Drug/Indication	Criteria	Recommended Dosing

Lumizyme (Alglucosidase alfa)
 	
Indication: Pompe Disease
(FDA approval)
ICD10: E74.02
	Infantile Onset Pompe Disease
	• Enrollee is ≤ 1 year of age
	• Must be prescribed by, or in consultation with, a physician experienced in metabolic or neuromuscular disorders
	• Enrollee has enzymatically confirmed diagnosis of Infantile Onset Pompe Disease through at least one of the following:
	  o two confirmed GAA gene mutations
	  o acid alpha-glucosidase (GAA) enzyme deficiency of <1% normal demonstrated from either a blood or tissue sample (must be confirmed positive and not indeterminate)
	• Enrollee has hypertrophic cardiomyopathy on echocardiogram
	
	Late-Onset Pompe Disease
	• Must be prescribed by, or in consultation with, a physician experienced in metabolic or neuromuscular disorders AND
	• The patient must have confirmed late-onset Pompe disease (LOPD) demonstrated by:
	  o Acid alpha-glucosidase (GAA) enzyme activity <40% of the laboratory's normal reference value AND
	  o At least one of the following:
	  ▪ Demonstration of deficient GAA enzyme activity from a second validated tissue or blood source (e.g., purified lymphocytes, fibroblasts or muscle)
	  ▪ Molecular genetic testing confirming two pathogenic GAA variants AND
		• 20 mg per kg body weight administered every two weeks as an intravenous infusion

	• The patient must demonstrate objective evidence of symptomatic neuromuscular involvement consistent with LOPD, including all of the following:
	  o Baseline percent-predicted forced vital capacity (FVC) between 30% and 80% AND
	  o Ability to walk ≥40 meters on a 6-minute walk test (6MWT) AND
	  o Documented lower extremity muscle weakness confirmed by validated motor assessment or neurological examination
	• The following baseline clinical measurements must be obtained within 90 days of initiating treatment
	  o Percent-predicted FVC (upright or supine)
	  o 6-minute walk test (6MWT) distance
	  o Ventilation status
	  ▪ Patients requiring invasive mechanical ventilation are excluded from coverage
	  o Current body weight
	• Lumizyme will not be approved for concurrent use with other enzyme replacement therapies for Pompe disease, except for brief transition periods when medically necessary.	

Nexviazyme (avalglucosidase alfa)
 	
Indication: Late-Onset Pompe Disease
(FDA approval)
ICD10: E74.02
	• Enrollee is ≥ 1 year of age
	• Must be prescribed by, or in consultation with, a physician experienced in metabolic or neuromuscular disorders AND
	• The patient must have confirmed late-onset Pompe disease (LOPD) demonstrated by:
	  o Acid alpha-glucosidase (GAA) enzyme activity <40% of the laboratory's normal reference value AND
	  o At least one of the following:
	  ▪ Demonstration of deficient GAA enzyme activity from a second validated tissue or blood source (e.g., purified lymphocytes, fibroblasts or muscle)
	  ▪ Molecular genetic testing confirming two pathogenic GAA variants AND
	• The patient must demonstrate objective evidence of symptomatic neuromuscular involvement consistent with LOPD, including all of the following:
	  o Baseline percent-predicted forced vital capacity (FVC) between 30% and 80% AND
	  o Ability to walk ≥40 meters on a 6-minute walk test (6MWT) AND
	  o Documented lower extremity muscle weakness confirmed by validated motor assessment or neurological examination
	• The following baseline clinical measurements must be obtained within 90 days of initiating treatment
	  o Percent-predicted FVC (upright or supine)
	  o 6-minute walk test (6MWT) distance
	  o Ventilation status
	  ▪ Patients requiring invasive mechanical ventilation are excluded from coverage
	  o Current body weight
	• Nexviazyme will not be approved for concurrent use with other enzyme replacement therapies for Pompe disease, except for brief transition periods when medically necessary.
		• Intravenous infusion dosed every two weeks
		• Weight ≥ 30 kg, the recommended dosage is 20 mg/kg (of actual body weight) every two weeks.
		• Weight < 30 kg, the recommended dosage is 40 mg/kg (of actual body weight) every two weeks.
		• See FDA prescribing information for important administration considerations

Pombiliti (cipaglucosidase alfa-atga) and Opfolda (miglustat)
 	
Indication: Late-Onset Pompe Disease
(FDA approval)
ICD10: E74.02
	• Enrollee is 18 years of age or older and weighs ≥ 40 kg
	• Must be prescribed by, or in consultation with, a physician experienced in metabolic or neuromuscular disorders AND
	• The patient must have confirmed late-onset Pompe disease (LOPD) demonstrated by:
	  o Acid alpha-glucosidase (GAA) enzyme activity <40% of the laboratory's normal reference value AND
	  o At least one of the following:
	  ▪ Demonstration of deficient GAA enzyme activity from a second validated tissue or blood source (e.g., purified lymphocytes, fibroblasts or muscle)
	  ▪ Molecular genetic testing confirming two pathogenic GAA variants AND
	• The patient must demonstrate objective evidence of symptomatic neuromuscular involvement consistent with LOPD, including all of the following:
	  o Baseline percent-predicted forced vital capacity (FVC) between 30% and 80% AND
	  o Ability to walk ≥40 meters on a 6-minute walk test (6MWT) AND
	  o Documented lower extremity muscle weakness confirmed by validated motor assessment or neurological examination
	• The following baseline clinical measurements must be obtained within 90 days of initiating treatment
	  o Percent-predicted FVC (upright or supine)
	  o 6-minute walk test (6MWT) distance
	  o Ventilation status
	  ▪ Patients requiring invasive mechanical ventilation are excluded from coverage
	  o Current body weight
	• Must have an inadequate response to Lumizyme (alglucosidase alfa) or Nexviazyme (avalglucosidase alfa-ngpt)
	• Pombiliti must be used in combination with Opfolda (miglustat)
	• Pombiliti and Opfolda will not be approved for concurrent use with other enzyme replacement therapies for Pompe disease, except for brief transition periods when medically necessary.
		Opfolda:
		• Weight 40 kg to 50 kg: 195 mg
		• Weight ≥ 50 kg: 260 mg
		• Taken orally 1 hour before Pombiliti infusion
		
		Pombiliti:
		20 mg per kg body weight administered every two weeks as an intravenous infusion

Continuation Criteria

Continued coverage requirements

1. Continuation approvals will be for 1 year at a time
2. Improvement in at least one of the following relative to baseline:
   a. Improvement or stabilization in percent-predicted FVC (same position as baseline required) **OR**
   b. Improvement or stabilization of 6MWT distance
3. For patients who have received more than 24 months of therapy, consideration for continued coverage may include documentation demonstrating mild or slow decline in the absence of improvement or stabilization requirements described above. Mild or slow disease progression is defined as:
   a. A decline in percent-predicted FVC of less than 2% per year (same position as baseline required)
   b. A decline in 6MWT distance of less than 30 meters per year
   c. A decline in one domain (percent-predicted FVC or 6MWT) and stability in the other

Considerations

- Prior authorization is obtained through the CDPHP pharmacy department.

GOVERNMENT PROGRAMS

CHILD HEALTH PLUS: Subject to all terms and conditions noted in above application.

MEDICARE CHOICES: Lumizyme, Nexviazyme, and Pombiliti: Subject to the terms and conditions noted in above policy for those medications listed as a medical benefit when administered and provided by physician office, coverage will be provided as a medical benefit. All other medications for Medicare Advantage with Part D members listed are subject to coverage under the current Part D benefit and Medicare Advantage Part D formulary.

Opfolda (miglustat): Not applicable.

SELECT/HARP PLAN: Subject to all terms and conditions noted in above application.
Opfolda: Not applicable. Effective April 1, 2023, the pharmacy benefit for Medicaid is administered by NYRx, the Medicaid Pharmacy Program.

CDPHP Pharmacy Services 2/12/2026

New: 2/2022

Revised	Reviewed
2/24, 2/26	2/23, 2/25

Revision Date	Changes Made
2/24	Added inclusion/exclusion criteria for new drug combination Pombiliti and Opfolda, updated name of policy to "Pharmaceutical Management of Pompe Disease"
2/2026	Separated out criteria for Infantile Onset Pompe Disease for Lumizyme Revised criteria for consistency of FVC and ventilation status Added 6MWT

CDPHP reserves the right to review this policy at any time and change it without notice.

Background

Amyotrophic Lateral Sclerosis (ALS) is a rapidly progressive, invariably fatal neurological disease that affects around 16,000 people in the United States. It is characterized by motor neuron degeneration in the motor cortex and spinal cord that leads to progressive muscle weakness. Onset of symptoms is gradual, and the rate of progression varies from person to person. Eventually, all muscles under voluntary control are affected and individuals lose their strength and their ability to mobilize and speak; when muscles in the diaphragm and chest wall fail, the ability to breath without ventilator support will be lost. Respiratory failure is the leading cause of death in patients with ALS, and in the majority of cases occurs within three to five years of symptom onset; however, in roughly 10% of cases, patients survive for greater than 10 years.

The severity of ALS is evaluated using the ALS Functional Rating Scale Revised (ALSFRS-R). It contains 12 items across four subdomains of bodily function (bulbar, fine motor, gross motor, and breathing). Each item is scored from 0 (total loss of function) to 4 (no loss of function). Total scores range from 0 to 48 with higher scores indicating better function. Regarding the clinical significance of changes in score, a survey of 65 members of the Northeast ALS Consortium (NEALS) showed that ninety percent believed a 20% change in slope was somewhat clinically significant; all surveyed believed that a 25% change or higher in score was at least somewhat clinically meaningful; and ninety-three percent believed that a 50% change in score is *very* clinically meaningful.

While there is no cure for ALS, current treatments seek to modulate the course of the disease. These therapies include riluzole (Rilutek, Exservan, Teglutik), edaravone (Radicava, Radicava ORS), and tofersen (Qalsody).

Radicava (edaravone) is a free-radical scavenger of peroxyl radicals and peroxynitrite that has been shown to inhibit motor neuron death by reducing oxidative stress in animal models. The exact mechanism is Radicava is unknown. FDA approval came following a six-month clinical trial conducted in Japanese patients with ALS who were living independently. At baseline, characteristics of the treatment arm (n=69) and placebo arm (n=68) were similar, and 90% of patients in the trial were being treated with riluzole. At week 24, there was a statistically significant difference between the decline in ALSFRS-R score in the treatment group compared with the placebo group. In May 2022, an oral formulation of edaravone was approved by the FDA based on a bioavailability study. It should be noted that for the oral formulation, timing is important in regards to both the fasting period prior to the dose, and subsequent feeding/nutrition administered after the dose.

Qalsody (tofersen) is indicated for the treatment of ALS in adults who have a mutation in the SOD1 gene. This indication is approved under accelerated approval based on reduction in plasma neurofilament light chain (NfL) observed in patients treated with Qalsody. Continued approval for this indication may be contingent upon verification of clinical benefit in confirmatory trial(s).

The efficacy of Qalsody was evaluated in the 28-week, double-blind, placebo-controlled Phase 3 VALOR study involving patients with weakness attributable to ALS and confirmed SOD1 mutation. A total of 108 patients were randomized to receive treatment with either Qalsody 100 mg (n=72) or placebo (n=36) for 24 weeks (3 loading doses followed by 5 maintenance doses).[10]

The primary analysis population (n=60, mITT) had SVC > 65% of predicted value and met criteria for rapid disease progression, defined by their pre-randomization ALSFRS-R decline slope and SOD1 mutation type. The primary efficacy analysis was change from baseline to Week 28 in the ALSFRS-R total score. While Qalsody demonstrated less decline in the ALSFRS-R compared to placebo at Week 28, the results were not statistically significant. The secondary endpoints of change from baseline at Week 28 in plasma NfL and cerebrospinal fluid (CSF) SOD1 protein were nominally statistically significant.

After the completion of the 28-week VALOR study, patients had the option to enroll in an open-label extension study. At the 52-week interim analysis, patients previously receiving placebo who initiated Qalsody saw reductions in Nfl, similar to those treated with Qalsody in the placebo-controlled period. Earlier initiation of Qalsody was associated with a trend for reduction in ALSFRS-R decline but was not statistically significant. In addition, earlier initiation of Qalsody was associated with a trend toward a reduction in the risk of death or permanent ventilation but was not statistically significant. It is noted in the Qalsody prescribing information that these results should be interpreted with caution given the limitations of data collected outside a controlled trial.

Summary	
Effective Date of Policy:	8/13/2026
Indications	G12.21 Amyotrophic lateral sclerosis (ALS)
Availability	Radicava: 30 mg/100 mL solution for injection (J1301) Radicava ORS: 105 mg/5 mL oral suspension in a multi-dose amber glass bottle Qalsody: Injection 100 mg/15 mL (6.7 mg/mL) solution in a single-dose vial (J1304)
Duration	Six months

Required Criteria for Approval	
All of the following conditions for the requested indication must be met in order to approve therapy:	
Specific Drug	**Criteria**
Radicava Amyotrophic Lateral Sclerosis (FDA approval) ICD10: G12.21	1. Must be greater than 18 years of age AND 2. Must be prescribed by or in consultation with a neurologist, or provider that specializes in Amyotrophiclateral sclerosis (ALS) AND 3. According to the prescriber, the patient must have a diagnosis of ALS that meets one of the following: a. "Definite" or "Probable" ALS as determined by revised El Escorial criteria or Awaji criteria (See appendix for criteria) OR b. Diagnosis of ALS in accordance with the Gold Coast Criteria (See appendix for criteria) AND 4. Must not have tracheostomy (trach) OR 5. For patients who have a trach, the provider must attest that the trach is for prevention of aspiration only 6. Radicava and generic edaravone will not be covered for any other non-FDA approved indication 7. Initial and recertification requests will be for 6 months at a time. Recertification requires provider attestation that: a. The patient continues to benefit from therapy AND b. The patient is not dependent on invasive ventilation or tracheostomy (unless the trach is for prevention of aspiration only). 8. Recommended Dosing: a. IV: 60mg administered as an IV infusion over 60 minutes. b. Oral Suspension: 105 mg (5 mL) taken orally or via feeding tube in the morning after overnight fasting. Food should not be consumed for 1 hour after administration except water. i. Initial treatment cycle: daily dosing for 14 days followed by a 14-day drug-free period ii. Subsequent treatment cycles: daily dosing for 10 days out of 14-day periods 9. Quantity limits for oral suspension: a. 50 mL bottle: 1 per 28 days b. 70 mL bottle: 1 per 365 days
Qalsody Amyotrophic Lateral Sclerosis (FDA approval) ICD10: G12.21	**<u>For all lines of business except Medicare Part B and D-SNP:</u>** 1. Must be prescribed by or in consultation with a neurologist, or provider that specializes in Amyotrophic Lateral Sclerosis (ALS) **AND** 2. Must be 18 years of age or older **AND** 3. Must have diagnosis of ALS with confirmed SOD1 mutation **AND** 4. Provider must attest that the patient has weakness attributable to ALS **AND** 5. Must not have tracheostomy (trach) **OR** 6. For patients who have a trach, the provider must attest that the trach is for prevention of aspiration only **AND** 7. Qalsody will not be covered for any other non-FDA approved indication 8. The recommended dosage is 100 mg (15 mL) of Qalsody per administration. Initiate Qalsody treatment with three (3) loading doses administered at 14-day intervals. Administer a maintenance dose every 28 days thereafter. 9. Initial and recertification will be for 6 months at a time. Recertification requires provider attestation that: a. The patient continues to benefit from therapy **AND** b. The patient is not dependent on invasive ventilation or tracheostomy (unless the trach is for prevention of aspiration only) 10. This indication is approved under accelerated approval based on reduction in plasma neurofilament light chain observed in patients treated with Qalsody. Continued approval for this indication may be contingent upon verification of clinical benefit in confirmatory trial(s) **<u>Medicare Part B, and D-SNP Plans:</u>** Medicare reviews are to follow the Local Coverage Determination (LCD) for Drugs and Biologicals, Coverage of, for Label and Off-Label Uses (L33394). The LCD can be found on the CMS website at: https://www.cms.gov/medicare-coverage-database/view/lcd.aspx?lcdid=33394

Considerations

- Patient must have prescription drug coverage administered by CDPHP for those agents fulfilled through the prescription benefit.
- Prior authorization is obtained through the CDPHP pharmacy department.

GOVERNMENT PROGRAMS

CHILD HEALTH PLUS:	Subject to all terms and conditions noted in above application.
MEDICARE CHOICES:	For Radicava ORS: Not applicable For Radicava intravenous injection and Qalsody (tofersen): Subject to all terms and conditions noted in above application.
SELECT/HARP PLAN:	Effective April 1, 2023, the pharmacy benefit for Medicaid is administered by NYRx, the Medicaid Pharmacy Program. Subject to all terms and conditions noted in above application if administered under the medical benefit.

CDPHP Pharmacy Services 8/13/2026

New: 4/2023

Revised	Reviewed
4/2024, 4/2025, 2/2026	

Revision Date	Changes Made
4/2024	Qalsody section • Therapy is being requested by a neurologist who specializes in motor neuron diseases • Updated Qalsody dosing and administration details
4/2025	Removed all information pertaining to Relyvrio as it has been removed from the market
2/2026	Updated Qalsody to not be medically necessary for Commercial lines of business
8/2026	Criteria for Commercial changed from "not medically necessary" to align with clinical criteria for Medicaid Managed Care (MMC) and Child Health Plus Updated Radicava criteria

This Pharmacy Policy is the exclusive property of Capital District Physicians' Health Plan, Inc. (CDPHP®) and its affiliated companies, CDPHP Universal Benefits,® Inc. (CDPHP UBI), and Capital District Physicians' Healthcare Network, Inc. (CDPHN). The contents and form of this policy are proprietary to CDPHP. Policy/Procedure Name: Pharmaceutical Treatment of Spinal Muscular Atrophy **Control Number: 1350/20.000303**

Disclaimer Notice

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to healthcare practitioners how to provide appropriate healthcare to their patients. Healthcare practitioners shall exercise their own medical judgment when deciding the most appropriate care for enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing healthcare services. CDPHP reserves the right to review this policy at any time and change it without notice.

Background

Spinal muscular atrophy (SMA) is a rare and irreversible neurodegenerative disease that affects the spinal cord, specifically the alpha motor neurons in the anterior horn.[6] As a result, SMA causes progressive proximal motor weakness and atrophy and in severe cases, often resulting in early mortality. Critical muscle functions lost include walking, speaking, swallowing, and breathing, and the primary cause of death results from respiratory muscle weakness leading to severe restrictive lung disease and progressive respiratory failure.[1] Prevalence is estimated at 1-2 per 100,000 persons and incidence around 1 in 10,000 live births.

SMA is linked to chromosome 5q and is recessive, caused by bi-allelic mutations in the survival motor neuron 1 (SMN1) gene, which produces the SMN protein that is essential for motor neuron development. Specifically, the mutations include the homozygous deletion or deletion and mutation of the alleles of the SMN1 gene on chromosome 5q.[6] The survival motor neuron 2 (SMN2) gene also produces SMN protein; however, only a small portion of the protein produced is functional. The number of SMN2 copies is important in determining the severity of SMA; however, those without SMN1 have an insufficient level of SMN protein regardless of the SMN2 copies. Characteristics of the different types of SMA are described in the chart below.

SMA Type	Age at Onset of Symptoms	Peak Motor Function Achieved	Lifespan	Copies of SMN2
Type 0	Prenatal onset	None	< 6 months	1 copy
Type 1	< 6 months	Sitting with support	< 2 years	1–3 copies
Type 2	6–18 months	May sit independently	> 2 years	2–3 copies
Type 3	> 18 months	May walk independently	Into adulthood	3–4 copies
Type 4	Adult onset	Will walk independently through adulthood	Death as an adult	≥ 4 copies

Spinraza (nusinersen) is an intrathecal agent used in the treatment of spinal muscular atrophy (SMA), and is currently FDA-approved for SMA types 1, 2, 3, or 4. Spinraza has been studied in clinical trials involving subjects with SMA types 1, 2, and 3 with an age of up to 12 years old. Spinraza works by increasing exon 7 inclusion in SMN2 (survival motor neuron-2) messenger RNA transcripts and producing full-length SMN proteins. This leads to an improvement in motor function in the studied population. The recommended dosage of Spinraza is 12 mg (5 mL) administered intrathecally. There are four loading doses (with 12 mg per dose); the first three doses are separated by 14-day intervals, and the fourth loading dose is given 30 days after the third dose. Maintenance doses are administered as 12 mg every four months.

Evrysdi (risdiplam) is an oral agent used for the treatment of SMA that is FDA approved for the treatment of SMA in pediatric and adult patients. FDA approval was based on the results of the open-label FIREFISH trial, where patients with SMA type 1 aged one to seven months were studied, and the placebo-controlled SUNFISH trial that enrolled patients with SMA type 2 or non-abmulatory SMA type 3 aged 2 to 25 years. Evrysdi is a first in class SMN2 mRNA splicing modifier that increases the amount of full-length SMN proteins prouced by the SMN2 gene.

Isembyld (apitegromab-mstn) is an intravenous infusion used in the treatment of spinal muscular atrophy (SMA), and is currently FDA-approved in adults and pediatric patients 2 years of age and older who are currently receiving a survival motor neuron 2 (SMN2)-targeted treatment. Isembyld is a fully human monoclonal IgG4 antibody that binds to promyostatin and latent myostatin and inhibits the activation of myostatin, blocking myostatin signaling, thus promoting increased muscle mass and strength. Approval was based on the phase 3 52-week randomized, double-blind, placebo-controlled SAPPHIRE trial. At 12 months, least squares mean difference in HFMSE change [KM7.1]from baseline was 1.8 [KM8.1](95% CI 0.30 to 3.32, p=0.019) points for participants aged 2-12 years receiving apitegromab versus placebo (least squares mean 0·6 vs -1.2). There is a warning therapy may increase the risk of fractures. The most common adverse reactions were upper respiratory tract infections, vomiting, cough, other viral infections, headache, gastroenteritis, pharyngitis, and hypersensitivity.

Summary	
Effective date of policy:	10/8/2026
Indications	Spinal muscular atrophy
ICD10 diagnosis codes	G12.9
Availability	Spinraza: Single-use vials (12mg/5mL, 28 mg/5 mL, 50 mg/5 mL) Evrysdi: 0.75 mg/mL oral solution when reconstituted, 5 mg tablets Isembyld: 150 mg/3 mL (50 mg/mL) single-dose glass vial
Limitations	CDPHP administers benefits to enrollees for Spinraza (nusinersen) and Isembyld (apitegromab-mstn) only if the enrollee has a medical benefit CDPHP administers benefits to enrollees for Evrysdi (risdiplam) only if the enrollee has a pharmacy benefit

Required Criteria for Approval	
All of the following conditions for the requested indication must be met in order to approve therapy:	
Indication	Criteria for Approval
Spinraza (nusinersen) **Spinal muscular atrophy** (FDA approval) ICD10: G12.9 *Medical benefit* HCPCS: J2326	**For Commercial/Essential/ Child Health Plus/Medicare Advantage:** **1.** Must be prescribed by or in consultation with a provider who specializes in the treatment of Spinal Muscular Atrophy (SMA) and/or neuromuscular disorders **AND** 2. Must have a diagnosis of Type I, II, or III Spinal Muscular Atrophy a. Confirmed by targeted mutation analysis i. Homozygous deletions of SMN1 gene **OR** ii. Homozygous mutation in the SMN1 gene (e.g., biallelic mutations of exon 7) **OR** iii. Compound heterozygous mutation in the SMN1 gene (e.g., deletion of SMN1 exon 7 and mutation of SMN1) **AND** **3.** Must have genetic testing confirming 1, 2, 3, or 4 copies of the SMN2 gene **a.** If genetic testing confirms 4 copies of the SMN2 gene, Spinraza will only be approved if the patient is symptomatic **AND** **4.** The patient must not have advanced disease (e.g., complete limb paralysis or permanent ventilator dependence **AND** 5. Progress notes containing results of at least one of the following baseline exams must be submitted to establish baseline motor ability: a. Hammersmith Infant Neurological Exam (HINE) **OR** b. Hammersmith Functional Motor Scale Expanded (HFMSE) **OR** c. Upper Limb Module (ULM) Test/Revised Upper Limb Module Test (RULM) **OR** **d.** Children's Hospital of Philadelphia Infant Test of Neuromuscular Disorders (CHOP- INTEND) **AND** **6.** There must be a proven contraindication to Evrysdi **a.** This requirement does not apply to Medicare Advantage **AND** **7.** Spinraza will not be approved for use in patients that have previously been treated with Zolgensma or Itvisma or in combination with Evrysdi or any other experimental therapy for spinal muscular atrophy **AND** **8.** Administration and Dose **a.** Spinraza must be administered in accordance with the current FDA-approved prescribing information. **b.** Low-Dose Spinraza will be required for all patients unless they meet the coverage criteria described in Spinraza High-Dose Criteria section below **c.** Both Low-Dose (12 mg) and High-Dose (28 mg maintenance) regimens must follow the labeled dosing schedule and monitoring requirements **AND** 9. Approval Timeframe and Recertification Requirements a. Approval Timeframe: 12-months b. Recertification Requirements i. Initial (12-months from treatment initiation), there must be documentation of ONE of the following: 1. Clinically meaningful response from pre-treatment baseline on at least one validated, age-appropriate SMA motor function scale: a. CHOP-INTEND: ≥ 4-point improvement from baseline b. HINE-2: Improvement in ≥ 1 motor milestone category without worsening

in any category
- c. HFMSE: ≥ 3-point improvement from baseline
- d. ULM/RULM: ≥ 2-point improvement from baseline **OR**

2. The patient has achieved or maintained a motor milestone not expected based on natural history (e.g., independent sitting, standing, ambulation, head control) **OR**
3. For patients with advanced disease at baseline (HFMSE ≤ 10 or CHOP-INTEND ≤ 20), there must be documentation of stabilization of motor function **AND** at least ONE of the following: respiratory stabilization (no new requirement for permanent ventilation), bulbar stabilization (no new requirement for enteral feeding), or preservation of a functionally meaningful motor ability as attested by the treating specialist.

ii. Continued (every 12-months after initial response has been established), there must be documentation of ongoing clinically meaningful therapeutic benefit, defined as meeting at least ONE of the following:
1. No decline exceeding the minimal clinically important difference (MCID) threshold for clinically meaningful deterioration on the primary motor scale used for monitoring (HFMSE: > 3-point decline; CHOP-INTEND: > 4-point decline; RULM: > 2-point decline), OR no loss of a previously achieved motor milestone.
2. Further improvement on a validated motor scale from the most recent assessment.
3. Documentation that the patient's disease course is meaningfully altered relative to the expected natural history for their SMA type, SMN2 copy number, and disease duration. This may include but is not limited to:
- a. Preservation of respiratory function (stable ventilatory support requirements; no progression to permanent invasive ventilation)
- b. Preservation of bulbar function (stable nutritional support requirements)
- c. Maintenance of functional independence in activities of daily living
- d. Slowed rate of motor decline relative to published natural history data

<u>For Medicaid/HARP:</u>

1. Must be prescribed by or in consultation with a provider who specializes in the treatment of Spinal Muscular Atrophy (SMA) and/or neuromuscular disorders AND
2. Must have a diagnosis of Type I, II, or III Spinal Muscular Atrophy
   - a. Confirmed by targeted mutation analysis
     - i. Homozygous deletions of SMN1 gene OR
     - ii. Homozygous mutation in the SMN1 gene (e.g., biallelic mutations of exon 7) OR
     - iii. Compound heterozygous mutation in the SMN1 gene (e.g., deletion of SMN1 exon 7 and mutation of SMN1) AND
3. The patient must not have advanced disease (e.g., complete limb paralysis or permanent ventilator dependence AND
4. Progress notes containing results of at least one of the following baseline exams must be submitted to establish baseline motor ability:
   - a. Hammersmith Infant Neurological Exam (HINE) OR
   - b. Hammersmith Functional Motor Scale Expanded (HFMSE) OR
   - c. Upper Limb Module (ULM) Test/Revised Upper Limb Module Test (RULM) OR
   - d. Children's Hospital of Philadelphia Infant Test of Neuromuscular Disorders (CHOP- INTEND) AND
5. Spinraza will not be approved for use in patients that have previously been treated with Zolgensma or Itvisma or in combination with Evrysdi or any other experimental therapy for spinal muscular atrophy AND
6. Administration and Dose
   - a. Spinraza must be administered in accordance with the current FDA-approved prescribing information.
   - b. Low-Dose Spinraza will be required for all patients unless they meet the coverage criteria described in Spinraza High-Dose Criteria section below
   - c. Both Low-Dose (12 mg) and High-Dose (28 mg maintenance) regimens must follow the labeled dosing schedule and monitoring requirements AND
7. Approval Timeframe and Recertification Requirements
   - a. Approval Timeframe: 12-months

	b. Recertification Requirements i. Initial (12-months from treatment initiation), there must be documentation of ONE of the following: 1. Clinically meaningful response from pre-treatment baseline on at least one validated, age-appropriate SMA motor function scale: a. CHOP-INTEND: ≥ 4-point improvement from baseline b. HINE-2: Improvement in ≥ 1 motor milestone category without worsening in any category c. HFMSE: ≥ 3-point improvement from baseline d. ULM/RULM: ≥ 2-point improvement from baseline OR 2. The patient has achieved or maintained a motor milestone not expected based on natural history (e.g., independent sitting, standing, ambulation, head control) OR 3. For patients with advanced disease at baseline (HFMSE ≤ 10 or CHOP-INTEND ≤ 20), there must be documentation of stabilization of motor function AND at least ONE of the following: respiratory stabilization (no new requirement for permanent ventilation), bulbar stabilization (no new requirement for enteral feeding), or preservation of a functionally meaningful motor ability as attested by the treating specialist. ii. Continued (every 12-months after initial response has been established), there must be documentation of ongoing clinically meaningful therapeutic benefit, defined as meeting at least ONE of the following: 1. No decline exceeding the minimal clinically important difference (MCID) threshold for clinically meaningful deterioration on the primary motor scale used for monitoring (HFMSE: > 3-point decline; CHOP-INTEND: > 4-point decline; RULM: > 2-point decline), OR no loss of a previously achieved motor milestone. 2. Further improvement on a validated motor scale from the most recent assessment. 3. Documentation that the patient's disease course is meaningfully altered relative to the expected natural history for their SMA type, SMN2 copy number, and disease duration. This may include but is not limited to: a. Preservation of respiratory function (stable ventilatory support requirements; no progression to permanent invasive ventilation) b. Preservation of bulbar function (stable nutritional support requirements) c. Maintenance of functional independence in activities of daily living d. Slowed rate of motor decline relative to published natural history data
Spinraza (nusinersen) High-Dose **Spinal muscular atrophy** (FDA approval) ICD10: G12.9 *Medical benefit* HCPCS: J2326	Criteria Applies to all LOB. The patient must meet **ONE** of the following (1, 2, or 3): 1. The patient must have severe Type 1 disease (defined as symptom onset ≤ 6 months or ≤ 2 SMN2 copies) **OR** 2. The patient is currently receiving the Low Dose Regimen for Spinraza for an adequate trial period (≥ 12 months) with documentation of plateau or declining function a. Plateau or declining function on the Low Dose Regimen is defined as any of the following: i. Failure to achieve meaningful improvement from pre-treatment baseline, defined as (1) < 4-point improvement on CHOP-INTEND (2) < 3-point improvement on HFMSE (3) < 2-point improvement on ULM/RULM ii. Clinically meaningful decline exceeding expected natural disease progression assessed over a 12-month time period, defined as: (1) ≥ 4 points decline on CHOP-INTEND (2) ≥ 3 points on HFMSE (3) ≥ 2 points on ULM/RULM (4) Loss of a previously achieved motor milestone (per HINE-2 criteria) iii. New requirement for respiratory support (BiPAP, CPAP, or mechanical ventilation) not present at treatment initiation iv. New requirement for nutritional support (G-tube or NG tube) not present at treatment

	initiation 3. For patients currently receiving the Low Dose Regimen for ≥ 12 months who are clinically stable (i.e., does not meet for coverage for plateau or declining function), coverage requires at least **ONE** of the following features considered high-risk for rapidly progressive disease: a. The patient has bulbar dysfunction as evidenced by dysphagia, weak suck/swallow, aspiration risk, feeding difficulty, or need for NG/G-tube nutritional support b. The patient has respiratory insufficiency as evidenced by need for BiPAP, CPAP, invasive ventilation, cough-assist dependence, recurrent respiratory decompensation, or clinically significant decline in pulmonary status attributable to SMA 4. The following patients do not qualify for coverage of the High Dose Regimen: a. Patients that are clinically stable on Low Dose Regimen for > 12 months **AND** do not have a high-risk feature for rapidly progressive disease 5. Approval Timeframe and Recertification Requirements a. For patients initiating treatment directly on the High-Dose Regimen (e.g., treatment naïve severe Type I disease) should follow the Approval Timeframe and Recertification Requirements described in the Spinraza Coverage Criteria section. b. For patients transitioning from the Low-Dose Regimen to the High-Dose Regimen after prior Spinraza exposure, recertification following the first 12 months of High-Dose therapy requires documentation of at least ONE of the following: i. Improvement on a validated motor function scale relative to status at High-Dose initiation ii. Stabilization of previously declining motor function relative to the period immediately preceding High-Dose initiation iii. Preservation of previously achieved motor milestones iv. Preservation or stabilization of respiratory function (e.g., no progression in ventilatory support requirements) v. Preservation or stabilization of bulbar function (e.g., no progression in nutritional support requirements) vi. Documentation from the treating specialist that the patient's disease trajectory has been meaningfully altered relative to the clinical course observed prior to High-Dose initiation vii. Following establishment of response to the High-Dose Regimen, patients should meet the Continued Recertification Requirements described in the Spinraza Coverage Criteria section.
Evrysdi (risdiplam) **Spinal muscular atrophy** (FDA approval) ICD10: G12.9 *Rx Benefit*	1. Must be prescribed by or in consultation with a provider who specializes in the treatment of Spinal Muscular Atrophy (SMA) and/or neuromuscular disorders AND 2. Must have a diagnosis of Type I, II, or III Spinal Muscular Atrophy a. Confirmed by targeted mutation analysis i. Homozygous deletions of SMN1 gene OR ii. Homozygous mutation in the SMN1 gene (e.g., biallelic mutations of exon 7) OR iii. Compound heterozygous mutation in the SMN1 gene (e.g., deletion of SMN1 exon 7 and mutation of SMN1) AND 3. Must have genetic testing confirming 1, 2, 3, or 4 copies of the SMN2 gene a. If genetic testing confirms 4 copies of the SMN2 gene, Evrysdi will only be approved if the patient is symptomatic AND 4. The patient must not have advanced disease (e.g., complete limb paralysis or permanent ventilator dependence) AND 5. Progress notes containing results of at least one of the following baseline exams must be submitted to establish baseline motor ability: a. Hammersmith Infant Neurological Exam (HINE) OR b. Hammersmith Functional Motor Scale Expanded (HFMSE) OR c. Upper Limb Module (ULM) Test/Revised Upper Limb Module Test (RULM) OR d. Children's Hospital of Philadelphia Infant Test of Neuromuscular Disorders (CHOP- INTEND) OR

e. Motor Function Measure 32 (MFM32) OR
f. Bayley Scales of Infant and Toddler Development- Third Edition gross motor scale (BSID-III) (For Infantile-Onset disease only) AND

6. Evrysdi will not be approved for use in patients that have previously been treated with Zolgensma or Itvisma and will not be approved in combination with Spinraza or any other experimental therapy for spinal muscular atrophy **AND**
7. Approved Daily Dosing
    a. Less than 2 months of age: 0.15 mg/kg of Evrysdi Oral Solution
    b. 2 months to less than 2 years of age: 0.20 mg/kg of Evrysdi Oral Solution
    c. 2 years of age and older weighing less than 20 kg: 0.25 mg/kg of Evrysdi Oral Solution
    d. 2 years of age and older weighing 20 kg or more: 5 mg of Evrysdi Oral Solution or Evrysdi Tablet
8. Quantity Limit
    a. Oral Solution: 80 mL per 30 days
        i. The allowed quantity will be reviewed at each authorization request in accordance with the FDA-approved weight-based dosing regimen. Coverage will be limited to the minimum number of 80 mL (60 mg) bottles necessary to deliver the patient's prescribed daily dose for the approved supply period, accounting for the 64-day in-use expiration of the constituted oral solution.
        ii. To accommodate anticipated pediatric weight gain between reviews, a volume buffer may be applied to the calculated quantity based on the patient's age:
            1. Infants < 2 months: 25%
            2. Infants/Toddlers 2 months to < 2 years: 15%
            3. Children ≥ 2 years and < 20 kg: 10%
            4. Patients ≥ 20 kg: no volume buffer required due to fixed 5 mg/day dose
    b. Tablet: 30 tablets per 30 days
9. Initial and continued approval will be at 12-month intervals. Subsequent approval will require documentation of positive response to therapy from pretreatment baseline status as evidenced by at least one of the following exams:
    a. HINE milestones:
        i. One of the following:
            1. Improvement or maintenance of previous improvement of at least 2 points (or maximal score) increase in ability to kick **OR**
            2. Improvement or maintenance of previous improvement of at least 1-point increase in any other HINE milestone (e.g., head control, rolling, sitting, crawling, etc.)
    b. HFMSE:
        i. One of the following:
            1. Improvement or maintenance of previous improvement of at least a 3- point increase in score from pretreatment baseline **OR**
            2. Patient has achieved and maintained any new motor milestone from pretreatment baseline when they would otherwise be unexpected to doso
    c. ULM/RULM:
        i. One of the following:
            1. Improvement or maintenance of previous improvement of at least a 2- point increase in score from pretreatment baseline **OR**
            2. Patient has achieved and maintained any new motor milestone from pretreatment baseline when they would otherwise be unexpected to doso
    d. CHOP-INTEND
        i. One of the following:
            1. Improvement or maintenance of previous improvement of at least a 4- point increase in score from pretreatment baseline **OR**
            2. Patient has achieved and maintained any new motor milestone from pretreatment baseline when they would otherwise be unexpected to doso
    e. MFM32
        i. One of the following:
            1. Improvement or maintenance of previous improvement of at least a 3-point or greater change from pretreatment baseline **OR**

	2. Patient has achieved and maintained any new motor milestone from pretreatment baseline when they would otherwise be unexpected to doso f. BSID-III i. Infantile-onset disease **AND** ability to sit without support for at least 5 seconds (BSID-III, Item 22)
Isembyld (apitegromab-mstn) **Spinal muscular atrophy** (FDA approval) ICD10: G12.9 *Medical benefit*	**Isembyld (apitegromab-mstn) for Commercial/Exchange/Essential Plan/Child Health Plus:** Based on a review of the available peer-reviewed evidence, Isembyld (apitegromab-mstn) is considered not medically necessary for the treatment of Spinal Muscular Atrophy (SMA). Apitegromab was studied in the multicenter phase 2 (NCT03921528) TOPAZ trial in patients with Type 2 or 3 SMA on nusinersen or no SMA therapy. This trial demonstrated the lack of efficacy in ambulatory patients and older non-ambulatory patients aged 5-21 based on the mean change from baseline in the Revised Hammersmith Scale (RHS) of -0.3 points in the ambulatory cohort (±2 points representing minimal detectable change) and Hammersmith Functional Motor Scale Expanded of 0.6 points in the older non-ambulatory cohort (approximately 3-4 point change represents clinically meaningful change). The Phase 3, 52-week double-blind, placebo-controlled SAPPHIRE trial (NCT05156320) studied apitegromab at 10 mg/kg and 20 mg/kg dosing in non-ambulatory patients age 2-21 with types 2 or 3 SMA on background nusinersen or risdiplam therapy. At 12 months, the primary endpoint least squares mean difference in HFMSE change from baseline was 1.8 (95% CI 0.30 to 3.32, p=0.019) points for participants aged 2-12 years receiving apitegromab versus placebo (least squares mean 0·6 vs -1.2). This does not meet the 3-4 point range that represents a clinically meaningful change. The secondary endpoint of least squares mean difference in HFMSE change from baseline in the 10 mg/kg group was 2.2 (95% CI 0.49 to 3.95); however, subgroup analyses had mixed results depending on nusinersen vs. risdiplam use, age, and region. Spinal Muscular Atrophy is a rare, progressive neuromuscular disorder with both pharmacologic as well as gene therapies available. Therefore, disease rarity, unique mechanism, and unmet needs were not considered sufficient to resolve the uncertainty regarding the clinical meaningfulness of the demonstrated incremental benefit. <u>Reconsiderations of Medical Necessity</u> This determination will be reevaluated when new evidence materially addresses the uncertainty regarding the clinical meaningfulness of apitegromab's treatment-attributable benefit. Evidence that may support reconsideration includes: • Replication or confirmation of clinically meaningful responder benefit in an additional adequately designed study • Demonstration of sustained benefit beyond the currently established 52-week controlled treatment period • Comparative or add-on evidence demonstrating clinically meaningful incremental benefit relative to established therapies **Isembyld (apitegromab-mstn) for Medicare Advantage/Medicaid Managed Care (MMC)/Health and Recovery Plans (HARP):** 1. Must be prescribed by or in consultation with a provider who specializes in the treatment of Spinal Muscular Atrophy (SMA) and/or neuromuscular disorders 2. Must be ≥ 2 years of age 3. Must have a diagnosis of Type II, or III Spinal Muscular Atrophy a. Confirmed by targeted mutation analysis i. Homozygous deletions of SMN1 gene OR ii. Homozygous mutation in the SMN1 gene (e.g., biallelic mutations of exon 7) OR iii. Compound heterozygous mutation in the SMN1 gene (e.g., deletion of SMN1 exon 7 and mutation of SMN1) 4. Must have genetic testing confirming 2, 3, or 4 copies of the SMN2 gene, consistent with Type II or III SMA 5. The patient must not have advanced disease (e.g., complete limb paralysis or permanent ventilator dependence)

6. Progress notes containing results of at least one of the following baseline exams must be submitted to establish baseline motor ability:
    a. Hammersmith Infant Neurological Exam (HINE) OR
    b. Hammersmith Functional Motor Scale Expanded (HFMSE) OR
    c. Upper Limb Module (ULM) Test/Revised Upper Limb Module Test (RULM) OR
    d. Children's Hospital of Philadelphia Infant Test of Neuromuscular Disorders (CHOP-INTEND) OR
    e. Motor Function Measure 32 (MFM32)
7. Must be non-ambulatory (Non-ambulatory patients must be able to sit independently (sits up straight with head erect for at least 10 seconds; does not use arms or hands to balance body or support position) per World Health Organization (WHO) motor milestones definition)
8. Must be on one background therapy for SMA (i.e., either nusinersen or risdiplam)
    a. If on Spinraza (nusinersen), patient must be currently receiving Spinraza for an adequate trial period (≥ 12 months)
        i. If patient was escalated to high dose Spinraza (nusinersen), patient must be currently receiving high dose Spinraza for an adequate trial period (≥ 12 months)
    b. If on Evrysdi (risdiplam), patient must be currently receiving Evrysdi for an adequate trial period (≥ 12 months)
9. Isembyld must be administered in accordance with the current FDA-approved prescribing information at a dose of 10 mg/kg.
10. Isembyld will not be authorized for any non-FDA approved indication
11. Isembyld will not be approved for use in patients that have previously been treated with Zolgensma or Itvisma
12. Approval Timeframe and Recertification Requirements
    a. Approval Timeframe: 12-months
    b. Recertification Requirements
        i. Initial (12-months from treatment initiation), there must be documentation of ONE of the following:
            1. Clinically meaningful response from pre-treatment baseline on at least one validated, age-appropriate SMA motor function scale:
                a. CHOP-INTEND: ≥ 4-point improvement from baseline
                b. HINE-2: Improvement in ≥ 1 motor milestone category without worsening in any category
                c. HFMSE or MFM32: ≥ 3-point improvement from baseline
                d. ULM/RULM: ≥ 2-point improvement from baseline
            2. The patient has achieved or maintained a motor milestone not expected based on natural history (e.g., independent sitting, standing, ambulation, head control) OR
            3. For patients with advanced disease at baseline (HFMSE ≤ 10 or CHOP-INTEND ≤ 20), there must be documentation of stabilization of motor function AND at least ONE of the following: respiratory stabilization (no new requirement for permanent ventilation), bulbar stabilization (no new requirement for enteral feeding), or preservation of a functionally meaningful motor ability as attested by the treating specialist.
        ii. Continued (every 12-months after initial response has been established), there must be documentation of ongoing clinically meaningful therapeutic benefit, defined as meeting at least ONE of the following:
            1. No decline exceeding the minimal clinically important difference (MCID) threshold for clinically meaningful deterioration on the primary motor scale used for monitoring (HFMSE or MFM32: > 3-point decline; CHOP-INTEND: > 4-point decline; RULM: > 2-point decline), OR no loss of a previously achieved motor milestone.
            2. Further improvement on a validated motor scale from the most recent assessment.
            3. Documentation that the patient's disease course is meaningfully altered

		relative to the expected natural history for their SMA type, SMN2 copy number, and disease duration. This may include but is not limited to: a. Preservation of respiratory function (stable ventilatory support requirements; no progression to permanent invasive ventilation) b. Preservation of bulbar function (stable nutritional support requirements) c. Maintenance of functional independence in activities of daily living d. Slowed rate of motor decline relative to published natural history data

Considerations

- CDPHP reserves the right to make decisions based on clinical judgment on a case-by-case basis.
- In clinical studies, prior use (at any time in the participants lives) and/or anticipated need for quinolones (chloroquine and hydroxychloroquine), thioridazine, vigabatrin, retigabine, or any other drug known to cause retinal toxicity, was part of the exclusion criteria.

Policy guidelines:

1. Utilization Management are contract dependent. Refer to specific contract/benefit language for exclusions.
    a. Coverage criteria may be dependent on the contract renewal date.
    b. Coverage of drugs listed in this policy are contract dependent.
    c. Not all contracts/benefits allow coverage of healthcare professional administered drugs as part of their pharmacy benefit
    d. Not all contracts/benefits cover all medical infusible drugs
2. This policy is applicable to drugs that are included on a specific drug formulary (Pharmacy benefit only). If a drug referenced in this policy is non-formulary, please reference the Non-Formulary Medication Exception Review Policy for review guidelines.
3. Clinical documentation must be submitted for each request (initial and recertification) unless otherwise specified (e.g., provider attestation required). Supporting documentation includes, but is not limited to, progress notes documenting previous treatments and treatment history, diagnostic testing, laboratory test results, genetic testing or biomarker results, imaging, and other objective or subjective measures of clinical benefit. For recertification, continued approval requires documentation demonstrating that the requested product is providing ongoing benefit to the patient, evidenced by improvement or stability in the disease state or condition, and that continued use remains medically necessary. Ongoing use of the requested product must continue to align with the current policy's preferred formulary. Recertification reviews may result in a requirement to trial more cost-effective treatment alternatives as they become available (e.g., generics, biosimilars, or other guideline-supported treatment options). Requested dosing must remain consistent with FDA-approved or off-label/guideline-supported dosing recommendations.
4. This policy does not apply to Medicare Part D and D-SNP pharmacy benefits. The drugs in this policy may apply to all other lines of business including Medicare Advantage.
5. For members with Medicare Advantage, medications with a National Coverage Determination (NCD) and/or Local Coverage Determination (LCD) will be covered pursuant to the criteria outlined by the NCD and/or LCD. NCDs/LCDs for applicable medications can be found on the CMS website at https://www.cms.gov/medicare-coverage-database/search.aspx. Indications that have not been addressed by the applicable medication's LCD/NCD will be covered in accordance with criteria determined by the Health Plan (which may include review per the Health Plan's Off-Label Use of FDA Approved Drugs policy). Step therapy requirements may be imposed in addition to LCD/NCD requirements.
6. All utilization management requirements outlined in this policy are compliant with applicable New York State insurance laws and regulations. Policies will be reviewed and updated as necessary to ensure ongoing compliance with all state and federally mandated coverage requirements.
7. All requests will be reviewed to ensure they are being used for an appropriate indication and may be subject to an off-label review in accordance with our Off-Label Use of FDA Approved Drugs Policy.

8. Manufacturers may either discontinue participation in, or may not participate in, the Medicaid Drug Rebate Program (MDRP). Under New York State Medicaid requirements, physician-administered drugs must be produced by manufacturers that participate in the MDRP. Products made by manufacturers that do not participate in the MDRP will not be covered under Medicaid Managed Care/HARP lines of business. Drug coverage will not be available for any product from a non-participating manufacturer. For a complete list of New/Reinstated & Terminated Labelers please visit: https://www.medicaid.gov/medicaid/prescriptiondrugs/medicaid-drug-rebate-program/newreinstated-terminated-labeler-information/index.html
9. This policy is based on available evidence as of the last review date. Coverage determinations are subject to applicable plan documents, state and federal regulations, and individual patient circumstances. This policy does not constitute medical advice.
10. For commercial contracts, medical necessity determinations align with the Certificate of Coverage issued by the Health Plan, which states that covered services must be clinically appropriate and not primarily for the convenience of the member, the member's family, or the provider.
11. This policy is subject to ongoing revision. Newly marketed drugs and existing drugs with new indications may require prior authorization until formal coverage criteria are established. Inclusion of a drug in this policy does not guarantee its current availability on the market, as some agents may be discontinued, withdrawn, or otherwise unavailable. As product status changes, drugs may be removed from the policy.

GOVERNMENT PROGRAMS

CHILD HEALTH PLUS: Subject to all terms and conditions noted in above application.

MEDICARE ADVANTAGE: Subject to all terms and conditions noted in above application.

SELECT PLAN/HARP: Subject to all terms and conditions noted in above application for Spinraza. Effective April 1, 2023, the pharmacy benefit for Medicaid is administered by NYRx, the Medicaid Pharmacy Program.

CDPHP Pharmacy Services 10/8/2026

New: 06/17

Revised	Reviewed
09/18, 6/20, 6/25, 5/26, 6/26, 10/26	6/21, 6/22, 6/23, 9/23, 9/24

Revision Date	Changes Made
6/25	Criteria regarding SMN2 copies adjusted to include 4 copies for symptomatic patients with SMA type 3
5/26	Updated Spinraza for Commercial vs. Medicaid criteria, Updated Evrysdi formatting, updated approval lengths to 12 months, added Spinraza HD, updated Evrysdi how supplied
6/26	Updated dosing and quantity for Evrysdi Updated Spinraza high dose criteria and made it its own section in the policy Updated clinical response criteria and recertification Added policy guidelines to considerations
10/26	Added Isembyld

Policy/Procedure Name: Pharmaceutical Treatment of Transthyretin-Mediated (ATTR) Amyloidosis **Control Number: 1350/20.000341**

Disclaimer Notice

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgment when deciding the most appropriate care for enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

Background

Transthyretin-mediated (ATTR) amyloidosis is a rare, progressive, and fatal multisystem illness caused by deposits of misfolded proteins produced by the liver called transthyretin (TTR). These proteins accumulate in the peripheral nerves, heart, kidney, and gastrointestinal tract resulting in polyneuropathy and cardiomyopathy. The amyloid deposits cause significant neurologic problems, functional limitations, and disability. The type of precursor protein, tissue distribution, and amount of amyloid deposition largely determines the clinical manifestations experienced. Musculoskeletal involvement can result in bilateral carpal tunnel syndrome, spinal stenosis, bicep tendon rupture, or arthropathies due to amyloid deposition in joints and surrounding structures. Gastrointestinal symptoms vary widely and include nausea, constipation, diarrhea, and weight loss. Specific neurologic symptoms include but are not limited to peripheral neuropathy, orthostatic hypotension, and gait and balance disorders (with subsequent evidence of amyloidosis). Cardiac manifestations may include but are not limited to heart failure with a preserved ejection fraction (HFpEF), heart failure with a reduced ejection fraction (HFrEF), conduction abnormalities (bundle branch or atrioventricular blocks, sinoatrial disease, atrial fibrillation), low-flow, low-gradient aortic stenosis (AS), as well as discordance between voltage on EKG and left ventricular hypertrophy (LVH) on ECHO or MRI. It is estimated that 13 to 17 percent of older patients with HFpEF (EF > 50%) may be on the basis of amyloid. Average survival after onset of neuropathy is two to 15 years; two to five years among patients presenting with cardiomyopathy.

Onpattro™ (patisiran) is a double-stranded small interfering ribonucleic acid (siRNA) that causes degradation of mutant and wild-type transthyretin (TTR) messenger RNA through RNA interference, which results in a reduction of serum TTR protein and TTR protein deposits in tissues. Onpattro is indicated for the treatment of polyneuropathy of hereditary transthyretin-mediated (hATTR) amyloidosis in adults. It carries a warning for infusion-related reactions and reduced vitamin A levels. Onpattro was studied in a randomized, double-blind, placebo-controlled phase III trial. This APOLLO NT trial established that Onpattro every three weeks was superior to placebo at 18 months in improving neuropathy, as demonstrated by a decrease from baseline in mNIS+7 and improvement in quality of life as demonstrated by a decrease in Norfolk QOL-DN score.

Amvuttra™ (vutrisiran) is a double-stranded siRNA-GalNAc conjugate that causes degradation of mutant and wild-type TTR mRNA through RNA interference which results in a reduction of serum TTR protein and TTR protein deposits in tissues. Amvuttra is indicated for the treatment of polyneuropathy associated with hereditary transthyretin-mediated amyloidosis in adults. Efficacy was evaluated in a randomized, open-label, phase III clinical trial (HELIOS-A) in which 164 adult participants were randomized 3:1 to receive either Amvuttra 25mg subcutaneous injection every three months or Onpattro 0.3 mg/kg intravenous infusion every three weeks. The placebo arm of the APPOLLO study was used as an external comparator since the participants were composed of a comparable adult population to the HELIOS-A study. The primary endpoint of the study was the change from baseline to month nine in the modified neuropathy impairment score +7 (mNIS+7). The clinical meaningfulness of the effects on the mNIS+7 score was assessed by the change from baseline to month nine in the Norfolk Quality of Life-Diabetic Neuropathy (QoL-DN) total score. Additional endpoints were gait speed as measured by the 10-minute walk test (10MWT) and modified body mass index (mBMI). Treatment with Amvuttra resulted in statistically significant improvements in the mNIS+7, Norfolk QoL-DN total score, and the 10MWT at month nine compared to placebo in the external study.

The FDA has set a PDUFA date of March 23, 2025, for the supplemental New Drug Application to expand Amvuttra's label to ATTR-CM. Efficacy was evaluated in a double-blind, randomized trial (HELIOS-B), where 655 assigned patients with ATTR-CM in a 1:1 ratio to receive vutrisiran (25 mg) or placebo every 12 weeks for up to 36 months. Vutrisiran treatment led to a lower risk of death from any cause and recurrent cardiovascular events than placebo (HR overall population, 0.72; 95% CI, 0.56 to 0.93; P=0.01; HR in the monotherapy population, 0.67; 95% CI, 0.49 to 0.93; P=0.02) and a lower risk of death from any cause through 42 months (HR in the overall population, 0.65; 95% CI, 0.46 to 0.90; P=0.01). In the overall population, treatment with vutrisiran resulted in less of a decline in the distance covered on the 6-minute walk test than placebo (least-squares mean difference, 26.5 m; 95% CI, 13.4 to 39.6; P<0.001) and less of a decline in the KCCQ-OS score (least-squares mean difference, 5.8 points; 95% CI, 2.4 to 9.2; P < 0.001).

Wainua™ (eplontersen) is an antisense oligonucleotide GaINAc conjugate that causes degradation of mutant and wild-type TTR mRNA, reducing protein deposits in tissues. Wainua is indicated for the treatment of polyneuropathy of hereditary transthyretin-mediated (hATTR) amyloidosis in adults. In the NEURO-TTRanform trial, a reduction in mNIS+7 score and Norfolk QoL-DN score were seen at week 66.

Vyndaqel and Vyndamax are both oral formulations of tafamidis. These formulations are both FDA-approved for the treatment of cardiovascular TTR amyloid. The ATTR-ACT trial demonstrated that tafamidis (pooled treatment with both formulations) compared to placebo had a lower rate of all-cause mortality and cardiovascular-related hospitalizations (combined). Secondary analysis identified that tafamidis had a lower rate of all-cause mortality compared to placebo (29.5% vs 42.9%; HR 0.7, 95% CI 0.51-0.96) as well as lower rate of cardiovascular-related hospitalization (RRR 0.68 - 0.48/year vs. 0.7/year; 95% CI 0.56-0.81).[6] Survival curves diverged only after 18 months of treatment.[6] Additional secondary endpoints included the six-minute walk test (6MWT), which assesses functional capacity. Tafamidis reduced the decline of the 6MWT by 75 meters at month 30.[6]

Attruby™ (acoramidis) is a selective stabilizer of transthyretin (TTR) that binds to TTR at thyroxine binding sites and slows dissociation of the TTR tetramer into its constituent monomers, which is the rate-limiting step in amyloidogenesis. In the ATTRibute-CM trial, all-cause mortality was reported as 19.3% in the acoramidis group compared to 25.7% in the placebo group, with a hazard ratio (HR) of 0.77 (95% CI 0.54-1.10; p = 0.15). There was a significant adjusted mean factor change in NT-proBNP from baseline of 0.529 (95% CI 0.46-0.60; p < 0.05), indicating better cardiac function preservation. Participants receiving acoramidis demonstrated an improvement in the 6-minute walk distance by 39.6 meters (95% CI 21.1-58.2; p < 0.001) from baseline, along with a reduction in cardiovascular-related hospitalizations to 26.7% compared to 42.6% in the placebo group (p < 0.0001). Additionally, the least means square change in the Kansas City Cardiomyopathy Questionnaire Overall Summary (KCCQ-OS) score was a significant 9.94 points (95% CI 5.97-13.91; p < 0.001), highlighting improvements in quality of life and functional status.

Summary	
Effective date of policy:	2/12/2026
Indications	See specific agents listed below
ICD10 diagnosis codes	See specific agents listed below
Availability	Onpattro™(patisiran): available as a 10 mg/5 mL single-dose vial Amvuttra (vutrisiran): available as a 25 mg/0.5mL single-dose prefilled syringe Wainua (eplontersen): available as 45 mg/0.8 mL single-dose autoinjector Vyndaqel™ (tafamidis meglumine): available as a 20 mg capsule Vyndamax (tafamidis): available as a 61 mg capsule Attruby (acoramidis): available as 356 mg tablets
Duration	Per product

Required Criteria for Approval

__All__ of the following conditions for the requested indication must be met in order to approve either ATTR or hATTR therapy separated below:

Indication	Inclusion	Recommended Dosing

Onpattro (patisiran)
 	
Indication
Polyneuropathy of hereditary transthyretin-mediated amyloidosis (hATTR)
(FDA approval)
 	
ICD10: E85.1
 	
HCPCS: J0222
	• The enrollee is ≥ 18 years of age
	• Prescribed by specialist experienced in the diagnosis of hATTR amyloidosis such as hematologist-oncologist, neurologist, gastroenterologist, geneticist, or nephrologist
	• The enrollee has a diagnosis of polyneuropathy of hereditary transthyretin-mediated amyloidosis confirmed by:
	  o Documentation of a pathologic mutation in the transthyretin (TTR) gene (via genetic testing/DNA sequencing) **and**
	  o Documented amyloid deposits determined by biopsy
	  ▪ Biopsy not necessary if enrollee has positive ^{99m}Tc-PYP along with positive genetics and known neuropathy
	• A baseline for one of the following diagnostic tests has been established (see below):
	  o Polyneuropathy disability (PND) score of IIIb or lower; OR
	  o Documentation of baseline functional ambulation performance (FAP) stage of 1 or 2
	• Must also have symptoms consistent with polyneuropathy attributed to hATTR and other causes of neuropathy have been excluded:
	  o Peripheral sensorimotor polyneuropathy symptoms, such as: tingling or increased pain in the hands/feet/arms, loss of feeling in the hands/feet, numbness or tingling in the wrists, carpal tunnel syndrome, loss of ability to sense temperature or pain, difficulty with
		Adults ≥ 18 years of age:
		• Less than 100 kg: 0.3 mg/kg once every three weeks
		• ≥ 100 kg: 30 mg once every three weeks
		• **Maximum Dosing: 30 mg IV every three weeks**

	fine motor skills, weakness/numbness/pain in the legs, difficulty walking, seizures, headaches, inability to perform activities of daily living (ADLs) o Autonomic neuropathy symptoms such as: orthostasis, abnormal sweating, sexual dysfunction, recurrent urinary tract infection, dysautonomic symptoms of constipation, diarrhea, nausea, vomiting, anorexia, and early satiety • Must be administered by a healthcare professional • Onpattro must be used as monotherapy and will NOT be covered in combination with Tegsedi (inotersen) or any other polyneuropathy of hereditary transthyretin mediated amyloidosis (hATTR) disease specific therapy. o Please note: Prior approval for any other polyneuropathy of hereditary transthyretin mediated amyloidosis (hATTR) specific treatment will be terminated upon approval of Onpattro • Current body weight and requested dose regimen must be submitted for initial review and each recertification request. • Onpattro will not be approved for ATTR cardiomyopathy • Initial approval for Onpattro will be for one year • Continued approval beyond on year and recertification every two years will require: o Documentation of improvement OR stability of disease and symptoms with Onpattro (via lab reports, progress notes, neurologic exam, PND or FAP score)	
Amvuttra (vutrisiran) **Indication Polyneuropathy of hereditary transthyretin-mediated amyloidosis (hATTR)** (FDA approval) ICD10: E85.1 HCPCS: J0225	• The prior authorization is obtained by a neurologist o Prior authorization may be obtained by cardiologist if member has both hATTR cardiomyopathy and neuropathy • The enrollee is ≥ 18 years of age • The enrollee has a diagnosis of polyneuropathy of hereditary transthyretin-mediated amyloidosis confirmed by: o Genetic testing documenting a pathogenic variant in *TTR (e.g., V30M)* **and** o Documented amyloid deposits determined by biopsy ▪ Biopsy not necessary if enrollee has positive ^{99m}Tc-PYP along with positive genetics and known neuropathy • A baseline Polyneuropathy disability (PND) score of IIIb or lower AND • Must also have symptoms consistent with polyneuropathy attributed to hATTR: o Peripheral sensorimotor polyneuropathy symptoms, such as: tingling or increased pain in the hands/feet/arms, loss of feeling in the hands/feet, numbness or tingling in the wrists, carpal tunnel syndrome, loss of ability to sense temperature or pain, difficulty with fine motor skills, weakness/numbness/pain in the legs, difficulty walking, seizures, headaches, inability to perform activities of daily living (ADLs) o Autonomic neuropathy symptoms such as: orthostasis, abnormal sweating, sexual dysfunction, recurrent urinary tract infection, dysautonomic symptoms of constipation, diarrhea, nausea, vomiting, anorexia, and early satiety AND • Comprehensive neurological examination has ruled out other causes of sensorimotor/autonomic neuropathy besides hereditary transthyretin-mediated amyloidosis (hATTR) o E.g., chronic inflammatory demyelinating polyneuropathy; diabetic neuropathy in the setting of uncontrolled diabetes • Must be administered by a healthcare professional	• Adults ≥ 18 years of age: 25 mg subcutaneously once every three months

	• Amvuttra must be used as monotherapy and will NOT be covered in combination with Tegsedi (inotersen), Onpattro (patisiran), Wainua (eplontersen) or any other polyneuropathy of hereditary transthyretin mediated amyloidosis (hATTR) disease specific therapy. Please note: Prior approval for any other polyneuropathy of hereditary transthyretin mediated amyloidosis (hATTR) specific treatment will be terminated upon approval of Amvuttra
	  o Amvuttra will not be approved for use in combination with tafamidis (Vyndamax/Vyndaqel) or acoramidis (Attruby)
	• Initial approval for Amvuttra will be for one year.
	• Approval will be for 1 year at a time
	  o Continued approval beyond on year and recertification every two years will require:
	  ▪ Documentation of improvement OR stability of disease and symptoms with Amvuttra (via lab reports, progress notes, neurologic exam, PND)
	• Quantity Limit: 1 syringe per 84 days	

Amvuttra (vutrisiran)
 	
Indication: Treatment of cardiomyopathy of wild type or hereditary transthyretin-mediated amyloidosis (ATTR-CM) (pending FDA approval)
 	
HCPCS: J0225
	• Prior authorization is obtained by or in consultation with a cardiologist
	• The enrollee is ≥ 18 years of age
	• Documented diagnosis of ATTR amyloidosis with cardiomyopathy, classified as either hATTR amyloidosis with cardiomyopathy to wtATTR amyloidosis with cardiomyopathy.
	  o The diagnosis must be confirmed by one the following:
	  ▪ 99mTechnetium-labeled pyrophosphate cardiac imaging (nuclear scintigraphy) positive for transthyretin (TTR) amyloid OR
	  ▪ Amyloid deposits identified on cardiac biopsy AND presence of a variant TTR genotype and/or TTR precursor protein identification by molecular genetic testing (i.e., immunohistochemistry, scintigraphy, or mass spectrometry) or next-generation sequencing (NGS)
	• Enrollee has documented echocardiogram (ECHO) including wall thickness and function and ideally strain imaging
	  o Strain imaging typically shows apical sparing/apical preservation
	• Classification of NYHA class I or class II/III heart failure with ≥ 1 hospitalizations for heart failure or clinical evidence of HF without prior hospitalization for HF (such as shortness of breath, peripheral edema, ascites, elevated jugular pressure, etc. requiring treatment with a diuretic for improvement)
	• The patient must have had a trial of tafamidis (Vyndamax/Vyndaqel) or acoramidis (Attruby) for at least 6 months, unless contraindicated or not clinically appropriate.
	  o The trial must provide evidence that treatment with tafamidis (Vyndamax/Vyndaqel) or acoramidis (Attruby) is no longer sufficient to control disease progression as demonstrated by at least one of the following (i, ii, iii, OR iv):
	  ▪ i. Sustained elevation of cardiac biomarkers (e.g., NT-proNBP or Troponin)
		• Adults ≥ 18 years of age: 25mg subcutaneously once every three months

	▪ ii. Worsening of cardiac function (e.g., decline in left ventricular ejection fraction or increased left ventricular wall thickness on imaging) ▪ iii. Clinical deterioration indicated by a decrease in 6-Minute Walk Test performance ▪ iv. Increasing amyloid burden on bone scintigraphy or cardiac MRI • To effectively monitor treatment process and clinical improvement, documentation of the following clinical parameters is required prior to initiating therapy: o Cardiac Biomarkers (NT-proBNP or troponin) o TTR Protein Level (i.e., serum TTR) o 6-Minute Walk Test • Amvuttra must be used as monotherapy o Amvuttra will not be covered for use in combination with tafamidis (Vyndamax) or acoramidis (Attruby) for the treatment of ATTR-CM ▪ The concurrent use of transthyretin (TTR) stabilizers (e.g., tafamidis [Vyndamax] or acoramidis [Attruby]) and TTR silencers (e.g., vutrisiran [Amvuttra])) is considered not medically necessary due to the absence of clinical evidence demonstrating additional therapeutic benefit (e.g., additional reduction in mortality or hospitalization) and safety • Initial approval for Amvuttra will be for one year • Recertification requirements o First recertification (after initial approval) will require documentation of the following: ▪ A reduction in cardiac stress or damage, or improving function as evidenced by a decrease in NT-proBNP or troponin from baseline ▪ A reduction in TTR production as evidenced by a decrease in serum TTR from baseline ▪ Improvement or stabilization of the 6-Minute Walk test compared to baseline values o Subsequent recertifications (after first recertification) will require documentation of the following: ▪ Continued reduction or stabilization of NT-proBNP or troponin (no increase in biomarker) ▪ Continued suppression of TTR production (no increase in serum TTR) ▪ Continued improvement or stabilization of the 6-Minute Walk test compared to baseline values • Quantity Limit: 1 syringe per 84 days	
Wainua (eplontersen) **Indication** **Polyneuropathy of hereditary transthyretin-mediated amyloidosis (hATTR)** (FDA approval)	• The prior authorization is obtained by a neurologist. o Prior authorization may be obtained by cardiologist if member has both hATTR cardiomyopathy and neuropathy • The enrollee is ≥ 18 years of age. • The enrollee has a diagnosis of polyneuropathy of hereditary transthyretin-mediated amyloidosis confirmed by: o Genetic testing documenting a pathogenic variant in *TTR (e.g., V30M)* **and**	• Adults ≥ 18 years of age: 45 mg by subcutaneous injection once monthly

ICD10: E85.1	○ Documented amyloid deposits determined by biopsy ▪ Biopsy not necessary if enrollee has positive ^{99m}Tc-PYP along with positive genetics and known neuropathy • A baseline Polyneuropathy disability (PND) score of IIIb or lower • Must also have symptoms consistent with polyneuropathy attributed to hATTR: ○ Peripheral sensorimotor polyneuropathy symptoms, such as: tingling or increased pain in the hands/feet/arms, loss of feeling in the hands/feet, numbness or tingling in the wrists, carpal tunnel syndrome, loss of ability to sense temperature or pain, difficulty with fine motor skills, weakness/numbness/pain in the legs, difficulty walking, seizures, headaches, inability to perform activities of daily living (ADLs) ○ Autonomic neuropathy symptoms such as: orthostasis, abnormal sweating, sexual dysfunction, recurrent urinary tract infection, dysautonomic symptoms of constipation, diarrhea, nausea, vomiting, anorexia, and early satiety AND • Comprehensive neurological examination has ruled out other causes of sensorimotor/autonomic neuropathy besides hereditary transthyretin-mediated amyloidosis (hATTR) ○ E.g., chronic inflammatory demyelinating polyneuropathy; diabetic neuropathy in the setting of uncontrolled diabetes • Wainua must be used as monotherapy and will NOT be covered in combination with Amvuttra (vutrisiran), Tegsedi (inotersen), Onpattro (patisiran) or any other polyneuropathy of hereditary transthyretin mediated amyloidosis (hATTR) disease specific therapy. Please note: Prior approval for any other polyneuropathy of hereditary transthyretin mediated amyloidosis (hATTR) specific treatment will be terminated upon approval of Wainua, AND • Initial approval for Wainua will be for one year. • Continued approval beyond on year and recertification every two years will require: ○ Documentation of improvement OR stability of disease and symptoms with Wainua (via lab reports, progress notes, neurologic exam, PND) • Quantity Limit: 1 pen per 30 days	
Vyndamax (tafamidis) **Indication: Treatment of cardiomyopathy of wild type or hereditary transthyretin-mediated amyloidosis (ATTR-CM) in adults to reduce cardiovascular mortality and cardiovascular-related hospitalization** (FDA Approval) ICD10: E85.4	• The medication must be prescribed by or in consultation with a physician who specializes in the treatment of amyloidosis, such as a cardiologist • The enrollee is ≥ 18 years of age • AL amyloid ruled out via free light chain assay SPEP/UPEP with immunoelectrophoresis • Diagnosis of ATTR-CM confirmed through a positive ^{99m}Tc-PYP **or** Amyloid deposits identified on cardiac biopsy AND presence of a variant TTR genotype and/or TTR precursor protein identification by molecular genetic testing (i.e., immunohistochemistry, scintigraphy, or mass spectrometry) or next-generation sequencing (NGS) • Enrollee has documented echocardiogram (ECHO) including wall thickness and function and ideally strain imaging ○ Strain imaging typically shows apical sparing/apical preservation • Classification of NYHA class I or class II/III heart failure with ≥ 1 hospitalizations for heart failure OR in the absence of prior hospitalization must have clinical evidence of heart failure with signs/symptoms (such as shortness of breath, peripheral edema, ascites, elevated jugular pressure, etc.) requiring treatment with a diuretic for improvement	Vyndamax: 61 mg orally once daily

	• To effectively monitor treatment process and clinical improvement, documentation of the following clinical parameters is required prior to initiating therapy:
	  o Cardiac Biomarkers (NT-proBNP or troponin)
	  o TTR Protein Level (i.e., serum TTR)
	  o 6-Minute Walk Test
	• Vyndamax must be used as monotherapy
	  o Vyndamax will NOT be covered for use in combination with acoramidis (Attruby) or vutrisiran (Amvuttra) for the treatment of ATTR-CM i. The concurrent use of transthyretin (TTR) stabilizers (e.g., tafamidis [Vyndamax] or acoramidis [Attruby]) and TTR silencers (e.g., vutrisiran [Amvuttra])) is considered not medically necessary due to the absence of clinical evidence demonstrating additional therapeutic benefit (e.g., additional reduction in mortality or hospitalization) and safety.
	• Initial approval: 1 year
	• Recertification: 1 year
	  o First recertification (after initial approval) will require documentation of the following:
	  ▪ A reduction in cardiac stress or damage, or improving function as evidenced by a decrease in NT-proBNP or troponin from baseline
	  ▪ Improvement or stabilization of the 6-Minute Walk test compared to baseline values
	  o Subsequent recertifications (after first recertification) will require documentation of the following:
	  ▪ Continued reduction or stabilization of NT-proBNP or troponin (no increase in biomarker)
	  ▪ Continued improvement or stabilization of the 6-Minute Walk test compared to baseline values
	• Quantity limit: 30 capsules per 30 days	

Attruby (acoramidis) **Indication: Treatment of the cardiomyopathy of wild-type or variant transthyretin-mediated amyloidosis (ATTR-CM) in adults to reduce cardiovascular death and cardiovascular-related hospitalization.** (FDA Approval) ICD10: E85.4	• The medication must be prescribed by or in consultation with a physician who specializes in the treatment of amyloidosis, such as a cardiologist • The enrollee is ≥ 18 years of age • Diagnosis of ATTR-CM confirmed through a positive ^{99m}Tc-PYP **or** Amyloid deposits identified on cardiac biopsy AND presence of a variant TTR genotype and/or TTR precursor protein identification by molecular genetic testing (i.e., immunohistochemistry, scintigraphy, or mass spectrometry) or next-generation sequencing (NGS) • Enrollee has documented echocardiogram (ECHO) including wall thickness and function and ideally strain imaging o Strain imaging typically shows apical sparing/apical preservation • Classification of NYHA class I or class II/III heart failure with ≥ 1 hospitalizations for heart failure **OR** in the absence of prior hospitalization must have clinical evidence of heart failure with signs/symptoms (such as shortness of breath, peripheral edema, ascites, elevated jugular pressure, etc.) requiring treatment with a diuretic for improvement • To effectively monitor treatment process and clinical improvement, documentation of the following clinical parameters is required prior to initiating therapy:	• Adults ≥ 18 years of age: Recommended dose of Attruby is **712 mg** given as two-356 mg tablets orally twice daily, with or without food.

- Cardiac Biomarkers (NT-proBNP or troponin)
- TTR Protein Level (i.e., serum TTR)
- 6-Minute Walk Test

- Attruby must be used as monotherapy
  - Attruby will not be covered for use in combination with tafamidis (Vyndamax) or vutrisiran (Amvuttra) for the treatment of ATTR-CM
    - The concurrent use of transthyretin (TTR) stabilizers (e.g., tafamidis [Vyndamax] or acoramidis [Attruby]) and TTR silencers (e.g., vutrisiran [Amvuttra])) is considered not medically necessary due to the absence of clinical evidence demonstrating additional therapeutic benefit (e.g., additional reduction in mortality or hospitalization) and safety.
- Initial approval: 1 year
- Recertification: 1 year
  - First recertification (after initial approval) will require documentation of the following:
    - A reduction in cardiac stress or damage, or improving function as evidenced by a decrease in NT-proBNP or troponin from baseline
    - Improvement or stabilization of the 6-Minute Walk test compared to baseline values
  - Subsequent recertifications (after first recertification) will require documentation of the following:
    - Continued reduction or stabilization of NT-proBNP or troponin (no increase in biomarker)
    - Continued improvement or stabilization of the 6-Minute Walk test compared to baseline values
- Quantity limit: 120 tablets/30 days

Exclusion Criteria

Concomitant treatment with more than one of the above agents will not be covered.

Therapy for patisiran (Onpattro), vutrisiran (Amvuttra), eplontersen (Wainua), tafamidis (Vyndamax), and acoramidis (Attruby) will not be authorized if **any** of the following criteria are met:

- Previous liver transplantation or liver transplantation while receiving therapy for hATTR
- New York Heart Association class of IV heart failure as determined by cardiology consult
- Presence of primary (light chain) amyloidosis, secondary (AA) amyloidosis or any other nonATTR amyloidosis
- Use in combination with each other

Considerations

- Patient must have medical drug benefit coverage administered by CDPHP for patisiran or vutrisiran and pharmacy drug benefit coverage through CDPHP for inotersen, eplontersen, Vyndaqel, Vyndamax or acoramidis.
- Prior authorization is obtained through the CDPHP pharmacy department.

GOVERNMENT PROGRAMS

CHILD HEALTH PLUS: Subject to all terms and conditions noted in above application.

MEDICARE ADVANTAGE: Onpattro (patisiran) and Amvuttra (vutrisiran): Subject to the terms and conditions noted in above policy for those medications listed as a medical benefit when administered and provided by physician office, coverage will be provided as a medical benefit. All other medications for Medicare Advantage with Part D members listed are subject to coverage under the current Part D benefit and Medicare Advantage Part D formulary.

Wainua (eplontersen): Not applicable.
Vyndaqel and Vyndamax: Not applicable.
Attruby: Not applicable

SELECT/HARP PLAN: Effective April 1, 2023, the pharmacy benefit for Medicaid is administered by NYRx, the Medicaid Pharmacy Program.

CDPHP Pharmacy Services 2/12/2026

New: 4/2019

Date	Notes
04/19	New Policy
04/21, 04/22	Reviewed with no changes
06/19, 04/20	Revised
12/22	Revised – added background information for Amvuttra, added inclusion criteria for Amvuttra, added trial of Onpattro for both Tegsedi and Amvuttra, removed subjective polyneuropathy scales for Onpattro and Tegsedi.
12/23	Added criteria for Onpattro that non-FDA approved uses would not be covered considering 10/8/23 FDA decision not to approve for ATTR-CM
4/24	Addition of Wainua with coverage criteria following FDA approval
9/24	Removal of Tegsedi following discontinuation of product
2/25	Addition of Amvuttra criteria for ATTR-CM Addition of Attruby criteria following FDA approval for ATTR-CM
2/26	Updated criteria – clarified clinical evidence of HF, documentation baseline clinical parameters, PND score for polyneuropathy agents

Policy/Procedure Name: Pharmacy Care Management (RxC/M) **Control Number: 1350/20.000358**

Disclaimer Notice

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgment when deciding the most appropriate care for enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

Summary

Effective Date of Policy: 6/11/2025

Description and Criteria of Pharmacy Care Management Model

Pharmacists within the managed care setting are perfectly positioned to provide a unique model of care for members that are on select high-impact Specialty agents. This collaborative effort places the Pharmacy Care Management Pharmacists (Rx C/M RPh) centrally, where they can effectively coordinate communication and care among the member, provider, and pharmacy to provide efficient, value-based care around these high impact Specialty agents. It is also the goal of this model to ensure delivery of evidence-based care in a way that supports the relationship between our members and their providers.

This enhanced management model applies to the agents listed in the table below (Table A) as well as new market entrants that are deemed high impact. The list contained within Table A is subject to change at any time, and may be without notice. These agents will be managed at an appropriate cadence to ensure delivery of pharmaceutical care in an efficacious, safe, and efficient manner, which is consistent with clinical evidence. Specific details of the interactions include the following:

Member: The Rx C/M RPh engages with the member telephonically and electronically upon initiation of therapy, and intermittently thereafter as determined by the medication regimen to ensure appropriate utilization, tolerability, and access to therapy.
Provider/Provider Representative: The Rx C/M RPh will obtain a direct contact at the Provider Office and will engage with that person to ensure CDPHP has access to requested laboratory follow up and pertinent clinical information, and that the Provider is aware of the status of the members therapy (i.e., Adherence, clinical benefit, tolerability).
Other Internal/External Care Management Teams: The Rx C/M RPh will collaborate with other identified care managers for each member to ensure coordination of care and to identify any unforeseen barriers to being successful with therapy.
Pharmacy/Infusion Company: The Rx C/M RPh will engage with a direct contact at the entity and will be telephonically or electronically authorizing all fills for the selected therapy. This authorization includes the initial fill, refill, or infusion of any of the agents listed in Table A.

The authorization for refills/subsequent infusions will be done by the Rx C/M RPh after a thorough review has been performed by the above parties to ensure an accurate, safe, effective, and efficient supply of the medication is provided.

Table A - Medications

Abecma (idecabtagene vicleucel)	Ilaris (canakinumab)	Saphnelo (anifrolumab)
Actemra (tocilizumab)	Ilumya (tildrakizumab-asmn)	Scenesse (afamelanotide)
Acthar (corticotropin)	Inbrija (levodopa oral inhalation)	Siklos (hydroxyurea)
Adakveo (crizanlizumab)	Infliximab Biosimilar Products	Siliq (brodalumab)
Adalimumab Biosimilar Products	Iqirvo (elafibranor)	Simponi (golimumab)
Adstiladrin (nadofaragen firadenovec)	Izervay (avacincaptad pegol)	Simponi Aria (golimumab)
Aduhelm (aducanumab)	Joenja (leniolisib)	Skyclarys (omaveloxolone)
Adzynma (ADAMTS13, recombinant-krhn)	Juxtapid (lomitapide)	Skyrizi (risankizumab-rzaa)
Agamree (vamorolone)	Kebilidi (eladocagene exuparvovec-tneq)	Skysona (elivaldogene autotemcel)
Alhemo (concizumab-mtci)	Kevzara (sarilumab)	Sohonos (palovarotene)
Alyftrek (vanzacaftor/tezacaftor/deutivacaftor)	Kineret (anakinra)	Soliris (eculizumab)
Amondys 45 (casimersen)	Kisunla (donanemab-azbt)	Spinraza (nusinersen)
Amtagvi (lifileucel)	Korlym (mifepristone)	Stelara (ustekinumab)
Amvuttra (vutrisiran)	Kymriah (tisagenlecleucel)	Stelara SC (ustekinumab)
Anktiva (nogapendekin alfa inbakicept-pmln)	Kuvan (sapropterin)	Sublocade (buprenorphine extended release) injection
Antihemophilic Factors (i.e., Advate, Adynovate, Altuviiio, Eloctate, Humate P, Jivi, Kogenate FS, Recombinate, SevenFact)	Lamzede (velmanase alfa)	Sucraid (sacrosidase)
Aqneursa (levacetylleucine)	Leqembi (lecanemab)	Syfovre (Pegcetacoplan)
Arcalyst (rilonacept)	Lenmeldy (atidarsagene autotemcel)	Synagis (Palivizumab)
Attruby (acoramidis)	Livmarli (maralixibat)	Taltz (Ixekizumab)
Aucatzyl (obecabtagene autoleucel)	Lumizyme (alglucosidase alfa)	Talvey (talquetamab)
Benlysta (belimumab)	Lunsumio (mosunetuzumab)	Tecartus (brexucabtagene autoleucel)
Beqvez (fidanacogene elaparvovec-dzkt)	Lupkynis (voclosporin)	Tecelra (afamitresgene autoleucel)
Beyfortus (nirsevimab-alip)	Lyfgenia (lovotibeglogene autotemcel)	Tecvayli (teclistamab)
Blincyto (blinatumomab)	Mavenclad (cladribine)	Tegsedi (Inotersen)
Breyanzi (lisocabtagene maraleucel)	Mayzent (siponimod)	Tepezza (teprotumumab)
Bylvay (odevixibat)	Mulpleta (lusutrombopag)	Tezspire (Tezepelumab)
Camzyos (mavacamten)	Nexviazyme (avalglucosidase alfa)	Tremfya (Guselkumab)
Carvykti (ciltacabtagene autoleucel)	Nucala (mepolizumab)	Tryngolza (olezarsen)
Casgevy (exagamglogene autotemcel)	Ofev (nintedanib)	Tysabri (Natalizumab)
Cimzia (certolizumab pegol)	Ogsiveo (nirogacestat)	Tzield (teplizumab-mzwv)
Columvi (glofitamab)	Ojemda (tovorafenib)	Ultomiris (ravicizumab)
Cosentyx (secukinumab)	Olpruva (sodium phenylbutyrate)	Uplizna (inebilizumab)
Crenessity (crinecerfont)	Olumiant (baricitinib)	Veopoz (pozelimab)
Crysvita (burosumab)	Onpattro (patisiran)	Vijoice (Alpelisib)
Daybue (trofinetide)	Opsynvi (macitentan and tadalafil)	Viltepso (vitolarsen)
Doptelet (avatrombopag)	Orencia (abatacept)	Vimizim (Elosulfase alfa)
Dupixent (dupilumab)	Orfadin (nitisinone)	Voranigo (vorasidenib)
Duvyzat (givinostat)	Otezla (apremilast)	Voydeya (danicopan)
Elfabrio (pegunigalsidase alfa)	Oxbryta (voxelotor)	Vyalev (foscarbidopa/foslevodopa)
Elevidys (delandistrogene moxeparvovec)	Oxervate (cenegermin-bkbj)	Vyjuvek (beremagene geperpavec)
Elrexfio (elranatamab)	Oxlumo (lumasiran)	Vyndamax (Tafamidis)
Emflaza (deflazacort)	Palforzia (peanut allergen powder)	Vyndaqel (Tafamidis meglumine)
Empaveli (pegcetacoplan)	Palynziq (pegvaliase)	Vyondys 53 (golodirsen)
Enbrel (Etanercept)	PiaSky (crovalimab)	Vyvgart (efgartigimod alfa)
Endari (L-glutamine)	Pombiliti (cipaglucosidase alfa) and Opfolda (miglustat)	Vyvgart Hytrulo (efgartigimod alfa and hyaluronidase-qvfc)
Enjaymo (Sutimlimab)	Pyrukynd (mitapivat)	Wainua (eplontersen)
Enspryng (satralizumab)	Qalsody (tofersen)	Winrevair (sotatercept-csrk)
Entyvio IV (vedolizumab)	Radicava (edaravone)	Xeljanz (Tofacitinib Citrate)
Entyvio SC (vedolizumab)	Ravicti (glycerol phenylbutyrate)	Xeljanz XR (Tofacitinib Citrate)
Epkinly (epcoritamab-bysp)	Remicade (infliximab)	Xenpozyme (Olipudase alfa)
Esbriet (pirfenidone)	Revuforj (revumenib)	Xolair (Omalizumab)
Etanercept Biosimilar Products	Rezdiffra (resmetirom)	Xolremdi (mavorixafor)
	Rinvoq (upadacitinib)	Xpovio (selinexor)
	Rituxan (rituximab)	Yescarta (axicabtagene ciloleucel)
	Rituximab Biosimilar Products	

Evkeeza (evinacumab-dgnb) Evrysdi (risdiplam) Exonodys 51 (eteplirsen) Fabhalta (iptacopan) Fabrazyme (agalsidase beta) Fasenra (benralizumab) Filsuvez (birch triterpenes) Fintepla (fenfluramine) Hemlibra (emicizumab) Hemgenix (etranacogene dezaparvovec) Humira (adalimumab) Hympavzi (marstacimab-hncq)	Rivfloza (nedosiran) Roctavian (valocotgene roxaparvovec) Rybrevant (amivantamab) Ryplazim (plasminogen, human) Rystiggo (rozanolixizumab) Rytelo (imetelstat)	Yorvipath (palopegteriparatide) Zilbrysq (zilucoplan) Zolgensma (onasemnogene abeparvovec) Zynteglo (betibeglogene autotemcel) Ztalmy (ganaxolone)

Considerations

- Patient must have drug coverage administered by CDPHP for the drugs in Table A.
- Prior authorization is obtained through the CDPHP pharmacy department pursuant to existing coverage criteria in applicable policies for each medication listed within Table A.

GOVERNMENT PROGRAMS

CHILD HEALTH PLUS: Subject to all terms and conditions noted in above application.

MEDICARE ADVANTAGE: Subject to all terms and conditions noted in above application.

SELECT/HARP PLAN: Effective April 1, 2023, the pharmacy benefit for Medicaid is administered by NYRx, the Medicaid Pharmacy Program

CDPHP Pharmacy Services 8/13/2026

New: 6/2019

Revised	Reviewed
9/2019, 9/2020, 4/2021, 4/2022, 4/2023, 6/2023, 6/2024, 6/2025	8/2026

Revision Date	Changes Made
4/2021	Added medications to Table A including: Amondys 45, Evrysdi, Esbriet, Evkeeza, Juxtapid, Ofev, Pegcetacoplan, Vimizim, Vyondys 53
4/2022	Added medications to Table A including: Aduhelm, Bylvay, Empaveli, Livmarli, Lumizyme, Lupkynis, Nexviazyme Oxlumo, Ryplazim, Saphnelo, Vyvgart
4/2023	Added medications to Table A including: Camzyos (Mavacamten), Enjaymo (sutimlimab), Pyrukynd (mitapivat), Radicava (edaravone), Soliris (Eculizumab), Spinraza (Nusinersen), Synagis (Palivizumab), Tezspire (tezepelumab), Vijoice (alpelisib), Xenpozyme (Olipudase alfa)
6/2023	Added medications to Table A including: Daybue (Trofinetide) and Skyclarys (Omaveloxolone)
6/2024	Added several medications to Table A
6/2025	Added several medications to Table A

MEDICAL POLICY

Medical Policy Title	**Photodynamic Therapy for Malignant Disease**
Policy Number	**8.01.06**
Current Effective Date	**November 1, 2026**
Next Review Date	**February 2027**

Our medical policies are guides to evaluate technologies or services for medical necessity. Criteria are established through the assessment of evidence based, peer-reviewed scientific literature, and national professional guidelines. Federal and state law(s), regulatory mandates and the member's subscriber contract language are considered first in the determination of a covered service.

(Link to Product Disclaimer)

POLICY STATEMENT(S)

I. Photodynamic therapy (PDT) with Photofrin is considered **medically appropriate** for **ANY** of the following indications:

   A. Treatment of early-stage non-small-cell lung cancer (NSCLC) in patients who are ineligible for surgery and radiation therapy;

   B. Reduction of obstruction and palliation of symptoms in patients with completely or partially obstructing endobronchial lesions;

   C. Palliative treatment of obstructing esophageal cancer;

   D. Treatment of Barrett's high-grade dysplasia (HGD) in patients who:

      1. are considered at high risk for adverse outcomes (morbidity and mortality) during prophylactic esophagectomy surgery; **and**

      2. decide on this treatment method, based on shared decision-making with their physician and understanding the actual risks and benefits of various treatment options;

   E. Palliative treatment of unresectable cholangiocarcinoma as an adjunct to stenting.

II. PDT with 5-aminolevulinic acid (5-ALA) topical preparation is considered **medically appropriate** for **EITHER** of the following indications:

   A. Superficial and nodular basal cell skin cancer, only when surgery or radiation is contraindicated;

   B. Bowen's disease (cutaneous squamous cell carcinoma in situ), only when surgery or radiation is contraindicated.

III. PDT is considered **investigational** in the treatment of other types of malignancies, including but not limited to colon, rectal, pancreas, hepatocellular, mesothelioma, prostate, bladder, brain, head and neck cancers, soft tissue sarcoma and Barrett's esophagus (other than HGD, as stated above).

IV. PDT with porfimer sodium (Photofrin) is contraindicated in patients with **ANY** of the following:

A. Known bone marrow suppression;

B. Porphyria or known allergies to porphyrins;

C. Existing tracheoesophageal or broncho-esophageal fistula;

D. Tumors eroding into a major vessel;

E. Esophageal or gastric varices or esophageal ulcers greater than one (1) cm in diameter.

RELATED POLICIES

Corporate Medical Policy

7.01.01 Focal Therapies for Prostate Cancer Treatment

8.01.21 Light and Laser Therapies for Dermatological Conditions

11.01.03 Experimental or Investigational Services

11.01.10 Clinical Trials

POLICY GUIDELINE(S)

I. A second laser treatment (with no additional Photofrin) can be given 96-120 hours after the first injection, preceded by debridement (via endoscopy) 48 hours after the initial light application.

II. Patients may receive a second course of PDT (with Photofrin) a minimum of 30 days after the initial therapy. Up to three (3) courses of PDT (every 30 days) can be given.

III. As pathologists do not always agree on differentiating between low- and high-grade dysplasia and between high-grade dysplasia and carcinoma in situ, in many cases, high-grade Barrett's dysplasia is confirmed by two pathologists with expertise in gastrointestinal pathology.

DESCRIPTION

PDT is a cancer treatment method using intravenous injection of a photosensitizing agent (e.g., porfimer sodium, Photofrin) and exposure of tumor cells to a laser light source to cause cellular damage. The clearance of porfimer sodium occurs over a period of time (40-72 hours) in normal tissue; however, tumor cells retain porfimer for a longer period. Treatment of the tumor is the result of selective retention of porfimer and selective delivery of light.

PDT with Photofrin is a two-stage process. The first stage is the intravenous injection of Photofrin. Illumination with 630-nm wavelength laser light constitutes the second stage of therapy. The laser treatment induces a photochemical, not a thermal, effect. The photochemical reaction results in the release of toxic, singlet oxygen that causes tumor necrosis.

PDT should not be confused with extracorporeal photopheresis, which is the treatment of certain skin malignancies through the use of ultraviolet light irradiation of the patient's blood.

SUPPORTIVE LITERATURE

Published studies have shown that PDT with Photofrin improves the quality of life (e.g., relief of dysphagia, improvement in dyspnea) and relieves obstruction by reducing tumor mass for those patients with obstructing tumors of the esophagus or endobronchial tree. For those patients with microinvasive NSCLC, not amenable to surgery or radiation, who were treated with PDT, reported tumor response rates (50-84%) and disease-free survival rates (2.7-4.1 years) are favorable. Studies investigating the Nd:YAG laser and PDT found that survival rates were comparable, and that PDT was technically easier to perform, more comfortable for patients, and caused fewer side effects (e.g., perforation).

In a systematic review and meta-analysis, investigators examined the effectiveness of PDT in the treatment of Bowen disease (BD) and cutaneous squamous cell carcinoma (cSCC) for clearance rate (CR) after 1 year. A total of 43 studies were included, enrolling 1,943 BD lesions and 282 SCC lesions. Pooled CRs for BD and SCC were 76 % (95 % CI: 71 % to 80%; I2 = 78.9 %) and 51 % (95 % CI: 35 % to 66 %; I2 = 85.7 %), respectively. The authors concluded that these findings supported the selective use of PDT for BD; however, patients should be advised of potential for recurrence. Moreover, these researchers stated that although PDT can be used for certain cases of cSCC, the high rate of treatment failure necessitates close surveillance for residual or recurrent disease; further studies are needed to justify the usage of PDT in the treatment of BD and cSCC (Yongpisarn 2022).

PDT has also been evaluated as an adjunct to stenting and drainage as a palliative treatment for unresectable bile duct cancer. Two pivotal yet small RCTs have demonstrated improvements in survival.

Ortner et al (2003) conducted a prospective, open-label, randomized multicenter study that aimed to compare PDT in addition to stenting with stenting alone in patients with NCC. A total of 39 patients with non-resectable cholangiocarcinoma were randomized to either PDT plus stenting (Group A, n =20) or stenting alone (Group B, n = 19). Investigators reported that the median survival was 493 days (95% CI, 276–710) in group A and 98 days (95% CI, 87–107) in group B ($P < 0.0001$). The investigators noted that PDT also improved biliary drainage and quality of life.

Zoepf et al (2005) conducted a randomized controlled study that investigated the influence of PDT on survival time in advanced bile duct cancer (BDC). A total of 32 patients with non-resectable cholangiocarcinoma were randomized. Light activation was performed in the patients assigned to PDT 48 hours after intravenous application of 2 mg/kg body weight of Photosan-3, an oligomer of hematoporphyrin that has been approved for use in the European Union but is not approved by the FDA. In the control group, patients were treated with stenting and drainage without PDT. The investigators stated that the PDT group and the control group were comparable due to age, gender, performance status, bilirubin level, and bile duct cancer stage. The investigators reported that the median survival time after randomization was 7 months for the control group and 21 months for the PDT group ($p = 0.0109$). The investigators noted that, in 50% of the initially percutaneously treated patients, they were able to change from percutaneous to transpapillary drainage after PDT.

Li et al (2023) stated that PDT is a promising treatment for non-muscle-invasive bladder cancer (NMIBC). In a systematic review, investigators examined the safety and effectiveness of PDT for the

treatment of NMIBC. A total of 28 single-arm studies were included in the meta-analysis. For unresectable NMIBC, therapeutic PDT achieved CR in 68 % (95 % CI: 59 % to 77 %) of patients. Among these CR cases, 71 % (95 % CI: 56 % to 85 %) and 38 % (95 % CI: 12 % to 64 %) had a RFS longer than 12 and 24 months, respectively. For Tis patients, the CR rate was 68 % (95 % CI: 56 % to 80 %), and 84 % (95 % CI: 48 % to 100 %) and 13 % (95 % CI: 1 % to 32 %) had a RFS longer than 12 and 24 months. For patients with resectable tumors, post-resection adjuvant PDT could provide a 12 and 24 months RFS in 81 % (95 % CI: 76 % to 87 %) and 56 % (95 % CI: 41 % to 71 %) of them. The complications were mostly mild and transient, including lower urinary tract symptoms and photosensitivity. The authors noted that although high-level evidence is still lacking, current studies suggested that both therapeutic and adjuvant PDT provided satisfying safety and effectiveness. Moreover, these researchers stated that as a promising option for NMIBC, PDT deserves further examination by future high-quality research.

Although PDT (using porfimer sodium or other photosensitizing agents) has been used in treatment of other cancers, all are either in Phase I or Phase II studies and have not yet been proven outside an investigational setting.

PROFESSIONAL GUIDELINE(S)

The 2026 National Comprehensive Cancer Network (NCCN) Clinical Practice Guidelines in Oncology state that in patients with superficial basal cell carcinoma or squamous cell carcinoma in situ, therapies such as topical imiquimod, topical 5-fluorouracil (5-FU), or photodynamic therapy (PDT) may be considered, although cure rates are approximately 10% lower than for surgical treatment modalities. These options are also recommended for patients where surgery or radiation therapy is contraindicated or impractical.

Additionally, the NCCN Clinical Practice Guidelines (V.2.2025) Biliary Tract Cancers states, "Photodynamic therapy (PDT) is an ablative therapy that involves intravenous injection of a photosensitizing drug followed by selective irradiation with light of a specific wavelength to initiate localized drug activation and has been used for palliation in patients with extrahepatic cholangiocarcinoma (CCA). The combination of PDT with biliary stenting was reported to be associated with prolonged overall survival (OS) in patients with unresectable CCA in two small RCTs."

REGULATORY STATUS

Photofrin (porfimer sodium) is the only photosensitizing agent with specific indications for use that has been approved by the U.S. Food and Drug Administration (FDA). It was approved in 2003.

The U.S. Food and Drug Administration (FDA) is responsible for ensuring the safety, efficacy, and quality of drugs sold in the United States. This includes both prescription and over-the-counter medications. Refer to the FDA Drug website. Available from: https://www.fda.gov/drugs [accessed 2025 Jan 12]

The FDA maintains information for consumers and health professionals on new drug warnings and other safety information, drug label changes, and shortages of medically necessary drug products. Available from: Drug Safety and Availability | FDA [accessed 2025 Jan 12]

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: PHYSICAL THERAPY

POLICY EFFECTIVE DATE:	3/1/2025
Policy Control #:	1370/20.000057
Next Annual Review:	March, 2027

DISCLAIMER

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgement when deciding the most appropriate care to enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

PROCEDURE CODES

Evaluation: 97161, 97162, 97163, 97164
Modalities: 97010-97039, G0281, G0283, G0329
Therapeutic Procedures: 97110-97546
Tests & Measurements: 97750, 97755
Orthotic & Prosthetic Management: 97760, 97761, 97763

DESCRIPTIONS

Physical therapy is the evaluation, treatment, or prevention of disability, injury, disease, or other condition of health using physical, chemical, and mechanical means, including but not limited to heat, cold, light, air, water, sound, electricity, massage, mobilization, and therapeutic exercises, with or without assistive devices; and the performance and interpretation of tests and measurements to assess pathophysiological, pathomechanical, and developmental deficits of human systems to determine treatment and assist in diagnosis and prognosis.

RESOURCE COORDINATION POLICY

Capital District Physicians' Health Plan, Inc.
CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: PHYSICAL THERAPY

Physical therapy services must be considered to be specific, effective, and reasonable treatment for the patient's diagnosis and physical condition relative to information gathered on the care plan/progress note. Services must be performed to achieve a specific diagnosis-related goal for a patient who has reasonable expectation of achieving measurable improvement in a reasonable time. These services must require the judgment, knowledge, and skills of a qualified provider because of the complexity and sophistication of the therapy and the physical condition of the patient.

Physical therapy services may be habilitative or rehabilitative in nature.

- Rehabilitation services are health care services that help a person keep, get back, or improve skills and functioning for daily living that have been lost or impaired because a person was sick, hurt, or disabled.

- Habilitation Services are health care services that help a person keep, learn, or improve skills and functioning for daily living. They include the management of limitations and disabilities, including services or programs that help maintain or prevent deterioration in physical, cognitive, or behavioral function.
    - Refer to specific member contracts for availability of benefits, if any, relating to habilitative services.

POSITION STATEMENT

CDPHP administers benefits for medically necessary physical therapy services as outlined below.

POLICY NAME: PHYSICAL THERAPY

Outpatient Physical Therapy

CDPHP administers benefits for medically necessary physical therapy services when all of the following conditions are met:

1. Physical therapy services are medically necessary, are recommended by the ordering practitioner, and are related to the treatment or diagnosis of a physical illness or injury (includes medically diagnosed congenital defect of a covered child).

2. Services are ordered by a primary care physician, neurologist, pediatric neurologist, neurosurgeon, orthopedic surgeon, physiatrist, rheumatologist, podiatrist, hand surgeon, vascular surgeon, or pulmonologist.

3. A plan to ensure the successful transition to a home exercise program will be initiated early in the course of therapy.

4. Services are provided by a qualified practitioner (e.g., physical therapist, physiatrist) who is performing within the scope of their license.

5. The goal of the program is to develop and train the patient to independently participate in a home exercise program to achieve maximum expected benefit.

6. Physical therapy services are subject to all applicable contract limitations.

Autism Spectrum Disorder

Benefits are provided for covered therapeutic services, to include those for habilitative services, necessary to develop, maintain, or restore, to the greatest extent practicable, functioning of an individual when such services are provided by a licensed physical therapist for the treatment of autism spectrum disorder. Such benefits will apply only to those plans to which the mandate applies.

Vestibular Rehabilitation Therapy

Benefits may be provided for vestibular rehabilitation therapy for enrollees who meet the following criteria:

- Documentation of vestibular hypofunction with continuous presenting symptoms for at least two months and;

POLICY NAME: PHYSICAL THERAPY

- Unresponsive to conventional therapy.

POLICY CONSIDERATIONS

Benefits for physical therapy services are subject to all contract limitations and appropriate visit cost-share as stated in the enrollee's contract.

CDPHP will reimburse physical therapy services as a global payment based upon first service billed, per date of service, per practitioner, per contractual agreement.

A physical therapy session is defined as treatment, and/or evaluation, on any given day. Sessions include a combination of modalities and procedures.

Certain physical therapy services may be billed by selected practitioners who are performing within their scope of practice.

All patients participating in physical therapy are expected to actively participate in a daily home exercise program, outlined by the physical therapist, to meet expected goals.

Benefits are provided for medically necessary physical therapy services in the home setting as follows:

- Services are rendered by a participating home health agency and;
- Required criteria for home health care services are met in accordance with resource coordination policy, Home Health Care.

Coverage is provided for establishment/re-evaluation of home self-management maintenance programs, up to a maximum of six visits per calendar year. No coverage will be provided for the continuation of maintenance programs (activities that preserve the patient's present level of function, or when no additional functional progress is apparent or expected to occur).

CDPHP does not provide benefits for massage therapy as a stand-alone treatment. Massage therapy (97124) is considered an acceptable treatment when it is part of a comprehensive treatment plan consisting of a combination of other covered procedures and modalities, and performed by a practitioner who is licensed and who is performing within the scope of the license.

Appending modifier 59 on the evaluation (97161-97163) does not provide additional reimbursement.

Capital District Physicians' Health Plan, Inc.
CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: PHYSICAL THERAPY

Medically necessary physical therapy conducted on two non-adjacent body parts (e.g., lumbosacral and cervical spine or a shoulder and wrist) will be reimbursed at one and a half times standard therapy when billed using modifier 59.

Medically necessary physical therapy conducted on two or more co-linear and adjacent body parts (e.g., cervical and thoracic spine or a shoulder, elbow, and wrist) will be reimbursed as a single standard therapy.

In a physical therapy session, it is expected there be a maximum ratio of up to three patients to one physical therapist (3:1 or 2:1 or 1:1) for all treatment modalities, regardless of treatment location (e.g., pool or land).
Gait training must be skilled in nature (i.e., designed to restore functional abilities).

- Benefits will be provided for covered durable medical equipment required as a part of a home program when in compliance with the requirements outlined in the CDPHP resource coordination policy, Durable Medical Equipment, Prosthetics/Orthotics & Medical Supplies, 1370/20.000509.

When a service or procedure that may be either habilitative or rehabilitative in nature is provided for habilitative purposes, the use of modifier 96 is required to indicate that the service or procedure provided was a habilitative service.

Services or procedures provided for rehabilitative purposes do not require the use of a modifier.

All physical therapy services are subject to retrospective review for medical necessity as defined by this policy and for compliance with the enrollee's contract.

- Providers who demonstrate unexpected variations in utilization outcomes over a period of time may be subject to focused review.

Coverage will no longer be provided once the allowable maximum benefit is exhausted, even if the medical necessity criteria stated above is met.

EXCLUSIONS

Physical therapy that duplicates services being provided as part of another therapy program through another therapy discipline (i.e., occupational therapy). When multiple therapies are used, each must have separate written treatment plans and must provide significantly different treatments.

Capital District Physicians' Health Plan, Inc.
CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: PHYSICAL THERAPY

Physical therapy that duplicates services being provided by a federal or state governmental agency (i.e., Early Intervention Program), by a school district (Individualized Educational Program) or by a developmental learning center that are sufficient in meeting the needs of an individual.

Chronic conditions which will require maintenance therapy (S8990) to prevent regression.

Any treatment relating to temporomandibular joint disease when it is dental in nature.

Iontophoresis (97033), used for administration of non-steroidal anti-inflammatory drugs or corticosteroids for treating musculoskeletal disorders, as scientific evidence does not support the use of this procedure as an effective physical therapy modality.

Infrared therapy (97026), used for the treatment of diabetic and/or non-diabetic peripheral sensory neuropathy, wound healing, or pain management (e.g., Anodyne Therapy System) as scientific evidence does not support the use of this procedure as an effective physical therapy modality.

Hippotherapy (S8940), as scientific evidence is insufficient to determine the effects of this technology on health outcomes for any indication, including autism spectrum disorder, cerebral palsy, or other motor dysfunctions.

Prolotherapy (M0076), for the treatment of joint or ligament instability, as scientific evidence does not support the use of this procedure as an effective physical therapy modality.

Orthotic and prosthetic training, fitting, and checkout (97760, 97761, 97763) are considered global to the dispensing of the device.

Services for the purpose of athletic training evaluation (97169, 97170, 97171, 97172), enhancing athletic performance or for recreation.

Sensory integrative techniques (97533), as scientific evidence does not support the use of these services as a physical therapy modality.

Self-care/home management training, community/work reintegration training, physical performance test or measurement, and assistive technology assessment (97535, 97537, 97750, 97755).

POLICY NAME: PHYSICAL THERAPY

Work hardening programs (97545, 97546), as such programs are not considered medically necessary, but rather a requirement of employment.

Benefits are not provided when a session consists of modalities alone (i.e., hot packs, whirlpool, paraffin baths, Hubbard Tank, cold packs/ice packs, and contrast baths). These alone are not considered a skilled level of treatment.

Functional rehabilitation programs when goals of increasing functional strength have been achieved and the patient no longer requires skilled physical therapy intervention to continue rehabilitative therapeutic exercises.

Gait training rendered for assistive walking, when the patient is walking repetitiously and merely improving distance or endurance, whether assistive or non-assistive.

Concurrent treatment for the same condition by both a chiropractor and physical therapist is not allowed.

CDPHP PRODUCT VARIATIONS

CHILD HEALTH PLUS	Subject to all terms and conditions noted above in the policy. • Benefits are provided for a condition amenable to significant clinical improvement within a period of 60 days or less from the date of the initial treatment.
MEDICARE ADVANTAGE	Subject to all terms and conditions noted above in the policy. Benefits for unlimited medically necessary physical therapy visits. Includes therapy that would otherwise be covered as an inpatient and is provided under the care of a physician pursuant to a written plan of treatment. The following physical therapy codes are covered: • Evaluation: 97161, 97162, 97163, 97164 • Modalities: 97010-97032, 97033-97039, G0281, G0283, G0329 (97026 is non-covered). G0281 and G0329 are only covered for chronic stage III and stage IV pressure ulcers, arterial ulcers, diabetic ulcers and venous stasis ulcers not demonstrating measurable signs of healing after 30 days of

POLICY NAME: PHYSICAL THERAPY

	conventional care as part of a therapy plan of care. • Therapeutic procedures: 97110-97130, 97139-97542, 97750, 97755, 97760-97763 (97545, 97546 are non-covered)
SELECT PLAN/HARP	Subject to all terms and conditions noted above in the policy. Benefit coverage includes unlimited medically necessary physical therapy visits. Benefits for functional electrical stimulation (97014, 97032) used as a treatment modality for spinal cord and head injury, cerebral palsy, and upper motor neuron disease are not provided. Coverage remains available for functional electrical stimulation for indications other than those listed above when medically necessary.
SMALL GROUP/ COMMERCIAL INDIVIDUAL:	Rehabilitative physical therapy services are covered only when: • Therapy is related to the treatment or diagnosis of a physical illness or injury (in the case of a covered child, this includes a medically diagnosed congenital defect); **and** • Therapy is ordered by a physician; **and** • The enrollee has been hospitalized or has undergone surgery for such illness or injury. Covered physical therapy services must begin within six months of the later to occur: • The date of the injury or illness that caused the need for the therapy; • The date of discharged from the hospital where the surgical treatment was rendered; **or** • The date outpatient surgical care is rendered. Habilitation services consisting of physical therapy are covered in the outpatient department of a facility or in a health care professional's office.

POLICY HISTORY

This section is intended to provide only highlights of the policy changes. The policy should always be reviewed in its entirety to ensure a comprehensive understanding of coverage.

Effective Date	Update
3/1/2025 *No change to effective date of policy	Under Medicare section, removed information on iontophoresis for hyperhidrosis as this listed in the Non-Covered Technologies policy with an exception for Medicare Advantage.
3/1/2025	Removed Pneumatic cervical traction devices (E0856) from Exclusions as it is addressed in the Durable Medical Equipment, Orthotics/Prosthetics and Medical Supplies policy.
9/1/2024	Under Policy Considerations added the following statement: Appending modifier 59 on the evaluation (97161-97163) does not provide additional reimbursement.
6/1/2023	Removed specific diagnoses from the exclusion section.
4/1/2022 *No change to policy effective date	Clarified coverage in Medicare section and removed deleted codes 97005 and 97006. Removed visit limitations under product variations as contracts are the best source for identifying limits.

MEDICAL POLICY

Medical Policy Title	**Platelet Rich Plasma and Growth Factor Treatments**
Policy Number	**2.01.24**
Current Effective Date	**January 1, 2027**
Next Review Date	**January 2027**

Our medical policies are guides to evaluate technologies or services for medical necessity. Criteria are established through the assessment of evidence based, peer-reviewed scientific literature, and national professional guidelines. Federal and state law(s), regulatory mandates and the member's subscriber contract language are considered first in the determination of a covered service. (Link to Product Disclaimer)

POLICY STATEMENT(S)

I. Platelet-Rich Plasma (PRP) and autologous platelet-derived preparations (i.e., Basic Fibroblast Growth Factor (BFGF), Epidermal Growth Factor (EGF), Placental Angiogenic Growth Factors (PGFs) are considered **investigational** for **ALL** indications.

8.01.10 Prolotherapy

11.01.03 Experimental or Investigational Services

POLICY GUIDELINE(S)

Not Applicable

DESCRIPTION

Growth factors are polypeptides produced by cells during development and in response to injury. Owing to their effects on cell proliferation, growth factors have undergone extensive analyses, to determine their usefulness as wound healing agents.

Examples of growth factors used in wound healing are:

I. Basic Fibroblast Growth Factor (BFGF);

II. Epidermal Growth Factor (EGF);

III. Placental Angiogenic Growth Factors (PGFs); and

IV. Platelet-Derived Growth Factor (PDGF).

Platelet-rich plasma (PRP) preparations, which contain growth factors, have been proposed as a primary treatment of miscellaneous conditions such as arthritis, Dupuytren's contracture, epicondylitis, plantar fasciitis, and tendinopathy.

SUPPORTIVE LITERATURE

Platini et al (2024) conducted a systematic review and meta-analysis to assess the efficacy and safety of autologous PRP gel for managing diabetic foot ulcers in older adults (N=598) across eight randomized controlled trials (RCTs). Compared with standard care, autologous PRP gel significantly improved wound healing rates (Relative Risk [RR]=1.32; 95% CI: 1.22 to 1.57; p<.0001; I2=23%) and reduced the time to complete healing (MD= -16.97 days; 95% CI: -32.64 to -1.29; p<.0001; I2=93%). PRP also shortened hospital stays (MD=-20.11 days; 95% CI: -38.02 to -2.20; p=.03) and decreased the amputation rate (RR=0.36; 95% CI: 0.16 to 0.84; p=.02; I2=0%) when compared to conventional treatments. The authors also noted its infection prevention efficacy during early treatment was significant at one week (RR=0.56; 95% CI: 0.34 to 0.91; p=.02) and two weeks (p=.01), but when assessed from week 4 to 12, no significant differences were observed. No improvements in the reduction of wound surface area were noted in the included studies. Heterogeneity across outcomes varied but was particularly high in healing duration outcomes. Funnel plot analyses revealed minimal publication bias. Limitations included non-standardized dosages of PRP, high heterogeneity for some pooled estimates, and insufficient reporting of some clinical outcomes.

Li et al (2025) conducted a RCT to evaluate tendon healing after arthroscopic extensor carpi radialis brevis (ECRB) repair in recalcitrant lateral epicondylitis (RLE) combined with PRP compared to surgery repair alone. Individuals (n=73) were randomized to the PRP group (n=35) and the control group (n=38). Tendon healing was assessed by MRI at follow up intervals (3, 6, and 12 months). No significant differences were found in magnetic resonance imaging classification and functional scores between groups at preoperative and follow-up periods. However, the PRP group showed a significant improvement in grip and wrist extension muscle strength at 6 weeks postoperatively (P = .008 and P < .001, respectively), whereas the control group did not (P = .583 and .056). No complications were associated with PRP injection. The authors concluded this RCT showed PRP used as an adjuvant to ECRB repair did not show a difference in tendon healing and functional outcomes compared with ECRB repair alone for RLE at 12-month follow-up.

Bains et al (2025) published results from a single center, double blind, RCT comparing PRP injections to corticosteroid (CS) injections in patients (n=52) with mild to moderate symptomatic knee osteoarthritis. Follow up at 6 weeks and 3 months conducted outcome measurements in pain scores, including Visual Analog Scale (VAS) and Numeric Pain Rating Scale (NPRS); and functional scores, including Western Ontario and McMaster Universities Osteoarthritis Index (WOMAC) and Knee Injury and Osteoarthritis Outcome Score (KOOS). Patients were randomized to receive treatment with an intra-articular injection of CS (n = 26) or PRP (n = 26). At six weeks, CS patients had significantly greater reductions from baseline in VAS (-24.26 versus -7.38, P = 0.033) and NPRS (-2.24 versus -0.92, P = 0.042). At three months, CS and PRP patients experienced similar improvements in VAS (-18.27 versus 13.27, P = 0.610) and NPRS (-1.81 versus -0.65, P = 0.798), respectively. Both groups experienced similar improvements in KOOS and WOMAC. The authors concluded this RCT showed treatment of mild to moderate knee osteoarthritis with CS injections demonstrated greater pain reduction at six weeks. Based on these findings, expectations regarding the clinical utility of PRP should be tempered. Limitations of the study include only mild to moderate knee osteoarthritis patients were recruited, patient report of pain and functional scores are subjective, and a lack of

long-term follow up.

PROFESSIONAL GUIDELINE(S)

The American Academy of Orthopaedic Surgeons clinical practice guidelines for the management of osteoarthritis of the hip (AAOS 2017), glenohumeral joint (AAOS 2020), and rotator cuff (AAOS 2025) do not recommend the use of PRP for management of these conditions.

The AAOS clinical practice guidelines for the management of osteoarthritis of the knee (AAOS 2021) made the following recommendations regarding PRP:

- "Platelet-rich plasma (PRP) may reduce pain and improve function in patients with symptomatic osteoarthritis of the knee. (Strength of Recommendation: Limited, downgrade)"

The National Institute for Health and Care Excellence (NICE) published interventional procedure guidance for PRP for knee osteoarthritis (NICE 2019) and state the evidence on efficacy is limited in quality.

The Agency for Healthcare Research and Quality (AHRQ) (2020) published a Technology Assessment on Platelet-Rich Plasma for Wound Care in the Medicare Population. This Technology Assessment was requested by the Centers for Medicare & Medicaid Services to inform reconsideration of a National Coverage Decision on autologous blood-derived products for chronic non-healing wounds. This Technology Assessment evaluates evidence in lower extremity diabetic ulcers, lower extremity venous ulcers and pressure ulcers. Their findings are as follows:

- "We are moderately confident that autologous platelet-rich plasma increases complete wound closure or healing (moderate strength of evidence [SOE]) in individuals with lower extremity diabetic ulcers. We have low confidence that autologous platelet-rich plasma may shorten time to wound closure (low SOE) and reduce wound size (low SOE). Evidence is insufficient to make conclusions about other important outcomes such as hospitalization, amputations, and wound recurrence.
- Evidence is insufficient to make conclusions about the effect of autologous platelet-rich plasma on wound healing in individuals with lower extremity venous ulcers.
- Evidence is insufficient to make conclusions about the effect of autologous platelet-rich plasma on wound healing in individuals with pressure ulcers.
- There is no statistically significant difference in adverse events and serious adverse events between autologous platelet-rich plasma and management without autologous platelet-rich plasma, though the available literature does not evaluate and report adverse events consistently.
- The available literature suffers from important limitations, such as inadequate description of offloading and wound care procedures, wound characteristics, platelet-rich plasma formulation techniques, concentration and volume; inadequate length of follow up and lack of stratification by comorbidities and other patient characteristics such as diabetes control, vascular perfusion and under representation of older adults."

REGULATORY STATUS

The FDA regulates human cells and tissues intended for implantation, transplantation, or infusion

through the Center for Biologics Evaluation and Research, under Code of Federal Regulation, Title 21, parts 1270 and1271. Under these regulations, certain products including blood products such as PRP are exempt and therefore, do not follow the traditional FDA regulatory pathway. To date, the FDA has not attempted to regulate activated PRP.

CODE(S)

POLICY EFFECTIVE DATE:	1/1/2026
Policy Control #:	1370/20.000483
Next Annual Review:	November, 2025

DISCLAIMER

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgement when deciding the most appropriate care to enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

PROCEDURE CODES

64566, 0587T-0590T, E0737, A4545, 0988T, 0989T

DESCRIPTION

Posterior tibial nerve stimulation (PTNS), also known as percutaneous tibial nerve stimulation, is a technique of electrical neuromodulation for the treatment of overactive bladder (OAB) and the associated symptoms of urinary urgency, urinary frequency, and urge incontinence in patients who have failed behavioral and/or pharmacologic therapies. PTNS treatment consists of a series of short-term insertions of a percutaneous needle electrode for approximately 30 minutes, with intermittent neuromodulation while the needle electrodes remain in place. The neurostimulator includes a lead set with surface electrodes and a needle electrode, which produces an electrical pulse that travels to the sacral nerve plexus via the tibial nerve. The sacral nerve plexus then regulates the bladder and the pelvic floor functionality.

POSITION STATEMENT

CDPHP administers benefits for PTNS for enrollees with overactive bladder syndrome as a less invasive third-line treatment in accordance with criteria outlined below.

PTNS is considered medically necessary when all of the following criteria are met:

POLICY NAME: POSTERIOR TIBIAL NERVE STIMULATION FOR URINARY DYSFUNCTION

- The enrollee has experienced OAB with associated symptoms of urinary urgency, urinary frequency, and urge incontinence for at least 12 months and the condition has resulted in significant disability (frequency and severity of leakages are limiting the enrollee's ability to participate in daily activities).
- An evaluation has been performed by an appropriate specialist (i.e., urologist or urogynecologist) and determined the individual is a candidate for PTNS
- The medical record demonstrates the following documentation:
    - The enrollee has been compliant with and failed a trial of symptom-appropriate behavioral therapy (e.g., pelvic floor exercise, biofeedback, timed voids, and fluid management), of sufficient length to evaluate potential efficacy.
    - The enrollee has been compliant with and has failed or been unable to tolerate a trial of at least two appropriate medications administered for four to eight weeks.
    - Voiding diary shows continued findings of OAB.
    - The enrollee demonstrates a willingness to attend in-office treatment sessions, to comply with the behavioral therapies, and to continue to keep voiding diaries including documentation of behavioral therapy compliance.

POLICY CONSIDERATIONS

Treatment will consist of an initial course of one 30-minute session per week for 12 weeks. If an enrollee fails to demonstrate improvement after twelve PTNS treatments, continued treatment is considered not medically necessary.

Treatments for maintenance therapy will be allowed only for those patients who achieved a >50% decrease in overactive bladder symptoms with the initial treatment and will be authorized for one 30-minute session per month. The expectation is that the maintenance treatments continue to demonstrate improvement as documented in the enrollee diary. Continued maintenance treatments are considered not medically necessary if improvement of symptoms subside. Prior authorization will be required following the initial 12-week course of PTNS and then yearly to document continued improvement of symptoms for ongoing maintenance treatments to be considered medically necessary.

Treatments for relapse shall only be allowed for those patients who achieved a > 50% decrease in overactive bladder syndrome symptoms with the initial treatment and then relapse. Treatments for relapse will consist of one 30-minute session per week for 12 weeks. If an enrollee fails to demonstrate improvement after these twelve PTNS treatments, further treatment is considered not medically necessary. Prior authorization will be required for PTNS treatments due to relapse.

EXCLUSIONS

CDPHP considers posterior tibial nerve stimulation experimental/investigational when criteria

above are not met. This would include but not be limited to:

- Posterior tibial nerve stimulation for fecal incontinence
- Implantable posterior tibial nerve stimulator (0587T-0590T)
- Transcutaneous tibial nerve stimulator, controlled by phone application (E0737, A4545 (supplies))
- Open insertion or replacement of integrated neurostimulation system for bladder dysfunction including electrode(s) (e.g., array or leadless), and pulse generator or receiver, including analysis, programming, and imaging guidance, when performed, posterior tibial nerve; subcutaneous and subfascial (0988T
- Revision or removal of integrated neurostimulation system for bladder dysfunction, including analysis, programming, and imaging, when performed, posterior tibial nerve; subcutaneous and subfascial (0989T)

PTNS treatment is contraindicated for the following circumstances:

- Individual with pacemakers or implantable defibrillators
- Individual prone to excessive bleeding,
- Individual with nerve damage that could impact either percutaneous tibial nerve or pelvic floor function
- Women who are pregnant or planning to become pregnant during the duration of the treatment.

MEDICAL POLICY

Medical Policy Title	**Powered Compression Devices/Lymphedema Pumps**
Policy Number	**1.01.17**
Current Effective Date	**November 1, 2026**
Next Review Date	**December 2026**

Our medical policies are based on the assessment of evidence based, peer-reviewed literature, and professional guidelines. Eligibility for reimbursement is based upon the benefits set forth in the member's subscriber contract. (Link to Product Disclaimer)

POLICY STATEMENT(S)

I. Standard pneumatic compression devices without calibrated gradient pressure (HCPCS codes E0650, E0651) and associated appliances are considered **medically appropriate** for home use when **ALL** of the following criteria are met:

   A. When used for the treatment of proven intractable lymphedema, regardless of body part;

   B. Documented failure of a 4-week trial of conservative therapy which consists of **ALL** of the following:

      1. Regular and compliant use of an appropriate compression bandage system or compression garment to provide adequate graduated compression;

      2. Regular exercise; **and**

      3. Elevation of the affected body part;

   C. The patient has undergone a supervised training program and is able to show proficiency in using the device.

II. Advanced pneumatic compression devices with calibrated gradient pressure (HCPCS code E0652) and associated appliances are considered **medically appropriate** for home use when **ALL** of the following criteria are met:

   A. The individual is otherwise eligible for a standard pneumatic compression pump, meeting the criteria in Policy Statement I;

   B. The individual meets **EITHER** of the following:

      1. Documented failure of a standard pneumatic compression device without calibrated gradient pressure; **or**

      2. Documentation of unique characteristics (e.g., significant scarring) that prevent satisfactory pneumatic compression with a standard compression device without calibrated gradient pressure.

III. Compression devices are considered **investigational** for **ALL** other indications, including but not limited to:

   A. Venous statis ulcers;

B. Peripheral artery disease (e.g., intermittent claudication, ischemia, arterial insufficiency) (HCPCS code E0675);

C. Non-pneumatic compression pump or non-pneumatic sequential compression garment for **any** indication (e.g., Koya Dayspring, VenoWave) (HCPCS codes E0680, E0681, E0682, E0677, E0678, E0679, E0683).

IV. Durable Medical Equipment (DME) Repair

A. Repair of a medically necessary compression device or components not under warranty will be considered **medically appropriate** when the following criteria are met:

1. Physician documentation includes **ALL** the following:

a. Date of compression device initiation;

b. Manufacturer warranty information, if applicable;

c. Attestation that the patient has been compliant with the use of the compression device and will continue to benefit from the use of the compression device;

2. The compression device is no longer functioning adequately; and **BOTH** of the following criteria are met:

a. Inadequate function interferes with activities of daily living; **and**

b. Repair is expected to make the equipment fully functional (as defined by manufacturer).

B. Repair of equipment damaged due to patient neglect, theft, abuse, or when another available coverage source is an option (e.g., homeowners, rental, auto, liability insurance, etc.) is **ineligible for coverage**.

V. DME Replacement

A. Replacement of a medically necessary compression device or components not under warranty will be considered **medically appropriate** when **EITHER** of the following criteria are met:

1. The compression device is no longer functioning adequately and has been determined to be non-repairable or the cost of the repair is in excess of the replacement cost;

2. There is documentation that a change in the patient's condition makes the present unit non-functional and improvement is expected with a replacement unit.

B. The replacement of a properly functioning compression device, its components or accessories is considered **not medically necessary**. This includes, but is not limited to, replacement desired due to advanced technology or to make the compression device more aesthetically pleasing;

C. The replacement of equipment damaged or lost due to patient neglect, theft, abuse, or when another available coverage source is an option (e.g., homeowners, rental, auto,

liability insurance, etc.) is **ineligible for coverage**.

D. Accessories or components for compression devices that are considered not medically necessary or investigational by peer-reviewed literature will also be considered as **not medically necessary or investigational** by the Health Plan.

RELATED POLICIES

Corporate Medical Policy

10.01.01 Breast Reconstruction Surgery and Prophylactic Breast Cancer Risk-Reducing Mastectomy

1370/20.000509 Durable Medical Equipment, Prosthetics/Orthotics & Medical Supplies

11.01.03 Experimental or Investigational Services

POLICY GUIDELINE(S)

I. The Federal Women's Health and Cancer Right Act (WHRCA) of 1998, as well as the New York Insurance Law, mandates coverage of all stages of reconstructive surgery (including surgery and reconstruction of other breast to produce symmetrical appearance, chest wall reconstruction, prosthesis and treatment of physical complication following mastectomy such as lymphedema) for all group health plans, whether insured or self-funded, that provide medical and surgical benefits including mastectomies. Federal laws do not require a diagnosis of breast cancer (preventive mastectomies are also covered).

II. According to the New York State Insurance Laws for prostheses and physical complications of all stages of the mastectomy, including lymphedemas, while an issuer may perform a medical necessity review of these items or services, the issuer should use appropriate written clinical criteria and the most recent medical literature to determine medical necessity.

III. Medical documentation of all of the following criteria is required for consideration of a powered compression device/ lymphedema pump:

A. The lymphedema is intractable (has been difficult to manage and nonresponsive to decongestive treatment). Documentation should include etiology, symptoms and objective findings, measurements establishing the severity of the condition, and the extent to which the lymphedema impairs function of the extremity causing pain and gross distention.

B. Conservative treatments have been tried and found inadequate (e.g., leg/arm elevation, custom fabricated gradient pressure stockings or sleeves, and exercise).

C. Appropriate oversight (e.g., instruction in the operation of the machine, amount of pressure to be used, frequency and duration of use, and ongoing monitoring of use and response to treatment) has been provided.

IV. Per the manufacturer's user guide (Tactile Medical, Minneapolis, MN), the Flexitouch and Flexitouch plus pneumatic compression devices have a two-year warranty for the controller and a five-year warranty for the garments and garment accessories. The average expected controller

lifetime is five years.

DESCRIPTION

Lymphedema is the abnormal accumulation of lymph fluid in the subcutaneous tissues, most commonly affecting the limbs, but it may also involve the chest, head and neck, or genitals. It is classified as either primary, due to a genetic malformation of the lymphatic system, or secondary, resulting from damage caused by surgery, radiation, or trauma. Although lymphedema is considered incurable, early-stage cases may be reversible. Without appropriate treatment, the condition typically progresses.

Management focuses on nonsurgical therapies to reduce limb volume and maintain size, including compression garments, exercise, and pharmacologic support. The standard of care for stage II lymphedema is Complete Decongestive Therapy (CDT), which consists of skin care, manual lymphatic drainage (MLD) or self-administered MLD (SMLD), and compression bandaging. MLD, performed by trained therapists, is a key component of CDT but is not recommended as a standalone treatment for volume reduction.

Compression therapy devices, commonly referred to as lymphedema pumps, are used to promote lymphatic and venous fluid movement from the extremities toward central drainage areas. These devices help prevent complications associated with unmanaged lymphedema and are being investigated as adjunctive therapy for chronic venous insufficiency and venous stasis ulcers. By mimicking the natural pumping action of the calf muscles, they enhance circulation, reduce swelling, and support ulcer healing.

Compression devices are generally categorized into four types:

- Standard non-segmental compression pumps are single-chamber, non-programmable devices that apply uniform pressure across the entire limb during inflation. These basic pumps do not allow for pressure variation between limb regions. Examples include the KCI Extremity Pump 7000 and Huntleigh Flowpress.
- Standard segmental compression pumps feature multiple chambers that inflate sequentially, delivering fixed pressure either equally or following a preset gradient. These non-programmable devices offer more targeted compression than non-segmental models. Examples include the Flowtron Hydroven FPR, KCI Extremity Pump 7500, Lympha Press, Petite Basic 701A, and BioCompression Pump Model 2004.
- Advanced pneumatic compression devices (APCDs) are programmable segmental pumps that deliver calibrated gradient pressure, higher distally and lower proximally, to promote central lymphatic and venous flow. Each chamber's pressure can be individually adjusted, allowing for customized therapy, especially beneficial for patients with localized sensitivity, scarring, or pain. Examples include the Flexitouch System, which features a two-phase treatment cycle, and the ACTitouch System, a wearable device offering both intermittent and sustained compression for venous ulcer management.
- Non-pneumatic compression devices utilize mechanisms other than air pressure to promote

lymphatic drainage and improve circulation. These portable devices are designed for mobility during treatment, making them suitable for daily activities. Examples include the Koya Dayspring and Dayspring Lite, which use shape-memory flex frames embedded in wearable garments to provide sequential calibrated gradient pressure. Another example is the Venowave VW5, a battery-operated device worn below the knee that uses peristaltic motion to promote upward fluid displacement in the lower limbs.

SUPPORTIVE LITERATURE

Lymphedema- Pneumatic Compression Applied to Extremities

Multiple moderate-to-high quality randomized controlled trials (RCTs) and systematic reviews have demonstrated significant improvements in lymphedema outcomes with the use of pneumatic compression pumps compared to conservative care alone.

Hou et al (2024) conducted a systematic review and meta-analysis of 12 studies (identified through March 2024) to assess the efficacy of intermittent pneumatic compression (IPC) as an adjunct to complete decongestive therapy (CDT) for treatment of breast cancer-related upper limb lymphedema. The results indicated that adding IPC to CDT enhanced lymphedema reduction during the initial 4 weeks of treatment. However, this benefit diminished over time, with reduced effectiveness observed approximately 9.4 ± 2.6 weeks after discontinuation of physical therapy. To sustain the synergistic effects of CDT and IPC in promoting lymphatic drainage and symptom relief, the authors recommend periodic and ongoing treatment. Treatment durations across the included studies ranged from 4 to 12 weeks, which may introduce potential bias.

Yao et al (2024) performed a systematic review and meta-analysis of nine RCTs comparing decongestive lymphatic therapy (DLT) with and without IPC in managing upper limb lymphedema following breast cancer surgery. The pooled standardized mean difference for percentage volume reduction was 0.63, indicating no statistically significant difference between the two groups ($p = .15$). Pain and heaviness scores were also similar. However, a significant improvement in external rotation joint mobility was observed in the DLT plus IPC group. These findings suggest that while DLT with IPC is as effective as DLT alone in reducing lymphedema volume and symptoms, it may offer additional benefits in improving joint mobility.

Zaleska and Krzesniak (2025) investigated the effects of a single 45-minute IPC session on fluid movement in patients with stage II and III breast cancer-related lymphedema (BCRL). The study included 25 patients and utilized indocyanine green imaging to assess lymphatic flow before and after treatment. Post-treatment, 92% of patients showed fluid movement in the upper arm, with newly identified drainage pathways directed toward the ipsilateral supraclavicular lymph node (30%), ipsilateral axilla (22%), and axilla, chest, and scapula (26%). Fluorescent intensity changes revealed decreased signal in the hand and forearm, increased signal in the arm (64%), and overall reduction along some or all limb segments (36%). Additionally, skin, and subcutaneous tissue stiffness decreased at all limb levels, with statistically significant reductions in the middle forearm (36.4%) and elbow (33.4%). The authors concluded that IPC effectively promotes proximal fluid movement, facilitates compensatory lymphatic drainage pathways, and reduces tissue stiffness. Early application

of IPC was recommended to prevent limb enlargement and secondary tissue changes.

Lymphedema - Pneumatic Compression Applied to Chest or Trunk

There is limited evidence in the peer-reviewed literature that pneumatic compression pumps applied to the chest and/or trunk provides incremental improvement beyond that provided by pumps treating the affected limb only.

Ridner et al (2012) conducted a RCT to evaluate the effectiveness of advanced pneumatic compression therapy applied to the trunk, chest, and arm (experimental group; n=21) versus treatment of the arm alone (control group; n=21) in patients with stage II breast cancer-related lymphedema. The Flexitouch System was used for both groups at home for 30 days. Statistically significant reductions in bioelectrical impedance and arm circumference were observed within each group; however, no statistically significant difference was found between the two groups. These findings suggest that while both treatments are effective in reducing lymphedema symptoms, there may be no added benefit to pneumatic treatment of the trunk and/ or chest for arm lymphedema. The authors recommend further research with a larger sample size to confirm these findings.

Fife et al (2012) conducted a randomized trial comparing the Flexitouch advanced pneumatic compression device (APCD) with a standard pneumatic compression device (SPCD), the Bio Compression Systems Sequential Circulator, in 36 women across three centers. All participants had at least 5% upper extremity edema volume and were randomized to use either device for one hour daily over 12 weeks (n=18 per group). The SPCD treated only the arm, while the APCD used three garments to treat the arm, chest, and truncal quadrant. Outcome assessments were performed by experienced lymphedema therapists, although blinding procedures were not reported. Edema outcomes were available for all participants, while local tissue water data were available for 28 (78%). At 12 weeks, two of the four primary outcomes showed statistically significant improvements favoring the APCD: percent edema volume reduction ($p = .047$) and tissue water content ($p = .049$). No significant differences were observed in absolute arm volume ($p = .141$) or edema volume in milliliters ($p = .050$). Study limitations include the small sample size, missing data, and lack of clarity regarding assessor blinding. The authors concluded that the observed improvements with APCD use warrant further, more comprehensive research.

Lymphedema - Pneumatic Compression Applied to the Head and Neck

The current literature on the use of the Flexitouch system for head and neck lymphedema (HNL) is limited and primarily consists of a few industry-sponsored randomized controlled trials (RCTs). These studies suggest that the device may offer modest reductions in HNL.

Mayrovitz et al (2017) conducted a functional usability study involving 44 patients with HNL. Participants reported the devices was comfortable and subjective improvement after a single treatment. However, the study was limited by its single-arm, single-treatment design and did not assess long-term home use. A secondary objective assessed safety and acute changes in edema using facial and neck measurements. Statistically significant reductions were observed in composite facial (82.5 ± 4.3 cm to 80.9 ± 4.1 cm; $p < .001$) and neck (120.4 ± 12.2 cm to 119.2 ± 12.1 cm; p

< .001) measurements, with no adverse events reported. Despite its limitations, the study suggests potential short-term benefits of the device.

Gutierrez et al (2019) evaluated the effects of advanced pneumatic compression device APCD treatment in ten head and neck cancer (HNC) survivors who underwent facial composite measurements and near-infrared fluorescence lymphatic imaging (NIRFLI) before and after (APCD) treatments. After a single pneumatic compression treatment, NIRFLI showed enhanced lymphatic uptake and drainage in all subjects. After two weeks of daily use, dermal backflow was reduced or resolved in six of the eight participants with baseline backflow. The authors noted that reductions in facial measurements generally aligned with imaging improvements and patient-reported outcomes. However, they emphasized the need for longer-term studies to determine sustained efficacy and the potential of APCD to reverse dermal backflow in HNL.

Gutierrez et al (2020) conducted an observational study to assess self-reported outcomes and satisfaction among 205 HNC survivors using the Flexitouch APCD for HNL. After at least 25 days of home use, participants completed pre- and post-treatment assessments evaluating efficacy, function, and symptom relief. Statistically significant improvements were observed across all symptom and function domains ($p < 0.00001$), based on the Wilcoxon Signed Rank test. Compliant use for a minimum of 30 minutes per day was high, with 71% reporting daily use and 87% expressing overall satisfaction. These findings support the device's potential for improving quality of life in HNL patients, though the study relied on self-reported data and lacked a control group.

Ridner et al (2021) conducted a randomized, wait-list controlled trial involving 49 patients (control group, n=24; intervention group, n=19). A total of 43 patients completed the study. All participants were assessed at 1, 4, and 8 weeks. The intervention group reported significant improvement in perceived ability to control lymphedema ($p=0.003$) and visible external swelling (front view $p < 0.001$, right view $p = 0.004$, left $p = 0.005$). However, there was no statistically significant differences were found in functional outcomes ($p=0.312$ - $p=0.615$) or in inflammatory biomarker levels ($p>0.10$) between groups from baseline to 8 weeks. Compliance was low, with only one participant using the device the prescribed. The authors concluded that the device appears safe and feasible for HNL management, but acknowledge the need for larger, more diverse RCTs.

Shires et al (2022) conducted a non-industry-sponsored retrospective cohort study evaluating patient-reported outcomes following prolonged home use of the Flexitouch APCD for HNL. Of the 35 patients approved for home-based therapy, the average time from cancer treatment completion to therapy initiation was 9 months. Common symptoms included stiffness (n=31), pain (n=29), dysphagia (n=20), and swelling (n=9). Compliance was high: 33 patients used the device daily, one used it twice daily, and one was non-compliant. The average duration of use was 4.4 months. Patients reported improvements in fibrosis, daily functioning, and overall satisfaction, supporting the potential value of home-based APCD therapy.

Tritter et al (2022) conducted a small pilot study to investigate anecdotal reports of improved dysphagia and dysphonia following pneumatic compression garment therapy (PCGT) in patients with cervical lymphedema post-radiation for head and neck cancer (HNC). Seven patients who had used PCGT for at least six months were surveyed. While 85% reported subjective improvement, objective

laryngoscopic assessments showed no significant change in laryngeal edema scores (p = .975). The authors noted that low inter-rater reliability may have affected the results. Despite the lack of objective findings, the authors concluded that the strong patient-reported benefits suggest the need for further formal investigation.

Cheng et al (2023) performed a systematic review and meta-analysis of 23 studies (n=2147 participants) published through January 2023 evaluating rehabilitation interventions for HNL. Interventions were categorized as standard lymphedema therapy (e.g., standard or modified CDT, early manual lymphatic drainage, focused exercise) and adjunct therapies (e.g., APCDs, kinesio taping, photobiomodulation, acupuncture Six studies (n=399) specifically assessed the Flexitouch APCD, including one RCT and five observational studies. Intervention durations ranged from a single session to six months. Most studies involved participants who had completed or were undergoing CDT, though one study noted no CDT use among its participants. Four studies (80%) were industry-funded or had author affiliations with the manufacture. While reported outcomes were generally positive, the studies were rated as low quality due to high risk of bias. The authors concluded that APCDs may be beneficial and appear safe, but higher-quality research is needed to inform treatment guidelines.

Gregor et al (2025) conducted a proof-of-concept study to evaluate the immediate effects of external advanced pneumatic compression (APC) on pharyngeal and laryngeal head and neck cancer-related lymphedema (HNCRL) using fluoroscopic imaging. Thirty patients underwent imaging before and after a single APC session. All participants demonstrated significant reductions in both external and internal lymphedema. The authors concluded that fluoroscopy is a clinically valuable tool for detecting and quantifying internal HNL and may complement clinical assessment for detecting, monitoring, and quantifying internal HNCRL.

Pneumatic Compression for Venous Insufficiency with Venous Statis Ulcer(s)

There is insufficient evidence in the peer-reviewed literature to establish that intermittent pneumatic compression (IPC) improves outcomes in patients with chronic venous insufficiency (CVI) or venous stasis ulcers.

A Cochrane review updated by Nelson et al (2014) examined whether IPC improves the healing outcomes in patients with of venous leg ulcers. In a meta-analysis of three of the five trials the added benefit of IPC over continuous compression therapy alone, combined treatment was associated with a significantly higher healing rate. However, two of the three trials included in the meta-analysis were judged to have a high risk of bias due to issues such as lack of blinding and unclear allocation or concealment methods. Additionally, there was substantial heterogeneity among the studies, and results from other randomized controlled trials (RCTs) were not pooled. Notably, two trials comparing IPC with continuous compression (stockings or bandages) did not find statistically significant differences in healing rates between groups.

A RCT by Dolibog et al (2014), published after the Cochrane review's literature search cutoff, compared five types of compression therapy for venous leg ulcers. The study evaluated changes in ulcer surface area, volume, linear dimensions, and healing rates. The treatment modalities included: intermittent pneumatic compression (IPC) using a 12-chamber Flowtron device, compression

stockings, multilayer bandages, two-layer bandages, and Unna boots. A total of 147 patients with unilateral venous leg ulcers were randomized into one of the five treatment groups. After two months, the highest healing rates were observed in the IPC group (57%; 16/28 patients), the ulcer stocking system group (56%; 17/30), and the multilayer bandage group (58%; 17/29). In contrast, significantly lower healing rates were reported in the two-layer bandage group (16%; 5/30) and the Unna boot group (20%; 6/30).

Alvarez et al (2020) conducted a small RCT involving patients (n= 52) with large chronic venous leg ulcers (>20 cm^2). The study compared intermittent pneumatic compression (IPC) plus standard compression therapy (n=27) to standard compression therapy alone (n=25), which consisted of multilayer compression bandages. IPC was administered for one hour, twice daily. At nine months, the median time to complete wound closure was significantly shorter in the IPC group compared to the control group (141 days vs. 211 days; p=.03). Additionally, greater pain relief was reported in the IPC group during the first three weeks of treatment, although pain levels were similar between groups at later time points.

A meta-analysis by Xu and Li (2023) was retracted in August 2024 due to findings that the peer review and publishing process for the article were found to be manipulated.

Pneumatic Compression for Arterial Insufficiency

There is insufficient evidence in the peer-reviewed literature to establish that intermittent pneumatic compression (IPC) improves outcomes in patients with chronic arterial insufficiency. Preliminary studies have proposed that IPC improves exercise tolerance in a model of peripheral arterial insufficiency, in part, by enhancing blood flow to collateral-dependent tissues but further research is needed to validate use for these indications.

Moran et al (2015) conducted a systematic review on the use of intermittent pneumatic compression (IPC) for patients with critical limb ischemia (CLI) who were not candidates for revascularization. The review included two controlled before-and-after (CBA) studies and six case series; no randomized controlled trials were identified. One retrospective CBA study using calf compression reported improved limb salvage and wound healing ($p < .01$). Another prospective CBA study using sequential compression of the foot and calf showed statistically significant improvements in claudication distance and quality of life. All included studies had a high risk of bias. The authors concluded that while IPC may be associated with improvements in limb salvage, wound healing, and pain management, the treatment remains unproven due to the lack of well-designed analytical studies.

Zaki et al (2016) performed a retrospective analysis involving 187 patients with critical limb ischemia, comparing outcomes between those who used a specific sequential pneumatic compression device and those who did not receive IPC therapy. The primary endpoint was limb salvage, with secondary endpoints including amputation-free survival and improvements in toe pressure. Among device users, amputation-free survival rates were 98% at 6 months and 96% at 12 months, compared to 90% and 84%, respectively, in the non-user group. Although the difference in limb salvage was not statistically significant ($p = .714$), significant improvements were observed in rest pain ($p < .0001$), reduction in minor amputations ($p = .023$), and overall amputation-free survival (p-value not fully reported).

Non-Pneumatic Compression

There are a few manufacturer-sponsored trials published in 2022. Rockson et al (2022a) conducted an open-label pilot study to the safety, efficacy, and impact on quality of life (QoL) of a novel wearable compression device, Dayspring, for the treatment of upper extremity lymphedema secondary to breast cancer. The study enrolled 40 participants, who used the device for 28 days. Participants in the intervention group received intermittent pneumatic compression therapy for approximately 44 minutes per day, with an adherence rate of 98%. At the end of the study period, participants experienced a statistically significant 18% improvement in overall QoL, as measured by the Lymphedema Quality-of-Life Questionnaire ($p < 0.001$). Additionally, there was a statistically significant reduction in limb volume (mean decrease of 2%; range: 1–12%; $p = 0.042$). The contralateral (non-study) arm showed a negligible, non-significant volume increase of 0.4% ($p = 0.042$). The authors concluded that the Dayspring device appears to be safe, well-tolerated, and effective in improving both limb volume and quality of life in patients with breast cancer-related lymphedema. They recommended further research to validate these findings in larger, controlled trials.

Rockson et al (2022b) conducted a non-randomized, open-label study to evaluate the safety and effectiveness of the Koya Dayspring device for lower limb lymphedema. The study enrolled 24 participants who used the Dayspring lower leg garment for one hour daily over a 12-week period. Participants were encouraged to remain active while wearing the device. The primary outcomes included changes in quality of life (QoL) and lower limb volume. Only 18 participants completed the study. Results showed an 8% improvement in QoL and a 39.4% reduction in lower limb edema compared to baseline, during which no compression pump had been used. Despite these promising findings, the study was limited by its small sample size and lack of a control group. The authors concluded that while the results are encouraging, larger, well-designed, and long-term studies are needed to establish the role of nonpneumatic compression therapy in standard lymphedema treatment protocols.

Rockson et al (2022c) reported findings from the NILE study, a multicenter randomized crossover head-to-head trial comparing the novel nonpneumatic Koya Dayspring to the APCD, the Flexitouch, in 50 adult women with unilateral breast cancer-related upper extremity lymphedema. Participants were randomized to use either the nonpneumatic compression device (NPCD) or the APCD for 28 days, followed by a 4-week washout period, and then crossed over to the alternate device for another 28 days. Compared to the APCD, NPCD resulted in a significantly greater mean reduction in limb edema volume (64.6% vs. 27.7%; $p < .001$), greater improvements in QoL scores, higher adherence (95.6% vs. 49.8%; $p < .001$), and greater patient satisfaction (90% vs. 14%; $p < .001$). Participants also reported that the NPCD facilitated exercise and was more convenient for travel. No adverse events were reported. No adverse events were reported. There was a significant difference in reported compliance between groups, with 95.6% of Dayspring subjects complying with the 60-minute per day therapy and only 49.8% of the control group subjects complying. The authors concluded that the NPCD was noninferior to the APCD in reducing edema volume and offered superior outcomes in symptom relief, adherence, and patient satisfaction.

Barfield et al (2025) conducted the TEAYS study, a randomized, prospective, multicenter, crossover

head-to-head trial designed to evaluate the safety and efficacy of a novel NPCD compared to an APCD for treating lower extremity lymphedema. Following a 30-day washout period without pneumatic therapy, 71 patients (108 affected limbs) were randomized to receive either NPCD or APCD treatment for 90 consecutive days. After this initial phase, participants underwent another 30-day washout period before crossing over to the alternate device for an additional 90 days. Outcome measurements were assessed at baseline and at the end of each 90-day treatment period, with patient-reported outcomes collected at the conclusion of the study. The NPCD group demonstrated a significantly greater mean reduction in limb edema volume compared to the APCD group (369.9 mL vs. 83.1 mL; $p < .05$). Quality of life improvements were also significantly greater with NPCD (mean change of 1.01; $p < .05$) compared to APCD (0.17; $p > .05$). Additionally, patients reported higher adherence with the NPCD (81% vs. 56%; $p < .001$) and greater satisfaction (78% vs. 22%). No device-related adverse events were reported. While the study was industry-funded and subject to potential biases common in crossover designs, the authors concluded that the TEAYS findings, in conjunction with prior research, support the NPCD as a differentiated and potentially superior treatment option for managing lower extremity lymphedema.

PROFESSIONAL GUIDELINE(S)

Pneumatic Compression for Lymphedema

In 2022, the American Venous Forum (AVF), American Vein and Lymphatic Society (AVLS), and the Society for Vascular Medicine (SVM) published an expert opinion consensus statement on lymphedema diagnosis and treatment (Lurie 2022). The following statements were issued regarding use of pneumatic compression:

- "Sequential pneumatic compression should be recommended for lymphedema patients." (92% panel agreement; 32% strongly agree)
- "Sequential pneumatic compression should be used for treatment of early stages of lymphedema." (62% panel agreement - consensus not reached; 38% panel disagreement; 2% strongly disagreed)

Pneumatic Compression for Venous Insufficiency with Venous Ulcer(s)

According to the 2014 joint guidelines from the Society for Vascular Surgery and the American Venous Forum on the management of venous ulcers, when IPC is used, rapid compression cycling appears to improve ulcer healing rates compared to slow cycling (86% vs 61% at 6 months; p=.003) (O'Donnell 2014). The guidelines state:

- "We suggest use of intermittent pneumatic compression when other compression options are not available, cannot be used, or have failed to aid in venous leg ulcer healing after prolonged compression therapy." (Grade – 2, Level of Evidence – C).

The 2025 NCCN clinical practice guidelines on cancer survivorship, version 2.2025, recommend education to identify signs and symptoms of lymphedema, as well as self-care management, skin care, and self-bandaging. The guidelines also recommend consideration of compression garments, manual lymphatic drainage, and pneumatic compression for ongoing home management.

The Wound Healing Society updated guidelines for venous ulcers in 2015 (Marston 2016). The guidelines recommend that for patients with venous ulcers, intermittent pneumatic pressure can be used with or without compression dressings and can provide another option in patients who cannot or will not use an adequate compression dressing system. Venous ulcers of the lower extremity are a chronic, long-term problem. Recurrence rates are as high as 70%; therefore, long-term maintenance must be addressed even for healed ulcers.

In 2019, the American Academy of Family Physicians published recommendations for diagnosis and treatment of venous ulcers (Bonkemeyer 2019). The following statements were issued regarding use of intermittent pneumatic compression.

- "Intermittent pneumatic compression may be considered when there is generalized, refractory edema from venous insufficiency; lymphatic obstruction; and significant ulceration of the lower extremity. Although intermittent pneumatic compression is more effective than no compression, its effectiveness compared with other forms of compression is unclear. Intermittent pneumatic compression may improve ulcer healing when added to layered compression."

In 2022, the AFF/AFLS/SVM expert opinion consensus on lymphedema diagnosis and treatment reached consensus that all patients with chronic venous insufficiency (C3–C6) should be considered for treatment similar to lymphedema patients (Lurie 2022). Studies have demonstrated that sequential pneumatic compression (SPC) results in more rapid healing of chronic venous stasis ulcerations compared to traditional compression bandages.

The 2022 European Society for Vascular Surgery (ESVS) issued clinical practice guidelines on the management of chronic venous disease of the lower limbs (De Maeseneer 2022).

- IPC has a limited role in the conservative treatment of CVD. There are no consistent data available on the use of IPC in CEAP clinical class $C0_S$ - C4.
- For patients with active venous leg ulceration, intermittent pneumatic compression should be considered when other compression options are not available, cannot be used, or have failed to promote ulcer healing. (Class IIb recommendation; Level of evidence B)

<u>Pneumatic Compression for Arterial Insufficiency</u>

The Wound Healing Society updated its guidelines in 2023 for the treatment of arterial insufficiency ulcers, reaffirming its 2014 recommendation. The guidelines state that intermittent pneumatic compression (IPC) can increase blood flow and may be beneficial for limbs with impaired distal perfusion, either as a pre- or post-revascularization intervention (Level II evidence) (Federman 2014, 2024).

In 2024, the American College of Cardiology (ACC) and the American Heart Association (AHA), in collaboration with other organizations, issued a joint clinical practice guideline for the management of lower extremity peripheral artery disease (PAD) (Gornik 2024). For patients with chronic limb-threatening ischemia (CLTI) who are not candidates for revascularization, the use of arterial IPC devices may be considered to support wound healing and alleviate ischemic rest pain. This

recommendation carries a Class 2b strength (weak recommendation) and is based on moderate-quality evidence from non-randomized studies.

REGULATORY STATUS

The Federal Women's Health and Cancer Right Act (WHRCA) of 1998, as well as the New York Insurance Law, mandates coverage of all stages of reconstructive surgery (including surgery and reconstruction of other breast to produce symmetrical appearance, chest wall reconstruction, prosthesis and treatment of physical complication following mastectomy such as lymphedema) for all group health plans, whether insured or self-funded, that provide medical and surgical benefits including mastectomies. Federal laws do not require a diagnosis of breast cancer (preventive mastectomies are also covered).

According to the New York State Insurance Laws for prostheses and physical complications of all stages of the mastectomy, including lymphedemas, while an issuer may perform a medical necessity review of these items or services, the issuer should use appropriate written clinical criteria and the most recent medical literature to determine medical necessity.

The United States Food and Drug Administration (FDA) regulates compression pumps as medical devices. All devices require FDA approval before marketing and use in the United States to ensure they are safe and effective for human use. Refer to the FDA Medical Device website. Available from: https://www.fda.gov/medical-devices [accessed 2025 Oct 21]

The FDA lists the most serious type of medical device recalls as well as early alert communications about corrective actions being taken by companies that the FDA believes are likely to be the most serious type of recalls. on our website by the date that the FDA posts the information on our website. Available from: https://www.fda.gov/medical-devices/medical-device-safety/medical-device-recalls [accessed 2025 Oct 21]

Pneumatic Compression

Several pneumatic compression pumps, indicated for the primary or adjunctive treatment of primary or secondary (e.g., postmastectomy) lymphedema, have been cleared for marketing by the U.S. Food and Drug Administration (FDA) through the 510(k) process. Examples of devices with these indications intended for home or clinic/hospital use include the Sequential Circulator (Bio Compression Systems); the Lympha-Press and Lympha-Press Optimal (Mego Afek); the Flexitouch and Flexitouch Plus systems (Tactile Medical, formerly Tactile Systems Technology); the Powerpress Unit Sequential Circulator (Neomedic); and the EzLymph and EzLymph M (EEZCare Medical).

Several pneumatic compression devices have been cleared by the FDA for treatment of venous stasis ulcers. Examples include the Lympha-Press, Flexitouch, Flexitouch Plus, and Recovery+ (Pulsar Scientific).

Non-Pneumatic Compression

In 2021, the FDA granted Class II 510(k) clearance for marketing two non-pneumatic, battery-operated, wearable compressible limb devices: the Koya Dayspring System and Dayspring Lite.

- Koya Dayspring system is a prescription-only wearable compression device designed to enhance lymphatic flow. It is indicated for a wide range of conditions, including lymphedema (primary and secondary), post-mastectomy edema, edema following trauma or sports injuries, post-immobilization edema, venous insufficiency, delayed wound healing, stasis dermatitis, venous stasis ulcers, arterial and diabetic leg ulcers, lipedema, and phlebolymphedema.
- Dayspring Lite is also a prescription-only wearable compression system, indicated for the treatment of chronic edema, lymphedema, venous insufficiency, and to support wound healing.

In 2008, the Venowave VW5 initially received FDA clearance in 2008 and was granted an updated 510(k) approval in 2024. This nonpneumatic, battery-operated device is intended for use in adults (18 years and older) to manage symptoms associated with post-thrombotic syndrome (PTS), reduce postoperative pain and swelling, and improve blood circulation. It is also indicated for the prevention of deep vein thrombosis (DVT), primary thrombosis, lymphedema, leg swelling due to vascular insufficiency, varicose veins, chronic venous insufficiency, and intermittent claudication.

The 2024 updated contraindications for the Venowave VW5 specify that the device "should not be used to treat patients who have open or freshly healed ulcers, other wounds, or otherwise fragile skin between the knee and ankle of the leg to be treated."

MEDICAL POLICY

Medical Policy Title	**Private Rooms**
Policy Number	**12.01.06**
Current Effective Date	**November 1, 2026**
Next Review Date	**November 2027**

Our medical policies are based on the assessment of evidence based, peer-reviewed literature, and professional guidelines. Eligibility for reimbursement is based upon the benefits set forth in the member's subscriber contract. (Link to Product Disclaimer)

POLICY STATEMENT(S)

I. Private rooms are generally excluded from coverage under the Health Plan's subscriber contracts and certificates.

II. A Health Plan Medical Director will review the physician's order and the patient's clinical record upon receipt of a request for a private room and may determine that a private room is **medically necessary** based on **ANY** of the following indications:

A. Patient has a contagious disease, and isolation is indicated to prevent its spread;

B. Patient is immunocompromised, and the risk of infection is serious;

C. Patient has radiation implants;

D. Patient has severe burns, there is no available bed in a burn unit;

E. Patient is a danger to self or others and requires one-on-one care by a staff member or seclusion due to extreme psychological conditions;

F. Patient has severe eclampsia.

PROFESSIONAL GUIDELINE(S)

Proprietary Information of Capital District Physicians' Health Plan, Inc. | CDPHP Universal Benefits,® Inc. | Capital District Physicians' Healthcare Network, Inc.

The Center for Disease Control's (CDC) guideline for isolation precautions to prevent transmission of infectious agents in the health care setting (CDC 2007, updated 2024) state single patient rooms are preferred when there is a concern about transmission of an infectious agent. Single-patient rooms are always indicated for patients placed on airborne precautions and in a protective environment and are preferred for patients who require contact or droplet precautions. They go on to say when there are only a limited number of single-patient rooms, it is prudent to prioritize them for those patients who have conditions that facilitate transmission of infectious material to other patients (e.g., draining wounds, stool incontinence, uncontained secretions) and for those who are at increased risk of acquisition and adverse outcomes resulting from hospital acquired infections (HAI) (e.g., immunosuppression).

RESOURCE COORDINATION POLICY

Capital District Physicians' Health Plan, Inc.
CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: PROSTATE RECTAL SPACERS

POLICY EFFECTIVE DATE:	10/1/2023
Policy Control #:	1370/20.000505
Next Annual Review:	January, 2027

DISCLAIMER

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgement when deciding the most appropriate care to enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

PROCEDURE CODES

55874

DESCRIPTION

Prostate rectal spacers are various materials or devices placed between the prostate and anterior wall of the rectum for use in men receiving radiation therapy for prostate cancer. The anterior wall of the rectum is considered a major dose-limiting factor in radiation therapy of prostate cancer. Physical separation is proposed to allow reduced toxicity and treatment intensification.

The SpaceOAR(R) System is made up of materials that break down naturally by the action of biological agents and is placed inside the patient through a needle. The system retains its position throughout the duration of the patient's radiotherapy treatments and because the system is biodegradable, is absorbed by the patient's body over time.

Barrigel, an injectable gel, is an advanced prostate spacer made from Non-Animal Stabilized Hyaluronic Acid (known as NASHA®). It is used for separation of the prostate and rectum during radiotherapy. It is indicated to temporarily position the anterior wall of the rectum away from the prostate during radiotherapy for localized prostate cancer; and in creating this space, it is the intent of Barrigel to reduce the radiation dose delivered to the anterior rectum. Barrigel is composed of biodegradable hyaluronic acid and maintains space for the entire course of prostate radiotherapy treatment; and it is absorbed by the patient's body over time.

Capital District Physicians' Health Plan, Inc.
CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: PROSTATE RECTAL SPACERS

POSITION STATEMENT

CDPHP considers transperineal periprostatic placement of biodegradable material (i.e., SpaceOAR, Barrigel) medically necessary in patients with clinically localized prostate cancer when **both** of the following are met:

1. All of the following criteria are met:
   - Low* or favorable intermediate prostate cancer risk group (AUA or NCCN criteria)
   - Dose escalated (≥ 76 Gy) conventional fractionation (1.8-2 Gy fractions) or moderate hypofractionation (HFX) (2.4-3.4 Gy fractions) IG-IMRT planned
   - Eastern Cooperative Oncology Group (ECOG) performance status ≤ 1
   - Modern localization techniques insufficient to improve oncologic cure rates and/or reduce side effects due to at least one of the following:
     - Anatomic geometry precluding ideal rectal constraints
       - (V70 < 10%, V65 < 2 0%, V40 < 40%)
       - Moderate HPX (dose constraints not yet standardized; employ those used in the supporting phase III trials)
     - Medication usage (e.g., anticoagulants)
     - Comorbid conditions (e.g., increased age, history of MI or CHF)

and

2. None of the following criteria exist:
   - Less than five-year life expectancy and asymptomatic
   - Prior prostate cancer treatment (surgery or radiation therapy)
   - Active bleeding disorder or clinically significant coagulopathy
   - Active inflammatory or infectious disease in the perineum or injection area (e.g., prostatitis, anorectal IBD)
   - Prostate volume > 80 cc

*Life expectancy ≥ 20 y (very low risk); ≥ 10 y (low risk)

POLICY CONSIDERATIONS

Use of a prostate rectal spacer is allowed **once** for enrollees with clinically localized prostate cancer meeting the criteria stated above in policy.

The Eastern Cooperative Oncology group (ECOG) performance Status can be accessed at: ECOG Performance Status.

EXCLUSIONS

Patients with obvious rectal invasion or visible T3 and posterior extension should not undergo perirectal spacer implantation.

POLICY NAME: PROTON BEAM THERAPY

POLICY EFFECTIVE DATE:	1/1/2020
Policy Control #:	1370/20.000495
Next Annual Review:	March, 2027

DISCLAIMER

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgement when deciding the most appropriate care to enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

PROCEDURE CODES

77520, 77522, 77523, 77525

DESCRIPTION

Proton beam therapy (PBT) is a form of external radiotherapy in which positively charged subatomic particles (protons) are precisely targeted to a specific tissue mass using a sophisticated stereotactic treatment planning-and-delivery system. The goal of proton beam therapy is to deliver a higher target dose with lower normal tissue exposure than is possible with conventional photon irradiation, thereby improving local control of tumors and reducing acute and late complications.

RELATED POLICIES/DOCUMENTS

Resource Coordination Policies:

Stereotactic Radiosurgery, 1370/20.000434

POSITION STATEMENT

CDPHP administers benefits for proton beam therapy in accordance with the Centers for Medicaid & Medicare Services local coverage determination as outlined below.

POLICY NAME: PROTON BEAM THERAPY

PBT is considered reasonable and necessary in instances where sparing the surrounding normal tissue cannot be adequately achieved with photon-based radiotherapy and is of added clinical benefit to the patient.

- The target volume is in close proximity to one or more critical structures, and a steep dose gradient outside the target must be achieved to avoid exceeding the tolerance dose to the critical structure(s).
- A decrease in the amount of dose inhomogeneity in a large treatment volume is required to avoid an excessive dose "hotspot" within the treated volume to lessen the risk of excessive early or late normal tissue toxicity.
- A photon-based technique would increase the probability of clinically meaningful normal tissue toxicity by exceeding an integral dose-based metric associated with toxicity.
- The same or an immediately adjacent area has been previously irradiated, and the dose distribution within the patient must be sculpted to avoid exceeding the cumulative tolerance dose of nearby normal tissue.

Proton beam therapy is considered medically necessary for any of the following conditions meeting at least one of the above stated criteria:

- Ocular tumors, including intraocular melanomas and melanoma of the uveal tract (includes the iris, ciliary body, and choroid)
- Tumors that approach or are located at the base of skull, including but not limited to:
    - Chordoma
    - Chondrosarcoma
    - Primary or metastatic tumors of the spine where the spinal cord tolerance may be exceeded with conventional treatment or where the spinal cord has previously been irradiated
- Unresectable benign or malignant central nervous system tumors to include but not be limited to primary and variant forms of astrocytoma, glioblastoma, medulloblastoma, acoustic neuroma, craniopharyngioma, benign and atypical meningiomas, pineal gland tumors, and arteriovenous malformations
- Primary hepatocellular cancer treated in a hypofractionated regimen
- Primary or benign solid tumors in children treated with curative intent and occasional palliative treatment when at least one of the four criteria noted above apply
- Patients with genetic syndromes making total volume of radiation minimization crucial, such as, but not limited to, NF-1 patients and retinoblastoma patients
- Pituitary neoplasm
- Advanced staged (e.g., T4) and/or unresectable lesions of the head and neck
- Malignant lesions of the paranasal sinuses and other accessory sinuses
- Unresectable retroperitoneal sarcomas

Capital District Physicians' Health Plan, Inc.
CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: PROTON BEAM THERAPY

While proton beam therapy is not a new technology, there is a need for continued clinical-evidence development and comparative-effectiveness analyses for the appropriate use of PBT for various disease sites. Coverage is provided for the following indications as long as the patient is enrolled in either an IRB-approved clinical trial or in a multi-institutional patient registry adhering to care requirements for clinical evidence development.

- Unresectable lung cancers and upper abdominal/peri-diaphragmatic cancers
- Advanced-stage, unresectable pelvic tumors including those with periaortic nodes or malignant lesions of the cervix
- Breast cancers
- Unresectable pancreatic and adrenal tumors
- Skin cancer with macroscopic perineural/cranial nerve invasion of skull base
- Unresectable malignant lesions of the liver, biliary tract, anal canal, and rectum
- Prostate cancer, without distant metastases
- Hodgkin or Non-Hodgkin Lymphoma involving the mediastinum or in non-mediastinal sites where PBT has the potential to reduce the risk of pneumonitis or late effects of radiation therapy (secondary malignancy, cardiovascular disease, or other chronic health conditions)
- Re-irradiation where prior radiation therapy to the site is the governing factor necessitating PBT in lieu of other radiotherapy

<u>Prostate Cancer</u>
Coverage and payments of proton beam therapy for prostate cancer will require:

a) Physician documentation of patient selection criteria (stage and other factors as represented in the NCCN guidelines);
b) Documentation and verification that the patient was informed of the range of therapy choices, including risks and benefits.

<u>Documentation Requirements:</u>

Documentation in the patient medical record must:

1. Support one or more medical necessity requirement(s) as stated above.
2. Include a treatment prescription that defines the goals of the treatment plan— including specific dose-volume parameters for the target and nearby critical structures--as well as pertinent details of beam delivery, such as method of beam modulation, field arrangement, and expected positional and range uncertainties.
3. Include a treatment plan, signed by a physician that meets the prescribed dose-volume parameters for the clinical target volume (CTV) and surrounding organs at risk (OARs) in the presence of expected uncertainties.
4. Describe the target setup verification methodology, including patient positioning, immobilization, and use of image guidance.
5. Include verification of planned dose distribution via independent dose calculation or physical measurement.

PROCEDURE CODES

96130, 96131, 96136, 96137, 96138, 96139, 96146

DESCRIPTION

Psychological testing is a set of formal written, visual, or verbal evaluations that make use of reliable and valid tests. Testing is done to assess intellectual and cognitive ability, executive functioning, psychopathology, personality style and organization, emotional and/or interpersonal processes, behavioral functioning, and adaptive skills for the purposes of diagnostic clarification and treatment planning.

Neuropsychological Testing 1370/20.000416

BEHAVIORAL HEALTH
RESOURCE COORDINATION POLICY

Capital District Physicians' Health Plan, Inc.
CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: PSYCHOLOGICAL TESTING

POSITION STATEMENT

CDPHP administers benefits for psychological testing, under the mental health portion of the contract, when one or more of the indications listed below are met.

For psychological testing to be authorized, it is assumed that the testing is being requested because face-to-face clinical evaluation, behavioral rating scales, review of pertinent history and/or consultation with collateral sources are insufficient to determine diagnostic clarification and/or establish a treatment plan. Psychological testing is considered medically necessary for the following indications:

- Psychological testing contributes necessary clinical information for differential diagnostic clarification.
- Designing a treatment plan would be ineffective and/or inefficient without information that can only be obtained by psychological testing.
- Results of psychological testing are required to formulate an initial treatment plan or are required to make necessary revisions to an existing treatment plan.
- An individual has undergone a course of psychological or psychiatric treatment and the response is not as expected from the treatment plan.
- Evaluation of an individual's functional capability to participate in behavioral health treatment.
- To do ADHD assessment testing when there is a documented issue of differential diagnosis and to facilitate treatment planning.
- To do pervasive developmental disorders assessment testing when there is a documented issue of differential diagnosis and to facilitate treatment planning.
- Bariatric pre-surgical psychological testing is conducted when needing to rule out psychiatric conditions potentially contra-indicative of surgery, and/or to evaluate the individual's ability to understand the risks of surgery, and/or evaluate the individual's ability to participate responsibly in post-surgical recovery behaviors and lifestyle changes.

Psychological testing is performed by licensed psychologists (Ph.D., Psy.D), with training and expertise in the types of tests/assessment being requested and who can perform them at a level proficient to interpret testing data.

POLICY CONSIDERATIONS

Psychological testing will apply against an enrollee's outpatient mental health benefit.

The reimbursable time for test administration is based on published standards or time(s) reported by the test publisher and/or in published test usage surveys of psychologists engaged in testing activities.

Capital District Physicians' Health Plan, Inc.
CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: PSYCHOLOGICAL TESTING

EXCLUSIONS

Psychological testing is **not** considered reasonable and necessary for the following indications:

- The use of psychological testing for primarily educational purposes (e.g., to rule out learning disability, determine learning style and/or assess academic achievement), or to provide support for academic accommodations.
- The use of psychological testing for an individual with an alcohol or drug diagnosis and less than 90 days of abstinence.
- Other sources of the same information are available (e.g., clinical interview, behavioral observations, or review of pertinent history).
- When psychological assessments can be obtained through the clinical evaluation alone.
- When testing has been performed in the last 12 months, unless clinical indicated to assess for rapid change in cognitive functioning or changes associated with medication changes.
- The diagnosis appears clear without testing.
- The results of testing will have no significant effect on the design or implementation of the treatment plan for a psychological disorder.
- The rationale for testing is vague and without a specific outcome measure (e.g., "my child's pediatrician is asking for it").
- Testing is for legal purposes including custody evaluations, parenting assessments, or other court ordered requests.
- Testing related to licensure/certification or career or workplace behaviors.
- The results of testing are primarily used for admission into a crisis center or an acute care treatment facility.
- When administered or scored by technicians not meeting the requirements outlined in the NYS Office of the Professions Education Law.
- When administered using a computerized automated instrument (96146) as it does not require a physician, psychologist or licensed mental health provider to provide interpretation and preparation of the report.

CDPHP PRODUCT VARIATIONS

CHILD HEALTH PLUS:	Subject to all terms and conditions noted above in the policy.
MEDICARE ADVANTAGE:	Subject to all terms and conditions noted above in the policy.

Background

Peripheral neuropathy is characterized by weakness, numbness, and pain that results from damage to the peripheral nerves located outside the brain and spinal cord. These symptoms can range from mild to debilitating but are rarely life-threatening. Symptoms can develop over the course of several days to several years. Peripheral neuropathy often results from another condition that causes damage in the peripheral nerves, one such condition being herpes zoster.

Postherpetic Neuralgia (PHN) is classified as the persistence of pain three months after the resolution of an outbreak of latent herpes zoster. It can affect 10 to 15 percent of patients who recover from an acute zoster outbreak. Postherpetic neuralgia is a painful chronic condition that can severely limit a patient's quality of life. The pain can manifest as a burning, aching, itching, or electric-shock-like feeling. It can lead to dysesthesias, paresthesia, and allodynia.

The American Academy of Neurology Practice Parameter on the treatment of postherpetic neuralgia (2004) has been retired but the Neuropathic Pain Special Interest Group (NeuPSIG) of the International Association for the Study of Pain conducted a systemic review and published their meta-analysis in 2015. Based on their GRADE classification gabapentin or pregabalin, tricyclic antidepressants, and the SNRIs duloxetine or venlafaxine are recommended as first line therapy. Capsaicin and lidocaine are reserved as second line treatment.

Diabetic Peripheral Neuropathy (DPN) is the onset of peripheral neuropathy caused by nerve damage resulting from high blood glucose. Half of all people with diabetes have some form of nerve damage, and often this nerve damage manifests as peripheral neuropathy of the hands and feet. Current guidelines from the American Diabetes Association suggest the use of pregabalin, gabapentin, and duloxetine as first line agents, with tricyclic antidepressants, venlafaxine, and carbamazepine as possible alternative treatment.

Qutenza®, is a high concentration capsaicin patch. It was shown to provide sustained pain relief over three months after one application with an average 30 percent decrease in numeric pain-rating-scale scores compared to placebo. Consistent with recognized evidence-based and peer-reviewed clinical criteria, the following policy is described.

Summary

Effective date of policy:	12/3/2025
Indications	Management of neuropathic pain with postherpetic neuralgia (PHN) and diabetic peripheral neuropathy (DPN) of the feet
ICD10 diagnosis codes	B02.23, B02.29, E08.40, E08.42, E10.40, E10.41, E10.42, E11.40, E11.41, E11.42, E13.40, E13.41, E13.42
Availability	Qutenza (capsaicin) 8% contains 179 mg per patch, J7336
Duration	Initial approval: Three (3) months; Continued approval: Twelve (12) months

Required Criteria for Initial Approval

All of the following conditions for the requested indication must be met in order to approve Qutenza:

Indication	Inclusion	Recommended Dosing Regimen
Postherpectic neuralgia (PHN) (FDA approval) ICD10:B02.23, B02.29	• The enrollee must have chronic PHN that has persisted for at least six months. • Documented date of onset of the zoster episode and location of the affected area are provided as part of the request for coverage. • Must be administered by a physician or by health care professionals under the direct supervision of a physician in an office-based setting. • Previous history that conventional PHN treatment courses of at least 30 days with each of the following medications was ineffective, unless contraindicated: o Gabapentin (Neurontin) or pregabalin (Lyrica); **and** o Either one SNRI or tricyclic antidepressant	Single 60-minute application of up to four patches every three months as needed

	○ SNRI: Duloxetine (Cymbalta) or venlafaxine (Effexor) ○ Tricyclic antidepressant: amitriptyline (Elavil), desipramine (Norpramin), or nortriptyline (Pamelor).	
Diabetic Neuropathy of the Feet (FDA approval) ICD: E08.40, E08.42, E10.40, E10.41, E10.42, E11.40, E11.41, E11.42, E13.40, E13.41, E13.42	• Must be administered by a physician or by health care professionals under the direct supervision of a physician in an office-based setting. • Previous history that conventional DPN treatment courses of at least 30 days with each of the following medications was ineffective, unless contraindicated: ○ Gabapentin (Neurontin) or pregabalin (Lyrica); **and** ○ Either one SNRI or tricyclic antidepressant ○ SNRI: Duloxetine (Cymbalta) or venlafaxine (Effexor) ○ Tricyclic antidepressant: amitriptyline (Elavil), desipramine (Norpramin), or nortriptyline (Pamelor). • Documented date of onset of the neuropathy and location of the affected area are provided as part of the request for coverage.	Single 30-minute application of up to four patches every three months as needed

Continuation Criteria

- Requests must include information on patient response to the initial treatment, and if approved, Qutenza will be approved for a period of up to 12 months (up to four patches per dose, no more often than every 12 weeks).
- Clinical response is maintained and there is an absence of unacceptable toxicity from the drug.

Considerations

- Prior authorization is obtained through the CDPHP pharmacy department.
- Prescription drug coverage with CDPHP is not required.
- Coverage for Qutenza® will be administered as a medical benefit when obtained and administered by a participating practitioner.
- Initial coverage approval will be for a single three-month treatment course of up to four patches.
- Requests for off-label uses of Qutenza® will be reviewed on a case-by-case basis. Please refer to pharmacy policy, Off-Label Uses of FDA Approved Drugs, control # 1350/20.000048.

Date	Notes
04/2012	New Policy
04/2013, 04/2014, 04/2015, 04/2018, 04/2019, 04/2020, 04/2021, 12/2022, 12/2025	Reviewed with no changes
04/2016, 04/2017,	Revised
10/2021	Updated to include pregabalin as an acceptable prerequisite for post herpetic neuralgia and diabetic peripheral neuropathy. Added the new indication for diabetic peripheral neuropathy. Added SNRIs duloxetine and venlafaxine to possible prerequisite treatments to diabetic peripheral neuropathy along with the tricyclic antidepressants.
12/2023	Updated background and references to reflect the AAN guideline being retired. Added additional/new supportive evidence of first and second line treatments. Added SNRIs duloxetine and venlafaxine to possible prerequisite treatments for postherpetic neuralgia.
12/2024	Revised. Added additional ICD 10 codes.

(CDPHP UBI), and Capital District Physicians' Healthcare Network, Inc. (CDPHN). The contents and form of this policy are proprietary to CDPHP. Any reproduction or replication of this policy without the express written permission of CDPHP, CDPHP UBI, and CDPHN is strictly prohibited. This policy is subject to contractual limitations and/or parameters established in any Employer sponsored Summary Plan Description (SPD) and/or Benefit Design Document (BDD).

Disclaimer Notice

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to healthcare practitioners how to provide appropriate healthcare to their patients. Healthcare practitioners shall exercise their own medical judgment when deciding the most appropriate care to enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing healthcare services. CDPHP reserves the right to review this policy at any time and change it without notice.

Background

A disease is considered rare if it affects less than 200,000 people in the United States. There are over 10,000 rare diseases and it is estimated that more than 30 million Americans live with a rare disease. The exact cause for many rare diseases remains unknown but it is believed that most are linked to a genetic mutation - approximately 80% of rare diseases have a genetic origin. Still, environmental factors may also play a role in some of these conditions. Considerable progress has been made in recent years to find ways to diagnose and treat rare diseases.

Summary

Effective Date of Policy:	10/1/2026

Actimmune (Interferon Gamma-1B) – Rx and Medical

1. For the treatment of Chronic Granulomatous Disease
    a. The prescribing physician is an infectious disease specialist or a hematologist/oncologist
    b. Diagnosis has been confirmed through neutrophil function tests
    c. Combination therapy with antibiotics (i.e., trimethoprim/sulfamethoxazole) and/or antifungals (i.e., itraconazole) have been shown to reduce the risk of severe infections.
2. In the treatment of severe, malignant osteopetrosis
    a. The prescribing physician is an orthopedic surgeon, hematologist, or an endocrinologist
    b. The diagnosis is confirmed through radiological evidence.
3. Approved dosing for those with a body surface area greater than 0.5 m^2 is 50 mcg/m^2 (1 million units/m^2) subcutaneously 3 times a week.
4. Doses above 50 mcg/m^2 will not be authorized.
5. Actimmune can be self-administered and therefore will be covered under the pharmacy benefit.
6. Actimmune will only be covered under the medical benefit if there is documentation that the patient has an inability to self-inject. For pediatric patients < 18 years of age, documentation must also include the inability of a caregiver to administer the medication. Self-injection criteria applies to:
    a. New Starts and recertification requests for all lines of business except Medicare Advantage.
7. Quantity limit: 1 vial per 28 days. Upon each review and dose escalation request, the allowed quantity will be reviewed in accordance with FDA-approved BSA-based dosing and, as such, will be limited to the minimum number of vials to obtain the appropriate weekly dose. For pediatric patients, a higher quantity may be allowed based on the patient's predicted growth, on a case-by-case basis.

Adzynma (apadamtase alfa) - Medical

1. Must be prescribed by, or in consultation with, a hematologist AND
2. Must have a diagnosis of congenital thrombotic thrombocytopenic purpura (cTTP) confirmed by all of the following (a, b, and c):
    a. ADAMTS13 activity < 10% AND
    b. Molecular genetic testing confirming a pathogenic variant or mutation of the ADAMTS13 gene [characterized by homozygous or compound heterozygous mutations] AND
3. Requests for prophylactic use of Adzynma for individuals new to therapy will require:
    a. The patient has a history of at least one documented TTP event OR
    b. The patient is currently receiving prophylactic therapy with commercially available plasma-based therapies (e.g., fresh frozen plasma, solvent/detergent-treated plasma, factor VIII/VWF concentrations)
4. See prescribing information for full dosing and administration information
5. Adzynma will not be authorized for any other non-FDA approved indication including immune mediated or acquired TTP

6. Initial approval will be for 6 months. Recertification will be for 12 months at a time and require documentation OR provider attestation that the following are met (a and b):
    a. The patient is responding to therapy (e.g., improvement in acute TTP events, TTP manifestations, thrombocytopenia events, microangiopathic hemolytic anemia events) AND
    b. Patient is not routinely using prophylactic plasma-based therapies OR routine use of prophylactic plasma-based therapies will be discontinued

HCPCS: J7171

Aldurazyme (laronidase) - Medical

1. Must have a diagnosis of Hurler, Hurler-Scheie, or Scheie form of MPS I confirmed by biochemical enzyme analysis for alpha-L-iduronidase enzyme deficiency in white blood cells or cultured skin fibroblasts
2. Patient must be followed by a physician experienced in metabolic disorders
3. Must have an affected 1st degree relative OR have clinical symptoms of the disease such as: Valvular heart disease, cardiomyopathy, obstructive sleep apnea, restrictive lung disease, reactive airway disease, joint stiffness, joint contractures, joint pain, spinal deformities, corneal clouding, glaucoma, developmental delay, mental retardation, communicating hydrocephalus, hearing loss, hepatomegaly, inguinal/umbilical hernia, and chronic infections
4. Must be ≥ 6 months of age
5. Current body weight and requested dose regimen must be submitted for initial review and each recertification request
6. Recommended Dosing: 0.58 mg/kg IV infusion once weekly

HCPCS: J1931

Aqvesme (mitapivat) - Rx

1. **Aqvesme is considered medically necessary for the treatment of anemia in <u>non-transfusion dependent alpha(α)-or beta(β)-thalassemia</u> when the following criteria are met:**
    i. Must have a diagnosis of α- or β-thalassemia (β-thalassemia with or without α-globin gene mutations, hemoglobin E (HbE)/β-thalassemia, or α-thalassemia (including hemoglobin H (HbH) disease)) based on Hb electrophoresis, Hb high-performance liquid chromatography (HPLC), and/or DNA analysis
        a. Aqvesme will not be covered for any other diagnoses including homozygous or heterozygous sickle hemoglobin (HbS) or hemoglobin C (HbC)
    ii. Must be at least 18 years of age
    iii. Must be prescribed by or in consultation with a hematologist or physician knowledgeable in the treatment of thalassemia
    iv. Must have documentation of hemoglobin (Hb) concentration ≤ 10.0 grams per deciliter (g/dL), based on an average of at least <u>two</u> Hb concentration measurements (separated by ≥ 7 days)
    v. Must be non-transfusion-dependent, defined as (a and b):
        a. ≤ 5 red blood cell (RBC) units transfused in the previous 24 weeks **AND**
        b. No RBC transfusion within the previous 8 weeks
    vi. Initial approval will be granted for 6 months. Recertification will require documented achieved hemoglobin response, defined as an increase in Hb by 1 g/dL or greater from baseline, based on an average of at least <u>two</u> Hb concentration measurements (separated by ≥ 4 weeks). Recertification will be for 12 months at a time.

2. **Aqvesme is considered medically necessary for the treatment of anemia in <u>transfusion-dependent alpha(α)-or beta(β)-thalassemia</u> when the following criteria are met:**
    i. Must have a diagnosis of α- or β-thalassemia (β-thalassemia with or without α-globin gene mutations, hemoglobin E (HbE)/β-thalassemia, or α-thalassemia (including hemoglobin H (HbH) disease)) based on Hb electrophoresis, Hb high-performance liquid chromatography (HPLC), and/or DNA analysis
        a. Aqvesme will not be covered for any other diagnoses including homozygous or heterozygous sickle hemoglobin (Hb S) or hemoglobin C (Hb C)
    ii. Must be at least 18 years of age
    iii. Must be prescribed by or in consultation with a hematologist or physician knowledgeable in the treatment of thalassemia
    iv. Must be transfusion-dependent, defined as (a and b):
        a. 6 to 20 red blood cells (RBC) units transfused in the previous 24 weeks **AND**
        b. Transfusion-free period no longer than 6 weeks in the previous 24 weeks
    v. **For individuals with <u>transfusion-dependent beta-thalassemia</u>**, must have serious side effects or drug failure with Reblozyl. This requirement does not apply to individuals with prior splenectomy.

a. This applies to new starts only

vi. Initial approval will be granted for 6 months. Recertification will require documented reduction in RBC transfusion burden after receiving Aqvesme. Recertification will be for 12 months at a time.

Quantity limit 56 tablets/28 days

Arcalyst (rilonacept) - Rx

1. Must have a diagnosis of Cryopyrin-Associated Periodic Syndromes (CAPS) with one ofthe following conditions: Familial Cold Autoinflammatory Syndrome (FCAS) also known as Familial Cold Urticaria **OR** Muckle-Wells Syndrome (MWS) **AND**
    a. Patient must be at least 12 years of age
    b. Patient is not on concurrent therapy with any of the following – Ilaris, Kineret, Enbrel, Humira, infliximab or Simponi
    c. The recommended dose for CAPS, FCAS, MWS
        i. Adults: Loading dose: 320 mg, delivered as two 160 mg (2 mL) injections. Maintenance dose: 160 mg (2 mL) injection once weekly.
        ii. Pediatric patients 12 years to 17 years: Loading dose: 4.4 mg/kg, up to a maximum of 320 mg, delivered as 1 or 2 injections (not to exceed 2 mL/injection). Maintenance dose: 2.2 mg/kg, up to a maximum of 160 mg (2 mL) injection, once weekly.
    d. **Note** – it is not known whether Arcalyst is effective in patients with Neonatal-Onset Multisystem Inflammatory Disease (NOMID), also referred to as Chronic Infantile Neurologic CutaneousArticular Syndrome (CINCA). **OR**
2. Must have a diagnosis of Deficiency of Interleukin-1 Receptor Antagonist (DIRA) confirmed by mutation in the *IL1RN* gene **AND**
    a. Must be prescribed by or in consultation with a rheumatologist, geneticist, dermatologist, or a physician specializing in the treatment of autoinflammatory conditions **AND**
    b. Patient must weigh at least 10 kg **AND**
    c. According to the prescriber, the patient has demonstrated clinical benefit with Kineret (anakinra subcutaneous injection). Examples of clinical benefits include resolution of skin rash, bone pain, and fever, normal acute phase reactants (CRP < 0.5 mg/dL), objective absence of skin rash, no radiological evidence of active bone disease, reduction in the use of corticosteroids **AND**
    d. Patient is not on concurrent therapy with any of the following – Ilaris, Kineret, Enbrel, Humira, infliximab or Simponi
    e. The recommended dose of Arcalyst for DIRA is as follows:
        i. Adult and pediatric patients weighing at least 10 kg: 4.4 mg/kg up to a maximum of 320 mg delivered as 1 or 2 injections (2 mL/injection) once weekly **OR**
3. Must have diagnosis of recurrent pericarditis (RP) defined as a subsequent pericarditis episode after a symptom-free interval of at least 4-6 weeks
    a. Must be prescribed by or in consultation with a cardiologist **AND**
    b. Patient must be ≥ 12 years or older **AND**
    c. Patient must be presenting with at least a second pericarditis recurrence (third pericarditis episode at minimum) despite treatment with NSAIDs, colchicine or corticosteroids, in any combination
        i. The current episode is characterized by pericardial pain for ≥ 1 day with a numerical rating scale (NRS) pain score of ≥ 4 **AND** a C-reactive protein level of at least of at least 1 mg/dL **OR**
        ii. The current episode must have met two or more of the following:
            1. Pericarditis chest pain (typically sharp chest pain, improved with sitting up and leaning forward)
            2. Pericardial rubs (superficial scratchy or squeaking sound heard with the diaphragm of a stethoscope over the left sternal border)
            3. New widespread ST-elevation or PR depression on ECG
            4. Pericardial effusion (new or worsening) **AND**
    d. Prescriber must attest that the patient will attempt to taper and discontinue NSAIDs, colchicine and/or corticosteroids while on Arcalyst **AND**
    e. Arcalyst will not be approved for patients with pericarditis secondary to tuberculosis, post-thoracic blunt trauma, myocarditis, systemic autoimmune diseases (excluding Still's disease), or neoplastic, purulent, or radiation etiologies **AND**
    f. Arcalyst will not be approved for patients with incessant or chronic pericarditis **AND**
    g. Patient is not on concurrent therapy with any of the following – Ilaris, Kineret, Enbrel, Humira, infliximab or Simponi
    h. The recommended dose for RP is as follows:
        i. Adults: Loading dose: 320 mg, delivered as two 160 mg (2 mL) injections. Maintenance dose: 160 mg (2 mL) injection once weekly.
        ii. Pediatric patients 12 years to 17 years: Loading dose: 4.4 mg/kg, up to a maximum of 320 mg, delivered as 1 or 2 injections (not to exceed 2 mL/injection). Maintenance dose: 2.2 mg/kg, up to a maximum of 160 mg (2 mL) injection, once weekly.

i. Initial approval of Arcalyst for recurrent pericarditis will be for 3 months. Recertification will require documentation that the patient has had no pericarditis recurrence while using Arcalyst **AND** documentation that NSAIDs, colchicine and/or corticosteroid doses have been reduced or discontinued.

4. Quantity limit of 4 vials/28 days
   a. The allowed quantity will be reviewed in accordance with FDA-approved weight and age-based dosing and, as such, will be limited to the minimum number of vials to obtain the appropriate weekly dose.
   b. A one-time override of 5 vials per 28 days will be allowed for diagnosis of CAPs, FCAS, MWS and RP to accommodate for the loading dose. A quantity limit exception (8 vials/28 days) can be granted for diagnosis of DIRA requiring 2 injections administered once weekly.

Camzyos (mavacamten) - Rx

1. Must be ≥ 18 years of age **AND**
2. Camzyos must be prescribed by, or in consultation, with, a cardiologist **AND**
3. Must have a diagnosis of symptomatic obstructive hypertrophic cardiomyopathy (oHCM) confirmed by echocardiogram **AND/OR** cardiac magnetic resonance showing <u>one</u> of the following (a or b):
   a. Maximal end-diastolic left ventricular wall thickness of ≥ 15 mm
   b. Maximal end-diastolic left ventricular wall thickness ≥ 13 mm **AND** <u>one</u> of the following (i or ii):
      i. Family history of HCM **OR**
      ii. A positive genetic test (e.g., *MYH7*, *TNNI3, TNNT2, TPM1, MYL2, MYL3, ACTC1)* **AND**
4. Diagnosis must not be due to a known infiltrative or storage disorder causing cardiac hypertrophy that mimicked obstructive HCM (i.e., Fabry disease, amyloidosis, or Noonan syndrome with left ventricular hypertrophy) **AND**
5. Must have New York Heart Association (NYHA) Class II or III functional status **AND**
6. Left ventricular ejection fraction (LVEF) must be ≥ 55% **AND**
7. Prescriber attestation must be received that REMS program requirements have been satisfied **AND**
8. Must have had serious side effects or drug failure to at least one non-vasodilating beta blocker (i.e., atenolol, bisoprolol, metoprolol) **AND** one non-dihydropyridine calcium channel blocker (must be separate trials), unless there is a documented medical reason why these agents cannot be used.
   a. Please note failure of non-vasodilating beta blocker or non-dihydropyridine calcium channel blocker therapy does not preclude concomitant use of these therapies with Camzyos**, AND**
9. Initial and subsequent approvals will be granted for 6 months at a time.
10. Subsequent approvals will require submission of progress notes documenting that the patient has achieved/maintained a positive clinical response to therapy.
    a. LVEF assessment by echocardiogram must be provided on each recertification request.
11. Camzyos will NOT be approved for continued therapy in patients with LVEF < 50%, symptomatic heart failure or worsening clinical status.
12. Camzyos will not be approved for any patients on strong or moderate CYP2C19 inhibitors or inducers, strong CYP3A4 inhibitors, or strong or moderate CYP3A4 inducers.
13. Quantity limit is 30 capsules/30 days.

Crenessity (crinecerfont) - Rx

1. Must be prescribed by or in consultation with an endocrinologist or pediatric endocrinologist AND
2. Must be 4 years of age and older AND
3. Must have a diagnosis of classic congenital adrenal hyperplasia (CAH) AND
   a. Note: Crenessity will not be authorized in patients with non-classic CAH which typically has a later-onset and presents with milder symptoms or may be asymptomatic
4. Must have 21-hydroxylase deficiency as confirmed by ONE of the following (a, b, c, OR d):
   a. Elevated 17-hydroxyprogesterone (17OHP) level
   b. Confirmed pathogenic variant in the CYP21A2 gene
   c. Positive newborn screening with confirmatory second-tier testing (e.g., liquid chromatography-tandem mass spectrometry)
   d. Cosyntropin stimulation that shows a markedly elevated 17OHP level from baseline AND
5. Must currently be receiving supraphysiological doses of glucocorticoid treatment at baseline AND
6. Crenessity must be used in combination with glucocorticoid treatment AND
7. Must have documentation of the following (a and b) prior to initiation of Crenessity in order to assess clinical response:
   a. Baseline glucocorticoid dose AND
   b. Baseline serum androstenedione level
8. Initial approval will be for 6 months. Continued approval will be for 12 months at a time and require documentation of ONE of the following (a or b):
   a. A reduction in glucocorticoid dose from baseline OR

b. A reduction in serum androstenedione from baseline

9. Quantity Limit:
    a. Capsules: 60 capsules/30 days
        i. For individuals concomitantly using a strong or moderate CYP3A4 inducers, a quantity limit exception will be authorized in accordance with FDA-approved labeling.
    b. Oral solution: 30 mL (1 bottle)/30 days
        i. Documentation that the patient is unable to swallow a capsule whole is required for the following scenarios
            1. For individuals weighing ≥ 55 kg OR
            2. For individuals weighing > 20 kg requiring a CYP3A4 dose adjustment
        ii. Upon each review and dose escalation request for the oral solution the allowed quantity will be reviewed in accordance with FDA-approved labeling (including dose adjustments required for strong or moderate CYP3A4 inducers) and as such will be limited to the minimum number of full bottles necessary to obtain the appropriate daily dose.

Cuprimine (penicillamine capsules) and penicillamine tablets - Rx

1. Must be used for an FDA approved indication: Wilson's Disease, Rheumatoid Arthritis or Cystinuria
2. For a diagnosis of Cystinuria:
    a. Must be prescribed by a nephrologist, urologist, or physician knowledgeable in the treatment of cystinuria **AND**
    b. Must have a diagnosis of cystinuria established by <u>one</u> of the following:
        i. Stone analysis showing 100% cystine calculi **OR**
        ii. Pathognomonic hexagonal cystine crystals on urine microscopy **OR**
        iii. Genetic test confirming two defects in SLC7A9 and/or ALC3A1 gene **AND**
    c. Prescriber must attest that the patient is unresponsive to high fluid intake, urine alkalization, and diet modification (i.e., sodium and protein restriction) **AND**
    d. Prescriber must attest that the patient will continue high fluid intake, urine alkalization, and diet modification in combination with requested therapy
    e. Initial authorization for cystinuria will be for 12 months. Recertification will be every 12 months and require evidence of clinical response defined as urinary cystine concentration < 250 mg/L **OR** decrease in cystine stone formation **AND**
3. **<u>For new starts and recertification requests (for all indications)</u>**:
    a. Brand Cuprimine will require documentation of serious side effects or drug failure with generic penicillamine capsules (generic Cuprimine) **AND** penicillamine tablets unless there is adequate justification as to why both penicillamine capsules **AND** tablets are not clinically appropriate.
    b. Penicillamine tablets will require documentation of serious side effects or drug failure with generic penicillamine capsules (generic Cuprimine) unless there is adequate justification as to why penicillamine capsules are not clinically appropriate.
4. Quantity limit: 180 capsules/30 days.
    a. A quantity limit exception of 480 capsules/30 days can be granted for a diagnosis of Cystinuria
    b. A quantity limit exception of 240 capsules/30 days can be granted for a diagnosis of Wilson's Disease

Fabhalta (iptacopan) - Rx

1. Fabhalta is considered medically necessary for the **treatment of paroxysmal nocturnal hemoglobinuria (PNH)** when the following criteria are met:
    a. Must be 18 years of age or older **AND**
    b. Must be prescribed by a hematologist or nephrologist **AND**
    c. Must have a diagnosis of paroxysmal nocturnal hemoglobinuria (PNH) confirmed by a flow cytometry test
    d. Initial approval for 6 months. Continued approval will be for 6 months and will require documentation that patient is tolerating therapy and is responding to treatment (i.e., decrease in number of transfusions, improvement in hemoglobin levels, normalization of LDH levels, symptom improvement) **OR**
2. Fabhalta is considered medically necessary for the treatment of **primary immunoglobulin A nephropathy (IgAN)** when the following criteria are met:
    a. Must be 18 years of age or older **AND**
    b. Must be prescribed, or in consultation with, a nephrologist **AND**
    c. Must have a diagnosis of primary immunoglobulin A nephropathy (IgAN), confirmed on biopsy **AND**
    d. Must have an eGFR <u>≥</u> 30 mL/min/1.73 m^2 **AND**
    e. Must provide baseline documentation that meets at least <u>one</u> of the following (note: documentation of the same laboratory parameter will be required upon recertification):
        i. A total urine protein <u>≥</u> 0.5 g/day **OR**
        ii. A urine protein-to-creatinine ratio (UPCR) <u>≥</u> 0.44 g/g **AND**
    f. Must have received the maximum or maximally tolerated dose of an angiotensin-converting enzyme inhibitor (ACEi) or an angiotensin II receptor blocker (ARB) for a <u>minimum of 3 months</u> prior to starting Fabhalta, unless there is documentation

that the patient is unable to tolerate or has a contraindication to an ACEi or ARB **AND**

g. Must have documentation of drug failure of Filspari **OR** Tarpeyo
h. Initial and recertification approvals will be for 9 months at a time. Continuation of therapy will require the following (documentation must be provided):
    i. Evidence of **one** of the following:
        1. Reduction in total urine protein from baseline **OR**
        2. Reduction in UPCR from baseline **AND**
    ii. Must have an eGFR ≥ 30 mL/min/1.73 m^2 **OR**

3. Fabhalta is considered medically necessary for the treatment of **complement 3 glomerulopathy (C3G)** when the following criteria are met:
    a. Must be 18 years of age or older **AND**
    b. Must be prescribed by or in consultation with a nephrologist **AND**
    c. Must have a diagnosis of complement 3 glomerulopathy (C3G) confirmed on renal biopsy **AND**
    d. Must be on a maximally recommended or tolerated dose of an angiotensin converting enzyme inhibitor (ACEI) or angiotensin receptor blocker (ARB) for at least 3 months prior to starting Fabhalta, unless there is documentation that the patient is unable to tolerate or has a contraindication to an ACEi or ARB **AND**
    e. Must meet one of the following (1 or 2):
        i. Must have documentation of drug failure (e.g., worsening kidney function and/or inadequate reduction in proteinuria) with systemic oral glucocorticoids (e.g., prednisone, methylprednisolone), unless there is documentation of serious side effects or contraindications to systemic oral glucocorticoids **OR**
        ii. Must have documentation of drug failure (e.g., worsening kidney function and/or inadequate reduction in proteinuria) with mycophenolate mofetil/mycophenolate sodium unless there is documentation of serious side effects or contraindications to mycophenolate mofetil/mycophenolate sodium **AND**
    f. Must have baseline documentation of a urine protein: creatinine ratio (UPCR) ≥ 1.0 g/g **AND**
    g. Must an estimated GFR ≥ 30 ml/min/1.73m^2
    h. Initial approval will be for 6 months, and recertification will be for 12 months at a time.
        i. Recertification will require documentation of the following:
            1. Reduction in UPCR from baseline **AND**
            2. Must have an eGFR of ≥ 30 ml/min/1.73m^2
4. Requests for non-FDA approved indications will not be covered.
5. Fabhalta will not be approved in combination with Trutakna, Voyxact or Vanrafia.
6. Concomitant use of another complement inhibitor (i.e., Soliris/Bkemv/Epysqli (eculizumab), Ultomiris (ravulizumab), Empaveli (pegcetacoplan)) will only be authorized for patients transitioning from Soliris/Bkemv/Epysqli (eculizumab), Ultomiris (ravulizumab), Empaveli (pegcetacoplan) to Fabhalta. After the initial approval period, requests for concomitant use of Fabhalta with Soliris/Bkemv/Epysqli (eculizumab), Ultomiris (ravulizumab), or Empaveli (pegcetacoplan) will be considered experimental/investigational and will not be approved.
7. Quantity limit: 60 capsules/30 days

Filspari (sparsentan) - Rx

1. Filspari is considered medically necessary for the treatment of **primary immunoglobulin A nephropathy (IgAN)** when the following criteria are met:
    a. Must be prescribed by, or in consultation with, a nephrologist **AND**
    b. Must be 18 years of age or older **AND**
    c. Must have a diagnosis of primary immunoglobulin A nephropathy (IgAN), confirmed on biopsy **AND**
    d. Must have an eGFR ≥ 30 mL/min/1.73 m^2 **AND**
    e. Must provide baseline documentation that meets at least one of the following (note: documentation of the same laboratory parameter will be required upon recertification):
        i. A total urine protein ≥ 0.5 g/day **OR**
        ii. A urine protein-to-creatinine ratio (UPCR) ≥ 0.44 g/g **AND**
    f. Must have received the maximum or maximally tolerated dose of an angiotensin-converting enzyme inhibitor (ACEi) or an angiotensin II receptor blocker (ARB) for a minimum of 3 months prior to starting Filspari, unless there is documentation that the patient is unable to tolerate or has a contraindication to an ACEi or ARB **AND**
    g. Prescriber must attest, or documentation must demonstrate, that Filspari will not be used in combination with any of the following: Renin- angiotensin-aldosterone system (RAAS) inhibitors, endothelin receptor antagonists (ERAs) or aliskiren. **AND**
    h. Must meet one of the following (i, ii, or iii):
        i. Must have documentation of drug failure after a minimum 3-month trial with an SGLT2 inhibitor, unless the patient has documentation of serious side effects or contraindication to an SGLT2 inhibitor **OR**

ii. Must have documentation of drug failure after a minimum 6-week trial of systemic oral glucocorticoids (i.e., prednisone, methylprednisolone), unless the patient has documentation of serious side effects or contraindication to systemic oral glucocorticoids **OR**
iii. Patient has one of the following (1 or 2):
1. Total urine protein > 1 g/day (UPCR > 0.8 g/g) **OR**
2. eGFR > 30 to < 60 mL/min/1.73 m^2

i. Initial and recertification approvals will be for 12 months at a time. Continuation of therapy will require the following (documentation must be provided):
i. Evidence of **one** of the following:
1. Reduction in total urine protein from baseline **OR**
2. Reduction in UPCR from baseline **AND**
ii. Must have an eGFR ≥ 30 mL/min/1.73 m^2 **OR**

2. Filspari is considered medically necessary for the treatment of **focal segmental glomerulosclerosis (FSGS)** when the following criteria are met:
a. Must be prescribed by, or in consultation with, a nephrologist **AND**
b. Must be 8 years of age and older **AND**
c. Must have a documented diagnosis of focal segmental glomerulosclerosis (FSGS) confirmed either by biopsy or genetic mutation in podocyte protein associated with FSGS (see Appendix) for genetic mutations **AND**
d. Must have eGFR ≥ 30 mL /min/1.73 m2 **AND**
e. Must have documented baseline urine protein to creatinine ratio (UPRC) of ≥ 1.5 g/g **AND**
f. Prescriber must attest, or documentation must demonstrate, that Filspari will not be used in combination with any of the following: Renin- angiotensin-aldosterone system (RAAS) inhibitors, endothelin receptor antagonists (ERAs) or aliskiren.
g. Filspari will **not** be authorized if the patient has nephrotic syndrome, where nephrotic syndrome is defined as the presence of all the following (i, ii, and iii):
i. Proteinuria > 3.5 g/24 hour (adults) or UPCR > 2.0 g/g (pediatric patients < 18 years of age)
ii. Serum albumin of < 3.0 g/L
iii. Edema
h. Initial and recertification will be for 9 months at a time. Recertification will require improvement in UPCR from baseline.

3. Requests for non-FDA approved indications will not be covered.
4. Quantity Limit: 30 tablets/30 days
a. A quantity limit exception of 60 tablets/30 days for the 400 mg strength tablet may be granted for a diagnosis of FSGS in patients weighing 50 kg or greater.

Firdapse (amifampridine) - Rx

1. Must be prescribed by a neurologist or neuromuscular specialist
2. Must be 6 years of age or older
3. Must have a diagnosis of Lambert-Eaton Myasthenic Syndrome (LEMS) confirmed by electromyography OR calcium channel antibody testing
4. Quantity limit 300 tablets per 30 days

Forzinity (elamipretide) - Medical

For **Commercial Plans** (including Exchange, Essential Plan, Child Health Plus): Based on review of peer-reviewed evidence and the Health Plan's Not Medically Necessary criteria, Forzinity (elamipretide) has not been medically proven to be effective and is therefore considered Not Medically Necessary for treatment of Barth syndrome.

The justification for Forzinity to be considered Not Medically Necessary is as follows:

- Based upon our assessment of the peer-reviewed medical literature, there is inconclusive evidence of a definite positive effect on health outcomes.
  - The pivotal randomized trial failed both prespecified primary endpoints (6-minute walk test and fatigue score) during the placebo-controlled phase; the approval was based on an endpoint that did not demonstrate benefit in the randomized phase and was observed during an uncontrolled open-label extension.
- Based upon our assessment of the peer-reviewed medical literature, there is inconclusive evidence that the drug, over time, leads to improvement in health outcomes (e.g., the beneficial effects of the service outweigh any harmful effects).
  - Reported long-term improvements derive from uncontrolled extension data without a concurrent comparator, limiting ability to distinguish drug effect from natural history variability, maturation/practice effects, and regression to the mean; adverse event burden (including injection site reactions) must be weighed against benefits.

- Based upon our assessment of the peer-reviewed medical literature, there is inconclusive evidence that the drug provides improvement in health outcomes in standard conditions of medical practice, outside the clinical investigatory settings
    - Available evidence is derived from specialized investigational settings, with no published real-world effectiveness demonstrating benefit under routine conditions of care.

Galzin (zinc acetate capsule) - Rx

1. Must be 10 years of age or older **AND**
2. Must have a diagnosis of Wilson's Disease **AND**
3. Must have been previously treated with a chelating agent (e.g., penicillamine or trientine)
4. Quantity Limit: 90 capsules/30 days

Gamifant (emapalumab-lzsg) - Medical

1. Gamifant is considered medically necessary for the treatment of primary hemophagocytic lymphohistiocytosis (HLH) with refractory, recurrent or progressive disease or intolerance with conventional HLH therapy when the following criteria are met:
    a. Prescribed by a physician who specializes in the treatment of HLH (such as a hematologist, oncologist, immunologist, or transplant specialist) **AND**
    b. The patient has a diagnosis of Primary HLH confirmed by at least ONE of the following (either i., ii., or iii)
        i. Genetic testing confirming biallelic pathogenic variants (e.g., PRF1, UNC13D/MUNC13-4, STX11 or STXBP2) **OR**
        ii. Positive family history (affected siblings or parental consanguinity) consistent with primary HLH in a symptomatic individual **OR**
        iii. Meet at least FIVE out of the following diagnostic criteria prior to treatment:
            1. Low or absent NK-cell activity (according to local laboratory reference)
            2. Fever ≥ 38.5°C (or 101.3°F)
            3. Splenomegaly
            4. Elevated ferritin ≥ 500 micrograms/L
            5. Elevated CD25 (i.e., soluble IL-2 receptor) ≥ 2,400 U/mL
            6. Hypertriglyceridemia (fasting triglycerides ≥ 265 mg/dL (3 mmol/L) and/or hypofibrinogenemia (fibrinogen ≤ 1.5g/L)
            7. Hemophagocytosis in bone marrow or spleen or lymph nodes
            8. Cytopenias affecting at least 2 of 3 lineages in the peripheral blood:
                a. Hemoglobin < 9 g/dL (or < 10 g/dL in infants < 4 weeks of age)
                b. Platelets < 100 x 10^9 /L
                c. Neutrophils < 1 x 10^9 /L, **AND**
    c. Evidence of active disease that is refractory, recurrent, or progressive despite at least ONE conventional HLH therapy OR severe intolerance to at least ONE conventional therapy. Examples of conventional HLH treatments include etoposide and dexamethasone, cyclosporine A, antithymocyte globulin and intrathecal methotrexate following a standard of care treatment protocol **AND**
    d. Administer dexamethasone concomitantly with Gamifant, **AND**
    e. Administer Gamifant until hematopoietic stem cell transplantation (HSCT) is performed or unacceptable toxicity. Discontinue Gamifant when patient no longer requires therapy for the treatment of HLH.
    f. Gamifant is dosed based on body weight. Therefore, current body weight and requested dose regimen must be submitted for initial review and each recertification request **AND**
    g. Initial approval for primary HLH will be for 2-month duration. Continuation of therapy at 2-month intervals will require the following documentation of therapeutic benefit:
        i. Complete response defined as normalization of all HLH abnormalities (i.e., no fever, no splenomegaly, neutrophils > 1x10^9 /L, platelets > 100x10^9 /L, ferritin < 2,000 ug/L, fibrinogen > 1.50 g/L, D-dimer < 500 ug/L, normal CNS symptoms, no worsening of sCD25 > 2-fold baseline); **OR**
        ii. Partial response defined as normalization of ≥ 3 HLH abnormalities, **OR**
        iii. HLH improvement defined as ≥ 3 HLH abnormalities improved by at least 50% from baseline **OR**
2. Gamifant is considered medically necessary for the treatment of HLH/macrophage activation syndrome (MAS) in known or suspected Still's disease, including systemic Juvenile Idiopathic Arthritis (sJIA), with an inadequate response or intolerance to glucocorticoids, or with recurrent MAS when the following criteria are met:
    a. Prescribed by a physician who specializes in the treatment of HLH (such as a hematologist, oncologist, immunologist, or transplant specialist) or physician who specializes in sJIA/Still's disease (such as a rheumatologist) **AND**
    b. The patient has a diagnosis of HLH/macrophage activation syndrome (MAS) in known or suspected Still's disease, including systemic Juvenile Idiopathic Arthritis (sJIA) **AND**
    c. Must have a diagnosis of active MAS defined as having met both of the following (i and ii):
        i. Ferritin > 684 ng/mL **AND**

ii. Must have at least TWO of the following:
1. Platelet count ≤ 181×10^9 /L
2. AST > 48 U/L
3. Triglycerides > 156 mg/dL
4. Fibrinogen levels ≤ 360 mg/dL A**ND**

d. Must have ONE of the following (i or ii):
i. Inadequate response, intolerance, or contraindication to high-dose intravenous glucocorticoids **OR**
ii. Recurrent MAS (defined as two or more episodes of MAS) **AND**

e. Gamifant is dosed based on body weight. Therefore, current body weight and requested dose regimen must be submitted for initial review and each recertification request

f. For HLH/macrophage activation syndrome (MAS) in the setting of Still's disease (including sJIA), initial approval will be for a 2-month duration.

g. Continuation of therapy will be at 2-month intervals and will require documentation of (i and ii):
i. Improvement in MAS signs/symptoms (i.e., fever, skin rash, hemorrhagic manifestations, CNS symptoms, respiratory function,) **AND**
ii. At least ONE of the following objective responses:
1. White blood cell above lower limit of normal (LLN)
2. Platelet count above LLN
3. Lactate dehydrogenase (LDH) below 1.5×the upper limit of normal (ULN)
4. ALT below 1.5× ULN
5. AST below 1.5×ULN
6. Fibrinogen > 100 mg/dL
7. Ferritin levels decreased ≥ 80% from baseline or < 2000 ng/mL

3. Prior authorization for Gamifant will apply regardless of the site of administration (applies to both the inpatient and outpatient setting). Gamifant must be administered by a healthcare professional and is covered under the medical benefit Recommended Dosing:
a. Primary HLH recommended starting dosage: 1 mg/kg as an intravenous infusion over 1 hour twice per week.
b. HLH/MAS in Still's disease recommended starting dose: 6 mg/kg, followed by 3 mg/kg every 3 days for 5 doses, then 3 mg/kg twice per week. Given as an intravenous infusion over 1 hour.
c. For both indications, the dose may be titrated up to a maximum of 10 mg/kg.

HCPCS: J9210

Ilaris (canakinumab) - Medical

1. Must meet the following prescriber requirement based on indication:
a. For treatment of active systemic juvenile idiopathic arthritis (SJIA) or Adult-Onset Still's Disease (AOSD), must be prescribed by a rheumatologist or immunologist
b. For treatment of Cryopyrin-Associated Periodic Syndromes (CAPS) or Periodic Fever Syndrome (PFS), must be prescribed by a geneticist, dermatologist, or prescriber who specializes in management of CAPS/PFS.
c. For treatment of acute gout flare, must be prescribed by a rheumatologist. **AND**
2. Must be at least 4 years of age and have a diagnosis of Cryopyrin-Associated Periodic Syndromes (CAPS) with one of the following conditions
a. Familial Cold Autoinflammatory Syndrome (FCAS) also known as Familial Cold Urticaria OR
b. Muckle-Wells Syndrome (MWS)
c. Dose is not to exceed 150 mg every 8 weeks **OR**
3. Must be at least 2 years of age with a diagnosis of active systemic juvenile idiopathic arthritis (SJIA)
a. Must have failed to respond to and/or is intolerant to approved disease- modifying antirheumatic drugs (DMARDs) agents, such as methotrexate, NSAIDs, analgesics or corticosteroids either alone or in combination
b. Dose is not to exceed 300 mg every 4 weeks **OR**
4. Must be at least 18 years of age with a diagnosis of Adult-Onset Still's Disease (AOSD)
a. Must have failed to respond to and/or is intolerant to approved disease- modifying antirheumatic drugs (DMARDs) agents, such as methotrexate, NSAIDs, analgesics or corticosteroids either alone or in combination
b. Dose is not to exceed 300 mg every 4 weeks **OR**
5. Must be at least 2 years of age with a diagnosis of one of the following Periodic Fever Syndromes (Hereditary Periodic Fevers)
a. Tumor Necrosis Factor-Receptor Associated Periodic Syndrome (TRAPS)
b. Hyperimmunoglobulin D Syndrome (HIDS)/Mevalonate Kinase Deficiency (MKD)
c. Familial Mediterranean Fever (FMF)
d. Dose is not to exceed 300 mg every 4 weeks.
6. Must be at least 18 years of age or older and used for treatment of an acute gout flare **AND**
e. Must be prescribed by a rheumatologist **AND**

f. Must have documentation that management of lifestyle factors have been implemented as appropriate (e.g., limiting alcohol intake, dietary modifications, weight loss) **AND**
g. Must have documentation of serious side effects or drug failure to the maximally tolerated dose, or contraindication, to all the following:
   i. NSAIDs **AND**
   ii. Colchicine **AND**
   iii. Corticosteroids (oral and injectable) **AND**
h. The patient must currently be taking, or prescriber must attest that the patient will initiate a urate lowering medication for the prevention of recurrent gout (e.g., allopurinol, probenecid, febuxostat).
i. Approval will be for 3 months to allow for treatment of one acute gout flare (150 mg subcutaneously).
j. Treatment for subsequent acute gout flares will not be authorized unless the following are met:
   i. Patient is optimized on urate lowering therapy for prevention (e.g., allopurinol, probenecid, febuxostat) **AND**
   ii. There has been an interval of at least 12 weeks before a new dose of Ilaris will be administered
   iii. For subsequent flare; approval will be for 3 months to allow for treatment of one acute gout flare (150 mg subcutaneously).

7. Patient does not have an infection and is not at high risk for infection
8. Patient is not on concurrent therapy with any of the following – Arcalyst, Kineret, Enbrel,Humira, infliximab or Simponi

Note – it is not known whether Ilaris is effective in patients with Neonatal-Onset Multisystem Inflammatory Disease (NOMID), also referred to as Chronic Infantile Neurologic Cutaneous Articular Syndrome (CINCA).

HCPCS: J0638

Imcivree (setmelanotide) - Rx

Based upon our review and assessment of peer-reviewed literature, Imcivree, has been medically proven to be effective and therefore **medically necessary** in the treatment of:

A. **Acquired hypothalamic obesity (HO**) if **ALL** the following criteria are met:
   1. Must be prescribed by, or in consultation with, an endocrinologist, expert in rare genetic disorders of obesity, or a medical geneticist **AND**
   2. Must be ≥ 4 years of age or older **AND**
   3. Must have evidence of acquired HO with documentation of hypothalamic injury or dysfunction (e.g., hypothalamic lesion, hypothalamic tumor, hypothalamic damage) **AND**
   4. Must have weight gain associated with the hypothalamic injury, with weight gain occurring within 12 months post-hypothalamic injury/dysfunction **AND**
   5. Must have a BMI of ≥ 30 kg/m2 for patients ≥ 18 years of age or BMI ≥ 95th percentile for age and sex for patients 4 to < 18 years of age **AND**
   6. Documentation of a recent (within the past month) height measurement, weight measurement, BMI, and growth chart (for pediatric patients) must be submitted for each review (initial and recertifications)
   7. Initial approval for acquired HO will be for 12 months.
   8. **Recertification for acquired HO** after the initial 12-month approval will require documentation of a ≥ 5% decrease from baseline body weight, or a ≥ 5% decrease from baseline body mass index (BMI) for patients with continued growth potential (pediatric patients). **OR**

B. **Obesity due to variants in the POMC, PCSK1, or LEPR genes** that are interpreted as 'pathogenic, likely pathogenic, or of uncertain significance (VUS),' or **Bardet-Biedl syndrome (BBS)** if **ALL** the following criteria are met:
   1. Must be prescribed by, or in consultation with, an endocrinologist, expert in rare genetic disorders of obesity, or a medical geneticist **AND**
   2. Must be ≥ 2 years of age or older **AND**
   3. Must have one of the following diagnoses **(a or b):**
   a. Must have a diagnosis of obesity due to POMC, PCSK1, and LEPR deficiencies that includes **ALL** the following (i-iv)
      i. A diagnosis of Obesity is defined as:
         1. Adult patients with a BMI of ≥ 30 kg/m2 **OR**
         2. Pediatric patients (6-17 years): For diagnosis of POMC, PCSK1, and LEPR deficiencies with body weight ≥ 95th percentile for age using growth chart assessments **OR**
         3. Pediatric patients (2 to less than 6 years): For diagnosis of POMC, PCSK1, and LEPR deficiencies with baseline BMI ≥ 97th percentile for age and sex and body weight ≥ 20 kg **AND**
      ii. Documentation of a recent (within the past month) height measurement, weight measurement, BMI, and growth chart (for pediatric patients) must be submitted for each review (initial and recertifications) **AND**
      iii. Obesity must be due to a homozygous or presumed compound heterozygous variant in at least one of the following genes, confirmed by genetic testing, **AND**:
         1. Proopiomelanocortin (POMC)

2. Proprotein convertase subtilisin/kexin type 1 (PCSK1)
3. Leptin receptor (LEPR)

iv. Documentation of genetic testing demonstrating that the variants in POMC, PCSK1, or LEPR genes are interpreted **as 'pathogenic,' 'likely pathogenic,' OR 'of uncertain significance (VUS)'** must be submitted. **Coverage will not be provided for variants identified as 'benign' or 'likely benign.'** Note, direct to consumer (DTC) testing will not be accepted as these tests do not determine if the gene variant is disease-causing.

v. Initial approval will be for 4 months **OR**

b. Must have a diagnosis of monogenic or syndromic obesity due to Bardet-Biedl syndrome (BBS) which includes the following (i-iii):

i. A diagnosis of Obesity is defined as:
1. Adult patients with a BMI of ≥ 30 kg/m2 **OR**
2. Pediatric patients (6-17 years): For diagnosis of BBS ≥ 97th percentile using growth chart assessments **OR**
3. Pediatric patients (2 to less than 6 years): For diagnosis of BBS with baseline BMI ≥ 97th percentile for age and sex and body weight ≥ 20 kg **AND**

ii. Documentation of a recent (within the past month) height measurement, weight measurement, BMI, and growth chart (for pediatric patients) must be submitted for each review (initial and recertifications) **AND**

iii. Patient has either 4 primary features **OR** 3 primary and 2 secondary features of BBS:
1. **Primary features:** Rod-cone dystrophy, Polydactyly, Obesity, Learning disabilities, Hypogonadism in males, Renal anomalies
2. **Secondary features:** Speech disorder/delay, Strabismus/cataracts/astigmatism, Brachydactyly/syndactyly, Developmental delay, Polyuria/polydipsia (nephrogenic diabetes insipidus), Ataxia/poor coordination/imbalance, Mild spasticity (especially lower limbs), Diabetes mellitus, Dental crowding/ hypodontia/small roots/high arched palate, left ventricular hypertrophy/congenital heart disease, Hepatic fibrosis **AND**
3. Initial approval will be for 12 months.

Recertification for obesity due to variants in the POMC, PCSK1, or LEPR genes:
After the initial approval of 4 months will require documentation of a ≥ 5% decrease of baseline body weight, or a ≥ 5% decrease of baseline body mass index (BMI) for patients with continued growth potential (pediatric patients). If the patient meets for recertification, approval will be for 8 months.

Recertification at the 1-year mark will require documentation that the patient achieved a ≥ 10% decrease of baseline body weight or a ≥ 10% decrease of BMI for patients with continued growth potential (pediatric patients). If the patient meets for recertification, approval will be for 1 year.

Recertifications thereafter will require documentation that the patient maintains a weight loss of ≥ 10% decrease of baseline body weight or a ≥ 10% decrease of BMI for patients with continued growth potential (pediatric patients). If the patient meets for recertification, approval will be for 1 year.

Recertification for obesity due to Bardet-Biedl syndrome (BBS) after the initial approval of 12 months will require documentation of a ≥ 5% decrease of baseline body weight, or a ≥ 5% decrease of baseline body mass index (BMI) for patients with continued growth potential (pediatric patients). If the patient meets for recertification, approval will be for 1 year.

Recertifications thereafter will require documentation that the patient maintains a weight loss of ≥ 5% decrease of baseline body weight or a ≥ 5% decrease of BMI for patients with continued growth potential (pediatric patients). If the patient meets for recertification, approval will be for 1 year.

C. Quantity Limit of 9 milliliters (9 vials) per 30 days.
   a. See prescribing information for dosage and administration details.
D. Imcivree will not be covered in the following circumstances:
   a. Non-FDA approved genetic conditions that can cause obesity (such as: Alström syndrome, Prader-Willi syndrome [PWS], etc.)
   b. A lifetime history of suicide attempt or any suicidal behavior within the last month
   c. Imcivree will not be authorized if the member has prior gastric bypass surgery resulting in > 10% weight loss durably maintained from the baseline pre-operative weight, with no evidence of weight regain

Increlex (mecasermin, recombinant rh-IGF-1) - Rx

1. Must be prescribed by an endocrinologist or pediatric endocrinologist
2. Patient must be 2 years old or greater
3. Patient must have severe primary IGF-1 deficiency (Primary IGFD) defined as:
    a. height standard deviation score < -3.0
    b. basal IGF-1standard deviation score < -3.0
    c. normal or elevated GH OR
4. Patient must have growth hormone (GH) gene deletion with the development of neutralizing antibodies to GH
5. Normal dose of 40-120 mcg/kg SQ twice daily given 20 minutes before or after a meal or snack to avoid hypoglycemia. Doses greater than 120 mcg/kg will not be covered
6. Increlex will not be covered for growth promotion in patients with closed epiphyses or as a substitute for growth hormone replacement therapy.

Isturisa (osilodrostat) - Rx

1. Must be 18 years of age or older
2. Must be prescribed by, or in consultation with, an endocrinologist
3. Must have a diagnosis of endogenous Cushing's Syndrome
4. Must have a mean urinary free cortisol (UFC) level that is at least 1.5x the upper limit of normal measured over three 24-hour measurements (ULN = 50 micrograms/24 hours or 145 nmol/24 hours)
5. Must have documentation of symptoms of Cushing's Syndrome (such as diabetes, central obesity, moon face, buffalo hump, osteoporosis, muscle wasting, hypertension, depression, and anxiety)
6. Must have documentation of a failed pituitary surgery or contraindication to Cushing's syndrome specific surgery
7. Must have had serious side effects or drug failure with oral ketoconazole **AND**
8. For Individuals with a diagnosis of Cushing's disease (Cushing's Syndrome that is caused by a pituitary adenoma), must have documentation of serious side effects or drug failure with at least 2 of the following (Note: if patient has had previous trial and failure of metopirone (metyrapone) then only 1 of the following is required):
    a. Signifor (either LAR or SC formulation)
    b. Lysodren (mitotane)
    c. Cabergoline
9. Initial approval will be for 3 months. Recertification at 3 months and thereafter will require laboratory results to document a recent UFC level within normal limits **AND** improvement in the symptoms of Cushing's Syndrome.
10. For recertification, the prescriber must also make clear the maintenance dose they are planning to use. Approval will be allowed for this amount for 1 year.
11. Dose increases beyond the initial 3 months will require documentation to show UFC levels above the upper limit of normal and documentation that the patient is still experiencing Cushing's Syndrome symptoms. If approved, dosage increase authorizations will be for 1 year and will allow the amount requested only.
12. Dosing must be in accordance with FDA labeling, starting at 2 mg twice daily, and increased by 1 mg or 2 mg twice daily, no more frequently than every 2 weeks based on the rate of cortisol changes, individual tolerability, and improvement in signs and symptoms.
13. Please see the Isturisa Efficient Dosing chart at the bottom of this document (Figure 1A) for information on the number of tablets allowed per 30 days of each strength for a given dosing.

Joenja (leniolisib) - Rx

1. Must be prescribed by an immunologist, allergist, hematologist, or prescriber who specializes in the treatment of activated phosphoinositide 3-kinase delta (PI3Kδ) syndrome (APDS)
    a. Note: APDS is also known as PI3Kδ-activating mutation causing senescent T cells, lymphadenopathy, and immunodeficiency (PASLI) AND
2. Must be ≥ 4 years of age to 75 years old AND
3. Must be > 27 kg AND
4. Must have confirmed APDS-associated genetic PI3Kδ mutation with a documented variant in either PIK3CD or PIK3R1 AND
5. Must meet at least one of the following(a-c):
    a. Have nodal and/or extranodal lymphoproliferation OR
    b. Have presence of > 1 measurable nodal lesion on CT or MRI OR
    c. Have clinical findings and manifestations compatible with APDS (such as history of repeated otosino-pulmonary infections, organ dysfunction (i.e., lung, liver), bronchiectasis, cytopenias, gastrointestinal disease, immune dysregulation (i.e., decreased naive B cells, reversed CD4/CD8 ratio))
6. Initial approval will be for 3 months. Recertification will require documentation that the patient has responded to therapy (i.e., improvement in clinical findings and/or manifestations of APDS such lymphoproliferation, recurrent infections, cytopenia, immunophenotyping). Recertification will be for 6 months at a time.

7. Recommended dosage: 70 mg administered orally twice daily approximately 12 hours apart, with or without food, in adult and pediatric patients 12 years of age and older and weighing ≥ 45kg. Note: Prior to treatment with Joenja, verify pregnancy status in individuals of reproductive potential prior to initiating treatment.
8. Quantity limit: 60 tablets/30 days

Juxtapid (lomitapide capsules) - Rx

1. Must be prescribed by or in consultation with a cardiologist, lipid specialist or endocrinologist AND
2. 2. Must be ≥ 2 years of age with a diagnosis of homozygous familial hypercholesteremia AND
    a. Genetic testing must demonstrate evidence of two mutant alleles at the low-density lipoprotein receptor (LDLR), apolipoprotein B (APOB), proprotein convertase subtilisin kexin type 9 (PCSK9) or low-density lipoprotein receptor adaptor protein 1 (LDLRAP1) gene OR
    b. Patient has a history of untreated LDL-C > 400 mg/dL or treated LDL-C > 300 mg/dL with either (i or ii):
        i. Xanthoma before the age of 10 years OR
        ii. ii. Evidence of heterozygous FH in one parent AND
3. 3. One of the following must be met (a or b):
    a. For individuals 10 years of age and older, member must have failed to reach target LDL-C while receiving treatment with maximally tolerated high potency statin (goal is atorvastatin 40-80 mg daily or rosuvastatin 20-40 mg daily), in combination with ezetimibe, and a PCSK9 inhibitor (Repatha, Praluent) for at least 8 weeks. A trial with a PCSK9 inhibitor is not required if the member is known to have two LDL-receptor negative alleles (null homozygous). OR
    b. For individuals 2 to 9 years of age, member must have failed to reach target LDL-C while receiving treatment with at least one lipid lowering therapy (e.g., statins, ezetimibe, lipoprotein apheresis) for at least 8 weeks. AND
4. LDL-C must be > 70 mg/dL for patients with clinical atherosclerotic cardiovascular disease (ASCVD) OR LDL-C must be > 100 mg/dL for patients without documented clinical ASCVD a. Clinical ASCVD defined as having a history of acute coronary syndrome, myocardial infarction (MI), stable or unstable angina, coronary/other arterial revascularization, stroke, TIA, peripheral arterial disease, or other documented atherosclerotic disease (such as coronary atherosclerosis, renal atherosclerosis, aortic aneurysm secondary to atherosclerosis, or Carotid plaque with ≥ 50% stenosis)
5. If patient is unable to tolerate statin therapy, documentation in progress notes must include:
    a. A contraindication to statin therapy according to FDA labeling OR
    b. History of statin-related rhabdomyolysis i. Must have symptoms consistent with rhabdomyolysis (i.e., muscle pain, swelling, and weakness, dark urine) AND ii. Must have creatine kinase (CK) level > 10 times upper limit of normal, myoglobinuria, or acute renal failure (increase in serum creatinine > 0.5 mg/dL) AND
    c. Patient was receiving a statin at the time of the event and symptoms resolved upon discontinuation of the statin OR
    d. History of statin intolerance. Documentation must include the following:
    e. Inability to tolerate at least 2 different statins
        i. At least 1 statin must be hydrophilic (such as pravastatin, fluvastatin, or rosuvastatin) starting at the lowest starting average daily dose AND
        ii. Intolerance associated with confirmed, intolerable statin-related adverse effects (i.e., muscle related symptoms) or significant biomarker abnormalities (i.e., ALT/AST > 3 times the upper limit of normal accompanied by increase in total bilirubin > 2 times the upper limit of normal) AND
        iii. Non-statin causes of muscle symptoms or biomarker abnormalities have been ruled out (for example, hypothyroidism, reduced renal function, reduced hepatic function, rheumatologic disorders such as polymyalgia rheumatic, steroid myopathy, vitamin-D deficiency, or primary muscle disease)
6. Must have had trial and failure/intolerance to a PCSK9 inhibitor (i.e., Praluent, Repatha) when used in combination with a maximally tolerated statin plus ezetimibe
    a. If patient is known to have two LDL-receptor negative alleles (null homozygous) then trial of PCSK9 inhibitor is not required
7. Documentation of baseline LDL-C level must be provided-measurement must occur within 60 days prior to treatment AND
8. Prescriber must attest that a discussion with the patient has taken place regarding a heart healthy diet, the importance of exercise, and smoking cessation (if applicable)
9. Initial approval will be for 8 weeks. Further approval will require evidence of an adequate reduction in LDL-C level defined as reduction in LDL-C level as compared to baseline LDL-C. Recertification will be required yearly thereafter.
10. Juxtapid will not be approved in combination with Evkeeza unless the patient has demonstrated failure to achieve target LDL-C while on Evkeeza in combination with:
    a. High-intensity or maximally tolerated statin therapy AND
    b. Ezetimibe AND
    c. A PCSK9 inhibitor (i.e., Praluent, Repatha) AND
    d. The patient has been on this drug combination for at least 6 months.
11. Quantity limit of 28 capsules per 28 days for 2.5 mg, 5 mg, and 10 mg and 56 capsules per 28 days for 20 mg and 30 mg strengths

Keveyis, generic dichlorphenamide and Ormalvi (dichlorphenamide) - Rx

1. Diagnosis must be made by a neurologist or muscle disease specialist.
2. Member must have a diagnosis of primary hypokalemic periodic paralysis AND
    a. The diagnosis must be confirmed by BOTH of the following:
        i. A genetic test confirming a skeletal muscle calcium or sodium channel mutation AND
        ii. Serum potassium concentration of less than 3.5 mEq/L during a paralytic attack
    b. Must have had trial and failure with prescription potassium supplementation AND
    c. The patient must have had a trial with oral acetazolamide therapy that did not result in improvement in severity or frequency of attacks OR
3. Member must have a diagnosis of primary hyperkalemic periodic paralysis AND
    a. The diagnosis must be confirmed by BOTH of the following:
        i. A genetic test confirming a skeletal muscle sodium channel mutation AND
        ii. Serum potassium concentration of greater than 5.0 mEq/L during a paralytic attack AND
    b. The patient must have had a trial with oral acetazolamide therapy that did not result in improvement in severity or frequency of attacks AND
4. Requests for Keveyis and Ormalvi require documentation of serious side effects or drug failure with generic dichlorphenamide.
5. For hypokalemic or hyperkalemic periodic paralysis, initial approval will be for 2 months. Recertification will require a documented improvement in the frequency or severity of attacks while taking Keveyis or generic dichlorphenamide. Recertification will be approved for 1 year
6. Initial dosing is one 50 mg tablet twice daily and can be titrated up to a maximum of 200 mg daily.
7. Quantity limit of 120 tablets per 30 days

Korlym and generic mifepristone 300 mg tablets - Rx

1. Must be 18 years of age or older
2. Member must have a diagnosis of endogenous Cushing's syndrome
3. Must also have a diagnosis of type 2 diabetes mellitus or glucose intolerance
4. Must have failed surgery or is not a candidate for surgery
5. Must be prescribed by, or in consultation with, an endocrinologist
6. Patients who meet the criteria for approval for treatment with Korlym will be approved for 12 months. Recertification will require patients to have stabilization/decrease in A1C or objective clinical response.
7. Requests for brand Korlym require documentation of serious side effects or drug failure with generic mifepristone 300 mg tablets (generic Korlym) will be required.
8. Recommended initial dosing is 300 mg once daily with a meal.
9. Increase in 300 mg increments to a maximum of 1200 mg once daily based on clinical response and tolerability. Do not exceed 20 mg/kg per day.
10. Quantity limit of 120 tablets per 30 days.

Mycapssa (octreotide acetate) - Rx

1. Must be prescribed by, or in consultation with, an endocrinologist AND
2. Must be 18 years of age or older AND
3. Must have a diagnosis of acromegaly AND
4. Must have failed pituitary surgery and/or radiation, or patient is not a candidate for surgery and/or radiation AND
5. Must be receiving treatment with either an injectable octreotide product (i.e., octreotide, Sandostatin, Sandostatin LAR) or injectable lanreotide products (i.e., lanreotide acetate injection, Somatuline Depot) for at least 6 months, with a stable dose for at least the last 3 months of therapy AND
6. Must have documented clinical response (defined as improvement or normalization of growth hormone (GH) and/or insulin-like growth factor-1 (IGF-1)) with either an injectable octreotide product or lanreotide acetate AND patient is tolerating therapy.
7. Recommended dosing: Initiate Mycapssa at dosage of 40 mg daily, administered as 20 mg orally twice daily. Monitor insulin-like growth factor (IGF-1) levels and patient's signs and symptoms every two weeks during titration. Titrate dosage based on IGF-1 levels and patient's signs/symptoms. Increase dose in increments of 20 mg daily. The maximum recommended dosage of Mycapssa daily dosage is 80 mg daily. See prescribing information for full details on recommended dosage, titration, and monitoring.
8. Initial approval for acromegaly will be for 12 months. Recertification for any further approval will require documentation of stable or improved GH and/or IGF-1 while on Mycapssa therapy.
9. Quantity limit: 120 capsules/30 days

Myqorzo –(aficamten) - Rx

1. Must be 18 years of age or older **AND**
2. Must be prescribed by, or in consultation with, a cardiologist **AND**

3. Must have a diagnosis of symptomatic obstructive hypertrophic cardiomyopathy (oHCM) confirmed by echocardiogram and/or cardiac magnetic resonance showing one of the following (a or b):
    a. Maximal end-diastolic left ventricular wall thickness of ≥ 15 mm **OR**
    b. Maximal end-diastolic left ventricular wall thickness ≥ 13 mm **AND** one of the following (1 or 2):
        i. Family history of HCM **OR**
        ii. A positive genetic test (e.g., MYH7, TNNI3, TNNT2, TPM1, MYL2, MYL3, ACTC1) **AND**
4. Diagnosis must not be due to a known infiltrative or storage disorder causing cardiac hypertrophy that mimicked obstructive HCM (i.e., Fabry disease, amyloidosis, or Noonan syndrome with left ventricular hypertrophy) **AND**
5. Must have resting left ventricular outflow tract gradient (LVOT-G) ≥ 30 mmHg or LVOT-G ≥ 50 mmHg after provocation (Valsalva maneuver or post-exercise) **AND**
6. Must have left ventricular ejection fraction (LVEF) ≥ 55% **AND**
7. Must have New York Heart Association (NYHA) Class II or III functional status **AND**
8. Must have had serious side effects or drug failure to at least one non-vasodilating beta blocker (i.e., atenolol, bisoprolol, metoprolol) AND one non-dihydropyridine calcium channel blocker (must be separate trials), unless there is a documented medical reason why these agents cannot be used.
    a. Please note failure of non-vasodilating beta blocker or non-dihydropyridine calcium channel blocker therapy does not preclude concomitant use of these therapies with Myqorzo **AND**
9. Prescriber attestation must be received that REMS program requirements have been satisfied
10. Initial and subsequent approvals will be granted for 6 months at a time. Subsequent approvals will require submission of progress notes documenting that the patient has achieved/maintained a positive clinical response to therapy.
    a. LVEF assessment by echocardiogram must be provided on each recertification request.
11. Myqorzo will NOT be approved for continued therapy in patients with LVEF < 40%, or if the patient has symptomatic heart failure or worsening clinical status due to systolic dysfunction.
    a. According to FDA labeling, after treatment interruption due to low LVEF, resume treatment no earlier than 7 days, when LVEF ≥ 55% and re-initiate dose titration at the starting dose of 5 mg. Reauthorization for individuals with interrupted treatment must provide documentation of LVEF > 55%.
12. Quantity limit is 30 tablets/30 days.

Palsonify (paltusotine) - Rx

1. Must be prescribed by, or in consultation with, an endocrinologist AND
2. Must be 18 years of age or older AND
3. Must have a diagnosis of acromegaly AND
4. Must have inadequate response despite pituitary surgery and/or radiation, or patient is not a candidate for surgery and/or radiation AND
5. Must have serious side effects or drug failure with maximally tolerated dose of lanreotide acetate (J1930 or J1932) or Somatuline Depot (J1930) AND
6. Documentation of baseline growth hormone (GH) and insulin-like growth factor-1 (IGF-1) will be required
7. Initial approval will be for 6 months. Recertification for further approval will require documentation of a decrease or normalization of GH and/or IGF-1 from baseline and will be for 12 months at a time.
8. Quantity limit: 60 tablets/30 days
    a. A quantity limit exception of up to 120 tablets/30 days of the 30 mg strength may be authorized for individuals on moderate to strong CYP3A4 Inducers

Recorlev (levoketoconazole) - Rx

1. Must be prescribed by, or in consultation with, an endocrinologist AND
2. Must be 18 years of age or older AND
3. Must have a diagnosis of endogenous Cushing's syndrome AND
4. Must have a mean urinary free cortisol (UFC) level that is at least 1.5x the upper limit of normal (ULN) measured over three 24-hour measurements (In clinical trials for Recorlev, ULN = 50 micrograms/24 hours or 138 nmol/24 hours) AND
5. Must have documentation of symptoms of Cushing's Syndrome (such as diabetes, central obesity, moon face, buffalo hump, osteoporosis, muscle wasting, hypertension, depression, and anxiety) AND
6. Must have documentation of failure of or contraindication to Cushing's syndrome specific surgery AND
7. Must have documentation of serious side effects or drug failure with oral ketoconazole AND
8. Individuals with a diagnosis of Cushing's Disease (Cushing's Syndrome that is caused by a pituitary adenoma) must have documentation of serious side effects or drug failure with at least 2 of the following. (Note: if patient has had previous trial and failure of metopirone (metyrapone) then only 1 of the following is required):
    a. Signifor (either LAR or SC formulation)
    b. Lysodren (mitotane)
    c. Cabergoline

9. Recorlev will not be approved for individuals with pituitary or adrenal carcinoma
10. Recorlev will not be approved for the treatment of fungal infections
11. Initial approval will be for 6 months. Recertification at 6 months and thereafter will require laboratory results to document a recent UFC level within normal limits AND improvement in symptoms of Cushing's Syndrome. Recertification will be annually thereafter.
    a. At the time of recertification, the prescriber must also make clear the maintenance dose they are planning to use. Approval will be allowed for this amount for 1 year.
12. Recommended dosing initially is 150 mg twice daily with or without food. Titrate the dosage by 150 mg daily not more frequently than every 2-3 weeks based on 24-hour urine free cortisol levels and patient tolerability. Monitor cortisol levels from at least two 24-hour urine free cortisol collections every 2-3 weeks until an adequate clinical response is achieved. The maximum recommended dosage is 1200 mg per day, administered as 600 mg twice daily. See full prescribing information for complete dosage and administration instructions.
13. Quantity limit: 60 tablets/30 days. The maximum quantity allowed for any dose request is 240 tablets/30 days.
    a. Initial approval will be limited to 60 tablets/30 days
    b. For dose escalation request during the initial titration period, the allowed quantity will be reviewed as follows:
        i. Documentation of a recent, within the past 2-3 weeks, UFC level above the upper limit of normal must be submitted
        ii. Each dose escalation request will be limited to 1 additional 150 mg tablet per day
        iii. Approval will be granted until the end of the drug approval period or for 1 year
    c. For dose escalation requests after the initial approval period, the allowed quantity will be reviewed as follows:
        i. Documentation showing a recent UFC level above the upper limit of normal
        ii. Documentation that the patient is still experiencing Cushing's Syndrome symptoms
        iii. Approval will be granted until the end of the drug approval period or for 1 year

Redemplo (plozasiran) - Rx

1. Must be prescribed by or in consultation with a cardiologist, lipid specialist, or endocrinologist **AND**
2. Must be 18 years of age and older **AND**
3. Must have a diagnosis of Familial Chylomicronemia Syndrome (FCS) **AND**
4. Must have fasting triglycerides (TGs) of ≥ 880 mg/dL (or 10 mmol/L) within the past 6 months **AND**
5. Must have genetic testing performed and meet one of the following (a or b):
    a. Genetic testing confirms biallelic pathogenic variants (i.e., homozygosity, compound heterozygosity, or double heterozygosity) in FCS-causing genes.
        i. Examples of FCS-causing genes include lipoprotein lipase (LPL), apolipoprotein C-II (APOC2), apolipoprotein C-VI (APOA5), glycosylphosphatidylinositol-anchored high-density lipoprotein1binding protein 1 (GPIHBP1), lipase maturation factor 1 (LMF1) **OR**
    b. Genetic testing is inconclusive (i.e., one or more variants of uncertain significance were identified) and one of the following are met (i, ii, or iii.):
        i. Must have a familial chylomicronemia syndrome (FCS) score ≥ 10 [see Appendix in Rare Diseases CRPA (Pharmacy-99)] **OR**
        ii. Must have a North American familial chylomicronemia syndrome (NAFCS) score ≥ 45 [see Appendix in Rare Diseases CRPA (Pharmacy-99)]
            A. NOTE: In patients ≥ 10 years of age, the NAFCS tool should only be used for patients who are not responsive to fibrates and high-dose omega-3 fatty acids even when the patient is compliant with therapy (i.e., TGs do not decrease by 20% or more and do not remain reduced). **OR**
        iii. Must meet the following:
            A. Must be refractory to refractory to standard triglyceride therapies (e.g., statins, fibrates, high-dose omega-3 fatty acids) **AND**
            B. Other causes of hypertriglyceridemia have been ruled out (e.g., alcohol excess, uncontrolled type 2 diabetes, medications, and medical conditions known to raise triglycerides) **AND**
            C. One of the following is met:
                1. History of acute pancreatitis **OR**
                2. History of recurrent abdominal pain without other known cause **AND**
6. Must have documentation or prescriber attestation that the patient has implemented appropriate dietary fat restrictions (e.g., consuming ≤ 20 g of fat per day) to manage FCS.
7. Redemplo will not be covered for any other non-FDA approved indications
8. Initial approval is for 6 months. Recertification will be every 12 months. Recertifications will require documentation of reduction in fasting TGs from baseline.
9. Quantity Limit: 25 mg/0.5 mL (1 pre-filled syringe) per 90 days

Sandostatin LAR and octreotide intramuscular injection - Rx and Medical

1. Must be 18 years of age or older **AND**
2. Must have a diagnosis of **acromegaly AND**
    a. Must be prescribed by, or in consultation with, an endocrinologist
    b. Must have persistent disease despite pituitary surgery and/or radiation, or patient is not a candidate for surgery and/or radiation
    c. **For New Starts Only for acromegaly diagnosis –must have serious side effects or drug failure with maximally tolerated dose of lanreotide acetate (J1930 or J1932) or Somatuline Depot (J1930).**
    d. Documentation of baseline growth hormone (GH) and insulin-like growth factor-1 (IGF-1) will be required
    e. Initial approval for acromegaly will be for 12 months. Recertification for any further approval will require documentation of a decrease or normalization of GH and/or IGF-1 from baseline **OR**
3. Must have a **cancer** diagnosis that meets the following:
    a. Must prescribed by, or in consultation with an Oncologist, Hematologist, or appropriate specialist [i.e., endocrinologist or gastroenterologist for neuroendocrine/adrenal tumor diagnosis] **AND**
    b. The requested use (indication AND regimen) must meet **one** of the following:
        i. Approved by the U.S. Food and Drug Administration (FDA) **OR**
        ii. A National Comprehensive Cancer Network (NCCN) category level 1 or 2A recommendation **OR**
        iii. Satisfied by the criteria required for the applicable line of business (LOB) for the treatment of cancer in the Off-Label Use of FDA Approved Drugs policy (Pharmacy-32) **AND**
    c. Step therapy requirements must be met for select indications as outlined below:
        i. **For all shared FDA label indications or compendia supported indications/regimens (defined as NCCN level of evidence 1 or 2A) related to neuroendocrine and/or adrenal tumor diagnosis**
        ii. **For New Starts Only—must have serious side effects or drug failure with lanreotide acetate (J1930 or J1932) or Somatuline Depot (J1930).**
    d. Initial certification for cancer diagnosis will be for 12 months. Recertification will require demonstration of stable or improved disease.
4. Recommended dosing (see package labeling for complete dosing recommendations):
    a. Patients Not Currently Receiving Sandostatin Injection Subcutaneously:
        i. Acromegaly: 50 mcg three times daily Sandostatin Injection subcutaneously for 2 weeks followed by Sandostatin LAR/ octreotide intramuscular injection 20 mg intragluteally every 4 weeks for 3 months
        ii. Carcinoid Tumors and VIPomas: Sandostatin Injection subcutaneously 100 to 600 mcg/day in 2-4 divided doses for 2 weeks followed by Sandostatin LAR/ octreotide intramuscular injection 20 mg every 4 weeks for 2 months
    b. Patients Currently Receiving Sandostatin Injection Subcutaneously:
        i. Acromegaly: 20 mg every 4 weeks for 3 months
        ii. Carcinoid Tumors and VIPomas: 20 mg every 4 weeks for 2 months
5. Quantity Limit: 1 kit/28 days. For the treatment of acromegaly, a quantity limit exception of 2 kits/28 days may be granted for the 20 mg strength to allow for a maximum daily dose of 40 mg.

HCPCS: J2353

Signifor LAR (pasireotide) - Medical

1. Must be prescribed by, or in consultation with, an endocrinologist **AND**
2. Must have a diagnosis of Cushing's disease
    a. Must not be a candidate for surgery or have had treatment failure with previous surgery. A non-surgical candidate is defined as either having a medical contraindication to surgery or having a tumor which is surgically unapproachable.
    b. A mean free cortisol (mUFC) level will be required at baseline and upon recertification.
    c. Initial approval for Cushing's disease will be for 3 months. Continuation of therapy will require evidence of a reduction in mUFC from baseline. For individuals who achieve a reduction in mUFC after 3 months, recertification will be required every 12 months. **OR**
3. Must have a diagnosis of acromegaly
    a. Must fail to achieve full biochemical control (Growth hormone < 2.5 mcg/L and normal IGF1) on maximally tolerated treatment with lanreotide acetate (J1930 or J1932) or Somatuline Depot (J1930).

i. The required use of lanreotide acetate (J1930 or J1932) or Somatuline Depot (J1930) applies to all lines of business for new starts only.

b. Recommended dosing for acromegaly: The initial dose is 40 mg by intramuscular injection once every 4 weeks. The dose may be increased to a maximum of 60 mg for patients who have not normalized growth hormone (GH) and/or age and sex adjusted insulin-like growth factor-1 (IGF-1) levels after 3 months of treatment with Signifor LAR at 40 mg and who tolerate this dose.

c. Initial approval and recertification for acromegaly will be for 12 months at a time.

d. Recertification will require the following:

i. Recertification after the initial 12 months will require documentation of response to therapy, including:

1. Reduction or stabilization in tumor volume from baseline assessed by MRI after initial 6 months of therapy **OR**

2. Mean growth hormone (GH) less than 2.5 mcg/L and/or a normal insulin-like growth factor- 1 (IGF-1) level after at least 12 months of initial therapy

ii. Yearly recertification thereafter will require documentation that the patient has maintained a clinical response to treatment.

4. Quantity limit of 1 injection (maximum 60 mg) every 28 days.

HCPCS: J2502

Signifor SC (pasireotide solution) - Rx

1. Must be prescribed by, or in consultation with, an endocrinologist AND
2. Must have a diagnosis of Cushing's disease AND
3. Must not be a candidate for surgery or have had treatment failure with previous surgery. A nonsurgical candidate is defined as either having a medical contraindication to surgery or having a tumor which is surgically unapproachable.
4. A mean free cortisol (mUFC) level will be required at baseline and upon recertification.
5. Initial approval will be for 3 months. Continuation of therapy will require evidence of a reduction in mUFC from baseline. For individuals who achieve a reduction in mUFC after 3 months, recertification will be required every 12 months.
6. Usual dosage is 0.3 to 0.9 mg SC twice a day
7. Quantity limit of 60 doses per 30 days

Skyclarys (omaveloxolone) - Rx

1. Must be prescribed by a neurologist or prescriber knowledgeable in the management of Friedreich's ataxia (FA) AND
2. Must be 16 age or older AND
3. Must have a diagnosis of FA confirmed by genetic testing [Note: 96% of affected individuals have homozygous GAA trinucleotide repeat expansions in the first intron of the FXN gene with the remaining individuals being compound heterozygous for a GAA expansion and a FXN point/insertion/deletion mutation]
4. Initial and recertification will be for 12 months at a time.
5. Recertification requests will require documentation that the patient continues to benefit from therapy (i.e., medical assessment demonstrating disease progression has slowed). NOTE: Due to the heterogeneous nature of the disease, physician attestation of clinical benefit may be considered upon recertification.
6. Quantity limit: 90 capsules/30 days

Sohonos (palovarotene) - Rx

1. Must be prescribed by or in consultation with an endocrinologist, geneticist, orthopedists, or prescriber specializing in fibrodysplasia ossificans progressiva (FOP) AND
2. Must have a diagnosis of FOP AND
3. Must have confirmed ACVR1 R206H mutation AND
4. Must have radiographic evidence of heterotopic ossification (HO) (computed tomography (CT) scan, magnetic resonance imaging (MRI), x-ray, positron emission tomography (PET) scan, etc.) AND
5. Must meet at least one of the following (a or b):
   a. Must be 8 years and older and designated female at birth OR
   b. Must be 10 years and older and designated male at birth
6. Sohonos will not be authorized in combination with another therapy for FOP (e.g. Pasatru)

7. Initial and recertification approvals will be for 6 months at a time. Recertification requests will require provider attestation that the patient is experiencing clinical benefit from treatment (reduction in annualized HO volume, reduction frequency/intensity of flare-ups, improvement in range of motion, etc.).
8. Quantity limit:
    a. 1 mg: 112 tablets/28 days
    b. 1.5 mg: 112 tablets/28 days
    c. 2.5 mg: 140 tablets/28 days
    d. 5 mg: 140 tablets/28 days
    e. 10 mg: 56 tablets/28 days

Syprine, generic trientene capsules, and Cuvrior (trientene tablets) - Rx

1. Must have a diagnosis of Wilson's Disease AND
2. The following age requirements must be met based on the product being requested:
    a. Requests for Syprine or generic trientine capsules: 6 years and older
    b. Requests for Cuvrior: 18 years and older AND
3. Must have had serious side effects or drug failure with penicillamine capsules (generic for Cuprimine) AND
4. Based on comparable indications, efficacy, safety profiles and dosing, ALL requests for trientine 500 mg capsules, Cuvrior, and Syprine will require use of generic trientine 250 mg capsules unless there is adequate justification by the prescriber as to why generic trientine 250 mg capsules are not clinically appropriate.
5. Quantity limit
    a. Syprine and generic trientine 250 mg capsules: 240 capsules per 30 days
    b. Cuvrior: 280 tablets per 28 days
    c. Trientine 500 mg capsules: 120 capsules per 30 days

Tarpeyo (budesonide delayed release capsules) - Rx

1. Must be prescribed by, or in consultation with, a nephrologist **AND**
2. Must be 18 years of age or older **AND**
3. Must have a diagnosis of primary immunoglobulin A nephropathy (IgAN), confirmed on biopsy **AND**
4. Must have an eGFR $\geq$ 30 mL/min/1.73 m^2 **AND**
5. Must have proteinuria defined as $\geq$ 0.5 g/day **OR** urine protein creatinine ratio (UPCR) $\geq$ 0.44 g/g **AND**
6. Must be on an angiotensin-converting enzyme inhibitor (ACEi) or an angiotensin II receptor blocker (ARB) at the maximum or maximally tolerated dose for a minimum of 3 months, unless there is documentation that the patient is unable to tolerate or treatment with an ACEi or ARB is contraindicated **AND**
7. Must meet one of the following:
    a. Must have documentation of drug failure after a minimum 3-month trial with an SGLT2 inhibitor, unless the patient has documentation of serious side effects or contraindication to an SGLT2 inhibitor **OR**
    b. Must have documentation of drug failure after a minimum 6-week trial of systemic oral glucocorticoids (i.e., prednisone, methylprednisolone), unless the patient has documentation of serious side effects or contraindication to systemic oral glucocorticoids **OR**
    c. Patient has one of the following:
        i. Total urine protein > 1 g/day (UPCR > 0.8 g/g) **OR**
        ii. eGFR > 30 to < 60 mL/min/1.73 m^2
8. Requests for non-FDA approved indications will not be covered.
9. Approval will be granted for 10 months. Retreatment will not be covered as the safety and efficacy of treatment with subsequent courses of Tarpeyo have not been established.
10. Recommended dosage is 16 mg administered orally once daily in the morning at least 1 hour before a meal. When discontinuing, reduce dosage to 8 mg once daily for the last two weeks.
11. Quantity Limit: 120 capsules/30 days (maximum of 1,108 capsules/365 days). Quantity limit exceptions will not be authorized.

Thiola, generic tiopronin, Thiola EC, Venxxiva, and generic tiopronin delayed release - Rx

1. Must be prescribed by a nephrologist, urologist, or physician knowledgeable in the treatment of cystinuria AND
2. Must have a diagnosis of severe homozygous cystinuria established by ONE of the following:
    a. Stone analysis showing 100% cystine calculi OR
    b. Pathognomonic hexagonal cystine crystals on urine microscopy OR

c. Genetic test confirming two defects in SLC7A9 and/or ALC3A1 gene AND
3. Must weigh 20 kg or greater AND
4. Prescriber must attest that the patient is unresponsive to high fluid intake, urine alkalization, and diet modification (i.e., sodium and protein restriction) AND
5. Prescriber must attest that the patient will continue high fluid intake, urine alkalization, and diet modification in combination with requested therapy
6. Initial authorization will be for 12 months. Recertification will be every 12 months and require evidence of clinical response defined as urinary cystine concentration < 250 mg/L OR decrease in cystine stone formation.
7. Quantity Limit:
   a. Thiola/tiopronin 100 mg: 300 tablets/30 days
   b. Thiola EC/Venxxiva/tiopronin delayed-release
      i. 100 mg: 300 tablets/30 days
      ii. 300 mg: 90 tablets/30 days

Note: Initial dosing is 800 mg per day. A multi-clinic trial demonstrated an average dose of approximately 1,000 mg/day. Dosage can be adjusted depending on urinary cystine levels.

Exceptions to the quantity limit can be made when there is documentation of conservative therapy in combination with standard dosing of Thiola/tiopronin. Conservative treatment includes Intake of at least 3 L of fluid (ten 10 oz. glassfuls), including 2 glasses with each meal and at bedtime. The patients should be expected to awake at night to urinate; they should drink 2 more glasses of fluids before returning to bed. Additional fluids should be consumed if there is excessive sweating or intestinal fluid loss. A minimum urine output of 2 L/day on a consistent basis should be sought. A modest amount of alkali should be provided in order to maintain urinary pH at a high normal range (6.5 to 7).

Trutakna (atacicept) - Rx

1. Must be prescribed by, or in consultation with, a nephrologist **AND**
2. Must be 18 years of age or older **AND**
3. Must have a diagnosis of primary immunoglobulin A nephropathy (IgAN), confirmed on biopsy **AND**
4. Must have an eGFR $\geq$ 30 mL/min/1.73 m^2 **AND**
5. Must provide baseline documentation that meets at least one of the following (note: documentation of the same laboratory parameter will be required upon recertification):
   a. A total urine protein $\geq$ 0.5 g/day **OR**
   b. A urine protein-to-creatinine ratio (UPCR) $\geq$ 0.44 g/g **AND**
6. Must have received the maximum or maximally tolerated dose of an angiotensin-converting enzyme inhibitor (ACEi) or an angiotensin II receptor blocker (ARB) for a minimum of 3 months prior to starting Trutakna, unless there is documentation that the patient is unable to tolerate or has a contraindication to an ACEi or ARB **AND**
7. Must meet one of the following:
   a. Must have documentation of drug failure after a minimum 3-month trial with an SGLT2 inhibitor, unless the patient has documentation of serious side effects or contraindication to an SGLT2 inhibitor **OR**
   b. Must have documentation of drug failure after a minimum 6-week trial of systemic oral glucocorticoids (i.e., prednisone, methylprednisolone), unless the patient has documentation of serious side effects or contraindication to systemic oral glucocorticoids
8. Initial and recertification approvals will be for 9 months at a time. Continuation of therapy will require the following (documentation must be provided):
   a. Evidence of **one** of the following:
      i. Reduction in total urine protein from baseline **OR**
      ii. Reduction in UPCR from baseline **AND**
   b. Must have an eGFR $\geq$ 30 mL/min/1.73 m^2
9. Requests for non-FDA approved indications will not be covered.
10. Trutakna will not be approved in combination with Fabhalta, Vanrafia, or Voyxact.
11. Quantity Limit: 4 prefilled autoinjectors per 28 days
12. This indication is approved under accelerated approval based on a reduction of proteinuria. Continued approval for this indication may be contingent upon verification and description of clinical benefit in a confirmatory clinical trial.

Tryngolza (olezarsen) - Rx

Tryngolza is considered medically for the treatment of **Familial Chylomicronemia Syndrome (FCS)** when the following criteria are met:
1. Must be prescribed by or in consultation with a cardiologist, lipid specialist, endocrinologist, or gastroenterologist **AND**

2. Must be 18 years of age and older **AND**
3. Must have a diagnosis of Familial Chylomicronemia Syndrome (FCS) **AND**
4. Must have fasting triglycerides (TGs) of ≥ 880 mg/dL (or 10 mmol/L) within the past 6 months **AND**
5. Must have genetic testing performed and meet one of the following (a or b):
    a. Genetic testing confirms biallelic pathogenic variants (i.e., homozygosity, compound heterozygosity or double heterozygosity) in FCS-causing genes.
        i. Examples of FCS-causing genes include lipoprotein lipase (LPL), apolipoprotein C-II (APOC2), apolipoprotein C-VI (APOA5), glycosylphosphatidylinositol-anchored high-density lipoprotein1binding protein 1 (GPIHBP1), lipase maturation factor 1 (LMF1) **OR**
    b. Genetic testing is inconclusive (i.e., one or more variants of uncertain significance were identified) and one of the following are met (i, ii, or iii):
        i. Must have a familial chylomicronemia syndrome (FCS) score ≥ 10 [see Appendix] **OR**
        ii. Must have a North American familial chylomicronemia syndrome (NAFCS) score ≥ 45 [see Appendix]
            A. NOTE: In patients ≥ 10 years of age, the NAFCS tool should only be used for patients who are not responsive to fibrates and high-dose omega-3 fatty acids even when the patient is adherent to therapy **OR**
        iii. Must meet the following (A, B, and C)**:**
    A. Must be refractory to refractory to standard triglyceride therapies (e.g., statins, fibrates, high-dose omega-3 fatty acids) **AND**
    B. Other causes of hypertriglyceridemia have been ruled out (e.g., alcohol excess, uncontrolled type 2 diabetes, medications and medical conditions known to raise triglycerides) **AND**
    C. One of the following is met (1 or 2):
        1. History of acute pancreatitis **OR**
        2. History of recurrent abdominal pain without other known cause **AND**
6. Must have documentation or prescriber attestation that the patient has implemented appropriate dietary fat restrictions (e.g., consuming < 20 g of fat per day) to manage FCS.

Tryngolza is considered medically for the treatment of **severe hypertriglyceridemia** when the following criteria are met:
1. Must be prescribed by or in consultation with a cardiologist, lipid specialist, endocrinologist, or gastroenterologist **AND**
2. Must be 18 years of age and older **AND**
3. Must have a diagnosis of severe hypertriglyceridemia, confirmed by fasting triglycerides (TGs) > 500 mg/dL, despite the ALL of following interventions (provider attestation is acceptable for criterion 3a-3c):
    a. Management of lifestyle factors have been implemented as appropriate (e.g., limiting alcohol intake, dietary modifications, weight loss) for at least 12 weeks
    b. Implementation of appropriate dietary restrictions (e.g., limiting added sugar intake to < 5% of total calories and total dietary fat intake to ≤ 20-25% of total calories; < 5% dietary fat per day if TG > 1000 mg/dL)
    c. Other causes of hypertriglyceridemia have been ruled out and/or addressed (e.g. alcohol excess, uncontrolled type 2 diabetes, medications and medical conditions known to raise triglycerides)
    d. Must have had trial and failure of a maximally tolerated high potency statin (goal is atorvastatin 40-80 mg daily or rosuvastatin 20-40 mg daily), in combination with either an omega-3 fatty acids (e.g. icosapent ethyl) or fibric acid derivative (e.g. fenofibrate) for at least 4 weeks (documentation is required)
4. Documentation of baseline TG level must be submitted within 60 days prior to treatment with Tryngolza. A baseline TG level is defined as a TG level collected while maintained on or following completion of an adequate trial with combination therapy as listed in criterion 3d

- Tryngolza will not be covered for any other non-FDA approved indications
- Initial approval is for 6 months. Recertification will be every 12 months. Recertifications will require documentation of reduction in fasting TGs from baseline.
- Quantity Limit: 1 autoinjector per 28 days

Uplizna (inebilizumab-cdon) - medical

For treatment of Neuromyelitis Optica Spectrum Disorder (NMOSD), please refer to Pharmaceutical Treatment of Neuromyelitis Optica Spectrum Disorder, 1350/20.000393

Uplizna is considered medically necessary for the treatment of **Immunoglobulin (Ig) G4-related disease (IgG4-RD)** when the following criteria are met:
1. Must be 18 years of age or older **AND**
2. Must be prescribed by or in consultation with a rheumatologist, immunologist, endocrinologist, nephrologist, or prescriber experienced treating IgG4-RD **AND**

3. Must have a diagnosis of IgG4-RD **AND**
4. Must meet all the following to confirm diagnosis:
    a. Must have documentation of ≥ 2 organ system/sites involvement at any time during the disease course and at least ONE of the following organs are affected: pancreas, bile ducts/biliary tree, orbits, lungs, kidneys, lacrimal glands, major salivary glands, retroperitoneum, aorta, pachymeninges, and/or thyroid gland **AND**
    b. Must have documentation that other condition that mimic IgG4-RD have been ruled out (e.g., infection, malignancy, other autoimmune conditions) **AND**
5. Must be currently experiencing IgG4- related disease flare (or had a recent flare within the past 12 months) requiring glucocorticoid treatment **AND**
6. Must have evidence of steroid-refractory disease (e.g., symptoms do not sufficiently improve, inadequate decrease in serum IgG4 concentrations) or patient is glucocorticoid-dependent and cannot reduce dose sufficiently without experiencing a flare or worsening of symptoms (e.g., patient developing a flare upon the tapering of prednisone below 10 mg/day).
7. Initial and recertification authorizations will be for 12 months at a time.
    a. Recertification will require documentation that patient is experiencing clinical benefit from therapy (e.g., reduction in flares, reducing glucocorticoid use, symptom improvement).

Uplizna is considered medically necessary for the treatment of **generalized myasthenia gravis (gMG)** when the following criteria are met:
1. Must be 18 years of age or older **AND**
2. Must be prescribed by or in consultation with a neurologist. If geographically available, it is also recommended for patients to have been evaluated by a neuromuscular specialist. **AND**
3. Must have a diagnosis of generalized myasthenia gravis (gMG) **AND**
4. Must have Myasthenia Gravis Foundation of America (MGFA) clinical classification class II to IV **AND**
5. Must be anti-acetylcholine receptor (AchR) antibody positive or Muscle-specific kinase (MuSK) positive **AND**
6. Must have documentation of a baseline Myasthenia Gravis Activities of Daily Living (MG-ADL) score of at least 6 **AND**
7. Must meet one of the following (i or ii)
    a. Must have had serious side effects or drug failure to ONE of the following treatments for gMG (1 or 2).
        i. Corticosteroids for at least 3 months of treatment **OR**
        ii. Non-steroidal immunosuppressive therapy (i.e., azathioprine, mycophenolate mofetil, cyclosporine) for at least 6 months of treatment **OR**
    b. Despite treatment with at least ONE immunosuppressant agent (i.e., corticosteroid, non-steroidal immunosuppressive therapy), the member required at least ONE treatment with plasma exchange, plasmapheresis, or intravenous immunoglobulin within the previous 12 months. **AND**
8. **For individuals with AChR positive gMG**: Must have had serious side effects or drug failure with Vyvgart Hytrulo prefilled syringe (PFS). This applies to New Starts only for all lines of business **except Medicare Part B.**
9. Uplizna will not be approved in combination with Soliris/Bkemv/ Epysqli, Ultomiris, Vyvgart/Vyvgart Hytrulo, Imaavy, Rystiggo or Zilbrysq, as Uplizna has not been studied in combination with these therapies.
10. Initial approvals will be for 6 months.
11. Continued approval will require documentation of ≥ 2-point improvement in the MG-ADL scale from baseline **OR** prescriber attests that patient is experiencing clinical benefit from treatment (i.e., reduction of myasthenia gravis exacerbations, improvement in symptoms such as swallowing, mobility, breathing). Recertification will be required every 12 months.

HCPCS: J1823

Vanrafia (atrasentran) - Rx

1. Must be prescribed by, or in consultation with, a nephrologist **AND**
2. Must be 18 years of age or older **AND**
3. Must have a diagnosis of primary immunoglobulin A nephropathy (IgAN), confirmed on biopsy **AND**
4. Must have an eGFR ≥ 30 mL/min/1.73 m^2 **AND**
5. Must provide baseline documentation that meets at least one of the following (note: documentation of the same laboratory parameter will be required upon recertification):
    a. A total urine protein ≥ 0.5 g/day **OR**
    b. A urine protein-to-creatinine ratio (UPCR) ≥ 0.44 g/g **AND**
6. Must have received the maximum or maximally tolerated dose of an angiotensin-converting enzyme inhibitor (ACEi) or an angiotensin II receptor blocker (ARB) for a minimum of 3 months prior to starting Vanrafia, unless there is documentation that the patient is unable to tolerate or has a contraindication to an ACEi or ARB **AND**

7. Must have documentation of drug failure of Filspari **OR** Tarpeyo
8. Initial and recertification approvals will be for 9 months at a time. Continuation of therapy will require the following (documentation must be provided):
    a. Evidence of **one** of the following:
        i. Reduction in total urine protein from baseline **OR**
        ii. Reduction in UPCR from baseline **AND**
    b. Must have an eGFR ≥ 30 mL/min/1.73 m^2
9. Requests for non-FDA approved indications will not be covered.
10. Vanrafia will not be approved in combination with Trutakna, Voyxact or Fabhalta
11. Quantity Limit: 30 tablets/30 days
12. This indication is approved under accelerated approval based on a reduction of proteinuria. Continued approval for this indication may be contingent upon verification and description of clinical benefit in a confirmatory clinical trial.

Vijoice (alpelisib) - Rx

1. Must be 2 years of age or older AND
2. Must be prescribed by a prescriber who specializes in PIK3CA-Related Overgrowth Spectrum (PROS) AND
3. Must have a diagnosis of PROS, confirmed by a prescriber specializing in PROS AND
4. Must have documentation of a mutation in the PIK3CA gene AND
5. Prescriber must attest that the patient's condition is severe or life threatening AND
6. Must have at least one target lesion identified on imaging at baseline AND
7. Must provide a baseline sum of measurable target lesion volume
8. Vijoice will not be covered for any other diagnosis
9. Recommended dosing in adult patients is 250 mg orally, once daily, administered as recommended until disease progression or unacceptable toxicity. Recommended dosing in pediatric patients (2 to less than 18 years of age) is 50 mg orally, once daily, administered as recommended until disease progression or unacceptable toxicity. See full prescribing information for complete dosing and administration recommendations.
10. Initial approval will be for 6 months. Recertification will be for 12 months at a time and will require documentation of:
    a. A decrease from baseline in sum of measurable target lesion volume, without debulking surgery, confirmed by at least one imaging assessment, in the absence of > 20% increase from baseline in any target lesion, progression of a non-target lesions, or appearance of any new lesions
11. Quantity limit:
    a. 50 mg oral granules: 28 packets/28 days
    b. 50 mg/day pack and 125 mg/day pack: 28 tablets/28 days
    c. 250 mg/day pack: 56 tablets/28 days
12. This indication is approved under accelerated approval based on response rate and duration of response. Continued approval for this indication may be contingent upon verification and description of clinical benefit in a confirmatory trial(s).

Voxzogo (vosoritide) - Rx

1. Must be prescribed by, or in consultation with, a geneticist, skeletal dysplasia specialist or pediatric endocrinologist AND
2. Must be less than 18 years of age AND
3. Must have a diagnosis of achondroplasia, confirmed by genetic testing (gain of function FGFR3 gene mutation) AND
4. Documentation of a recent (within previous 6 months) annualized growth velocity (AGV) to establish baseline AGV AND
5. One of the following must be met (a or b):
    a. Annualized growth velocity (AGV) > 1.5 cm/year (based on documentation provided to satisfy criterion #4) OR
    b. Radiographic evidence (within previous 6 months) demonstrating open epiphyses
6. Must not have previous treatment with growth hormone, insulin-like growth factor 1, or anabolic steroids within the previous 6 months
7. Prescriber must attest that patient does not have planned or expected limb-lengthening surgery
    a. If the patient had limb-lengthening surgery, it must have occurred at least 18 months prior to the Voxzogo request
8. For individuals 2 years and older, must have serious side effects or drug failure with Yuviwel
9. Initial approval will be for 6 months. Recertification requests will be granted for 6 months and require recent (within 6 months) documentation of the following (a and b):
    a. One of the following are met (i or ii)
        i. A recent AGV ≥ 1.5 cm/year **OR**
        ii. Radiographic evidence demonstrating open epiphyses

AND

b. Evidence of an increase in AGV from baseline

10. Voxzogo will not be authorized if there is documented evidence of closed epiphyses
11. Voxzogo will not be authorized for use in combination with Yuviwel
12. The recommended dose of Voxzogo is based on the patient's body weight (see prescribing information)
13. Quantity limit: 30 vials (3 co-packs)/30 days
14. This indication is approved under accelerated approval based on an improvement in annualized growth velocity. Continued approval for this indication may be contingent upon verification and description of clinical benefit in confirmatory trial(s).

Voydeya (danicopan) - Rx

1. Must be 18 years of age or older AND
2. Must be prescribed by a hematologist or nephrologist AND
3. Must have a diagnosis of paroxysmal nocturnal hemoglobinuria (PNH) confirmed by a flow cytometry test AND
4. Must be receiving ravulizumab (e.g., Ultomiris) or eculizumab (e.g., Soliris, Bkemv, Epysqli) therapy for at least 6 months AND
5. Must have documented evidence of extravascular hemolysis (EVH) while receiving ravulizumab (e.g., Ultomiris) or eculizumab (e.g., Soliris, Bkemv, Epysqli). [examples of EVH: anemia, elevated absolute reticulocyte count, elevated LDH, elevated bilirubin, increase in transfusion requirements, etc.] AND
6. Prescriber must attest that Voydeya will be used in combination with ravulizumab (e.g., Ultomiris) or eculizumab (e.g., Soliris, Bkemv, Epysqli) AND
7. Voydeya will not be authorized in combination with any other complement inhibitor beyond those included in the FDA-labeled indication (e.g., Empaveli (pegcetacoplan), Fabhalta (iptacopan), Piasky (crovalimab)) as these combinations have not been studied and will be considered experimental/investigational.
8. Voydeya will not be authorized for any other non-FDA approved indication
9. Initial approval for 6 months. Continued approval will be for 6 months and will require documentation that the patient is tolerating therapy and is responding to treatment (i.e., decrease in number of transfusions, improvement in hemoglobin levels, normalization of LDH levels, symptom improvement).
10. Quantity Limit: 180 tablets/30 days

Voyxact (sibeprenlimab) - Rx

1. Must be prescribed by, or in consultation with, a nephrologist **AND**
2. Must be 18 years of age or older **AND**
3. Must have a diagnosis of primary immunoglobulin A nephropathy (IgAN), confirmed on biopsy **AND**
4. Must have an eGFR > 30 mL/min/1.73 m^2 **AND**
5. Must provide baseline documentation that meets at least one of the following (note: documentation of the same laboratory parameter will be required upon recertification):
    a. A total urine protein > 0.5 g/day **OR**
    b. A urine protein-to-creatinine ratio (UPCR) > 0.44 g/g **AND**
6. Must have received the maximum or maximally tolerated dose of an angiotensin-converting enzyme inhibitor (ACEi) or an angiotensin II receptor blocker (ARB) for a minimum of 3 months prior to starting Voyxact, unless there is documentation that the patient is unable to tolerate or has a contraindication to an ACEi or ARB **AND**
7. Must meet one of the following:
    a. Must have documentation of drug failure after a minimum 3-month trial with an SGLT2 inhibitor, unless the patient has documentation of serious side effects or contraindication to an SGLT2 inhibitor **OR**
    b. Must have documentation of drug failure after a minimum 6-week trial of systemic oral glucocorticoids (i.e., prednisone, methylprednisolone), unless the patient has documentation of serious side effects or contraindication to systemic oral glucocorticoids **OR**
    c. Patient has one of the following:
        i. Total urine protein > 1 g/day (UPCR > 0.8 g/g) **OR**
        ii. eGFR > 30 to < 60 mL/min/1.73 m^2
8. Initial and recertification approvals will be for 9 months at a time. Continuation of therapy will require the following (documentation must be provided):
    a. Evidence of one of the following:
        i. Reduction in total urine protein from baseline **OR**

ii. Reduction in UPCR from baseline **AND**

b. Must have an eGFR > 30 mL/min/1.73 m^2

9. Requests for non-FDA approved indications will not be covered.
10. Voyxact will not be approved in combination with Fabhalta, Trutakna, or Vanrafia
11. Quantity Limit: 400 mg/2mL (1 prefilled syringe) per 28 days
12. This indication is approved under accelerated approval based on a reduction of proteinuria. Continued approval for this indication may be contingent upon verification and description of clinical benefit in a confirmatory clinical trial.

Vykat XR (diazoxide choline) - Rx

1. Must be prescribed by or in consultation with an endocrinologist, medical geneticist, or prescriber who specializes in the treatment of Prader-Willi syndrome (PWS)
2. Must be 4 years of age or older
3. Must have a diagnosis of PWS confirmed with generic testing establishing abnormal DNA methylation of chromosome 15q11.2-q13
4. Must have documentation of hyperphagia (e.g., intense/persistent hunger, extreme food-seeking behaviors)
5. Must have documentation of recent weight (within 30 days) to ensure appropriate dose
6. Provider must attest that caregiver or patient have implemented and will continue strategies to establish a food-secure environment
7. Vykat XR will not be authorized for treatment of hyperphagia in patients without Prader-Willi syndrome
8. Initial approval and continues may be issued for 6 months at a time. Continuation of therapy will require:
    a. Recent (within 30 days) documentation of weight to ensure appropriate dose
    b. Documentation or provider attestation that Vykat XR is providing clinical benefit (e.g., decrease in food-related symptoms that interfere with activities of daily living)
9. Quantity limit: 30 tablets/30 days
    a. Upon each drug review and dose escalation request, the allowed quantity will be reviewed in accordance with FDA-approved weight-based dosing and, as such, will be limited to the minimum number of tablets to obtain the appropriate daily dose.

Xolremdi (mavorixafor) - Rx

1. Must be prescribed by an immunologist, hematologist, or prescriber who specializes in the management of WHIM (warts, hypogammaglobulinemia, infections and myelokathexis) syndrome **AND**
2. Must be 12 years of age or older **AND**
3. Must have a diagnosis of WHIM syndrome confirmed by genotype variant of CXCR4 **AND**
4. Must have documentation of the following laboratory values at baseline, to assess clinical response to treatment:
    a. Absolute lymphocyte count (ALC) **AND**
    b. Absolute neutrophil count (ANC) **AND**
5. Must have ANC of ≤ 400 cells/μL prior to starting Xolremdi
6. Initial approval will be for 6 months. Recertification will be for 12 months at a time and requires documentation of improvement of ALC and/or ANC from baseline.
    a. NOTE: If ALC and ANC values do not improve from baseline while on Xolremdi, then documentation must be submitted demonstrating objective clinical response to therapy that warrants continuation of Xolremdi (e.g., reduction or improvement in frequency, duration, or severity of infections; reduction in the need for antibiotics; fewer warts; improvement in white blood cell count (WBC) or absolute monocyte count (AMC)).
7. Quantity Limit: 120 capsules/30 days

Yartemlea (narsoplimab-wuug) – Medical

1. Must be prescribed by, or in consultation with, a hematologist, oncologist, transplant specialist, or specialist in the treatment of hematopoietic stem cell transplant-associated thrombotic microangiopathy (TA-TMA) AND
2. Must be 2 years of age or older AND
3. Must be post-hematopoietic stem cell transplant (HSCT) AND
4. Must have documentation of laboratory results indicating a diagnosis of hematopoietic stem cell transplant-associated thrombotic microangiopathy (TA-TMA), defined as both of the following (a and b).
    a. Platelet count < 150 x 10^9/L AND
    b. Evidence of microangiopathic hemolysis, defined as one of the following (i, ii, or iii):
        i. Presence of schistocytes

ii. Serum lactate dehydrogenase (LDH) above the upper limit of normal (ULN)
iii. Haptoglobin below the lower limit of normal (LLN) AND

5. Yartemlea will not be authorized in combination with a complement inhibitor (including but not limited to eculizumab, ravulizumab, pegcetacoplan)
6. Initial approval will be for 6 months. Recertification will be for 12 months at a time and require one of the following is met (a or b)
    a. Member is responding to therapy, defined as both of the following (i and ii):
        i. Improvement in clinical status of at least one organ system (e.g., blood, kidney, pulmonary, gastrointestinal, neurological) [See Considerations for examples of clinical status improvement by organ] or independence from red blood cell (RBC) and/or platelet transfusions AND
        ii. Both of the following are met (1 and 2):
            1. LDH level is less than 1.5x ULN AND
            2. Platelet count is improved, defined as:
                a. For baseline platelet count ≤ 20,000/µL (i, ii, and iii):
                    i. ≥ 3-fold increase in platelet count AND
                    ii. Post-baseline platelet count ≥ 30,000/µL AND
                    iii. Receipt of no platelet transfusions within 2 days prior to the platelet count assessment OR
                b. For baseline platelet count > 20,000/µL (i, ii, and iii):
                    i. ≥ 50% increase in platelet count AND
                    ii. Platelet count ≥ 75,000/µL AND
                    iii. Receipt of no platelet transfusions within 2 days prior to the platelet count assessment. OR
    b. Member has had inadequate improvement in TA-TMA signs and symptoms and requires escalation in dosing frequency to twice weekly, based on FDA approved labeling.

Yorvipath (palopegteriparatide) - Rx

1. Must be 18 years of age and older AND
2. Must be prescribed by or in consultation with an endocrinologist AND
3. Must have a diagnosis of chronic hypoparathyroidism of postsurgical, autoimmune, genetic, or idiopathic etiologies for at least 6 months AND
4. Must have documented history of hypocalcemia in the setting of inappropriately low serum parathyroid (PTH) levels AND
5. Patient must currently be receiving conventional therapy for hypoparathyroidism consisting of active vitamin D (calcitriol) and calcium supplementation AND
6. Prescriber must attest to the following (a and b):
    a. The patient's hypoparathyroidism cannot be adequately controlled with conventional therapy alone AND
    b. Prior to initiating Yorvipath, the following will be verified in accordance with the FDA-approved prescribing information (i and ii):
        i. Serum 25(OH) vitamin D levels are within normal range AND
        ii. Albumin-corrected serum calcium is > 7.8 mg/dL (or ionized serum calcium is > 4.40 mg/dL) AND
7. Yorvipath will not be authorized for acute postsurgical hypoparathyroidism (defined as postsurgical hypoparathyroidism for a duration of less than 6 months) AND
8. Yorvipath will not be authorized in combination with any other PTH analogs (e.g., teriparatide) AND
9. Yorvipath will not be authorized for non-FDA approved indications.
10. Initial and recertification approval will be for 12 months at a time. Recertification requests will require prescriber attestation the patient is demonstrating clinical benefit from therapy (e.g., reduction in dose or discontinuation of active vitamin D and/or therapeutic doses of elemental calcium; maintenance of albumin-adjusted serum calcium within normal range).
11. Quantity limit: 2 pens per 28 days

Yuviwel (navepegritide) – Rx

1. Must be prescribed by, or in consultation with, a geneticist, skeletal dysplasia specialist or pediatric endocrinologist AND
2. Must be 2 years of age to less than 18 years of age AND
3. Must have a diagnosis of achondroplasia, confirmed by genetic testing (gain of function FGFR3 gene mutation) AND
4. Must have documentation of a recent (within previous 6 months) annualized growth velocity (AGV) to establish baseline AGV AND
5. One of the following must be met (a or b):

a. Annualized growth velocity (AGV) ≥ 1.5 cm/year (based on documentation provided to satisfy criterion #4) OR
b. Radiographic evidence (within previous 6 months) demonstrating open epiphyses AND

6. Must not have previous treatment with growth hormone, insulin-like growth factor 1, or anabolic steroids within the previous 6 months
7. Prescriber must attest that patient does not have planned or expected limb-lengthening surgery
    a. If the patient had limb-lengthening surgery, it must have occurred at least 18 months prior to the Yuviwel request
8. Initial approval will be for 6 months. Recertification requests will be granted for 6 months and require recent (within 6 months) documentation of the following (a and b):
    a. One of the following are met (i or ii)
        i. A recent AGV ≥ 1.5 cm/year OR
        ii. Radiographic evidence demonstrating open epiphyses AND
    b. Evidence of an increase in AGV from baseline
9. Yuviwel will not be authorized if there is documented evidence of closed epiphyses.
10. Yuviwel will not be authorized for use in combination with Voxzogo
11. The recommended dosage of Yuviwel is based on the patient's body weight (see prescribing information)
12. Quantity limit: 4 kits (4 vials) per 28 days
    a. A quantity limit exception will be authorized for patients weighing 56 kg or more to allow for 8 kits (8 vials) per 28 days
13. This indication is approved under accelerated approval based on an improvement in annualized growth velocity. Continued approval for this indication may be contingent upon verification and description of clinical benefit in confirmatory trial(s)

Ztalmy (ganaxolone) - Rx

1. Must be prescribed by or in consultation with a neurologist
2. Patient must be 2 years of age or older
3. Must have a diagnosis of seizures associated with cyclin-dependent kinase-like 5 deficiency disorder (CDD) confirmed by CDKL5 genetic testing
4. Documented trial and failure of at least two antiepileptic therapies
5. Initial approval will be for 6 months and require documentation of baseline monthly seizure frequency.
6. Recertification will require documentation of a sustained reduction in monthly seizure frequency compared to baseline.
7. Quantity limit: 1 bottle per 28 days. Upon each review and dose escalation request, the allowed quantity will be reviewed in accordance with FDA-approved weight-based dosing and, as such, will be limited to the minimum number of bottles to obtain the appropriate daily dose.

Considerations

- Prior authorization is obtained through the CDPHP pharmacy department.

The 2019 American College of Rheumatology/European League Against Rheumatism classification criteria for IgG4-related disease
Step 3 Inclusion criteria: domains and items**

Domain and Items	Score¶
Histopathology	
Uninformative biopsy	0
Dense lymphocytic infiltrate	+4
Dense lymphocytic infiltrate and obliterative phlebitis	+6
Dense lymphocytic infiltrate and storiform fibrosis with or without obliterative phlebitis	+13
***Immunostaining**#*	
IgG4+:IgG+ ratio is 0 to 40% or indeterminate and the number of IgG4+ cells/HPF is 0 to 9.‡	0
IgG4+:IgG+ ratio is ≥ 41% and the number of IgG4+ cells/HPF is 0 to 9 or indeterminate; or the IgG4+:IgG+ ratio is 0 to 40% or indeterminate and the number of IgG4+ cells/HPF is ≥ 10 or indeterminate.	+7
IgG4+:IgG+ ratio is 41 to 70% and the number of IgG4+ cells/HPF is ≥ 10; or the IgG4+:IgG+ ratio is ≥ 71% and the number of IgG4+ cells/HPF is 10 to 50.	+14
IgG4+:IgG+ ratio is ≥ 71% and the number of IgG4+ cells/HPF is ≥ 51.	+16
Serum IgG4 concentration	
Normal or not checked	0

> Normal but < 2 times upper limit of normal	+4
2 to 5 times upper limit of normal	+6
> 5 times upper limit of normal	+11
Bilateral lacrimal, parotid, sublingual, and submandibular glands	
No set of glands involved	0
1 set of glands involved	+6
2 or more sets of glands involved	+14
Chest	
Not checked or neither of the items listed is present	0
Peribronchovascular and septal thickening	+4
Paravertebral band-like soft tissue in the thorax	+10
Pancreas and biliary tree	
Not checked or none of the items listed is present	0
Diffuse pancreas enlargement (loss of lobulations)	+8
Diffuse pancreas enlargement and capsule-like rim with decreased enhancement	+11
Pancreas (either of above) and biliary tree involvement	+19
Kidney	
Not checked or none of the items listed is present	0
Hypocomplementemia	+6
Renal pelvis thickening/soft tissue	+8
Bilateral kidney cortex low-density areas	+10
Retroperitoneum	
Not checked or neither of the items listed is present	0
Diffuse thickening of the abdominal aortic wall	+4
Circumferential or anterolateral soft tissue around the infrarenal aorta or iliac arteries	+8

¶ Only the highest-weighted item in each domain is scored.
# Biopsies from lymph nodes, mucosal surfaces of the gastrointestinal tract, and skin are not acceptable for use in weighting the immunostaining domain.
** "Indeterminate" refers to a situation in which the pathologist is unable to clearly quantify the number of positively staining cells within an infiltrate yet can still ascertain that the number of cells is at least 10/high-power field (hpf). For a number of reasons, most often pertaining to the quality of the immunostain, pathologists are sometimes unable to count the number of IgG4+ plasma cells with precision yet even so, can be confident in grouping cases into the appropriate immunostaining result category.

**Full classification criteria may be found at: https://acrjournals.onlinelibrary.wiley.com/doi/epdf/10.1002/art.41120

CHILD HEALTH PLUS:	Subject to all terms and conditions noted in above application.
MEDICARE ADVANTAGE:	Subject to all terms and conditions noted in above application if administered under the medical benefit. Forzinity: Not applicable
SELECT/HARP PLAN:	Subject to all terms and conditions noted in above application if administered under the medical benefit. Effective April 1, 2023, the pharmacy benefit for Medicaid is administered by NYRx, the Medicaid Pharmacy Program.

CDPHP Pharmacy Services 10/1/2026

New: 2/2026

Revised	Reviewed
3/2026, 5/2026, 6/2026, 7/2026, 8/2026, 9/2026	

Revision Date	Changes Made
2/2026	Added Forzinity, Redemplo, and Tryngolza.
3/2026	Added Aldurazyme. Updated Tryngolza to remove step through Redemplo.
5/2026	Added Myqorzo, Voyxact. Moved Juxtapid, Gamifant, Voxzogo, Xolremdi, Skyclarys from standalone policy to this policy.
5/2026	Added Yartemlea and Yuviwel Added Recorlev
5/2026	Moved Palsonify and Ilaris from standalone policies Added Mycapssa, Sandostatin LAR and Signifor LAR
6/2026	Added Juxtapid 2.5 mg QL Updated Voxzogo criteria
7/2026	Added Adzynma
8/2026	Added Arcalyst, Crenessity, Imcivree, Increlex, Isturisa, and Trutakna Moved Camzyos, Fabhalta, Joenja, Sohonos, Tarpeyo, trientene/Syprine/Cuvrior, Vijoice, Voydeya, Vykat XR, Yorvipath, and Ztalmy from standalone policies Updated proteinuria levels and combination therapy language for Fabhalta, Vanrafia, Voyxact, Filspari, and Tarpeyo Removed Adzynma requirement the patient does not have anti-ADAMTS13 autoantibodies Added new Tryngolza indication for new indication for severe hypertriglyceridemia Removed accelerated approval statement from Fabhalta for IgAN Added Trutakna as a drug Fabhalta. Vanrafia, and Voyxact cannot be used in combination with Uplizna - For a diagnosis of IgG4-RD, removed requirement of > 20 score on the 2019 ACR/EULAR HgG4-RD classification criteria
8/2026	Added Actimmune, Keveyis, generic dichlorphenamide and Ormalvi (dichlorphenamide), Firdapse, Korlym

This Pharmacy Policy is the exclusive property of Capital District Physicians' Health Plan, Inc. (CDPHP®) and its affiliated companies, CDPHP Universal Benefits,® Inc. Policy/Procedure Name: RDEB Pharmaceutical Treatment **Control Number: 1350/20.000484**

Disclaimer Notice

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgment when deciding the most appropriate care to enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

Background

Vyjuvek is a herpes-simplex virus type 1 (HSV-1) vector-based gene therapy (gel formulation) indicated for the treatment of wounds in patients six months of age and older with dystrophic epidermolysis bullosa (DEB) with mutation(s) in the collagen type VII alpha 1 chain (COL7A1) gene. Those with autosomal dominant DEB (DDEB) have lower than normal functional anchoring fibrils and those with autosomal recessive DEB (RDEB) have no functional anchoring fibrils.

Dystrophic epidermolysis bullosa is one of the major forms of epidermolysis bullosa. The signs and symptoms can vary widely among affected children and adults. In mild cases, blistering may primarily affect the hands, feet, knees, and elbows whereas severe cases involve widespread blistering. Some children even develop blisters in the moist tissue that line the mouth, throat, stomach, intestines, and rectum, even food friction or bowel movements can cause painful blisters. This disease process can lead to vision loss, disfigurement, and other serious medical problems. DEB is even associated with fatal skin cancers, known to be aggressive and difficult to treat. DEB is caused by changes (mutations) in the *COL7A1* gene and may be inherited in an autosomal dominant or autosomal recessive manner depending on the subtype.

Treatment is aimed at managing a few aspects of the disease including wound care, and pain management. The blistering and raw skin, infections and even normal GI processes, all cause pain in this population.

Dystrophic epidermolysis bullosa (DEB) is caused by mutation(s) in the COL7A1 gene, which results in reduced or absent levels of biologically active COL7. Upon topically applying Vyjuvek to wounds, it can transduce both keratinocytes and fibroblasts, and upon entry into the cells the vector genome is deposited into the nucleus. At this point, the transcription of the encoded human COL7A1 is initiated, which allows for the production and secretion of COL7 by the cell in its mature form. COL7 arrange themselves into long, thin bundles that form anchoring fibrils which hold the epidermis and dermis together and are essential for maintaining skin integrity.

The efficacy of Vyjuvek in subjects one year of age and older with dystrophic epidermolysis bullosa (DEB) with mutation(s) in the COL7A1 gene was evaluated in one randomized, double-blind, intra-subject placebo-controlled trial. All study subjects had clinical manifestations consistent with DEB and genetically confirmed mutation(s) in the COL7A1 gene. Two comparable wounds in each subject were selected and randomized to receive either topical application of Vyjuvek gel or the placebo (excipient gel) weekly for 26 weeks. There were 31 subjects enrolled, including 30 with autosomal recessive DEB and one with autosomal dominant DEB, ages between 1 and 44 years. Efficacy was established on the basis of improved wound healing defined as the difference in the proportion of complete (100%) wound closure at 24 weeks confirmed at two consecutive study visits two weeks apart, weeks 22 and 24 or at weeks 24 and 26. Efficacy was supported by the difference in the proportion of complete wound closure assessed at weeks 8 and 10 or at weeks 10 and 12 between the Vyjuvek and placebo arms. Complete (100%) wound closure was defined as durable wound closure evaluated at two consecutive visits two weeks apart (as noted above). At weeks 22 & 24 or 24 & 26, in those receiving Vyjuvek, 20 subjects or 65% had complete wound closure, compared to 8 or 26%, 39% treatment difference, p = 0.012. Adverse reactions include itching, chills, redness, rash, cough, and runny nose. There were no discontinuations due to adverse reactions.

Summary

Effective Date of Policy:	2/12/2026
Indications	Dystrophic epidermolysis bullosa with mutation(s) in the collagen type VII alpha 1 chain (COL7A1) gene
ICD10 Diagnosis Codes	Q81.2
Availability	Vyjuvek is a biological suspension, mixed into excipient gel, for topical application. Vyjuvek biological suspension is supplied as a 1.0 mL extractable volume in a single dose vial at a nominal concentration of 5×10^9 PFU/mL. The excipient gel is supplied as a 1.5 mL fill volume in a separate single use vial. Vyjuvek biological suspension (1 mL) is mixed into the excipient gel vial prior to administration as Vyjuvek gel. Filsuvez is supplied in 25 mL white aluminum tubes containing 23.4 grams of gel per tube

	Zevaskyn is supplied in sheets of 41.25 m^2 (5.5 cm x 7.5 cm) and up to 12 sheets may be manufactured from the patient's biopsies and supplied for potential use. Due to Zevaskyn's autologous nature, a repeated biopsy may be required if manufacturing failure occurs.
Duration	Six months

Required Criteria for Initial Approval	
All of the following conditions for the requested indication must be met in order to approve therapy:	
Filsuvez (birch triterpenes)	1. Must be prescribed by, or in consultation, with a dermatologist or pediatric dermatologist, or clinical expert in epidermolysis bullosa (EB) AND 2. Must be 6 months of age or older AND 3. Must have a diagnosis of dystrophic epidermolysis bullosa (DEB) or junctional epidermolysis bullosa (JEB), confirmed on genetic testing (e.g., mutations in COL7A1 or PLOD3 for DEB and LAMA3, LAMB3, LAMC2, COL17A1, ITGA6, ITGB4, or ITGA3 for JEB) AND 4. Must have documentation within the previous month indicating which cutaneous wound(s) will be treated with Filsuvez AND 5. Prescriber must attest the following (a and b): a. The wound(s) being treated is (are) 10 cm^2 to 50 cm^2 AND b. The wound(s) being treated is (are) aged > 21 days to < 9 months AND 6. Filsuvez will not be authorized in combination with Vyjuvek or Zevaskyn for the treatment of the same wound(s). 7. Filzuvez will not be authorized for concomitant use with Vyjuvek or Zevaksyn for the treatment of different wounds located on different areas of the body, unless there is adequate documentation justifying the need for separate products on different wounds located on different areas of the body. 8. Use of Filsuvez on a wound(s) previously treated with Vyjuvek or Zevaskyn requires adequate documentation demonstrating inadequate response or treatment failure to previous treatment(s). 9. Initial and recertification approval will be for 3 months at a time. Recertification will require documentation of clinical improvement of the treated wound (s) AND a. The treated wound(s) has not completely closed or has re-opened OR b. New, previously untreated wound(s) require treatment. 10. Quantity Limit: 15 tubes/30 days a. Requests for higher quantities will require the prescriber provide an estimate of how frequently the patient will require wound dressing changes (e.g., daily, every other day) AND number of wounds being treated
Vyjuvek (beremagene geperpavec-svdt)	1. Must be prescribed by, or in consultation with, a dermatologist or pediatric dermatologist, or clinical expert in epidermolysis bullosa (EB) **AND** 2. Must have a diagnosis of dystrophic epidermolysis bullosa (DEB) [either recessive DEB (RDEB) or dominant DEB (DDEB)] **AND** 3. Must have confirmed mutation(s) in the collagen type VII alpha 1 chain (COL7A1) gene **AND** 4. Must have documentation within the previous month indicating which cutaneous wound(s) will be treated with Vyjuvek. 5. If Vyjuvek is being administered by the patient or caregiver, Vyjuvek will be considered for coverage on the pharmacy benefit. If Vyjuvek is being administered by a healthcare professional, Vyjuvek will be considered for coverage on the medical benefit. 6. Vyjuvek will not be authorized in combination with Filsuvez (birch triterpenes gel) or Zevaskyn for the treatment of the same wound(s) 7. Vyjuvek will not be authorized for concomitant use with Filsuvez or Zevaskyn for the treatment of different wounds located on different areas of the body, unless there is adequate documentation justifying the need for separate products on different wounds located on different areas of the body. 8. Use of Vyjuvek on a wound(s) previously treated with Filsuvez or Zevaskyn requires adequate documentation demonstrating inadequate response or treatment failure to previous treatment(s). 9. The recommended dosage of Vyjuvek gel is based on age (see prescribing information for dosing) and is applied topically to wound(s) once a week. Based on the prescribing information, no more than one vial per week of mixed Vyjuvek gel should be used (NOTE: mixed Vyjuvek gel includes Vyjuvek biological suspension combined with excipient gel).

	10. Initial approval will be for 6 months. Recertification will be for 6 months at a time and require documentation of clinical improvement in the treated wound(s) **AND** a. The treated wound(s) has not completely closed or has re-opened **OR** b. New, previously untreated wound(s) require treatment 11. Quantity Limit: 10 mL allowed in a 28-day period
Zevaskyn (prademagene zamikeracel)	1. Must be prescribed by, or in consultation, with a dermatologist or pediatric dermatologist, or clinical expert in epidermolysis bullosa (EB) **AND** 2. Must be 6 years of age or older **AND** 3. Must have a diagnosis of **recessive** dystrophic epidermolysis bullosa (RDEB) confirmed by mutations in both *COL7A1 genes* **AND** 4. Must have documentation within the previous month indicating which cutaneous wound(s) will be treated with Zevaskyn **AND** 5. The wound(s) being treated must be a stage 2 wound, defined as an open skin wound with partial thickness loss of dermis that has not extended through the dermis into subcutaneous tissue **AND** 6. Zevaskyn will not be authorized in combination with Vyjuvek or Filsuvez for treatment of the same wound(s). 7. Zevaskyn will not be authorized for concomitant use with Vyjuvek or Filsuvez for the treatment of different wounds located on different areas of the body, unless there is adequate documentation justifying the need for separate products on different wounds located on different areas of the body. 8. Use of Zevaskyn on a wound(s) previously treated with Vyjuvek or Filsuvez requires adequate documentation demonstrating inadequate response or treatment failure of previous treatment(s). 9. A one-time approval will be authorized for the designated wound(s) to be treated that meet the above criteria. Approval will be authorized for 6 months to allow adequate time to schedule and perform surgical application. a. Reauthorization will not be allowed for wound(s) previously treated with Zevaskyn. b. A new request is required for subsequent wound(s) that have not previously been treated with Zevaskyn. Documentation of wound(s) previously treated with Zevaskyn will be required.

Considerations

- Prior authorization is obtained through the CDPHP pharmacy department.

Background

Beta-thalassemia is an inherited hemoglobinopathy characterized by hemoglobin subunit beta (HBB) gene mutations, impairing beta-globin production. Transfusion-dependent beta-thalassemia (TDT, also known as beta-thalassemia major and Cooley's anemia) is one of the more severe forms of thalassemia because patients are unable to make enough beta-globin to form normal adult hemoglobin. For patients with TDT, transfusions are required every 2–5 weeks. Patients with TDT experience severe symptoms related to anemia (e.g., fatigue, weakness, shortness of breath) and iron overload that can also damage the heart, liver, and other endocrine organs. TDT can also cause ineffective erythropoiesis, which contributes to bone deformities and growth retardation in children. One recent study found that the median age of death for patients with TDT was 45 years (interquartile range [IQR]: 29–52 years) and the mean age was 43.9 years.

The current standard of care for treatment of TDT is a combination of blood transfusions and iron chelation therapy to manage secondary iron overload from the transfusions. In November 2019, Reblozyl (luspatercept)/BMS, an erythroid maturation agent, was approved for treatment of TDT. Use of this agent is intended to reduce the number of required blood transfusions.

Myelodysplastic syndromes (MDS) are a heterogeneous group of clonal hematopoietic cell disorders characterized by abnormal differentiation, morphology, and maturation of myeloid cells. Systemic consequences include anemia, bleeding, an increased risk of infection, and an increased risk of transformation to acute leukemias (acute myeloid leukemia [AML] in 20%–50% of MDS patients). Distinction and classification of MDS and AML are somewhat arbitrary, as patients with 20%–30% blasts are considered to have MDS by French-American-British (FAB) criteria, but AML by the World Health Organization (WHO) classification. Precise estimates of MDS incidence are unknown, as results from epidemiologic studies vary from 10,000 to 40,000 new cases in the United States each year. The nonspecific symptoms or lack of symptoms entirely in the early stages of the disease may not be recognized, and testing via bone marrow biopsy may be delayed due to comorbidities.

Reblozyl was FDA approved for the treatment of anemia failing an erythropoiesis-stimulating agent (ESA) and requiring 2 or more red blood cell (RBC) units over 8 weeks in adult patients with very low- to intermediate-risk myelodysplastic syndromes with ring sideroblasts (MDS-RS) or with myelodysplastic/myeloproliferative neoplasm with ring sideroblasts and thrombocytosis (MDS/MPN-RS-T) in April 2020. Approval was based on the Phase 3 MEDALIST trial where 229 patients randomized 2:1 to receive either subcutaneous luspatercept at a starting dose level of 1 mg/kg every 3 weeks, with titration up to 1.75 mg/kg, if needed (n = 153), or placebo subcutaneously every 3 weeks (n = 76) for ≥ 24 weeks The primary endpoint was RBC-TI for ≥ 8 weeks between Week 1 and Week 24; secondary endpoints included RBC-TI for ≥ 12 weeks between Week 1 and Week 24, and between Week 1 and Week 48. Moreover, achievement of modified hematologic improvement-erythroid (mHI-E) response for any consecutive 56-day period was assessed using International Working Group 2006 criteria. Findings demonstrated that 37.9% of patients treated with luspatercept experienced RBC transfusion independence (RBC-TI) for ≥ 8 weeks versus 13.2% in those who received placebo (odds ratio [OR], 5.1; P <.0001) Moreover, 52.9% of patients treated with luspatercept achieved an mHI-E response versus 11.8% of those who received placebo (P <.0001), and 28.1% of patients in the luspatercept arm achieved RBC-TI for ≥ 12 weeks versus 7.9% of the placebo group (OR, 5.1; P = .0002).

On August 28th, 2023 the FDA approved Reblozyl for the treatment of anemia without previous erythropoiesis stimulating agent use (ESA-naïve) in adult patients with very low- to intermediate-risk myelodysplastic syndromes (MDS) who may require regular red blood cell (RBC) transfusions. This expanded indication to the first-line setting is based on interim results from the pivotal Phase 3 COMMANDS trial, in which Reblozyl demonstrated superior efficacy of concurrent RBC transfusion independence (RBC-TI) and hemoglobin (Hb) increase compared to epoetin alfa, an ESA, regardless of ring sideroblast status. The COMMANDS (NCT03682536) is a Phase 3, open-label, randomized study that compares the effectiveness and safety of Reblozyl to epoetin alfa for treating anemia due to myelodysplastic syndrome (MDS) with a risk level of very low-, low-, or intermediate-risk (IPSS-R). The patients involved in the study were dependent on red blood cell (RBC) transfusions and had not previously received erythropoiesis stimulating agents (ESA). The primary endpoint of the study was to evaluate RBC transfusion independence (RBC-TI) for a duration of 12 weeks, with a mean hemoglobin increase of at least 1.5 g/dL. Additionally, key secondary endpoints included RBC-TI for 24 weeks, RBC-TI for a minimum of 12 weeks, and assessing erythroid response (HI-E) for at least 8 weeks during weeks 1-24 of the study. The trial, results showed 58.5% (n=86) of patients treated with Reblozyl vs. 31.2% (n=48) of patients treated with epoetin alfa achieved the primary endpoint of RBC-TI of at least 12 weeks with a mean Hb increase of at least 1.5 g/dL within the first 24 weeks (p<0.0001). The most common (> 10%) adverse reactions were diarrhea, fatigue, hypertension, peripheral edema, nausea, and dyspnea. 58.5% (n=86) of patients receiving Reblozyl vs. 31.2% (n=48) of patients receiving epoetin alfa

achieved the primary endpoint of RBC-TI of at least 12 weeks with concurrent mean Hb increase of at least 1.5 g/dL within the first 24 weeks (p<0.0001). HI-E increase of at least 8 weeks was achieved by 74.1% (n=109) of Reblozyl patients vs. 51.3% (n=79) of epoetin alfa patients (p<0.0001). Within the first 24 weeks of treatment, RBC-TI of at least 24 weeks was achieved by 47.6% (n=70) of Reblozyl patients vs. 29.2% (n=45) of epoetin alfa patients (p=0.0012). RBC-TI of at least 12 weeks was achieved by 66.7% (n=98) of Reblozyl patients vs. 46.1% (n=71) of epoetin alfa patients (p=0.0003).

Summary	
Effective Date of Policy:	2/12/2026
Indications	• Anemia in adult patients with beta thalassemia who require regular red blood cell (RBC) transfusions • Anemia without previous erythropoiesis stimulating agent use (ESA-naïve) in adult patients with very low- to intermediate-risk myelodysplastic syndromes (MDS) who may require regular red blood cell (RBC) transfusions • Anemia failing an erythropoiesis stimulating agent and requiring 2 or more RBC units over 8 weeks in adult patients with very low- to intermediate-risk myelodysplastic syndromes with ring sideroblasts (MDS-RS) or with myelodysplastic/myeloproliferative neoplasm with ring sideroblasts and thrombocytosis (MDS/MPN-RS-T)
HCPCS Code	J0896
Availability	25 mg or 75 mg lyophilized powder in a single-dose vial for reconstitution
Duration	Initial: 6 months Continuation: 6 months

Required Criteria for Initial Approval

All of the following conditions for the requested indication must be met in order to approve therapy

Indication	Inclusion Criteria	Dosing Regimen

Indication
Anemia in adults with beta thalassemia
 	
ICD10: D56.1, D56.5
	• Must have a diagnosis of beta thalassemia (including HbE/beta thalassemia and beta thalassemia combined with alpha-thalassemia) based on Hb electrophoresis, Hb high-performance liquid chromatography (HPLC), and/or DNA analysis
	  o Reblozyl will not be covered for any other diagnoses including alpha thalassemia and sickle cell beta thalassemia (also known as hemoglobin S/β-thalassemia)
	• Must be at least 18 years of age
	• Must be followed by a hematologist or physician knowledgeable in the treatment of beta thalassemia
	• Must require regular RBC transfusions defined as:
	  o A need for at least 6 RBC units in the previous 24 weeks
	  o No transfusion-free period greater than 35 days in the previous 24 weeks
	• Reblozyl must be given by a healthcare professional and therefore, will only be covered under the medical benefit
	• Current body weight and requested dosing regimen must be submitted for initial review and each recertification request
	• Initial approval will be granted for 6 months
		• Dosing for beta thalassemia should be initiated at 1 mg/kg every 3 weeks
		• If there is no reduction in RBC transfusion burden after 6 weeks of treatment (2 doses) at 1 mg/kg dosing, the dose should be increased to 1.25 mg/kg every 3 weeks
		• If there is no reduction in RBC transfusion burden after 9 weeks of treatment (3 doses) at the maximum dose (1.25 mg/kg every 3 weeks), treatment should be discontinued and will not be approved for additional administration
		• The maximum recommended dose for this indication is 1.25 mg/kg every 3 weeks. **Requests for higher doses will not be approved.**

Indication
Anemia in adults with myelodysplastic syndromes (MDS)
 	
ICD10: select subcodes of D46
	Diagnosis of **very low-to intermediate-risk myelodysplastic syndrome** AND:
	• Must be at least 18 years of age AND
	• Must be followed by a hematologist, oncologist, or physician knowledgeable in the treatment of myelodysplastic syndromes AND
	• Patient must have required two or more RBC units over an eight-week period in the preceding 16 weeks; AND
	  o Patient has no prior treatment with erythropoiesis stimulating agents (ESA); OR
	  o Patient must be refractory to an erythropoiesis stimulating agent, where refractory is defined as lack of 1.5 gm/dL rise in hemoglobin or lack of decrease in RBC transfusion requirement by 6 to 8 weeks of treatment OR
	  o Patient must have documented ineligibility to an ESA which is defined as a serum erythropoietin (EPO) level ≥ 500 mU/mL OR
	  o Patient must have documented intolerance, adverse event, or contraindication to an ESA
	
	Diagnosis of **very low-to intermediate-risk myelodysplastic/myeloproliferative neoplasm with ring sideroblasts and thrombocytosis (MDS/MPN-RS-T)** AND
	• Must be at least 18 years of age AND
	• Must be followed by a hematologist, oncologist, or physician knowledgeable in the treatment of myelodysplastic syndromes AND
	• Must have presence of ring sideroblasts is defined as ≥ 15% ring sideroblasts or ≥ 5% ring sideroblasts with an SF3B1 mutation AND
	• Must have required two or more RBC units over an eight-week period in the preceding 16 weeks AND
	  o Patient must be refractory to an erythropoiesis stimulating agent, where refractory is defined as lack of 1.5 gm/dL rise in hemoglobin or lack of decrease in RBC transfusion requirement by 6 to 8 weeks of treatment OR
	  o Patient must have documented ineligibility to an ESA which is defined as a serum EPO level ≥ 500 mU/mL OR
	  o Patient must have documented intolerance, adverse event, or contraindication to an ESA
	• Reblozyl must be given by a healthcare professional and therefore, will only be covered under the medical benefit
	• Current body weight and requested dosing regimen must be submitted for initial review and each recertification request
		• Dosing for MDS associated anemia should be initiated at 1 mg/kg every 3 weeks
		• If patient is not RBC transfusion-free after 6 weeks of treatment (2 doses) at 1 mg/kg dosing, the dose should be increased to 1.33 mg/kg every 3 weeks
		• If patient is not RBC transfusion-free after 6 weeks of treatment (2 doses) at 1.33 mg/kg dosing, the dose should be increased to 1.75 mg/kg every 3 weeks
		• If patient has not had any reduction in RBC transfusion burden after 9 weeks of treatment (3 doses) at 1.75 mg/kg dosing, treatment should be discontinued and will not be approved for additional administration
		• The maximum recommended dose for this indication is 1.75 mg/kg every 3 weeks. **Requests for higher doses will not be approved**

Continuation Criteria		
• Recertification will require documented reduction in RBC transfusion burden after receiving Reblozyl • Approval timeframes after the initial 6 months will be granted for 6 months		

Considerations

- Patient must have medical drug coverage administered by CDPHP.
- Prior authorization is obtained through the CDPHP pharmacy department.

MEDICAL POLICY

Medical Policy Title	**Reduction Mammaplasty (Mammoplasty)**
Policy Number	**7.01.39**
Current Effective Date	**October 1, 2026**
Next Review Date	**July 2027**

Our medical policies are guides to evaluate technologies or services for medical necessity. Criteria are established through the assessment of evidence based, peer-reviewed scientific literature, and national professional guidelines. Federal and state law(s), regulatory mandates and the member's subscriber contract language are considered first in the determination of a covered service. (Link to Product Disclaimer)

This policy does not address reduction mammaplasty for males, refer to InterQual.

POLICY STATEMENT(S)

Post-Mastectomy

I. Reduction mammaplasty (also known as reduction mammoplasty or breast reduction) performed to achieve symmetry of the contralateral (opposite) breast following a mastectomy or partial mastectomy (e.g., lumpectomy, segmentectomy, quadrantectomy) is considered **medically appropriate** consistent with Federal and New York State law (see Regulatory Section).

Symptomatic Macromastia

II. Reduction mammaplasty is considered **medically appropriate** for the treatment of symptomatic macromastia when **ALL** of the following criteria are met:

   A. The individual is at least 18 years of age or has completed breast growth with documented stable breast size for at least one (1) year;

   B. At least two (2) of the following persistent physical symptoms have affected activities of daily living for at least one (1) year:

      1. Back, neck, or shoulder pain;
      2. Breast pain;
      3. Headache;
      4. Upper extremity paresthesia;
      5. Persistent shoulder grooving from bra straps; **or**
      6. Intertrigo at the inframammary fold;

   C. The planned amount of breast tissue to be removed per breast meets **either** of the following:

      1. At least the 22nd percentile on the Schnur Sliding Scale based on the individual's body surface area (BSA) (see Policy Guideline III); **or**
      2. At least 500 grams per breast or 1,000 grams bilaterally, regardless of BSA.

Proprietary Information of Capital District Physicians' Health Plan, Inc. | CDPHP Universal Benefits,® Inc. | Capital District Physicians' Healthcare Network, Inc.

III. Reduction mammaplasty is considered **not medically necessary** when the above criteria are not met, including but not limited to asymptomatic macromastia or pendulous breasts, difficulty with clothing fit, or nipple-areolar distortion.

RELATED POLICIES

Corporate Medical Policy

7.01.11 Cosmetic and Reconstructive Procedures

10.01.01 Breast Reconstruction Surgery

POLICY GUIDELINE(S)

I. Medical record documentation must include a detailed description of symptoms (including functional impairments and duration of symptoms), the patient's height and weight, and the amount of breast tissue to be removed (in grams). Photographs may be beneficial and may be requested as part of the medical necessity review.

II. The Schnur Sliding Scale is a guideline that establishes a minimum per-breast tissue resection weight based on BSA. Resection weights at or above the 22nd percentile are considered to meet the required threshold, while resection weights below the 22nd percentile are considered cosmetic. BSA may be calculated using either the Mosteller or Du Bois formula.

III. When choice of formula results in differing eligibility determinations for requests near the 22nd percentile threshold, individual consideration will be based on a review by a Health Plan Medical Director, using the individual's medical record in conjunction with policy criteria.

Schnur Sliding Scale (Lower 22nd Percentile)

DESCRIPTION

Breast hypertrophy, or macromastia, is a condition characterized by excessive breast tissue that causes persistent physical symptoms due to increased breast volume and weight. The resulting mechanical strain on the musculoskeletal system commonly leads to neck, back, and shoulder pain; painful shoulder grooving from bra straps; inframammary intertrigo; headaches; breast pain; and upper extremity paresthesias. Gigantomastia is a rare form of macromastia characterized by excessive breast growth that may occur during puberty or pregnancy, or with the use of certain medications.

Reduction mammaplasty is the surgical excision of excess skin and underlying breast tissue to reduce breast volume. When performed for symptomatic macromastia, the goal is to relieve pain and improve functional impairment.

Breast development in adolescents progresses through recognized stages of maturation (Tanner stages I–V), typically reaching full maturity by Tanner stage V. However, the timing of breast maturity varies considerably among individuals and may be influenced by body habitus. For the purposes of surgical timing, breast maturity should be assessed using Tanner staging, with postmenarcheal status and documented stability of breast size as supportive indicator of maturity.

The Schnur Sliding Scale (Schnur 1991) is an objective tool used to help differentiate between cosmetic and medically necessary reduction mammaplasty. It was developed in response to a need from health insurance carriers for an evidence-based method to evaluate medical necessity. Using data collected from plastic surgeons, Schnur and colleagues created a scale correlating body surface area (BSA) with the weight of breast tissue removed. The scale stratifies individuals into three groups based on resection weight relative to BSA, with a weight at or above the 22nd percentile considered medically necessary. Despite its known limitations as a predictor of resection weight, the Schnur Sliding Scale remains widely used as criterion for reduction mammaplasty.

SUPPORTIVE LITERATURE

Studies have consistently demonstrated that reduction mammaplasty results in significant improvement in symptoms related to macromastia, including chronic neck, back, and shoulder pain. Additional documented benefits include improvements in respiratory function, sleep, headaches, and psychological outcomes (e.g., self-esteem, sexual function, and quality of life), as well as increased participation in exercise programs and other physical and social activities (Singh and Losken 2012; Hernanz 2016; Elfanagely 2021; Torresetti 2022; Crittenden 2023; Wang 2023).

Kerrigan et al (2002) conducted the BRAVO (Breast Reduction: Assessment of Value and Outcomes) trial, a prospective multicenter study, to assess existing prediction rules for reduction mammaplasty eligibility. The authors reported that neither the Schnur Sliding Scale nor the 500-gram minimum rule was able to successfully predict which group of women would gain greater improvement from surgery. The BRAVO study proposed a symptom-based definition of medical necessity using a Physical Symptoms Count instrument assessing seven symptoms: upper back pain, neck pain, shoulder pain, numbness, arm pain, bra strap grooves, and rashes. The presence of two or more of these symptoms, occurring most or all of the time, successfully differentiated surgical candidates from controls (89.9% vs. 2%).

Lin et al (2021) conducted a systematic review and meta-analysis of randomized controlled trials (RCTs) (N=285) comparing reduction mammaplasty with a control intervention (nonoperation or physiotherapy exercises) for the treatment of breast hypertrophy. Four RCTs were included in meta-analyses reporting on change in pain, physical function, and psychological function after interventions. The analysis confirmed statistically significant ($p<.00001$) post-operative improvements in pain, physical function, and psychological function compared to the control intervention. The authors concluded that mammaplasty had a positive and significant effect on health-related quality of life, including pain, physical, and psychological functioning, in individuals with breast hypertrophy.

Adolescents (under 18 years of age)

The evidence supports reduction mammaplasty in adolescents with symptomatic macromastia. Prospective studies have demonstrated significant and sustained improvements in pain, physical function, self-esteem, and quality of life; with complication rates comparable to those observed in adults (Nuzzi 2017; Nuzzi 2019; Hudson 2021; Morrison 2023; Payne 2023). Current evidence does not support strict age-based exclusions; rather, individualized assessment based on breast maturity, symptom severity, and physiologic and emotional readiness is recommended.

Nuzzi et al (2020) conducted a cross-sectional study reviewing the medical records of 481 women aged 12 to 21 years who underwent reduction mammaplasty to predict the optimal timing, or biological "sweet spot," for reduction mammaplasty to minimize the risk of breast regrowth in adolescents. Surgery performed less than 3 years after menarche increased the likelihood of glandular regrowth by over 700 percent in healthy-weight and overweight subjects (OR, 7.43; 95% CI, 1.37 to 40.41). Breast size appears to stabilize considerably later in obese adolescents, and breast growth in obese macromastia patients may not end until 9 years after menarche; operating on obese women before this time point increased the likelihood of glandular breast regrowth by almost 120 percent (OR, 1.18; 95% CI, 1.11 to 1.26). The authors concluded that these findings suggest that age restrictions imposed by care providers and third-party payors may be arbitrary. Surgical

readiness should be determined on an individual basis incorporating the patient's biological and psychological maturity, obesity status, potential for postoperative benefit, and risk tolerance for postoperative breast growth.

PROFESSIONAL GUIDELINE(S)

The American College of Obstetricians and Gynecologists Committee Opinion No. 686 (2017; reaffirmed in 2020 and 2024) acknowledged that breast reduction surgery in adolescents with large breasts can relieve back, shoulder, and neck pain.

- Adolescent recommendations for timing of surgery include postponing surgery until breast maturity is reached, waiting until there is stability in cup size over 6 months, and waiting until the age of 18 years. Although there is no one consensus on timing, it may reasonably be determined by the severity of symptoms.

In 2022, the American Society of Plastic Surgeons (ASPS) (Perdikis 2022) issued a revised guideline through a multidisciplinary workgroup consisting of the American Society of Plastic Surgeons, the American Society of Breast Surgeons, and the American Physical Therapy Association.

- Strong recommendation that post-menarche female patients presenting with breast hypertrophy should be offered reduction mammaplasty surgery as first-line therapy over nonoperative therapy based solely on the presence of multiple symptoms rather than resection weight. This indicates that reduction mammaplasty is considered standard of care for symptomatic patients, even without documentation of symptoms for a significant length of time.

The ASPS 2022 guideline acknowledged that numerous studies, including the BRAVO study conducted by Kerrigan and colleagues in 2002, have demonstrated the lack of correlation between the amount of resected weight and symptomatic relief. The society reported evidence demonstrating that resection weight does not accurately predict patient-oriented outcomes such as alleviation of pain and related symptoms; therefore, resected weight should not be the primary determinant of medical necessity.

REGULATORY STATUS

The Women's Health and Cancer Rights Act of 1998 (WHCRA) is a federal law that mandates coverage of all stages of reconstructive surgery (including surgery and reconstruction of the other breast to produce symmetrical appearance, prostheses, and treatment of complications following mastectomy) for all group health plans, whether insured or self-funded, that provide medical and surgical benefits, including for mastectomies.

New York State Insurance (ISC) Laws mandate coverage for surgery and reconstruction of the contralateral breast or chest wall to produce a symmetrical appearance after a mastectomy or partial mastectomy; in the manner determined by the attending physician and the patient to be appropriate.

New: 1/01

Revised:05/02, 10/02, 03/05, 03/12, 11/12, 01/15, 07/15, 01/17, 01/18, 01/19, 11/19, 1/22, 3/22, 11/22, 1/23, 7/24, 3/25, 5/26

Reviewed: 9/03, 6/04, 2/06, 1/07, 12/07, 1/09, 1/10, 1/11, 1/12, 1/13, 1/14, 1/16, 1/20, 1/21, 1/24, 1/26, 9/26

Date	Summary of Changes

10/1/26	• Annual review; replaced <18 not medically necessary criteria with medically necessary criteria; minor editorial updates for clarity. • Policy edit to clarify "per breast" to the Schnur Sliding Scale content in the Policy Guidelines.
6/1/2026	• Transitioned Reduction Mammoplasty for Hypertrophic Breast policy, 1370/20.000254 to Lifetime Healthcare Companies policy template.
8/1/2024* *No change to effective date for this update	• Updated requirements for submitting medical photographs.
8/1/2024	• Added information regarding reduction mammoplasty or mastopexy being performed as a 2-stage procedure for a nipple sparing mastectomy.
2/1/2023	• Removed the following requirement under Policy Considerations: Letter of medical necessity from the treating physician stating a belief that the benefits of breast reduction surgery outweigh the increased risk for infection following such surgery for an enrollee with a BMI > 25.
12/1/22* *No change to effective date of policy	Added language to require original photographs.
4/1/2022	Under the position statement for reduction mammoplasty to achieve symmetry, updated the requirement from "cancer surgery/indications" to "mastectomy or partial mastectomy".
1/1/2022	Added reference to Gender Dysphoria Therapies policy under the Exclusions section for exceptions.
1/1/2020	Moved all coverage criteria from Medicare section to the Application section. Removed reference that breast reconstruction surgery would only be covered for a breast cancer diagnosis to indicate that it would be covered regardless of diagnosis following any medically necessary mastectomy or partial mastectomy.

CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: REMOTE PATIENT MONITORING (RPM) AND REMOTE THERAPEUTIC MONITORING (RTM)

POLICY EFFECTIVE DATE:	7/1/2026
Policy Control #:	1370/20.000521
Next Annual Review:	September, 2027

DISCLAIMER

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgement when deciding the most appropriate care to enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

PROCEDURE CODES

RPM codes: 99091, 99445, 99453, 99454, 99457, 99458, 99470

RTM codes: 98975, 98976, 98977, 98978, 98979, 98980, 98981, 98984, 98985, 98986

DESCRIPTIONS

Remote patient monitoring (RPM) refers to the monitoring of physiological data, such as, weight, blood pressure, pulse oximetry, respiratory rate by means of digital technology.

Remote therapeutic monitoring (RTM) refers to the monitoring and collection of non-physiological data, such as, medication and therapy adherence and response by means of digital technology.

RELATED POLICIES/DOCUMENTS

POSITION STATEMENT

CDPHP considers RPM medically necessary when all the indications outlined below are met:

POLICY NAME: REMOTE PATIENT MONITORING (RPM) AND REMOTE THERAPEUTIC MONITORING (RTM)

- Services must monitor one of the below acute care or chronic conditions and the member is at risk of clinically significant changes in medical status which warrant enhanced monitoring based on current status and instability of the underlying clinical condition:
  - Congestive heart failure (CHF)
  - Chronic obstructive pulmonary disease (COPD)
  - Uncontrolled diabetes (DM)

    AND
- Hospitalization(s) or emergency department visits within one year with a primary diagnosis of CHF/COPD/Diabetes

Authorizations will be allowed for one year at a time. For continued services, following the one-year approvals, documentation must include patient adherence and documentation from the treating provider attesting that the patient has benefited from this monitoring and continuation is medically necessary.

POLICY CONSIDERATIONS

The use of information technology for RPM must meet the following:

- The device used to collect and transmit the data must meet the definition of a medical device as defined by the FDA
- Data is being assessed to detect acute changes in clinical status and prompt intervention
- Physiologic data must be electronically collected and automatically uploaded to the secure location where the data is available for analysis and interpretation by the billing practitioner
- Remote physiologic monitoring data must be collected for 2–15 or 16+ days out of 30 days, depending on the code descriptor.

EXCLUSIONS

- RPM for conditions other than uncontrolled DM, COPD, or CHF are considered not medically necessary.
- RPM for the convenience of the individual, physician, caregiver, or other health care provider are considered not medically necessary.
- Remote therapeutic monitoring (RTM) (98975, 98976, 98977, 98978, 98979, 98980, 98981, 98984, 98985, 98986) are considered experimental/investigational.

POLICY NAME: REMOTE PATIENT MONITORING (RPM) AND REMOTE THERAPEUTIC MONITORING (RTM)

CDPHP PRODUCT VARIATIONS

CHILD HEALTH PLUS:	Subject to all terms and conditions noted above in the policy.
MEDICARE ADVANTAGE:	Subject to all terms and conditions noted above in the policy.
SELECT PLAN/HARP:	Medical conditions that may be treated/monitored by means of RPM include, but are not limited to, congestive heart failure, diabetes, chronic obstructive pulmonary disease (COPD), wound care, polypharmacy, mental or behavioral problems, and technology-dependent care such as continuous oxygen, ventilator care, total parenteral nutrition, or enteral feeding. RPM may be used during pregnancy and postpartum as well. Telehealth services provided by means of RPM should be billed using CPT code "99091" [collection and interpretation of physiologic data (e.g., Electrocardiography (ECG), blood pressure, glucose monitoring) digitally stored and/or transmitted by the patient and/or caregiver to the physician or other qualified health care professional, qualified by education, training and licensure/regulation (when applicable) requiring a minimum of 30 minutes of time. RPM services may be delivered by clinical staff; however, the service must be ordered by a physician or other qualified health care professional. Clinical staff includes individuals under the direction of a physician or qualified health care professional who do not independently bill professional services, such as pharmacists and some registered dieticians. Providers delivering RPM services must confirm that they operate within their scope of practice. Clinical staff may not order nor modify prescriptions. This service is not intended for retail pharmacists. CPT code "**99457**" requires a live, interactive communication with

the patient/caregiver. The interactive communication contributes to the cumulative time, but it does not need to represent the entire cumulative reported time of the treatment management services. Providers are not to bill CPT code "**99457**" more than one time per New York State (NYS) Medicaid member, per 30-day period.

CPT code **"99470"** is a companion code to **"99457"** that allows providers to bill for a lower duration of 10 to 19 minutes of clinical time. Do not report **"99470"** in the same 30-day period as **"99457"**. In each calendar month, providers may report:

- **"99470"** for 10 to 19 minutes of treatment management services; *or*
- **"99457"** for at least 20 minutes of treatment management services.

Maternity RPM services:
In an effort to reduce maternal and infant morbidity and mortality, an additional allowance may be reimbursable for RPM equipment provided by enrolled providers to pregnant and postpartum members using CPT codes "99453" and "99454" with "HD" modifier.

NYS Medicaid reimburses an additional allowance for RPM during pregnancy and up to 84 days postpartum using CPT code **"99453"** for set-up and patient education and CPT code **"99454"** for monitoring. CPT code **"99445"** is now part of a duration-based series with CPT code **"99454"**. Do not report CPT code **"99445"** in the same 30-day period as CPT code **"99454"**. For each 30-day period of RPM for prenatal and postpartum services, providers may report:

- CPT code **"99445"** for two days up to 15 days of monitoring; *or*
- CPT code **"99454"** for at least 16 days up to 30 days of monitoring.

Please note that 99091 and 99454 are both intended to be billed once monthly but cannot be billed on the same day.

DESCRIPTION

Residential Treatment Services (RTS) are provided to individuals who require 24-hour treatment and supervision in a safe therapeutic environment. RTS is a 24- hour a day/seven day a week facility-based level of care. RTS provides individuals with severe and persistent psychiatric and/or substance use disorders therapeutic intervention and specialized programming in a controlled environment with a high degree of supervision and structure. RTS addresses the identified problems through a wide range of diagnostic and treatment services, as well as through training in basic skills, such as social skills and activities of daily living needed to transition to community living. The services are provided in the context of a comprehensive, multidisciplinary, and individualized treatment plan that is frequently reviewed and updated based on the individual's clinical status and response to treatment. This treatment primarily provides social, psychosocial rehabilitative training, and a focus on family or caregiver support. Active involvement of family/significant other through family therapy is a key element of

treatment and is strongly encouraged unless contraindicated.

RELATED POLICIES/DOCUMENTS

Refer to the following related resource coordination policies and guideline:

- Concurrent Review, 1370/20.000174
- Review Process for Resource Coordination, 1370/20.000213
- Concurrent Review Guideline

POSITION STATEMENT

CDPHP utilizes New York State Level of Care for Alcohol and Drug Treatment Referral 3.0 for substance use disorders and InterQual for determining medical necessity criteria relating to residential behavioral health level of care for eating and mental health disorders, in addition to general requirements outlined below.

General Requirements

- For treatment of mental, nervous, and emotional disorders, the residential facility must be established and operating in accordance with the standards pursuant to regulations of the New York Commissioner of Mental Health as defined by sub division 10 of section 1.03(33) of the Mental Hygiene Law or be part of a comprehensive care center for eating disorders pursuant to Article 27-J of the Public Health Law and, in other states, to facilities that are licensed or certified to provide the same level of treatment.
- For treatment of alcoholism, substance use, and dependency, coverage of services is limited to OASAS-certified facilities defined in 14 NYCRR 819.2(a)(1) and that are certified by OASAS and, in other states, those facilities that are licensed or certified by a similar state agency and which are accredited by the Joint Commission as alcoholism, substance use disorder, or chemical dependence programs.
- The services are essential health needs of the member and provided in the context of a comprehensive, multidisciplinary, and individualized treatment plan that is frequently reviewed and updated based on the individual's clinical status and response to treatment. Services include psychiatric and health care services, in addition to educational, social, and vocational services as needed, and are treatments based in guidelines as determined by medical research and/or expert consensus.
- Services must be required for purposes other than for the convenience of the provider or comfort of the patient.
- Discharge planning is documented and must begin at admission, including plans for reintegration into the home and community. If discharge to a home/family is not an option, alternative placement must be rapidly identified and there must be regular documentation of active efforts to secure such placement.

Capital District Physicians' Health Plan, Inc.
CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: RESIDENTIAL TREATMENT FACILITIES FOR MENTAL HEALTH AND SUBSTANCE USE DISORDERS

- Staff monitoring is provided 24 hours a day/seven days per week.
- This level of care requires at least weekly physician visits.
- Three meals are made available to furnish sufficient nutrients and calories to meet normal needs, as well as the special needs of persons in recovery.

Mental Health

1. A mental health disorder is present (DSM-5 code related diagnosis) that requires, and can reasonably be expected to respond to, therapeutic intervention.

2. The individual is experiencing emotional or behavioral problems in the home, community, and/or treatment setting and is not sufficiently stable, either emotionally or behaviorally, to be treated outside of a highly structured 24-hour therapeutic environment.

3. The individual demonstrates a capacity to respond favorably to rehabilitative counseling and training in areas such as problem solving, life skills development, medication adherence, and independent or semi-independent living as appropriate.

4. The individual may have a history of multiple hospitalizations or other treatment episodes at other levels of care and/or a recent inpatient stay with a history of poor treatment adherence or outcome.

5. The individual lacks community/primary supports sufficient to maintain him/her in the community with treatment at a lower level.

Substance Use Disorders

1. A substance use disorder (SUD) is present (DSM-5 code-related diagnosis) that requires and can reasonably be expected to respond to therapeutic intervention at this level of care.

2. The individual has minimal to no withdrawal symptoms or is stable enough that any withdrawal can be safely managed at this level of care.

3. The individual lacks community/primary supports sufficient to maintain him/her in the community with treatment at a lower level.

4. Despite repeated attempts by the individual to refrain from substances, the individual has displayed an inability to maintain abstinence outside a structured residential setting.

5. The individual is not experiencing behavioral or biomedical problems severe enough to preclude treatment outside of a highly structured 24-hour therapeutic environment.

POLICY CONSIDERATIONS

Residential treatment for mental health or substance use disorders is considered equivalent to treatment rendered in skilled nursing facilities or rehabilitation hospitals.

Coverage for inpatient admission for substance use disorder treatment at an OASAS-licensed facility that participates in the CDPHP network is not subject to preauthorization. Coverage will be subject to concurrent review on day 29 of the inpatient admission if the OASAS-licensed facility notifies CDPHP of both the admission and the initial treatment plan within two business days of admission. The entire stay may be reviewed, including the initial 28-day period, to determine whether the admission and treatment is medically necessary. Care for members discharged prior to day 29 will be reviewed retrospectively. Facilities are required to notify CDPHP of discharge within 24 hours of the discharge date and retrospective review may begin when CDPHP is notified of the discharge. The facilities must hold members harmless for any denial of stay based upon retrospective review. *Applies to member contracts issued or renewed on or after 1/1/17. Self-insured, FEHB, and Medicare Choices products are excluded from this consideration and will follow standard prior authorization requirements.

EXCLUSIONS

The following criteria are not considered appropriate for treatment in residential level of care:

- The individual exhibits severe suicidal, homicidal, or acute mood symptoms/thought disorder that, require a more intensive level of care.
- The individual or parent/guardian does not voluntarily consent to admission or treatment.
- The individual can be safely maintained and effectively treated at a less intensive level of care.
- The individual has medical conditions or impairments that would prevent beneficial utilization of services, or is not stabilized on medications.
- The primary problem is social, legal, economic (e.g., housing, family, conflict, etc.), or admission is being used as an alternative to incarceration.
- The primary problem is academic or the residential setting is licensed/accredited only by the state Department of Education. Admission to a therapeutic boarding school is excluded from coverage and educational services should be arranged through the school district and/or the state Department of Education.

CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: RESIDENTIAL TREATMENT FACILITIES FOR MENTAL HEALTH AND SUBSTANCE USE DISORDERS

- Residential services for the primary treatment of developmental disabilities including Autism Spectrum Disorder: such services are available through the NYS Office for People with Developmental Disabilities.
- Services provided in NYS Licensed Residential/Housing Programs as defined in section 31.02 of the Mental Hygiene Law and various sections of 14 NYCRR, including but not limited to: Apartment, Support Community Residence; Apartment, Treatment Community Residence; Children and Youth Community Residence; Congregate, Support Community Residence; Congregate, Treatment Community Residence; Teaching Family Home; Service Enriched Single Room Occupancy; and Residential Treatment Facility for Youth and Children, are excluded from coverage. These services are available through NYS Office of Mental Health.
- Residential services for individuals who are incarcerated, confined, or committed to a local correctional facility or prison, or a custodial facility for youth operated by the NYS Office of Children and Family Services are subject to review of NYS legislation in effect at the time of the request for the service.
- Except for Select Plan/HARP, residential services solely because they are ordered by a court.
- Wilderness therapy programs are not considered residential treatment programs.
- Residential programs that utilize interventions that are not Evidence-based Programs and Practices.

CDPHP PRODUCT VARIATIONS

CHILD HEALTH PLUS:	Coverage for residential treatment services for mental health is not included in the Child Health Plus benefit package. Eff 4/1/2023: Residential Rehabilitation Services for Youth (RRSY) for the treatment of substance use disorders is covered when rendered in a Part 817 OASAS certified program. • This includes all services provided by the RRSY, as described in OASAS Part 817. These services include, but are not limited to, clinical services, recovery support services, educational and vocational assessments and services, Medication for Addiction Treatment (MAT) and food and nutrition services. Clinical services include individual, group, and family counseling, assessment and referral services for patients and significant others (e.g., parent/guardian(s), sibling(s), partner(s), etc.), medical and psychiatric consultation, and HIV and AIDS, hepatitis C, tuberculosis, and other communicable diseases education, risk assessment, supportive counseling and referral. • Services must be clinically indicated and specified in the

MEDICAL POLICY

Medical Policy Title	**Responsive Neurostimulation for the Treatment of Refractory Focal Epilepsy**
Policy Number	**7.01.103**
Current Effective Date	**September 1, 2026**
Next Review Date	**May 2027**

Our medical policies are guides to evaluate technologies or services for medical necessity. Criteria are established through the assessment of evidence based, peer-reviewed scientific literature, and national professional guidelines. Federal and state law(s), regulatory mandates and the member's subscriber contract language are considered first in the determination of a covered service. (Link to Product Disclaimer)

POLICY STATEMENT(S)

I. Responsive neurostimulation (RNS) is **medically appropriate** for an individual with refractory focal epilepsy who meet **ALL** of the following criteria:

   A. 18 years or older;

   B. Diagnosed with focal seizures with one (1) or two (2) well-localized seizure foci identified;

   C. Have had an average of three (3) or more disabling seizures (e.g., motor focal seizures, complex focal seizures, or secondary generalized seizures) per month over the prior three (3) months;

   D. Refractory to medical therapy (unsuccessful treatment with two (2) or more-appropriate antiepileptic medications at therapeutic doses);

   E. Not a candidate for focal resective epilepsy surgery (e.g., have an epileptic focus near the eloquent cerebral cortex; have bilateral temporal epilepsy);

   F. Does not have **ANY** of the following contraindications for responsive neurostimulation device placement:

      1. have three (3) or more specific seizure foci;
      2. have primary generalized epilepsy;
      3. have a rapidly progressive neurologic disorder;
      4. have one (1) or more implanted medical devices that delivers electrical energy to the brain;
      5. are unable or do not have the necessary assistance to properly operate the device or magnet; **or**
      6. are high risk for surgical complications (e.g., active systemic infection or coagulation disorders [e.g., use of antithrombotic therapies or platelet count below 50,000]).

II. RNS is **investigational** for all other indications.

Proprietary Information of Capital District Physicians' Health Plan, Inc. | CDPHP Universal Benefits,® Inc. | Capital District Physicians' Healthcare Network, Inc.

Device Replacement

III. Replacement of a medically necessary RNS or components not under warranty will be considered **medically appropriate** when **EITHER** of the following criteria are met:

   A. The device is no longer functioning adequately and has been determined to be non-repairable or the cost of the repair is in excess of the replacement cost; **or**

   B. There is documentation that a change in the individual's condition makes the present unit non-functional and improvement is expected with a replacement unit.

IV. The replacement of a properly functioning RNS, its components or accessories is considered **not medically necessary.** This includes, but is not limited to, replacement desired due to advanced technology or to make the device more aesthetically pleasing.

V. The replacement of equipment damaged or lost due to individual neglect, theft, abuse, or when another available coverage source is an option (e.g., homeowners, rental, auto, liability insurance, etc.) is **ineligible for coverage.**

VI. Accessories or components for RNS that are considered not medically necessary or investigational by peer-reviewed literature will also be considered as **not medically necessary or investigational** by the Health Plan.

7.01.23 Deep Brain Stimulation

11.01.03 Experimental or Investigational Services

POLICY GUIDELINE(S)

Not Applicable

DESCRIPTION

Seizures have been defined as paroxysmal disorders of the central nervous system characterized by abnormal cerebral neuronal discharge with or without loss of consciousness. Medically refractory seizures are defined as seizures that occur despite therapeutic levels of antiepileptic drugs or seizures that cannot be treated with therapeutic levels of antiepileptic drugs because of intolerable adverse effects of these drugs.

The goal of epilepsy surgery is to either remove the seizure-producing area of the brain or to limit the spread of seizure activity. Surgical results can be considered curative (stopping the seizures) or palliative (restricting the spread of the seizure). The type of surgery performed is dependent on the

type of seizure and where the seizures begin in the brain. Curative procedures (e.g., temporal lobectomy, cortical excision, hemispherectomy) are performed when tests consistently point to a specific area of the brain where the seizures begin. Palliative procedures (e.g., corpus callosotomy, subpial transections) are performed when a seizure focus cannot be determined, or there are multiple seizure foci, or the seizure onset zone overlaps brain areas critical for speech, movement, or vision.

Responsive neurostimulation (RNS, NeuroPace Inc., Mountain View, CA) is considered a palliative option in individuals for whom resective surgery is not possible (e.g., two seizure foci, focus on the eloquent cortex) but whose seizure focus, or foci can be identified. The NeuroPace RNS System is an implantable therapeutic device that continuously monitors brain electrical activity, detects abnormal electrical activity, and responds by delivering electrical stimulation of up to two epileptic focus areas, to normalize that activity before an individual experiences a seizure. The NeuroPace RNS System includes a cranially implanted programmable neurostimulator, which is connected to one or two depth and/or subdural cortical strip leads that are surgically placed in or on the brain at the seizure focus. The implant procedure typically takes place during one inpatient stay. Battery life is about eight years, and revision is typically a same-day procedure. The RNS Neurostimulator model RNS320 is considered magnetic resonance (MR) conditional. MR imaging may be performed safely on individuals implanted with the RNS320 system only under very strict, specific conditions defined in their magnetic resonance imaging (MRI) Guidelines manual.

There are some key differences between the RNS System and other neurostimulators. Open-loop stimulations, such as deep brain stimulation (DBS), deliver scheduled intermittent stimulations for a pre-set duration and may not necessarily be applied during an ictal period. The RNS System is a closed-loop stimulator and only provides stimulation when abnormal electrical activity is detected. After the first stimulation, if seizure activity is redetected, it will deliver up to a maximum of five consecutive stimulations. The RNS System depth electrodes or subdural cortical strip leads also act as recording instruments, which continuously monitor brain electrical activity and store electrocorticograms (ECoG) for later review. This information is used by practitioners to optimize programming of the RNS System neurostimulator, to reduce seizure frequency, make informed decisions regarding the individual's progress, and diagnose any changes in the epileptiform discharges. Due to the limited number of ECoGs that can be stored on the device, individuals or caregivers must be able to regularly record and download data.

SUPPORTIVE LITERATURE

The RNS System has demonstrated safety and effectiveness in individuals who average three or more disabling seizures per month over the three most recent months (with no fewer than two seizures in any month) but has not been evaluated in individuals with less frequent seizures. Individuals who are not candidates for resective epilepsy surgery and have few treatment options may benefit from the RNS System. The evidence includes an industry-sponsored RCT, as well as a long-term, open-label study, and is sufficient to determine that the technology results in a meaningful improvement in the net health outcome.

The RNS System Pivotal Trial (Morrell 2011) was a multicenter, double-blinded, sham-controlled trial

in which 191 patients with medically intractable focal epilepsy were implanted with the RNS System device and randomized to treatment or sham control one month after device implantation. Eligible patients were adults with focal seizures whose epilepsy had not been controlled with at least two trials of antiepileptic drugs (AEDs), who had at least three disabling seizures (motor focal seizures, complex focal seizures, or secondary generalized seizures) per month, on average, and who had standard diagnostic testing that localized one or two epileptogenic foci. Patients were randomized to active stimulation (n=97) or sham stimulation (n=94). After the four-week post-operative period, patients received either sham or active stimulation, according to group assignment. There was a four-week stimulation optimization period, followed by a three-month blinded evaluation period. In the evaluation period, all outcome data were gathered by a physician blinded to group assignment, and the neurostimulator was managed by a nonblinded physician. One patient in each group did not complete the stimulus optimization period (one due to subject preference in the active stimulation group; one due to death in the sham stimulation group). An additional patient in each group did not complete the blinded evaluation phase due to emergent explant of the device. After the three-month blinded evaluation period, all patients received active stimulation during an open-label follow-up period. At the time of the Morrell publication, 98 subjects had completed the open-label period, and 78 had not. Eleven patients did not complete the open-label follow-up period (five due to death, two to emergent explant, four to study withdrawal). The trial's primary effectiveness objective was to demonstrate a significantly greater reduction in the frequency of total disabling seizures in the treatment group, compared with the sham group, during the blinded evaluation period relative to baseline (pre-implant). The mean pre-implant seizure frequency per month in the treatment group was 33.5 (range, 3-295) and 34.9 (range, 3-338) in the sham group. Mean seizure frequency modeled using generalized estimating equations was significantly reduced in the treatment group, compared with the sham group (p=0.012). During the blinded evaluation period, the mean seizure frequency in the treatment group was 22.4 (range, 0.0-226.8) and 29.8 (range, 0.3-44.46) in the sham group. The treatment group experienced a -37.9% change in seizure frequency (95% confidence interval [CI], -6.7% to -27.7%), while the sham group experienced a -17.3% change in seizure frequency (95% CI, -29.9% to -2.3%). By the third month of the blinded evaluation period, the treatment group had 27% fewer days with seizures, while the sham group experienced 16% fewer days (p=0.048). There were no significant differences between groups over the blinded evaluation period for secondary end points of responder rate (proportion of subjects who experienced at least a 50% reduction in mean disabling seizure frequency versus the pre-implant period), change in average frequency of disabling seizures, or change in seizure severity. During the open-label period, subjects in the sham group demonstrated significant improvements in mean seizure frequency compared with the preimplant period (p=0.04). For all subjects (treatment and sham control), the responder rate at one-year post-implant was 43%. Overall quality of life scores improved for both groups, compared with baseline at one year (p=0.001) and two years post-implant (p=0.016). For the study's primary safety end point, the significant adverse event rate over the first 28 days post-implant was 12%, which did not differ significantly from the prespecified, literature-derived comparator of 15% for implantation of intracranial electrodes for seizure localization and epilepsy surgery. During the implant period and the blinded evaluation period, the significant adverse

event rate was 18.3%, which did not differ significantly from the prespecified, literature-derived comparator of 36% for implantation and treatment with deep brain stimulation for Parkinson disease. The treatment and sham groups did not differ significantly in terms of mild or serious adverse events during the blinded evaluation period. Intracranial hemorrhage occurred in nine (4.7%) of 191 subjects; implant or incision site infection occurred in 10 (5.2%) of 191 subjects, and the devices were explanted from four of these subjects. The authors concluded responsive cortical stimulation may provide another treatment option for persons with medically intractable partial seizures. This study was funded by NeuroPace, Inc.

In a follow-up to the RNS System Pivotal Trial, Heck et al (2014) compared outcomes at one- and two-years post-implant, with baseline for patients in both groups (sham and control) who had the RNS stimulation device implanted during the RNS System Pivotal Trial. Of the 191 subjects implanted, 182 subjects completed follow-up to one-year post-implant, and 175 subjects completed follow-up to two years post-implant. Six patients withdrew from the trial, four underwent device explantation due to infection, and six subjects died. Four deaths were attributed to possible or definite sudden, unexplained death in epilepsy (SUDEP); one of these subjects was randomized to the sham group and did not have stimulation enabled. One subject died of lymphoma and one of suicide. The subject who died of suicide had a preexisting history of depression but was clinically stable at the time of enrollment. During the open-label period, at two years of follow-up, median percent reduction in seizures was 53%, compared with the pre-implant baseline ($p<0.001$), and the responder rate (percentage of subjects with a 50% or more reduction in seizures) was 55%.

Loring et al (2015) analyzed one of the trial's pre-specified safety end points (neuropsychologic function) during the Pivotal trial's open-label period. Neuropsychological testing focused on language and verbal memory, measured by the Boston Naming Test and the Rey Auditory Verbal Learning Test. A total of 175 patients had cognitive assessment scores at baseline and at one or two (or both) years and were included in this analysis. The authors used reliable change indices (RCIs) to identify patients with changes in test scores beyond that attributed to practice effects or measurement error in the test-retest setting, with 90% RCIs used for classification. Overall, no significant group-level declines in any neuropsychological outcomes were detected. On the Boston Naming Test, 23.5% of subjects demonstrated RCI improvements, while 6.7% had declines; on the Rey Auditory Verbal Learning Test, 6.9% of subjects demonstrated RCI improvements, and 1.4% demonstrated declines.

Meador et al (2015) reported on quality of life and mood outcomes for individuals in the RNS pivotal trial. At the end of the blinded study period, both groups reported improvements in Quality of Life in Epilepsy Inventory-89 (QOLIE-89) scores, with no statistically significant differences between groups. In analysis of those with follow-up to two years post-enrollment, implanted patients had statistically significant improvements in QOLIE-89 scores from enrollment to one- and two-year follow-up. Mood, as assessed by the Beck Depression Inventory and the Profile of Mood States, did not worsen over time.

The Long-Term Treatment (LTT) Study was a seven-year, multicenter, prospective, open-label study to evaluate the RNS System's long-term efficacy and safety in individuals who participated in the device's feasibility or pivotal trials. Bergey et al (2015) reported on follow-up for 191 subjects who

participated in a two-year randomized, blinded, controlled study and 65 subjects who completed a two-year open label safety study (n=230) for a median 5.4 years. A total of 39 participants discontinued participation in the LTT Study, resulting in 191 active participants. For follow-up at years three and six, the median percent reductions in seizures were 60% and 66%, respectively. Responder rates were 58% and 59% for year three and year six, respectively. Statistically significant quality of life improved at four years, with a trend toward improvement at five years. After five years, the sample sizes were not sufficient to reliably assess statistical significance. The most common adverse events were implant site infection (n=24 [9.4%]) and increase in complex focal seizures (n=20 [7.8%]). There were 11 deaths, seven of which were attributed to possible, probable, or definite SUDEP. The authors stated that the frequency of deaths, including deaths by SUDEP, was not greater than expected in patients with medically intractable partial onset seizures.

Nair et al (2020) conducted a long-term, prospective, open-label study that included patients who participated in the two-year feasibility or pivotal studies of the RNS System between 2004 and 2018. Patients were followed up for an additional seven years. Overall, 230 patients enrolled in the study, and 162 completed all nine years of follow-up, providing a total of 1895 patient-implantation years. Among 68 patients who discontinued the study, 4 experienced emergent explants, five were lost to follow-up, nine were deceased, and 50 withdrew. The mean follow-up period was 7.5 years. At nine years, the median percent reduction in seizure frequency was 75% ($p<0.0001$), 73% of patients were considered responders, and 35% had at least 90% reduction in seizure frequency. Overall, 18.4% of patients experienced at least one year free of seizures. Overall scores for quality of life and epilepsy-targeted and cognitive domains of the Quality of Life in Epilepsy-89 inventory remained significantly improved at year 9 ($p<0.05$). The only device-related serious adverse events that were reported in at least 5% of patients were implantation site infection and elective explantation of the neurostimulator, leads, or both. Overall, serious device-related implantation site infection occurred in 12.1% of patients. No serious adverse events occurred related to stimulation.

Skrehot et al (2023) conducted a systematic review and meta-analysis of prospective and retrospective studies comparing the efficacy of different neurostimulation modalities, that included vagus nerve stimulation (VNS), responsive neurostimulation (RNS), and deep brain stimulation (DBS) for focal epilepsy. Data was available for analysis at one year follow up, seizure reductions observed were 66.3% for RNS (N=372; 5 studies) and 32.9% for VNS (N=61; 5 studies) and 58.4% for DBS (N=209;10 studies). At 2 years follow-up, seizure reductions observed were 56.0% for RNS (N=280; 4 studies), 44.4% for VNS (N=42; 3 studies), and 57.5% for DBS (N=158;6 studies). At 3 years follow-up, seizure reductions observed were 68.4% for RNS (N=261; 4 studies), 53.5% for VNS (N=13; 1 study), and 63.8% for DBS (N=111;5 studies). The authors noted RNS studies had high heterogeneity and VNS studies had low heterogeneity. RNS and DBS have similar seizure reduction efficacy and had greater seizure reductions compared to VNS in the first-year post implantation, with the differences diminishing with longer term follow up. Authors noted that many of the studies were observational, non-randomized, or retrospective in nature, reducing the reliability of their results. The evidence suggests seizure reductions were greater for RNS compared to VNS at one-year post-implantation with diminishing differences in longer-term follow-up.

Pediatrics

RNS is not FDA approved for patients younger than 18 years of age and published literature on children is limited. RNS has been used on an off-label basis in pediatric patients.

In 2023, the Pediatric Epilepsy Research Consortium (PERC) published findings (Hansen 2024) from a multicenter, prospective, case series including data from 22 collaborating US pediatric epilepsy centers. Of 1,426 patients included in the comprehensive PERC surgery database at the time of analysis, 56 unique patients from 12 centers received RNS for focal drug-resistant epilepsy not considered candidates for resective surgery. The mean age at RNS implantation was 14.9 years (range, 5.6 to 19.5 years; S.D., 3.7) with mean duration of epilepsy at the time of implantation of 8.1 years (range, 0.8 to 16.9 years; S.D., 3.9). Surgical complications occurred in three individual patients (5.3%) including one patient with a malpositioned lead and transient weakness and two patients who had transient weakness in relation to resection or subdural grid placement, not related to RNS placement. With a mean duration of follow-up of one year, 65% of the patients with RNS enabled experienced a >50% seizure reduction. The authors acknowledged that there are important limitations in generalizing the findings from this study and that randomized controlled studies of RNS in children are necessary to understand the efficacy and safety in this vulnerable population.

PROFESSIONAL GUIDELINE(S)

Professional societies do not provide specific published practice guidelines for RNS as they do for other treatments such as medical guidelines or position statements. However, these societies offer recommendations and guidance through various channels including articles, clinical reviews and guidelines from related fields as well as supporting documents from organizations like the American Epilepsy Society.

REGULATORY STATUS

The U.S. Food and Drug Administration (FDA) regulates the RNS Systems as medical devices. All RNS Systems including related components require FDA approval before marketing and use in the United States to ensure they are safe and effective for human use. Refer to the FDA Medical Device website. Available from: https://www.fda.gov/medical-devices [accessed 2026 Apr 02]

The U.S. Food and Drug Administration (FDA) approved the NeuroPace RNS System in 2013 (P100026) for the adjunctive treatment of medically intractable focal epilepsy in adults with frequent and disabling seizures (motor partial seizures, complex partial seizures, and/or secondarily generalized seizures), who have undergone diagnostic testing that localized no more than two epileptogenic foci and are refractory to two or more antiepileptic medications.

The FDA lists the most serious type of medical device recalls as well as early alert communications about corrective actions being taken by companies that the FDA believes are likely to be the most serious type of recalls. Available from: Medical Device Recalls | FDA [accessed 2026 Apr 02]

CODE(S)

- Codes may not be covered under all circumstances.
- Code list may not be all inclusive (AMA and CMS code updates may occur more frequently than policy updates).
- (E/I)=Experimental/Investigational
- (NMN)=Not medically necessary/appropriate

CPT Codes

Code	Description
61850	Twist drill or burr hole(s) for implantation of neurostimulator electrodes, cortical
61860	Craniectomy or craniotomy for implantation of neurostimulator electrodes, cerebral, cortical
61863	Twist drill, burr hole, craniotomy or craniectomy with stereotactic implantation of neurostimulator electrode array in subcortical site (e.g., thalamus, globus pallidus, subthalamic nucleus, periventricular, periaqueductal gray), without use of intraoperative microelectrode recording; first array
61864	each additional array
61880	Revision or removal of intracranial neurostimulator electrodes
61885	Insertion or replacement of cranial neurostimulator pulse generator or receiver, direct or inductive coupling; with connection to single electrode array
61886	with connection to 2 or more electrode arrays
61888	Revision or removal of cranial neurostimulator pulse generator or receiver
61889	Insertion of skull-mounted cranial neurostimulator pulse generator or receiver, including craniectomy or craniotomy, when performed, with direct or inductive coupling, with connection to depth and/or cortical strip electrode array(s)
61891	Revision or replacement of skull-mounted cranial neurostimulator pulse generator or receiver with connection to depth and/or cortical strip electrode array(s)
61892	Removal of skull-mounted cranial neurostimulator pulse generator or receiver with cranioplasty, when performed
95836	Electrocorticogram from an implanted brain neurostimulator pulse generator/transmitter, including recording, with interpretation and written report, up to 30 days
95970	Electronic analysis of implanted neurostimulator pulse generator/transmitter (e.g., contact group[s], interleaving, amplitude, pulse width, frequency [Hz], on/off cycling, burst, magnet mode, dose lockout, patient selectable parameters, responsive neurostimulation, detection algorithms, closed loop parameters, and passive parameters) by physician or other qualified health care professional; with

Code	Description
	brain, cranial nerve, spinal cord, peripheral nerve, or sacral nerve, neurostimulator pulse generator/transmitter, without programming
95971	Electronic analysis of implanted neurostimulator pulse generator system (eg, rate, pulse amplitude, pulse duration, configuration of wave form, battery status, electrode selectability, output modulation, cycling, impedance and patient compliance measurements); simple spinal cord, or peripheral (ie, peripheral nerve, sacral nerve, neuromuscular) neurostimulator pulse generator/transmitter, with intraoperative or subsequent programming
95983	Electronic analysis of implanted neurostimulator pulse generator/transmitter (e.g., contact groups[s], interleaving, amplitude, pulse width, frequency [HZ], on/off cycling, burst, magnet mode, dose lockout, patient selectable parameters, responsive neurostimulation, detection algorithms, closed loop parameters, and passive parameters) by physician or other qualified health care professional; with brain neurostimulator pulse generator/transmitter programming, first 15 minutes face-to-face time with physician or other qualified health care professional
95984	each additional 15 minutes face-to-face time with physician or other qualified health care professional (list separately in addition to code for primary procedure)

RESOURCE COORDINATION POLICY

Capital District Physicians' Health Plan, Inc.
CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: REVIEW PROCESS FOR RESOURCE COORDINATION

POLICY EFFECTIVE DATE:	1/1/2026
Policy Control #:	1370/20.000213
Next Annual Review:	July, 2027

DISCLAIMER

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgement when deciding the most appropriate care to enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

DESCRIPTION

Process utilized by resource coordination to render timely decisions on all requests for services, to review and determine whether health care services that have been provided, are being provided, or are proposed to be provided to an enrollee, whether undertaken prior to, concurrent with, or subsequent to the delivery of such service are medically necessary.

POSITION STATEMENT

Resource Coordination Policies:

- Medically Fragile Children, 1370/20.000514

POSITION STATEMENT

The CDPHP resource coordination department provides complete and timely review of and notification of determination on all requests for services received according to the process outlined below.

Capital District Physicians' Health Plan, Inc.
CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: REVIEW PROCESS FOR RESOURCE COORDINATION

Coverage determinations for behavioral health services are made in a manner consistent with accepted medical practices and Federal and State behavioral health parity laws.

The review process for behavioral health services includes application of criteria that are no more stringent than criteria used in the review of medical services and the review process itself is comparable to and no more stringent than the process for reviewing medical services.

1. **Request for service is received in the resource coordination department.**

   - CDPHP enrollee's contract and resource coordination prior authorization guideline outline those services that require prior authorization.
   - If a request for service is received and no authorization is required, the enrollee, enrollee's duly authorized representative, physician, referral specialist, or vendor is notified by a CDPHP staff member.
   - Request may be received via phone, fax, email, or standard mail.
   - Request may be from the enrollee, enrollee's duly authorized representative, physician, referral specialist, or vendor.
   - If anyone other than a physician initiates the request, the physician may be contacted for informational purposes.

2. **Request is date stamped.**

   - The Document Management staff date stamp all incoming mail based on the date received at CDPHP.
   - Faxes are received electronically, generating notification page indicating the date/time received.
   - Requests received by telephone are documented in Facets, which automatically dates each entry.
   - Requests received by email are automatically date/time stamped by the server and saved to member's Macess folder by the clinical reviewer.

3. **Request is received by or is forwarded to a clinical reviewer.**

   - Administrative personnel trained in the principles and procedures of intake screening and data collection, review request submission, and prepare the case to forward to clinical reviewer. Administrative personnel are supervised by a licensed health care professional.
   - All requests for medical services are reviewed by a registered nurse (RN) or licensed practical nurse (LPN).
   - All requests for behavioral health services are reviewed by a licensed mastered social worker (LMSW), licensed clinical social worker (LCSW), licensed mental health counselor (LMHC), or registered nurse (RN).

4. **Requests are documented in Facets.**

    - Facets/Salesforce is updated by the clinical reviewer throughout the review process as per department procedure.

5. **Enrollee eligibility is confirmed by the reviewer.**

    - Enrollee name and identification number are required. Gender and date of birth may be required if multiple enrollees have the same name. Effective dates as well as any contract or rider-specific limitations are reviewed. Reviewer verifies that the request is not a duplicate or an appeal.

6. **Resource coordination staff identify themselves by name, title, and organization when initiating or returning calls regarding utilization management issues**.

    - Routine inbound/outbound communication regarding utilization management determinations, including questions regarding the UM process, takes place during regular business hours (Monday through Friday, 8 a.m. to 5 p.m. On-call staff is available for urgent issues after-hours, weekends, and holidays by calling the resource coordination department at 1-800-274-2332 or the behavioral health department at 1-888-320-9584.

7. **Clinical information is obtained to support the medical necessity of the request, or in the case of a contractual review, enrollee-specific contract is reviewed.**

    - The reviewer is responsible for obtaining the following information for all case reviews:
        - Name
        - Date of birth (age)
        - Service requested
        - Enrollee's diagnosis, including comorbidities
        - Clinical information supporting the requested service
        - Supporting literature for any request for new technology
        - Information obtained is the minimum needed to make an informed determination. No undue burden is placed on the practitioner.
        - Enrollee-specific contract is reviewed to determine coverage availability.

8. **Claims history is reviewed by the clinical reviewer for any service that is monitored.**

    - Each contract may have different services that have calendar year or lifetime maximums.

9. **The reviewer requests additional information when all or part of the information is**

incomplete.

- Additional clinical information is requested from the practitioner via telephone and/or in writing.

10. **Complete clinical information is reviewed against established criteria, including the state's guidance on care for medically-fragile children as applicable. In the case of a contractual review, the enrollee-specific contract is reviewed.**

- The reviewer utilizes InterQual® for admission, concurrent, and discharge review, as well as procedure-specific authorization (Information relating to these guidelines may be accessed at https://www.changehealthcare.com/clinical-decision-support/interqual for medical and behavioral health services. InterQual® provides nationally recognized, evidence-based criteria. CDPHP resource coordination policies are utilized for coverage guidelines of medical technologies and new uses of existing technologies; the enrollee's contracts and riders are utilized to determine if a service is covered or excluded. Reviewers utilize evidence-based and peer reviewed clinical review criteria that are appropriate to the age of the patient.
- In addition, for services related to the treatment of substance use disorders, the reviewer utilizes LOCADTR-3 patient placement tool, which takes into consideration the strengths and needs of the individual.
- In addition to reviewing against established criteria, the reviewer reviews and/or investigates both the participating delivery system and community resources to identify available resources to meet the enrollee's needs.
- Out-of-network services will be approved if the reviewer determines its panel or network does not have a health care provider with appropriate training and experience to meet the needs of the enrollee or the requested service is determined to be materially different from an available in-network health service and cannot be provided through the CDPHP participating provider network.
- For behavioral health services, in situations where the medically necessary level of care does not exist (e.g., rural location), the health plan may make available the proper level of care in another location, or authorize a higher than otherwise needed level of care, to ensure that services will meet the member's essential needs for safe and effective treatment.

11. **Resource coordination decision-making is based only on appropriateness of care and service.**

- Utilization decision-making is based only on appropriateness of care and service and existence of coverage. Staff who make utilization-related decisions should be particularly aware of the special concern about the risks of underutilization.
- CDPHP does not specifically reward practitioners or other individuals for issuing denials of coverage or care.

- Financial incentives for resource coordination decision-makers do not encourage decisions that result in underutilization. CDPHP does not use incentives to reward restrictions of care.
- An adverse determination will not be based on:
  - Enrollee's refusal to consent to observing any health care service.
  - Lack of reasonable access to a health care provider's medical or treatment record, unless the reviewer has provided reasonable notice to the enrollee, enrollee's designee, or enrollee's health care provider, of medical/treatment records needed. CDPHP works collaboratively with practitioners and facilities to obtain all information necessary to complete review.

12. **CDPHP considers information obtained through review activities as strictly confidential.**

- Refer to CDPHP "Standards of Conduct".

13. **Requests that meet the established criteria are approved by the clinical reviewer.**

- Clinical reviewers (registered nurse (RN) or licensed practical nurse (LPN)) who make medical UM decisions are supervised by an RN with an active New York state license.
- Clinical reviewers (licensed mastered social worker (LMSW), licensed clinical social worker (LCSW), licensed mental health counselor (LMHC), or registered nurse (RN)) who make behavioral health UM decisions are supervised by an appropriately licensed and qualified behavioral health professional.
- Upon approval, the practitioner and the enrollee, or enrollee's designee, are notified via telephone and in writing.

14. **Requests that do not meet the established criteria are forwarded to a medical director by the clinical reviewer.**

- The medical director (board certified medical or behavioral health physician) reviews the individual enrollee circumstances, available practice guidelines, applicable contract benefits, the capacity of the CDPHP participating practitioner and provider delivery system and supporting resource coordination policies and procedures to render a determination.
  - **Medicare Advantage:** Medical director also reviews Centers for Medicare & Medicaid Services local and national medical review policies.
- Out-of-network services will be approved if the reviewer determines its panel or network does not have a health care provider with appropriate training and experience to meet the needs of the enrollee or the requested service is determined to be materially different from an available in- network health service and cannot be provided through the CDPHP participating provider network.
- When the clinical judgment necessary to render a determination on a specific case is

outside the expertise of the medical director, a clinical peer reviewer will be utilized as outlined in Resource Coordination Policy: *Clinical Peer Reviewers*, # 1370/20.000270.
- The medical director or clinical peer reviewer may also speak with the requesting provider.

15. **The medical director will approve or deny service request.**

- The medical director will document the following information on all determinations:
  - The specific reason(s) for the determination;
  - Reference to the specific contract provision(s) on which the determination is based;
  - If any internal rule, guideline, protocol, policy, or other similar criterion was relied upon in making the determination, a statement of what specific criterion was relied upon; and
  - If the determination is based on medical necessity, experimental treatment or similar exclusion or limit, an explanation of the scientific or clinical judgment for the determination, applying the terms of the plan to the enrollee's medical circumstances.
- The clinical reviewer will notify the practitioner and the enrollee via telephone followed in writing. The denial determination, including the clinical rationale, will be communicated both verbally and in writing as documented by the medical director.
- The clinical reviewer will notify the practitioner or their office staff that the medical director is available to discuss the denial determination by calling the resource coordination department at (518) 641-4100 or 1-800-274-2332. The clinical reviewer will document the time and date of this notification and with whom he/she spoke.

16. **The requesting practitioner may request a reconsideration (peer-to-peer review) of an adverse determination when they have not had the opportunity to speak with the medical director who rendered the determination or a clinical peer representative.**
- Reconsideration review is not applicable to a determination made as a result of retrospective review or contractual denial.
- CDPHP allows 14 calendar days from the date of the initial adverse determination for the ordering/attending practitioner/provider to request reconsideration. If the request for reconsideration is made after the 14 days have passed, the case would be processed as an enrollee appeal once the provider obtains sign off from the enrollee and submits the provider designation form. If the request is concurrent in nature, the practitioner has individual rights to appeal and would not require sign-off from the enrollee.
- All reconsiderations will take place within one business day of receipt of the request from the practitioner/provider. If the ordering/attending physician/provider requests that reconsideration be done on a specific day, we will allow the review, if it is within 14 calendar days of the decision. The final decision will be made within one business day of the discussion.
- A reconsideration will be considered closed if the physician/provider has not contacted the CDPHP medical director within 14 calendar days of the original decision.

- Verbal and written notification of the reconsideration determination will be provided.
- In the event the adverse determination is upheld after reconsideration, the enrollee, enrollee's designee, or the enrollee's health care provider may appeal the determination and are notified verbally, and in writing, on how to initiate the appeal process. Notice of an adverse determination includes:
  - The reason(s) for the determination including the clinical rationale, if any;
  - Instructions on how to initiate the appeals process;
  - Notice of the availability, upon request of the enrollee, enrollee's designee, or enrollee's health care provider, of the clinical review criteria relied upon to make the determination; and
  - Specify what, if any, additional necessary information to be provided to, or obtained by, CDPHP in order to render a decision on the appeal.
- Medicare Advantage: Reconsideration of an adverse determination is not applicable to the Medicare Advantage Plans. Members are to follow the standard appeals process as outlined in the Evidence of Coverage for responding to an adverse determination.

17. **The clinical reviewer educates the enrollee regarding alternatives for continuing and/or obtaining services when available on all denials, with special attention given to benefit exhaustion.**

- The clinical reviewer educates the enrollee regarding local, state, and federal programs available to meet their health care needs when such a program exists.
- The clinical reviewer assists the enrollee with obtaining such services to ensure a smooth and timely transition of care.

18. **All determinations must be made in a timely manner.**

- CDPHP utilizes the following standards for timeliness (refer to the following product-specific attachments):
  - Attachment A: Commercial (Large & Small Group/Individual)
  - Attachment B: Medicare Advantage
  - Attachment C: Select Plan/HARP and Child Health Plus
-

19. **Utilization review is not conducted more frequently than is reasonably required to assess whether the health care services under review are medically necessary**.

- There is no requirement for prior authorizations for admissions to inpatient mental health care for adults or children presenting in hospital emergency departments and determined by an emergency department physician to need inpatient care to stabilize and treat an emergency condition.

POLICY NAME: REVIEW PROCESS FOR RESOURCE COORDINATION

- Refer to Resource Coordination Policy: *Prior Authorization Guideline*, # 1370/20.000425

- There is no requirement that providers demonstrate evidence that an adult or child presents an imminent danger to self or others for clinical reviewers to approve admission to or continued inpatient mental health care.

- There is no requirement that providers demonstrate evidence of the adult or child's active participation in treatment and/or benefit from treatment for authorization of continued mental health care.

- There is no requirement that all inpatient mental health care is subject to concurrent utilization review.
  - Inpatient mental health treatment may be subject to concurrent review only when specific quality or clinical triggers are met.
  - Clinical reviewers offer coordination of care to all enrollees who are admitted for inpatient mental health and substance use treatment regardless of whether or not utilization review or a coverage determination is required.

20. **Criteria utilized to render a resource coordination determination are available to the enrollee or practitioner upon request.**

- Enrollees and practitioners may request clinical guidelines and/or policies used in making resource coordination determinations by contacting the resource coordination department as outlined in the resource coordination determination letter.

21. UM Information Integrity

The medical and behavioral health utilization review teams, in coordination with the Plan's corporate security oversight team, maintains and audits the process for ensuring the integrity of UM information used in the processing of denials, this includes but is not limited to the dates the requests were received, the appropriate practitioner review, collection of clinical information, documentation of the final decision, the date of the decision notification and the denial notice. Utilization management decisions are documented in the Plan's system of record, Facets.

CDPHP considers date of receipt, the date that a request was received. All requests for medical or behavioral health utilization review are date stamped upon receipt as follows:

- The date and time the request was received by CDPHP (user field 1 in Facets) is manually documented within the record based on the date stamp described below:
- The Document Management staff of the Plan will date stamp all incoming mail with the date the mail was received by CDPHP. CDPHP receives mail on business days only.
- Faxes and emails are received electronically, indicating the date/time received into any department of CDPHP.

- Requests received by telephone are documented in the Facets system of the Plan which automatically dates each entry.

Facets is updated by the clinical reviewer throughout the review process as per department procedure which includes but is not limited to the following documentation:

- The date and time the request was received by CDPHP (user field 1)
- The written notification is defined as the date the letter is generated to the member/provider
    - Denial letters generated up until 2:00 p.m. will be mailed on the same business day. Letters generated after 2:00 p.m. will be mailed on the next business day.
    - The date and time of Facets-generated letters can be viewed in the attachments tab of the Prospective UM module.
    - The date and time of Macess-generated letters is evidenced by the date and time stamp of the "letter generated" note in Facets entered by the user in the related authorization.
    - The "letter generated" note is not modifiable. The letter is saved in Macess with the date it was generated which is also not modifiable.
- Only Utilization Review Nurses/Behavioral Health Clinical Reviewers, including Supervisors and Managers, and Clinical Support Specialists that are involved in the prior authorization process are authorized to correct dates/times in user fields and only if a key stroke error was made. If such a correction is done, a note will be added in the note field of the authorization to document the reason for the correction, describe the change which was made, the date/time of the correction and who made the correction. This note is given a system-generated date and time stamp that is unmodifiable. Facets will also show the user who last updated the user field.
- CDPHP defines the following as inappropriate modifications to a UM case:
    - Falsifying UM dates (received date, decision date, notification date)
    - Creating documents without performing the required activities
    - Fraudulently altering existing documents (clinical received from providers, board certified consultant review, denial notices)
    - Attributing review to someone who did not perform the activity
    - Updates to information within a UM case by an unauthorized individual
- Corrections for dates on verbal or written notifications cannot be made by any CDPHP utilization review staff. A new note will be added to the auth to explain any errors in the documentation of verbal notifications or regeneration of written notifications if necessary.
- All written notifications are stored in the CDPHP Macess system. Dates cannot be altered within this system. Written notifications that need to be corrected before they have been mailed, will be removed from Macess using the CDPHP Service Now process with a note entered on the authorization with the service now incident number of such.

22. UM Information Integrity Oversight

- A sample of 5% or up to 50 (whichever is less) medical and behavioral health

utilization management denials with modifications found will be selected to audit compliance with this policy annually. If 50 such cases with modifications are not identified, we will audit all records with modifications. The audit findings will be documented in a workbook which contains verification of the accuracy of the modified data entry of all dates captured within the authorization. If any modifications were made to one of these dates outside of the parameters of this policy, that will be documented.

- The audit workbook will contain any identified factors contributing to the non-compliance with this policy, any identified coaching and/or training needed, any process improvements that were made due to the audit findings and any disciplinary action taken from these findings, if necessary.
- If there are findings of modifications made in violation of this policy, audits will be changed to quarterly until 3 consecutive quarters of improvements in findings is realized.
- UM management will provide appropriate feedback/re-education to any staff members who through the audit have been found in non-compliance by making inappropriate modifications per the guidelines within this policy.
- If the UM leadership identifies fraud and misconduct this will be reported to NCQA
- A report will be generated from this sample review tracking to validate and analyze that the process described is being followed by all staff and to evaluate for opportunities to improve documentation for process improvement.
- Oversight of this audit process will be reported out annually to the Utilization Management Committee.
- Annually, the Plan's Identity and Access Management team reviews staff access to Facets and the functionality they are approved or to ensure access is still appropriate for each staff's job responsibilities.

23. UM Information Integrity Training

- Annual training will be provided to all UM staff on inappropriate documentation and updates to UM information as defined within this policy.
- The training will also inform UM staff of the organizations audits of staff documentation and updates within UM authorizations.
- UM staff will be made aware of the process for documenting and reporting inappropriate documentation to both the designated individuals when identified and NCQA when the organization identifies fraud and/or misconduct.

CDPHP has controls in place to protect data from unauthorized modification. Refer to the following policies:

- Corporate Information Security Policy
- Physical & Environmental Security
- User Registration and Management
- Password Policy

POLICY NAME: REVIEW PROCESS FOR RESOURCE COORDINATION

CDPHP PRODUCT VARIATIONS

CHILD HEALTH PLUS	Subject to all terms and conditions noted above in the policy.
MEDICARE ADVANTAGE	Subject to all terms and conditions noted above in the policy.

SELECT PLAN/HARP	Subject to all terms and conditions noted above in the policy in addition to the following:
	• All behavioral health decision-makers have clinical expertise in treating enrollee's condition, stratified by age.
	• Behavioral health denials are conducted by a peer with credentials at least equal to that of the recommending clinician.
	• All behavioral health admission and continued stay authorizations are under the direction of a CDPHP medical director with a minimum of three years' experience in a behavioral health setting.
	• For all inpatient behavioral health treatment denials, review will be completed by:
	  ○ A physician board certified in general psychiatry for inpatient psychiatric treatment.
	  ○ A physician board certified in child and adolescent psychiatry for inpatient psychiatric treatment for enrollees age 18 and under.
	  ○ A physician certified in addiction treatment for inpatient substance use disorder treatment.
	• LOCADTR 3 is utilized to determine level of care for inpatient and outpatient substance use disorder services.

POLICY HISTORY

This section is intended to provide only highlights of the policy changes. The policy should always be reviewed in its entirety to ensure a comprehensive understanding of coverage.

Effective Date	Update

POLICY NAME: REVIEW PROCESS FOR RESOURCE COORDINATION

1/1/2026	Updated required timeframe for Standard Preauthorization Review for Medicare in Attachment B and for Medicaid in Attachment C.
7/1/2025	NCQA standard for System Controls has changed to UM Information Integrity. Policy updates also completed on UM Information Integrity to support changes to the NCQA standard.
1/1/2025	Updated policy for Child Health Plus to mirror all Select Plan/HARP's rules/timeframes.
8/8/2024	Updates made to #19 regarding generation of denial letters.
3/1/2024	Updated the timeframe to close a reconsideration from 1 business day to within 14 calendar days of the original determination. Under attachment B updated timeframe for standard preauthorization review. Under attachment A & C updated verbiage for Inpatient Mental Health Admissions. Added additional information regarding notice of an adverse determination which was formerly housed in the obsolete Resource Coordination policy *1370/20.0000146 Reconsideration of Adverse Determination.*
7/1/2022* No change to effective date of policy	Removed reference to LOCUS OR CALOCUS for Behavioral Health services. Added detailed language explaining reviewer types to satisfy NCQA UM standards.
7/1/2022	System Control Oversight section updated for NCQA requirements.
4/01/2022	To meet new NCQA requirement, added section in regard to System Control Oversight.
1/1/2022	Removed MCG guideline references and replaced with InterQual.
12/1/21	Added verbiage to the member notification process: • A voicemail left for an enrollee will only consist of the name of the CDPHP employee calling, the phone number to return the call and a reference number to the case the call pertains to.
1/1/21* *No change to effective date	Added turnaround determination timeframes for inpatient or SNF members to go to an acute rehab facility in the Pre-Authorization and Concurrent Review sections in Att A and Att C.

Capital District Physicians' Health Plan, Inc.
CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: REVIEW PROCESS FOR RESOURCE COORDINATION

1/1/21	Changes made throughout policy regarding Behavioral Health as part of regulatory requirement issued by NYS Office of Mental Health (OMH).
11/1/20	Added section for System Control Standards.

This Resource Coordination Policy is the exclusive property of Capital District Physicians' Health Plan, Inc. (CDPHP®) and its affiliated companies, CDPHP Universal Benefits,® Inc. (CDPHP UBI) and Capital District Physicians' Healthcare Network, Inc. (CDPHN). The contents and form of this policy are proprietary to CDPHP. Any reproduction or replication of this policy without the express written permission of CDPHP, CDPHP UBI, and CDPHN is strictly prohibited. This policy is subject to contractual limitations and/or parameters established in any Employer sponsored Summary Plan Description (SPD) and/or Benefit Design Document (BDD).

POLICY NAME: REVIEW PROCESS FOR RESOURCE COORDINATION

Attachment A

Commercial (Large & Small Group/Individual)
Timeframe Requirements

Preauthorization Reviews:

Standard Preauthorization Reviews

- If all necessary information is submitted with the request, CDPHP will make a determination, providing notice to the enrollee, or enrollee's designee, and the enrollee's provider, by telephone and in writing, within three business days of receipt of the request.

- Upon receipt of request for a member who is currently in an inpatient hospital or a skilled nursing facility to go to an acute rehabilitation facility, the turnaround time for this determination is one business day.

- If additional information is needed, it will be requested within the three business days of receipt of request. The enrollee, or enrollee's designee, or the enrollee's provider will have 45 calendar days to provide the necessary information. If requested information is received within 45 calendar days, CDPHP will make a determination and provide notice to the enrollee, or enrollee's designee, and the enrollee's provider, by telephone and in writing, within three business days of receipt of the information. If all necessary information is not received within 45 days, the plan will make a determination within 15 calendar days of the end of the 45-day period.

Urgent/Expedited Preauthorization Reviews

- Enrollee, or enrollee's designee, or practitioner may request an urgent care/expedited review. If requested by a practitioner, review must be expedited. If requested by enrollee, CDPHP can determine if expedited review is medically necessary.

- If all necessary information is submitted with the request, CDPHP will make a determination, providing notification to the enrollee, or enrollee's designee, and the provider by telephone within 72 hours of receipt of the request. Written notice will follow within three business days of receipt of request.

- If additional information is needed, it will be requested within 24 hours. The enrollee, or enrollee's designee, or the enrollee's provider will have 48 hours to submit this information. CDPHP will make a determination and provide notice to the enrollee, or enrollee's designee, and the enrollee's provider by telephone and in writing within 48 hours of the earlier of receipt of the requested information or the end of the 48-hour time period.

Court Ordered Treatment Reviews

- If all necessary documentation is submitted with the request, CDPHP will make a determination regarding a request for court ordered treatment relating to a mental health and /or substance use disorder and provide notice, by telephone, to the enrollee or enrollee's designee, and the enrollee's provider within 72 hours of receipt of the request. Written notification for elective court ordered admissions will be provided within three business days of receipt of the request. Where feasible, telephonic and written notification will also be provided to the court.

Concurrent Review

Standard Concurrent Reviews

- Decisions for services during the course of care (concurrent review) will be made, and notice provided to the enrollee, or enrollee's designee, and the enrollee's provider, by telephone and in writing, within one business day of receipt of all necessary information. Written notification includes number of extended services approved, the new total of approved services, date of onset of services and next review date.

- Upon receipt of request for a member who is currently in an inpatient hospital or a skilled nursing facility to go to an acute rehabilitation facility, the turnaround time for this determination is one business day.

- If additional information is needed, CDPHP will request it within one business day. The enrollee, or enrollee's designee, or the enrollee's provider will have 45 calendar days to provide the necessary information. CDPHP will make a determination and provide notice to the enrollee, or enrollee's designee, and the enrollee's provider, by telephone and in writing, within one business day of receipt of the requested information. If requested information is not received, notice is provided within 15 calendar days of the end of the 45-day time period.

Urgent/Expedited Concurrent Reviews

- For concurrent reviews that involve an extension of urgent care, if the request for coverage is made at least 24 hours prior to the expiration of a previously approved treatment, CDPHP will make a determination and provide notice to the enrollee, or enrollee's designee, and the enrollee's provider by telephone within 24 hours of receipt of the request. Written notice will be provided within one business day of receipt of the request for coverage if all necessary information was included or three calendar days from the verbal notification if all necessary information was not included. Written notification includes number of extended services approved, the new total of approved services, date of onset of services and next review date.

- If the request for coverage is not made at least 24 hours prior to the expiration of a previously approved treatment, and all information necessary to make a determination has

been received, CDPHP will make a determination and provide notice to the enrollee, or enrollee's designee, and the enrollee's provider within 72 hours or one business day from receipt of the request, whichever is earlier. If additional information is needed, we will request it within 24 hours. The enrollee, or enrollee's designee, or enrollee's provider will have 48 hours to submit the information. CDPHP will make a determination and provide written notice to the enrollee, or enrollee's designee, and enrollee's provider within one business day or 48 hours of receipt of the information, whichever is earlier or, if information is not received, within 48 hours of the end of the 48-hour period.

Inpatient Substance Use Disorder Treatment Reviews (Special conditions apply.)

- CDPHP will make a determination regarding a request for inpatient substance use disorder treatment submitted at least 24 hours prior to discharge from an inpatient admission within 24 hours of receipt of the request and will provide coverage for the inpatient substance use disorder treatment while determination is pending.
- Coverage for inpatient admission for substance use disorder treatment at an OASAS-licensed facility that participates in the CDPHP network is not subject to preauthorization. Coverage will be subject to concurrent review on day 29 of the inpatient admission if the OASAS-licensed facility notifies CDPHP of both the admission and the initial treatment plan within two business days of admission. If the facility fails to notify CDPHP of either the admission or the treatment plan within two business days of admission, CDPHP may begin concurrent review immediately upon learning of the admission. In either case, the entire stay may be reviewed, including the initial 28-day period, to determine whether the admission and treatment is medically necessary. Applies to member contracts issued, renewed, modified, or amended on or after 1/1/17. Self-insured, FEHB, and Medicare Choices products are excluded from this consideration and will follow standard prior authorization requirements.

Inpatient Mental Health Admissions (Special conditions apply.)

- Coverage for inpatient admission to a participating facility within New York State, for the treatment of a mental health condition, is not subject to preauthorization. For children under age 18, coverage may be subject to concurrent review on day 15 of the inpatient admission if the facility notifies CDPHP of both the admission and the initial treatment plan within two business days of admission. The entire stay may be reviewed, including the initial 14-day period, to determine whether the admission and treatment is medically necessary. Care for members discharged prior to day 15 may be reviewed retrospectively if one or more specific quality or clinical triggers are met. The specific trigger met will be documented by the reviewer. Facilities are required to notify CDPHP of discharge within 24 hours of the discharge date and retrospective review may begin when CDPHP is notified of the discharge. *Applies to member contracts issued or renewed on or after 1/1/20. This does not apply to self-funded (ASO) or Medicare Choices member contracts. Applies to members under age 18 at the time of their hospitalization.

POLICY NAME: REVIEW PROCESS FOR RESOURCE COORDINATION

Retrospective Review

- If CDPHP has all necessary information to make a determination regarding a retrospective claim, CDPHP will make a determination and notify the enrollee, or the enrollee's designee, within 30 calendar days of receipt of the request. If additional information is needed, CDPHP will request it within 30 calendar days. The enrollee, or enrollee's designee, or the enrollee's provider will then have 45 calendar days to provide the information. CDPHP will make a determination and provide notice to the enrollee, or enrollee's designee, and enrollee's provider in writing, within 15 calendar days of the earlier of our receipt of the information or the end of the 45-day period.

- CDPHP will only reverse a prior authorized treatment, service, or procedure on retrospective review when:

    - The relevant medical information presented to us upon retrospective review is materially different from the information that was presented during the prior authorization review; and
    - The relevant medical information presented to us upon retrospective review existed at the time of the prior authorization but was withheld from or not made available to us; and
    - CDPHP was not aware of the existence of the information at the time of the prior authorization review; and

Had CDPHP been aware of such information, the treatment service or procedure being requested would not have been authorized. The determination is made using the same specific standards, criteria, or procedures as used during the preauthorization review.

Notification

- All notifications identified above, both verbal and written, are completed within the timeframes identified and in compliance with all other notification requirements found in applicable law.

    - **Telephonic notification** – the enrollee, or enrollee's designee, and the enrollee's provider are notified of the decision.
        - In the case of an initial adverse determination, at the time of telephonic notification, the enrollee, or enrollee's designee, and the enrollee's provider are notified of how to initiate the appeal process based on the enrollee's contract/Plan.
        - When notifying by telephone the clinical reviewer documents the date, time, and name of the person notified in the case record. A voicemail left for an enrollee will only consist of the name of the CDPHP employee calling, the phone number to return the call and a reference number to the case the call pertains to.

    - **Written notification** – The enrollee, or enrollee's designee, and the enrollee's provider receive written confirmation of the determination. A copy of the written confirmation is

scanned into the enrollee's computerized file.

- In the case of an initial adverse determination, the written notice includes, in addition to all other notification requirements found in applicable law:
  - That the notice constitutes the initial adverse determination, specifically identifying that requested service was not medically necessary or experimental/investigational and the clinical rationale for the decision.
  - How to initiate the standard and expedited appeals process based on the enrollee's contract/plan and specify what, if any, additional information must be provided to, or obtained by, CDPHP in order to render a decision on the appeal.
  - Instruction on filing an external appeal within four months of the final adverse determination letter or Plan letter agreeing to waive the internal appeal process.
  - Statement that CDPHP will not retaliate or take any discriminatory action against the enrollee, or enrollee's designee, because s/he filed an appeal.
  - If enrollee completes the expedited appeal process and CDPHP upholds the denial, the enrollee may file either a standard appeal or an external appeal.
  - If enrollee completes the standard appeal process and CDPHP upholds the denial, the enrollee may apply for an external appeal within 45 days of receipt of the final adverse determination notice.
  - The enrollee and CDPHP may jointly agree to waive the CDPHP appeal process, and the enrollee may apply for an external appeal within 45 days of this agreement.
  - Notice of availability, upon request, of the clinical review criteria relied upon to make such determination.

Attachment B
Medicare Timeframe Requirements

Standard Preauthorization Review

- CDPHP renders a determination and provides notification as expeditiously as the enrollee's health condition requires, but no later than 7 calendar days from receipt of the request. Request for additional information is made within three business days of receipt of the coverage request.

- CDPHP may extend the timeframe for up to an additional 14 calendar days if the enrollee, or enrollee's designee, requests the extension. CDPHP may also extend the timeframe for up to 14 calendar days for non-participating providers if they justify a need for additional information and how the extension is in the best interest of the enrollee. The enrollee, or enrollee's designee, must be notified in writing of any extension, including enrollee's right to file an expedited grievance if he/she disagrees with decision to grant an extension.

- CDPHP notifies the enrollee, or enrollee's designee, in writing as expeditiously as the enrollee's health condition requires, but no later than the expiration of any extension that occurs.

Expedited/Urgent Preauthorization Review

- Enrollee, or enrollee's designee, or practitioner may request an expedited review. If requested by a practitioner, review must be expedited. If requested by enrollee, or enrollee designee, CDPHP can determine if expedited review is medically necessary. If CDPHP denies enrollee's request for expedited review, enrollee, or enrollee's designee, is given prompt oral notice of the denial, advising request will be reviewed under the standard timeframe, identifying enrollee's right to file an expedited grievance if he/she disagrees with decision not to expedite, as well as right to resubmit request if physician support to expedite is obtained. Written notice is provided within three calendar days of the decision to not expedite review.

- If decision is made to approve request for expedited review, determination is made as expeditiously as the enrollee's health condition requires, but no later than 72 hours from receipt of the request. Enrollee, or enrollee's designee, and practitioner must be aware of the determination prior to the end of the 72-hour review period. Written notice is provided within three calendar days of the oral notification.

POLICY NAME: REVIEW PROCESS FOR RESOURCE COORDINATION

- If additional information is required from a *non-contract* provider to make a decision, CDPHP must request the necessary information from the *non-contract* provider within 24 hours of the initial request for an expedited organization determination.

- CDPHP may extend the timeframe for up to an additional 14 calendar days if the enrollee, or enrollee's designee, requests the extension. CDPHP may also extend the timeframe for up to 14 calendar days for non-participating providers if they justify a need for additional information and how the extension is in the best interest of the enrollee. The enrollee, or enrollee's designee, must be notified in writing of any extension, including enrollee's right to file an expedited grievance if he/she disagrees with decision to grant an extension.

- CDPHP notifies the enrollee, or enrollee's designee, in writing as expeditiously as the enrollee's health condition requires, but no later than the expiration of any extension that occurs.

Retrospective Review

- CDPHP renders a determination and provides written notification within 30 calendar days of obtaining the request. Up to a 30-day extension may be utilized when all necessary information has not been received within the initial 30 days, provided the enrollee, or enrollee's designee, is notified in writing prior to the expiration of the initial 30-day period of what additional information is needed and the date by which a determination will be rendered.

- CDPHP will only reverse a prior authorized treatment, service, or procedure on retrospective review when:
  - The relevant medical information presented to us upon retrospective review is materially different from the information that was presented during the prior authorization review; **and**
  - The relevant medical information presented to us upon retrospective review existed at the time of the prior authorization but was withheld from or not made available to us; and
  - CDPHP was not aware of the existence of the information at the time of the prior authorization review; **and**
  - Had CDPHP been aware of such information, the treatment service or procedure being requested would not have been authorized. The determination is made using the same specific standards, criteria, or procedures as used during the preauthorization review.

Notification

- All notifications identified above, both verbal and written, are completed within the timeframes identified and in compliance with all other notification requirements found in applicable law

  - **Telephonic notification** – The enrollee, or enrollee's designee, and the enrollee's

provider are notified of the decision.

- In the case of an initial adverse determination, at the time of telephonic notification, the enrollee, or enrollee's designee, and the enrollee's provider are notified of how to initiate the appeal process based on the enrollee's contract/Plan.
- When notifying by telephone the clinical reviewer documents the date, time, and name of the person notified in the case record. A voicemail left for an enrollee will only consist of the name of the CDPHP employee calling, the phone number to return the call and a reference number to the case the call pertains to.

- **Written notification** – The enrollee, or enrollee's designee, and the enrollee's provider receive written confirmation of the determination. A copy of the written confirmation is scanned into the enrollee's computerized file.
  - In the case of an initial adverse determination, the written notice includes how to initiate the standard and expedited appeals process based on the enrollee's contract/ plan and what additional information needs to be provided.
  - In accordance with guidelines from the Centers for Medicare & Medicaid Services (CMS), hospitals are responsible for issuing the Important Message (IM) to an enrollee or designee upon admission and no later than two days prior to discharge. In an enrollee initiates a QIO appeal, CDPHP will issue the Detailed Notice of Discharge. Hospitals will provide a copy of the Detailed Notice of Discharge to the enrollee and maintain a copy in the record.

POLICY NAME: REVIEW PROCESS FOR RESOURCE COORDINATION

Attachment C
Select Plan/HARP and Child Health Plus Timeframe Requirements

In all cases, determinations are made as fast as the enrollee's condition requires. The timeframes below are outside timeframes for determinations.

Preauthorization Reviews

Standard Preauthorization Reviews

- CDPHP renders a determination and provides notification within three business days of receipt of necessary information, but no later than 7 calendar days from receipt of the request. If additional information is needed, it will be requested within the three business days of receipt of request.

- Upon receipt of request for a member who is currently in an inpatient hospital or a skilled nursing facility to go to an acute rehabilitation facility, the turnaround time for this determination is one business day.

- This timeframe may be extended for up to 14 calendar days if the enrollee, enrollee's designee, or practitioner requests an extension, orally or in writing. Requests by enrollees, enrollee's designee, or their practitioners are presumed to be in the enrollee's best interest, thereby ensuring the extension of time for a determination is appropriate. CDPHP does not request an extension of the review period. CDPHP will make a determination and provide notice to the enrollee, or enrollee's designee, and practitioner, by telephone and in writing, as fast as the enrollee's condition requires and within three business days of receipt of necessary information, but no later than the date the extension expires.

Urgent/Expedited Preauthorization Reviews

- Enrollee, or enrollee's designee, or practitioner may request an urgent care/expedited review. If requested by a practitioner, or when determined necessary by CDPHP, review must be expedited. If requested by enrollee, or enrollee designee, CDPHP can determine if expedited review is medically necessary. If CDPHP denies enrollee's request for expedited review, the request will be handled under the standard review timeframes, with written notice to the enrollee, or the enrollee's designee, advising of this, including a description of the timeframes, and a statement that oral interpretation and alternate formats are available and how to access the alternate format.

- CDPHP renders a determination and provides notification as soon as possible, taking into account the medical condition of the enrollee, but no later than 72 hours from receipt of the request.

- This timeframe may be extended for up to 14 calendar days if the enrollee, enrollee's

designee, or practitioner requests an extension, orally or in writing. Requests by enrollees, enrollee's designee, or their practitioners are presumed to be in the enrollee's best interest, thereby ensuring the extension of time for a determination is appropriate. CDPHP does not request an extension of the review period. CDPHP will make a determination and provide notice to the enrollee, or enrollee's designee, and practitioner, by telephone and in writing, as fast as the enrollee's condition requires and within three business days of receipt of necessary information, but no later than the date the extension expires.

Concurrent Review

Standard Concurrent Reviews

- CDPHP renders a determination and provides notification within one business day of receipt of necessary information, but no more than 14 calendar days from receipt of the request. Written notification includes number of extended services approved, the new total of approved services, date of onset of services and next review date.

- Upon receipt of request for a member who is currently in an inpatient hospital or a skilled nursing facility to go to an acute rehabilitation facility, the turnaround time for this determination is one business day.

- This timeframe may be extended for up to 14 calendar days if the enrollee, enrollee's designee, or practitioner requests an extension, orally or in writing. Requests by enrollees, enrollee's designee, or their practitioners are presumed to be in the enrollee's best interest, thereby ensuring the extension of time for a determination is appropriate. CDPHP does not request an extension of the review period. CDPHP will make a determination and provide notice to the enrollee, or enrollee's designee, and practitioner, by telephone and in writing, as fast as the enrollee's condition requires and within one business day of receipt of necessary information, but no later than the date the extension expires.

Urgent/Expedited Concurrent Reviews

- CDPHP renders a determination and provides notification as soon as possible, taking into account the medical condition of the enrollee, but no later than one business day after receipt of necessary information, not to exceed 72 hours after receipt of the request. Written notification includes number of extended services approved, the new total of approved services, date of onset of services and next review date.

- This timeframe may be extended for up to 14 calendar days if the enrollee, enrollee's designee, or practitioner requests an extension, orally or in writing. Requests by enrollees, enrollee's designee, or their practitioners are presumed to be in the enrollee's best interest, thereby ensuring the extension of time for a determination is appropriate. CDPHP does not request an extension of the review period. CDPHP will make a determination and provide

notice to the enrollee, or enrollee's designee, and practitioner, by telephone and in writing, as fast as the enrollee's condition requires and within one business day of receipt of necessary information, but no later than the date the extension expires.

Inpatient Substance Use Disorder Treatment Reviews (Special conditions apply)

- CDPHP will make a determination regarding a request for inpatient substance use disorder treatment submitted at least 24 hours prior to discharge from an inpatient admission within 24 hours of receipt of the request and will provide coverage for the inpatient substance use disorder treatment while determination is pending.
- Coverage for inpatient admission for substance use disorder treatment at an OASAS-licensed facility that participates in the CDPHP network is not subject to preauthorization.

Inpatient Mental Health Admissions (Special conditions apply.)

- Coverage for inpatient admission to a participating facility within New York State, for the treatment of a mental health condition, is not subject to preauthorization. For children under age 18, coverage may be subject to concurrent review on day 15 of the inpatient admission if the facility notifies CDPHP of both the admission and the initial treatment plan within two business days of admission. The entire stay may be reviewed, including the initial 14-day period, to determine whether the admission and treatment is medically necessary. Care for members discharged prior to day 15 may be reviewed retrospectively if one or more specific quality or clinical triggers are met. The specific trigger met will be documented by the reviewer. Facilities are required to notify CDPHP of discharge within 24 hours of the discharge date and retrospective review may begin when CDPHP is notified of the discharge. *Applies to member contracts issued or renewed on or after 1/1/20. This does not apply to self-funded (ASO) or Medicare Choices member contracts. Applies to members under age 18 at the time of their hospitalization.

Timeframes for Actions Other Than Service Authorizations

Reductions/Terminations of Approved Care

- CDPHP will notify the enrollee, or the enrollee's designee, of any decision to reduce or end coverage of previously authorized service within an authorization period. CDPHP will provide written notice to the enrollee, or enrollee's designee, at least 10 days prior to the intended action, except:
  - The period of advance notice is shortened to five days in cases of confirmed enrollee fraud; **or**
  - The contractor may mail notice not later than date of the action for the following:
    - The death of the enrollee;

  - A signed written statement from the enrollee requesting service termination or giving information requiring termination or reduction of services (where the Enrollee understands that this must be the result of supplying the information);
  - The enrollee's admission to an institution where the enrollee is ineligible for further services;
  - The enrollee's address is unknown, and mail directed to the enrollee is returned stating that there is no forwarding address;
  - The enrollee has been accepted for Medicaid services by another jurisdiction; or
  - The enrollee's physician prescribes a change in the level of medical care.
- For long term services and supports, when CDPHP intends to reduce, suspend, or terminate a previously authorized service, or issue an authorization for a new period that is less in level or amount than previously authorized, CDPHP will not set the effective date of the action to fall on a non-business day.

Retrospective Review

- CDPHP renders a determination and provides notification within 30 calendar days of obtaining the request. Up to a 15-day extension may be utilized when all necessary information has not been received within the initial 30 days, provided the enrollee, or enrollee's designee, is notified in writing prior to the expiration of the initial 30-day period of what additional information is needed and the date by which a determination will be rendered. The enrollee, or enrollee's designee, is given 45 days from receipt of the extension notice to provide the necessary information.

- CDPHP will only reverse a prior authorized treatment, service, or procedure on retrospective review when:
  - The relevant medical information presented to us upon retrospective review is materially different from the information that was presented during the prior authorization review; and
  - The relevant medical information presented to us upon retrospective review existed at the time of the prior authorization but was withheld from or not made available to us; and
  - CDPHP was not aware of the existence of the information at the time of the prior authorization review; and
  - Had CDPHP been aware of such information, the treatment service or procedure being requested would not have been authorized. The determination is made using the same specific standards, criteria or procedures as used during the preauthorization review.

- In the case of a contractual denial, the written notice is generated on the day the determination is made.

Notification

POLICY NAME: REVIEW PROCESS FOR RESOURCE COORDINATION

- All notifications identified above, both verbal and written, are completed within the timeframes identified and in compliance with all other notification requirements found in applicable law.

- **Telephonic notification** – the enrollee, or enrollee's designee, and the enrollee's provider are notified of the decision. Verbal notification is not provided for retrospective.
  - In the case of an initial adverse determination, at the time of telephonic notification, the enrollee, or enrollee's designee, and the enrollee's provider are notified of how to initiate the appeal process based on the enrollee's contract/Plan.
  - When notifying by telephone the clinical reviewer documents the date, time, and name of the person notified in the case record. A voicemail left for an enrollee will only consist of the name of the CDPHP employee calling, the phone number to return the call and a reference number to the case the call pertains to.

- **Written notification** – The enrollee, or enrollee's designee, and the enrollee's provider receive written confirmation of the determination. The notice to the provider contains the same information as the notice given to the enrollee. A copy of the written confirmation is scanned into the enrollee's computerized file.
  - Notices are written in easily understood language and are accessible to non-English speaking and visually impaired enrollees.
  - Notice identifies that oral interpretation and alternate formats of written material for enrollee with special needs are available and how to access the alternate formats.
  - The right of the enrollee to contact the New York State Department of Health (NYSDOH) with his/her complaint, including the NYSDOH's toll-free number for complaints
  - In the case of an initial adverse determination, the written notice includes/identifies, in addition to all other notification requirements found in the New York State Department of Health action and grievance system requirements (Appendix F), the following:
    - That the notice constitutes the initial adverse determination.
    - For determinations that do not involve medical necessity or experimental/investigational service:
      - Description of action CDPHP has taken or intends to take;
      - Reasons for the action, including clinical rationale if applicable.
    - For determinations that involve medical necessity or experimental/investigational service, a statement of clinical rationale that identifies:
      - Enrollee and nature of his/her medical condition;
      - Medical service, treatment or procedure requested; and
      - The basis on which the reviewer determined that the service, treatment, or procedure is or was not medically necessary or experimental/investigational, which demonstrates that reviewer considered enrollee specific clinical information in the determination.
    - Statements of reasons and clinical rationale is sufficiently specific to enable enrollee, or the enrollee's designee, and enrollee's health care provider to

make an informed judgement regarding whether or not to appeal the adverse determination, and the grounds for such an appeal.

- Statement of what, if any, additional information must be provided to, or obtained by, CDPHP in order to render a decision on the appeal.
- Process and timeframes for filing appeal with CDPHP, including explanation that an expedited review of the appeal can be requested if a delay would significantly increase the risk to the enrollee's health, and a toll-free number for filing an oral appeal.
- Statement that CDPHP will not retaliate or take any discriminatory action against the enrollee, or enrollee's designee, because s/he filed an appeal.
- The right of the enrollee to designate a representative to file appeals on his/her behalf.
- Instruction on filing an external appeal within four months of the final adverse determination letter or plan letter agreeing to waive the internal appeal process.
- Timeframes within which the appeal determination must be made.
- If enrollee completes the expedited appeal process and CDPHP upholds the denial, the enrollee may file either a standard appeal or an external appeal.
- If enrollee completes the standard appeal process and CDPHP upholds the denial, the enrollee may apply for an external appeal within 45 days of receipt of the final adverse determination notice.
- The enrollee and CDPHP may jointly agree to waive the CDPHP appeal process, and the enrollee may apply for an external appeal within 45 days of this agreement.
- Notice of availability, upon request, of the clinical review criteria relied upon to make such determination.
- The notice entitled "Managed Care Action Taken" for denial of benefits or for termination or reduction in benefits, as applicable, containing the enrollee's fair hearing (does not apply to Child Health Plus) and aid continuing rights.

Policy/Procedure Name: Ryoncil (remestemcel-l-rknd) **Control Number: 1350/20.000570**

Disclaimer Notice

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgment when deciding the most appropriate care to enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

Background

Ryoncil ™ (remestemcel-L) is an allogeneic bone marrow-derived mesenchymal stromal cell therapy indicated for the treatment of pediatric steroid-refractory acute graft-versus-host disease (SR-aGVHD) in patients 2 months ≤ 18 years of age. Ryoncil is administered via intravenous (IV) infusion, typically in a series of eight doses over four weeks.

The exact mechanism of action of Ryoncil is not fully understood; however, it is believed to function through immunomodulatory and anti-inflammatory effects. Clinical studies suggest that Ryoncil interacts with immune effector cells such as T cells and dendritic cells to reduce inflammatory cytokine production, support tissue repair, and promote immune homeostasis. These processes are the crux in the management of GVHD.

Acute GVHD is a serious and potentially life-threatening complication of allogeneic hematopoietic stem cell transplantation (HSCT) that can involve one or more organ systems (e.g., the skin, gastrointestinal tract, and liver). Steroids are the first-line treatment; however, up to 50% of pediatric patients do not adequately respond. These cases are considered steroid-refractory and are at high risk for morbidity and mortality.

Approval of Ryoncil was based on the results from a single-arm, phase III trial (MSB-GVHD001; NCT02336230) that included 54 pediatric patients with grade B-D SR-aGVHD after receiving allogeneic HSCT. The underlying reasons for allogeneic HSCT were hematologic malignancies (67%) and non-malignant disease (37%). The trial demonstrated an overall response rate of 70% (n = 38/54).

According to the National Comprehensive Cancer Network (NCCN) guidelines, treatment of SR-aGVHD involves consideration of several second-line agents. There is, however, no single standard approach. Options may include ruxolitinib, anti-thymocyte globulin, and extracorporeal photopheresis. Ryoncil has not yet been added to the NCCN guidelines.

Summary

Effective Date of Policy:	6/11/25
Indications	Steroid-refractory graft-versus-host-disease (SR-aGVHD)
ICD10 Diagnosis Codes:	D89.810
HCPCS Code	J3402
Availability:	Single-Use Vials: $25x10^6$ MSCs in 3.8mL
Duration:	4 weeks

Required Criteria for Approval

1. Must be prescribed by or in consultation with an oncologist, hematologist, BMT specialist, or other qualified health professionals experienced in the management of Steroid Refractory acute Graft versus Host Disease (SR-aGVHD) AND
2. Patient must be ≥ 2 months to 17 years of age AND
3. Must have a diagnosis of Steroid Refractory acute Graft versus Host Disease (SR-aGVHD) following receipt of allogeneic hematopoietic stem cell transplantation (HSCT) AND
4. Must have Grade B–D aGvHD as defined using the modified Glucksberg grading system or the International Blood and Marrow Transplantation Registry (IBMTR). Objective documentation must be submitted confirming grade (severity) of disease (including but not limited to skin involvement [BSA], serum bilirubin levels, and stool volume [mL/day])
    a. Grade III-IV (modified Glucksberg)/C-D (IBMTR) disease involving the skin, liver, or gastrointestinal (GI) tract OR
    b. Grade II (modified Glucksberg)/B (IBMTR) disease involving the liver or gastrointestinal (GI) tract with or without concomitant skin disease AND
5. Must have documentation of steroid refractory defined as progression within 3 days or no improvement within 7 days of consecutive treatment with 2 mg/kg/day methylprednisolone (or prednisone dose equivalent)
6. Must have a medical reason why Jakafi AND all NCCN Category 2A recommended alternative therapies for Steroid Refractory acute Graft versus Host Disease (SR-aGVHD) cannot be used (e.g., ECP, basiliximab, infliximab, ATG).

a. A letter of medical necessity must be submitted confirming that all alternative therapies including Jakafi and NCCN category 2A alternative therapies are not appropriate or suitable considering the specific organ involvement, severity of SR-aGVHD, prior treatment history, comorbidities, and the institutional experience. AND

7. Baseline documentation of all organ involvement, including unaffected organs at the time of diagnosis, will be required. Incomplete documentation may result in an inability to evaluate the patient's eligibility for additional or repeat treatment.
8. Treatment Response Evaluation
    a. Response should be evaluated
        i. 28 days after the first dose for Initial Treatment
        ii. 56 days after Continued Therapy (if applicable) AND
    b. Objective documentation must be submitted confirming the patient's response to therapy (including but not limited to skin involvement [BSA], serum bilirubin levels, and stool volume [mL/day]) AND
    c. Response must be assessed across all organ systems that were documented as baseline and will be identified as one of the following:
        i. Partial or Mixed Response
            1. Partial Response – defined as organ improvement of at least one stage without worsening of any other organ
            2. Mixed response – defined as improvement in at least on evaluable organ stage with worsening in another
        ii. Complete Response - defined as a resolution of acute GVHD in all involved organs
        iii. No Response - defined as no change in any organ stage in any organ system and no improvement in organ stage.
9. Requirements for Continued or Additional (Recurrence) Treatment
    a. For Continued Treatment, the patient must have had a Partial or Mixed Response (as defined in 8.c.i.) to Initial Treatment OR
    b. For Additional (Recurrence) Treatment, the patient must have achieved a Complete Response (as defined in 8.c.ii.) to treatment (Initial or Continued) AND
        i. The patient must have a return or worsening of SR-aGVHD symptoms consistent with the requirements in criteria 4 (above)
            1. a) Occurring more than 28 days after the first infusion of Initial Therapy OR
            2. b) Occurring more than 56 days after achieving Complete Response to continued therapy AND
        ii. The patient must have not initiated another systemic therapy for Steroid Refractory acute Graft versus Host Disease (SR-aGVHD)
    c. No Response: Additional treatment will not be authorized for patients who had No Response to the initial treatment course.
10. Approved Dosage:
    a. Initial Treatment: 2×10^6 mesenchymal stromal cells (MSC)/kg body weight per intravenous infusion given twice a week for 4 consecutive weeks for a total of 8 infusions
    b. Continued or Additional (Recurrence) Treatment
        i. For Partial or Mixed Response: 2×10^6 mesenchymal stromal cells (MSC)/kg body weight per intravenous infusion given once weekly for an additional 4 weeks for a total of 4 additional infusions (12 infusions total)
        ii. For recurrence of SR-aGVHD after Complete Response: 2×10^6 mesenchymal stromal cells (MSC)/kg body weight per intravenous infusion given twice a week for an additional 4 consecutive weeks for a total of 8 additional infusions (16 infusions total)
11. Approval Timeframes:
    a. Initial Treatment: 4 weeks (28-days)
    b. Repeated Administration
        i. For Partial or Mixed Response: 4 weeks (28-days)
        ii. For recurrence of SR-aGVHD after Complete Response: 4 weeks (28-days)
    c. The approved dosage (10a,b) are provided per lifetime
12. Ryoncil will not be approved for uses beyond FDA approved indications including but not limiting to the treatment of chronic GVHD, non-SR-aGVHD, SR-aGVHD not associated with allogeneic HSCT, concomitant use with other systemic first-line or second-line SR-aGVHD therapies, adult patients with SR-aGVHD.

Considerations

Prior authorization must be obtained through the CDPHP pharmacy department.

CDPHP reserves the right to review this policy at any time and change it without notice.

Background

RYPLAZIM (plasminogen, human-tvmh) is plasma-derived human plasminogen indicated for the treatment of patients with plasminogen deficiency type 1 (hypoplasminogenemia).

Plasminogen deficiency (PLGD; hypoplasminogenemia [HPG]) is an autosomal recessive multisystem disorder characterized by formation of fibrinous pseudomembranes on mucous membranes throughout the body. Plasminogen is the precursor to plasmin, a serine protease that cleaves fibrin and other proteins to restore blood vessel patency and maintain the extracellular matrix following establishment of hemostasis. Plasmin is important for regulating the inflammatory response as well as wound healing and tissue remodeling. The spectrum of this disease is not comprehensively described and is thought to be underdiagnosed. A clinical distinction is made between PLG variants (The *PLG* gene encodes plasminogen) that cause hypoplasminogenemia (reduced levels of plasminogen, type I disease) versus those that cause a dysfunctional protein (type II disease).

Type I disease: reduced protein production (quantitative deficiency, hypoplasminogenemia), plasminogen levels and functional activity both reduced.

Type II disease (more common): dysfunctional protein (qualitative deficiency, dysplasminogenemia), plasminogen levels normal but activity is reduced.

The clinical presentation involves many different body systems and is quite varied. Ligneous conjunctivitis (pseudomembrane formation in the conjunctiva of the eye) is the most easily recognizable and the most common presentation (80-90% of those with PLGD and often presenting finding). Other common sites include the GI tract, ear, and mouth (gingiva, tonsils), and urogenital. Also, skin lesions have been reported in areas of sun exposure, with a specific rare condition noted including juvenile colloid milium. More serious body systems affected include the respiratory tract where both upper and lower lesions can occur, and results can be fatal (airway obstruction).

Evaluation for disease involves laboratory testing of both plasminogen activity and antigen levels. The normal range of plasminogen activity is 70-130 percent, activity levels of < 40-45 percent is consistent with deficiency. In terms of antigen levels, these are measured using an immunologic assay with a normal range of 6-25 mg/dL. It is to be noted that normal ranges are lower in neonates and infants, and one should reference age-specific normal ranges.

Ryplazim is made from purified human plasma and works to increase the level of plasminogen in the blood to temporarily correct the plasminogen deficiency and reduce or resolve lesions. In Ryplazim's Phase 2/3 clinical trial, all 14 patients achieved target trough plasminogen activity levels and saw improvement in the number and/or size of their lesions by Week 48. Ryplazim was well tolerated, with no deaths or serious adverse events observed in its clinical trials. The most commonly reported adverse effects in Ryplazim Trial 2 included headache (43%), nasopharyngitis (36%), abdominal pain (29%), nausea (29%), diarrhea (21%), rhinorrhea (21%), and cough (21%). Three patients in Ryplazim Trial 2 developed anti-plasminogen antibodies following treatment with Ryplazim; however, trough plasminogen activity levels suggested that these antibodies were not neutralizing antibodies (i.e., inhibitors) to plasminogen. Patients using Ryplazim should be monitored for a loss of clinical effect (new or recurrent lesions), and regular trough plasminogen activity levels should be obtained.

Other management concepts beyond Ryplazim or plasminogen replacement include Fresh Frozen Plasma (FFP), immunosuppressants (corticosteroids, azathioprine, cyclosporine A), hormone therapy (estrogens, gestagens, androgens), anticoagulants, among other therapies.

Summary

Effective Date of Policy:	2/12/2026
Indications	Plasminogen deficiency type 1 (hypoplasminogenemia)
ICD10 Diagnosis Codes	E88.02
HCPCS Code	J2998

Availability	*Single-dose 50-mL vial containing 68.8 mg of plasminogen as a lyophilized powder for reconstitution with 12.5 mL of Sterile Water for Injection. After reconstitution, each vial will contain 5.5 mg/mL of plasminogen.*
Duration	Initial: 3 months Continuation: 3-12 months

Required Criteria for Initial Approval

All of the following conditions for the requested indication must be met in order to approve therapy.

Specific Drug	Inclusion Criteria	Recommended Dosing
Indication Plasminogen deficiency type 1 (hypoplasminogenemia) (FDA approval) ICD10: E88.02	• Enrollee is at least 11 months of age. • Therapy is being requested by a hematologist, geneticist, pulmonologist, ophthalmologist, or prescriber specializing in plasminogen deficiency type 1 • Must have diagnosis of plasminogen deficiency type 1 AND • Must have baseline plasminogen activity level < 45% (Note: if the patient is receiving plasminogen supplementation with fresh frozen plasma, allow for a 7-day washout period before obtaining baseline plasminogen activity level.) • Must have documented history of lesions consistent with a diagnosis of congenital plasminogen deficiency (i.e., ligneous conjunctivitis, ligneous gingivitis, growths in the mucous membrane of the middle ear, respiratory tract, gastrointestinal tract) • Initial approval will be for 12 weeks o A quantity limit sufficient to allow for 6.6 mg/kg body weight administered every 2 days will be authorized for 12 weeks.	• 6.6 mg/kg body weight given every two to four days via intravenous infusion.

Continuation Criteria

Recertification after the initial 12-week approval will be reviewed as follows:

- Must provide documentation of the trough plasminogen activity level that was obtained approximately 72 hours after the initial dose of Ryplazim and prior to the second dose to confirm dosing frequency used in the initial 12-week approval period aligns with FDA-labeling
- Duration of continued approval will be dependent on the patient's initial 12-week response:
  - For patients who have documented resolution of lesions, approval will be authorized for 12 months. Quantity limit authorizations (dose and frequency) will be based on FDA-approved labeling
  - For patients who do not have resolution of lesions or have new or recurrent lesions, continued approval will be authorized for an additional 12-weeks along with request for additional quantity to optimize dosing frequency. A quantity limit sufficient to allow for 6.6 mg/kg body weight administered every 2 days will be authorized for this additional 12-week period.
    - If patient has a documented clinical efficacy after the additional 12 weeks (i.e., resolution of lesions, improvement in size/number of lesions, trough plasminogen activity level > 10% above baseline trough level), continued approval will be authorized for 12 months. Quantity limit authorizations (dose and frequency) will be based on FDA-approved labeling.
    - Ryplazim will not be authorized beyond 24 weeks of therapy if confirmed (repeat) trough plasminogen activity level is
- Yearly recertification requests will require:
  - Documentation that the patient has maintained a clinical response to treatment
  - Quantity limit authorizations (dose and frequency) will be based on FDA-approved labeling.

Considerations

- Prior authorization is obtained through the CDPHP pharmacy department.

MEDICAL POLICY

Medical Policy Title	**Sacral Nerve Stimulation**
Policy Number	**7.01.10**
Current Effective Date	**September 1, 2026**
Next Review Date	**November 2026**

Our medical policies are based on the assessment of evidence based, peer-reviewed literature, and professional guidelines. Eligibility for reimbursement is based upon the benefits set forth in the member's subscriber contract. (Link to Product Disclaimer)

POLICY STATEMENT(S)

Sacral Nerve Stimulation for the Treatment of Urinary Conditions

I. Sacral nerve stimulation is a **medically appropriate** treatment option for individuals ≥ 16 years who meet specific criteria for **BOTH** Trial Stimulation and Permanent Placement:

A. Trial Stimulation

1. Individual has a diagnosis of chronic, idiopathic, non-obstructive, urinary retention who meet **ANY** of the following criteria:
   a. Failed clean-self-catheterization; or
   b. Have not tolerated clean-self-catheterization;

   OR

2. Individual has a diagnosis of urgency-frequency syndrome, overactive bladder, or urge incontinence that is unrelated to a neurological condition, who meets the **ALL** of the following criteria:
   a. Symptoms have persisted for more than six (6) months; and
   b. Documentation supports the following:
      i. Failure of conventional treatments (e.g., pelvic floor exercises, lifestyle therapy, bladder training); **and**
      ii. Failure of **ONE** of the following pharmacologic treatments.
         a) Two (2) different anticholinergics; **or**
         b) One (1) anticholinergic and one (1) beta-3 adrenergic agonist;

AND

B. Permanent Placement

1. Trial demonstrated at least 50% improvement in voiding incontinence and urinary symptoms; **or**
2. Trial demonstrated a 50% decrease in residual urine volume.

Proprietary Information of Capital District Physicians' Health Plan, Inc. | CDPHP Universal Benefits,® Inc. | Capital District Physicians' Healthcare Network, Inc.

II. Sacral nerve stimulation is considered **investigational** for **ALL** other indications, including, but not limited to, the following:

A. Stress incontinence;

B. Urge incontinence due to a neurological condition (e.g., diabetic neuropathy, multiple sclerosis, spinal cord injury);

C. Other types of chronic voiding dysfunction.

Sacral Nerve Stimulation for the Treatment of Fecal Incontinence

III. Sacral nerve stimulation is a **medically appropriate** treatment option for individuals ≥ 16 years who have fecal incontinence, when **ALL** of the following indications are met:

A. Have demonstrated an appropriate response to trial stimulation. An appropriate response is defined as at least a 50% improvement in voiding/incontinence for fecal symptoms;

B. Chronic fecal incontinence of greater than two (2) episodes per week with a duration greater than six (6) months (or 12 months, if occurring after vaginal childbirth);

C. Documented failure of prescribed conservative therapies (e.g., pharmacologic treatments, dietary changes) performed for more than three (3) months;

D. Incontinence unrelated to an anorectal malformation, chronic inflammatory bowel disease, or neurologic condition such as peripheral neuropathy or complete spinal cord injury.

Device Repair

IV. Repair of a medically necessary sacral nerve stimulator or components not under warranty will be considered **medically appropriate** when the following criteria are met:

A. Physician documentation includes **ALL** of the following:

1. Date of device implantation/initiation;
2. Manufacturer warranty information, if applicable;
3. Attestation that the patient has been compliant with the use of device and will continue to benefit from the use of device;

B. The device is no longer functioning adequately; and **BOTH** of the following criteria are met:

1. Inadequate function interferes with activities of daily living; **and**
2. Repair is expected to make the equipment fully functional (as defined by manufacturer).

C. Repair of equipment damaged due to patient neglect, theft, abuse, or when another available coverage source is an option (e.g., homeowners, rental, auto, liability insurance, etc.) is **ineligible for coverage**.

Device Replacement

V. Replacement of a medically necessary sacral nerve stimulator or components not under warranty will be considered **medically appropriate** when **EITHER** of the following criteria are met:

   A. The device is no longer functioning adequately and has been determined to be non-repairable, or the cost of the repair is in excess of the replacement cost;

   B. There is documentation that a change in the patient's condition makes the present unit non-functional and improvement is expected with a replacement unit.

VI. The replacement of a properly functioning sacral nerve stimulator, its components or accessories, is considered **not medically necessary**. This includes, but is not limited to, replacement desired due to advanced technology or in order to make the device more aesthetically pleasing.

VII. The replacement of equipment damaged or lost due to patient neglect, theft, abuse, or when another available coverage source is an option (e.g., homeowners, rental, auto, liability insurance, etc.) is **ineligible for coverage**.

VIII. Accessories or components for sacral nerve stimulators that are considered not medically necessary or investigational by peer-reviewed literature will also be considered as **not medically necessary** or **investigational** by the Health Plan.

IX. Sacral nerve stimulation is considered **investigational** for **ALL** other indications, including, but not limited to, the following:

   A. Stress incontinence;

   B. Urge incontinence due to a neurological condition (e.g., diabetic neuropathy, multiple sclerosis, spinal cord injury);

   C. Other types of chronic voiding dysfunction;

   D. Constipation;

   E. Chronic pelvic pain.

X. Bilateral sacral nerve stimulation is considered **investigational**.

DESCRIPTION

Urinary Incontinence

Urinary voiding dysfunction is usually defined as the inability to control urination. Urinary voiding disorders are generally divided into five (5) types, depending on the pathophysiology involved: urge incontinence (a subtype of which is urgency-frequency syndrome), overflow incontinence (also known as urinary retention), stress incontinence, mixed incontinence, and functional incontinence. Urge incontinence is defined as leakage of urine when there is a strong urge to void. Urgency-frequency is an uncontrollable urge to urinate, resulting in very frequent, small volumes. Urgency-frequency is a prominent symptom of interstitial cystitis. The term "overactive" bladder is frequently used when describing the symptoms of urgency-frequency and urge incontinence. Urinary retention is the inability to completely empty the bladder of urine.

Sacral nerve stimulation (SNS), or sacral neuromodulation (SNM), is defined as the implantation of a permanent device that modulates the neural pathways controlling bladder or rectal function. The SNS device consists of an implantable pulse generator that delivers controlled electrical impulses. This pulse generator is attached to wire leads that connect to the sacral nerves, most commonly the S3 nerve root. Two external components of the system help control the electrical stimulation. A control magnet is kept by the patient and can be used to turn the device on or off. A console programmer is kept by the physician and used to adjust the settings of the pulse generator.

Treatment using SNS is one of several alternative modalities for patients with urinary urge incontinence, significant symptoms of urgency-frequency, or non-obstructive urinary retention who have failed behavioral (e.g., prompted voiding) and/or pharmacologic therapies.

Before implantation of the permanent device, patients undergo an initial testing phase to estimate potential response to treatment. The first type of testing developed was percutaneous nerve evaluation (PNE). This procedure is done with the patient under local anesthesia, using a test needle to identify the appropriate sacral nerve(s). Once identified, a temporary wire lead is inserted through the test needle and left in place for four to seven days. This lead is connected to an external stimulator, which is carried in the patient's pocket or on the patient's belt. Patients who show a 50% or greater reduction in symptom frequency are deemed eligible for the permanent device. The second type of testing is a two-stage surgical procedure. In stage one, a quadripolar-tined lead is implanted and tested for as long as several weeks. Patients who show a 50% or greater reduction in symptom frequency can proceed to stage two of the surgery, which is the permanent implantation of the neuromodulation device. The two-stage surgical procedure has been used in various ways, including as an alternative to PNE, for patients who failed PNE, for patients with an inconclusive PNE, or to further refine patient selection for patients who had a successful PNE. Approximately 63% of patients have a successful testing phase. The permanent device is implanted under general anesthesia, with the pulse generator inserted in the upper gluteal region.

Fecal Incontinence

Fecal incontinence is defined as the uncontrolled passage of feces or gas for at least one month's duration, in an individual of at least four (4) years of age, who had previously achieved control. Severity may range from involuntary passage of flatus to complete loss of bowel control.

SUPPORTIVE LITERATURE

Urinary Incontinence

In 1999, the FDA approved clinical studies of the Medtronic InterStim System for sacral nerve stimulation, allowing a large multicenter, randomized clinical trial to evaluate the safety and effectiveness of SNS for treating urinary urgency/frequency. Patients underwent test stimulation, and those showing ≥ 50% improvement were randomized into treatment or control groups. For urinary retention, 83% of treated patients achieved successful outcomes at six (6) months, with sustained improvements observed at 12 and 18 months. Similarly, patients with urgency/frequency symptoms experienced significant reductions in daily voids, increased voided volumes, and reduced urgency, with 88% achieving clinical success at six (6) months. Safety data from 581 patients and 219 implants revealed that most adverse events were resolved, with a surgical revision rate of 33.3%. The therapy demonstrated reversible effects and did not compromise urologic function. Overall, the InterStim System was found to be safe and effective for patients who had failed or could not tolerate conservative treatments.

A study by Groen et al (2011) provided the longest follow-up data on SNM for women with refractory idiopathic urge urinary incontinence. In this longitudinal series, 60 patients were followed for at least five years after receiving the therapy. Treatment success was defined as a minimum 50% reduction in daily incontinent episodes or pad usage. At one (1) month, 87% of patients met this criterion, but the success rate declined to 62% by the five-year mark. Complete continence was achieved by 25% of patients at one (1) month and 15% at five (5) years. Despite the decrease in efficacy over time, 80% of the women continued using the device at five (5) years. Adverse events were reported in 53% of patients most commonly related to hardware issues or discomfort, and 15 patients required a total of 23 reoperations. Most pain-related complications were managed conservatively.

Schwarztuch et al (2024) evaluated the feasibility, safety, and efficacy of SNM in patients with neurogenic lower urinary tract dysfunction (NLUTD) and/or fecal incontinence (FI), comparing outcomes to those with non-neurogenic conditions. Conducted as a retrospective single center study from 2017 to 2022, 67 patients underwent two-stage implantation of the InterStim II device. Of these patients, 16 had underlying neurologic conditions such as multiple sclerosis, spinal stenosis, or Parkinson's disease. Clinical success was defined as a ≥ 50% improvement in catheterizations or incontinence episodes. Results showed comparable success rates between the neurogenic (50%) and non-neurogenic (56.9%) groups, with no significant differences in surgical duration, follow-up, or device removal rates. Predictors of success included a maximal cystometric capacity below 430 mL and detrusor contraction during voiding. SNM was well tolerated in neurogenic patients, with low adverse event rates and no infections reported. Limitations of the study include a small sample size, heterogeneous patient characteristics, and a mid-term follow-up duration. Overall, the study supports SNM as a viable treatment option for carefully selected neurogenic patients who are refractory to conservative therapies, demonstrating similar outcomes to non-neurogenic populations.

Fecal Incontinence (FI)

Wexner et al (2010) evaluated the safety and effectiveness of SNS in a large patient population under an FDA approved investigational protocol for individuals with fecal incontinence. Patients who experienced a ≥ 50% improvement during the test stimulation phase received permanent

implantation of the InterStim Therapy device (Medtronic, Minneapolis, MN). The primary efficacy endpoint was defined as achieving therapeutic success ≥ 50% reduction in weekly incontinent episodes at 12 months compared to baseline. Of the 133 patients who underwent test stimulation, 90% were successful. A total of 120 patients (110 female), with a mean age of 60.5 years and an average FI duration of 6.8 years, received permanent implants. The mean follow-up duration was 28 months (range: 2.2–69.5 months). At 12 months, 83% of subjects met the criteria for therapeutic success (95% CI: 74%–90%; P < 0.0001), with 41% achieving complete continence. At 24 months, the success rate increased to 85%. The average number of weekly incontinent episodes decreased from 9.4 at baseline to 1.9 at 12 months and 2.9 at 24 months. No unexpected adverse device effects were reported.

Bharucha and colleagues (2017) published an American Gastroenterological Association (AGA) clinical practice update expert review of best practices for the management of fecal incontinence using surgical interventions and device-aided therapy. They advised that SNS should be considered for patients with moderate-to-severe fecal incontinence in whom symptoms have not responded after a three-month or longer trial of conservative measures. In addition, the authors found no evidence that SNS improves bowel symptoms or rectal evacuation in defecatory disorders.

Vollebregt et al (2024) conducted a randomized, double-blind, multicenter crossover trial to evaluate the clinical efficacy and underlying mechanisms of subsensory SNM in adults with chronic fecal incontinence (FI) who had failed conservative treatment. The study included two 16-week treatment periods (active SNM vs. sham stimulation), followed by a 26-week open-label phase, totaling 58 weeks. A mechanistic sub-study using magnetoencephalography (MEG) assessed brain-anorectum connectivity. Due to COVID-19 disruptions, 39 participants were randomized, with 16 completing the primary outcome assessment. The primary endpoint reduction in FI episodes per week, showed a non-significant improvement with SNM compared to sham (−0.7 episodes/week; p = 0.06). However, sensitivity analysis suggested a potentially meaningful effect (−0.9 episodes/week; p = 0.04). Open-label follow-up revealed sustained symptom improvement, with FI episodes decreasing from 6.2 to 3.2 per week, along with marked reductions in urgency and loperamide use. Mechanistic findings showed no significant differences in cortical responses between SNM and sham stimulation or between patients and healthy controls. MEG data confirmed bilateral sensorimotor activation during anal stimulation and voluntary squeeze, but SNM did not produce measurable changes in brain activity.

PROFESSIONAL GUIDELINE(S)

The American College of Obstetricians and Gynecologists (ACOG) Practice Bulletin for Urinary Incontinence in Women (2015) suggests consideration of sacral neuromodulation for patients with recalcitrant urinary urge incontinence who have failed other conservative measures.

The 2019 American Urological Association guidelines on the diagnosis and treatment of overactive bladder states that sacral neuromodulation may be offered as a third-line treatment in carefully selected individuals with severe refractory symptoms or in those who are not candidates for second-line therapy (e.g., oral antimuscarinics, oral β3-adrenoceptor agonists, transdermal oxybutynin) and are willing to undergo surgery (recommendation, evidence strength Grade C.

In 2020, the National Institute for Health and Care excellence (NICE) issued guidance on the Axonics sacral neuromodulation system for treating refractory overactive bladder. The guidance states that the Axonics system should be considered an option for people with refractory overactive bladder. Similar to the 2004 guidance it states that use of SNS for urge incontinence and symptoms of urgency or frequency is supported by evidence of efficacy and safety.

In 2016, the American Society of Colon and Rectal Surgeons (ASCRS) released a clinical practice guideline for the management of constipation. The guidelines states that sacral neuromodulation may be an effective treatment for individuals with chronic constipation and successful peripheral nerve evaluation test when conservative measures have failed. However, it is not currently approved by the U.S. FDA for this condition in the United States (Grade of Recommendation: Weak, based on moderate quality evidence, 2B).

In 2023, the ASCRS released an updated clinical practice guideline for the treatment of fecal incontinence. The guidelines state that sacral neuromodulation may be considered as a first-line surgical option for incontinent individuals with and without sphincter defects (strength of recommendation, conditional; GRADE quality of evidence is low).

REGULATORY STATUS

Medical Devices

The United States Food and Drug Administration (FDA) regulates medical devices including sacral nerve stimulators. All medical devices including related components require FDA approval before marketing and use in the United States to ensure they are safe and effective for human use. Refer to the FDA Medical Device website. Available from: https://www.fda.gov/medical-devices [accessed 2025 Oct 17]

SNS has been approved by the Food and Drug Administration (FDA) since 1997 for the treatment of urinary urge incontinence, and its indications were later expanded to include urinary retention and urgency/frequency symptoms. There are two SNS systems currently approved by the United States Food and Drug Administration (FDA) for use in the treatment of urge incontinence, urgency-frequency, non-obstructive urinary retention, and fecal incontinence. The Interstim Sacral Nerve Stimulation System from Medtronic received approval in 1997 for urge incontinence, in 1999 for urgency-frequency and nonobstructive urinary retention, and in 2011 for fecal incontinence. The Axonic Sacral Neuromodulation System from Axonics received FDA approval for the treatment of urge incontinence, urgency-frequency, and non-obstructive urinary retention, and received pre-market approval for fecal incontinence, in 2019.

Medtronic has since received FDA approval for different models of SNS devices, the Interstim Micro, a small rechargeable device with 15 years of battery life, and the Interstim X, a recharge-free device, offering more than 10 years of battery life without any need to recharge. Both devices utilize a programming device in the form of what looks like a smartphone so that patients can discreetly adjust their own settings. Both devices have magnetic resonance imaging (MRI) modes and allow for full body 1.5T and 3T MRI scans under certain conditions.

In 2023, the Virtis Sacral Neuromodulation System (Nuvectra) was approved by the FDA for treatment of urinary retention and symptoms of overactive bladder, including urinary urge incontinence and significant symptoms of urgency-frequency in individuals who have failed more conservative treatments.

CODE(S)

Policy/Procedure Name: Scenesse (Afamelanotide) **Control Number: 1350/20.000491**

Disclaimer Notice

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgment when deciding the most appropriate care to enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

Background

Erythropoietic protoporphyria (EPP) is a genetic disorder due to ferrochelatase enzyme (FECH) deficiency resulting in an accumulation of protoporphyrin IX in the skin and liver. Protophyrin IX reacts to visible light, including sunlight and some artificial light, and can cause anaphylactoid and phototoxic reactions in people with EPP. After exposure to light, the skin may become itchy and red. Affected individuals may also experience a burning sensation on their skin. The hands, arms, and face are the most commonly affected areas. Cumulative exposure to light, even just a few minutes daily, will eventually trigger these symptoms. Some patients with EPP may also have complications related to liver and gallbladder function. EPP can result either from mutations of the ferrochelatase gene (FECH), or less commonly the delta-aminolevulinic acid synthase-2 gene (ALAS2). When EPP is due to an ALAS2 mutation it is termed X-linked protoporphyria (XLP) because the ALAS2 gene is found on the X chromosome. XLP accounts for approximately 2 to 10% of EPP cases. EPP affects males and females in equal numbers. It is estimated that the disorder occurs in about 1 in about 74,300 individuals. The onset of symptoms affecting the skin usually occurs in infancy; however, in some cases, onset may not occur until adolescence or adulthood.

The diagnosis of EPP is established by finding an abnormally high level of total erythrocyte protoporphyrin and showing that this increase is mostly free protoporphyrin rather than zinc protoporphyrin. There is considerable confusion about which test to order. Sometimes laboratories have measured only zinc protoporphyrin and reported results incorrectly as "protoporphyrin" or "free erythrocyte protoporphyrin (FEP)". Laboratories that measure total erythrocyte protoporphyrin, free protoporphyrin and zinc protoporphyrin and report results reliably are Porphyria Laboratory and Center, University of Texas Medical Branch at Galveston, 1-409-772-4661 and Mayo Medical Laboratories, 1-800-533-1710. Porphyrins are almost always elevated in plasma in EPP but may be normal in mild cases. Genetic testing is also an important component in diagnosis.

Mainstay of therapy has been supportive care including light avoidance, sun protection (complete light blocking creams), clothing, and vitamin D supplementation to correct for deficiency. Some patients note increased tolerance to sunlight with beta-carotene (Lumitene), especially in the summer. In the largest case series with 133 patients, 22 reported no effect and 111 reported moderate to substantial improvement in sunlight tolerance. It is dosed at 30 to 300 mg (1 to 10 capsules) daily and titrated to maintain serum carotene levels in the range of 600 to 800 mcg/dL or a tolerable degree of yellowish skin pigmentation. If the patient is not experiencing reduced symptoms with an adequate carotene level after three months, the therapy may be discontinued, as most individuals notice a protective effect within one to three months.

Scenesse (afamelanotide) is FDA approved and indicated to increase pain free light exposure in adult patients with a history of phototoxic reactions from EPP. It acts by increasing the levels of eumelanin in the skin, shielding against UV radiation (UVR) and visible light, including sunlight. Afamelanotide is a synthetic form of a hormone called alpha-melanocyte stimulating hormone. Afamelanotide increasing skin cell production of eumelanin which in turn can help to reduce the sensitivity of the skin to sunlight and artificial UV light sources. It is administered by a proficient health care professional under the skin every two months. A total of 168 patients with EPP from Europe (74 patients) and the United States (94 patients) were included in phase 3, multicenter, randomized, double-blind, placebo-controlled trials. They received 16 mg of afamelanotide, implanted at intervals of 60 days (for as long as 120 days in the United States and as long as 240 days in Europe). The primary efficacy endpoint was duration of direct sunlight exposure between 10:00 a.m. and 3:00 p.m. (in EU trial) and 10:00 am and 6:00 p.m. (in U.S. trial) on days when no pain was experienced. In the U.S. study, the duration of pain-free time after six months was longer in the afamelanotide group (median, 69.4 hours, vs. 40.8 hours in the placebo group; P=0.04). In the European Union study, the duration of pain-free time after nine months was also longer in the afamelanotide group than in the placebo group (median, 6.0 hours vs. 0.8 hours; P=0.005), and the number of phototoxic reactions was lower in the afamelanotide group (77 vs. 146, P=0.04). Adverse events were mostly mild; serious adverse events were not thought to be related to the study drug.

In December 2023, the Journal of the American Academy of Dermatology (JAAD) published evidence-based consensus guidelines for the diagnosis and management of erythropoietic protoporphyria and X-linked protoporphyria. In this review, they recommended that afamelanotide, administered every two months, should be used for prevention of phototoxic symptoms in EPP, with skin exams occurring every six months by a dermatologist.

Summary

Effective Date of Policy:	9/10/2025
Indications	Increase pain free light exposure in adult patients with a history of phototoxic reactions from erythropoietic protoporphyria (EPP)
ICD10 Diagnosis Codes	E80.0

Availability	Implant: 16 mg of afamelanotide
J-Code	J7352
Duration	Initial: 6 months Continuation: 1 year
Limitations	Scenesse must be administered by a health care professional proficient in the subcutaneous implantation procedure; therefore, it is covered under the medical benefit.

Required Criteria for Initial Approval

All of the following conditions for the requested indication must be met in order to approve Scenesse:

Indication	Inclusion Criteria	Recommended Dosing Regimen
Increase pain free light exposure in adult patients with a history of phototoxic reactions from erythropoietic protoporphyria (EPP) (FDA approval) ICD10: E80.0	• Enrollee is at least 18 years of age, or older • Prescribed by a dermatologist or hematologist or geneticist with expertise in the diagnosis and management of EPP • Definitive diagnosis of erythropoietic porphyria supported by: o A marked increase (5-50 times) in total erythrocyte protoporphyrin (300-5000 µg/dL erythrocytes, reference interval <80 µg/dL) determined by an accredited laboratory. **AND** Elevated erythrocyte metal-free protoporphyrin greater than or equal to 85% of the total erythrocyte protoporphyrin as determined by an accredited laboratory. Laboratory report should document total erythrocyte protoporphyrin/porphyrin; erythrocyte zinc protoporphyrin and erythrocyte metal-free (free) protoporphyrin **OR** o Identification of biallelic pathogenic variants in ferrochelatase (*FECH)* on molecular genetic testing • History of documented characteristic symptoms of phototoxicity due to EPP such as burning, itching, swelling, pain and redness of the skin during or after exposure to sunlight or fluorescent light causing reduced quality of life	• Standard dose is one 16 mg implant inserted subcutaneously above the supra-iliac crest every 2 months. • Administration more frequently than every 2 months (shorter dose interval) will not be covered.

Exclusion Criteria

- Personal history of melanoma or dysplastic nevus syndrome.
- Current Bowen's disease, basal cell carcinoma, squamous cell carcinoma, or other malignant or premalignant skin lesions.
- Non-erythropoietic protoporphyria (EPP) skin disorders such as xeroderma pigmentosum, epidermolysis bullosa, polymorphous light eruption (PLE), discoid light eruption (DLE), solar urticaria or due to other porphyrias such as porphyria cutanea tarda and congenital erythropoietic porphyria

Continuation Criteria

- Recertification timeframe after the initial approval will be for one year and will be limited to the total number of implants approved for that year. For example: recertification for one year with approval for a maximum of 3 implants to be administered every 2 months during the period of high sunlight exposure.
- Documentation of a positive response to treatment such as decreased frequency and severity of phototoxic reactions, increased duration of sun exposure, increased quality of life, AND
- Enrollee has been examined to monitor preexisting and new skin pigmentary lesions

Considerations

- Prior authorization is obtained through the CDPHP pharmacy department.
- A quantity limit of 3 implants per year during periods of high sunlight exposure will apply. Requests for more than 3 implants per year will be evaluated on a case-by-case basis with prescriber documentation of medical necessity.

CDPHP reserves the right to review this policy at any time and change it without notice.

PROCEDURE CODES

99202-99205, 99212-99215, 99231-99233

DESCRIPTION

A second medical opinion is an opinion obtained from an additional health care professional, prior to the performance of a medical service or surgical procedure that is used to educate a member regarding treatment alternatives, and/or to determine medical necessity.

RELATED POLICIES/DOCUMENTS

Resource Coordination Policies:

- Out-of-Network Care, 1370/20.000145.
- Prior Authorization Guideline, 1370/20.000425

POSITION STATEMENT

CDPHP administers benefits for an enrollee to obtain a second opinion for the treatment of cancer, surgical procedure, or other instances as outlined below.

Second Cancer Opinion

CDPHP administers benefits for one second opinion by an appropriate specialist, including but

not limited to a specialist affiliated with a specialty care center, for the treatment of cancer in the event of a positive or negative diagnosis of cancer, or a recurrence of cancer, or a recommendation of a course of treatment for cancer.

The second opinion may be obtained from a non-participating specialist, including but not limited to a specialist affiliated with a specialty care center for the treatment of cancer, when such services are requested in writing by the attending physician and are determined medically appropriate by a CDPHP medical director.

- *This coverage applies to the out-of-network consultation only.* Requests for additional out-of-network testing or treatment is subject to benefit limitations stated in the enrollee's contract and will require prior authorization.

Second Surgical Opinion

CDPHP administers benefits for a second surgical opinion by a qualified physician on the need for surgery.

In some instances, CDPHP reserves the right to require a second surgical opinion prior to authorizing a surgical procedure.

- The second opinion must be provided by a board-certified specialist after a face-to-face examination.

Second Opinions in Other Cases

CDPHP administers benefits for a second medical opinion in instances where an enrollee does not agree with a provider's recommended course of treatment.

- Enrollees may request CDPHP designate another provider to render a second opinion.

POLICY CONSIDERATIONS

In instances above, where the second opinion differs from the original, a third opinion will be granted.

- Third opinion consultations are also subject to the terms and conditions stated in this policy.
- CDPHP will approve covered, medically necessary services that are supported by a majority of the providers that have reviewed the case.

The CDPHP resource coordination department will provide case management services to facilitate a timely transfer of appropriate medical records.

CDPHP will determine where the recommended treatment plan is to be provided.

Capital District Physicians' Health Plan, Inc.
CDPHP Universal Benefits,® Inc.
Capital District Physicians' Healthcare Network, Inc.

(Collectively referred to within this policy as "CDPHP®")

POLICY NAME: SECOND OPINIONS

EXCLUSIONS

No benefits are available for patients to continue to obtain opinions, beyond those stated above.

CDPHP PRODUCT VARIATIONS

CHILD HEALTH PLUS	Subject to all terms and conditions noted above in the policy.
MEDICARE ADVANTAGE	Second opinion for the treatment of cancer must be obtained within the CDPHP participating provider network unless it is determined the network does not have a qualified health-care provider with appropriate training and expertise to render such an opinion.
SELECT PLAN/HARP	Second opinion for the treatment of cancer must be obtained within the CDPHP participating provider network unless it is determined the network does not have a qualified health-care provider with appropriate experience or expertise to render such an opinion. • Health care providers within New York State will be utilized whenever possible. Second Medical/Surgical Opinions- Medicaid /HARP enrollees may obtain second opinions for diagnosis of a condition, treatment, or surgical procedure by a qualified physician or appropriate specialist, including one affiliated with a specialty care center. In the event that CDPHP determines that it does not have a participating provider in its network with appropriate training and experience qualifying the participating provider to provide a second opinion, CDPHP shall make a referral to an appropriate non-participating provider. CDPHP shall pay for the cost of the services associated with obtaining a second opinion regarding medical or surgical care, including diagnostic and evaluation services, provided by the non-participating provider.

MEDICAL POLICY

Medical Policy Title	**Serum Antibodies for the Diagnosis of Inflammatory Bowel Disease**
Policy Number	**2.02.19**
Current Effective Date	**January 1, 2027**
Next Review Date	**November 2026**

Our medical policies are based on the assessment of evidence based, peer-reviewed literature, and professional guidelines. Eligibility for reimbursement is based upon the benefits set forth in the member's subscriber contract. (Link to Product Disclaimer)

POLICY STATEMENT(S)

I. Serologic testing of biomarkers including, but not limited to anti-neutrophil cytoplasmic antibodies (ANCA) or anti-Saccharomyces cerevisiae (ASCA); antibodies of outer membrane porin C of the bacteria Eschericia coli (anti-OmpC); Pseudomonas fluorescens-associated sequence I2 (anti-I2); flagellin CBir1 (anti-cBir1); antichitobioside antibodies (ACCA IgA); antilaminaribioside antibodies (ALCA IgG); and antimannobioside antibodies (AMCA IgG) (e.g.; Prometheus IBD sgi Diagnostic testing), is considered **not medically necessary** for **ALL** indications including, but not limited to:

   A. To diagnose and monitor patients with inflammatory bowel disease (IBD);

   B. To distinguish ulcerative colitis (UC) from Crohn's disease (CD).

RELATED POLICIES

Not Applicable

POLICY GUIDELINE(S)

Laboratories performing clinical tests must be certified under the Clinical Laboratory Improvement Amendments of 1988 (CLIA).

DESCRIPTION

Inflammatory bowel disease (IBD) is a chronic disease of the gastrointestinal tract that consists of two related diseases, ulcerative colitis (UC) and Crohn's disease (CD). Although UC and CD are generally considered distinctive forms of IBD, their clinical presentations commonly overlap. Furthermore, for approximately 10-15% of patients with IBD, the distinction between UC and CD cannot be made with certainty. These patients are given a diagnosis of indeterminate colitis (IC). A correct diagnosis of IBD, especially the differentiation between CD and UC is highly important in determining treatment and prognosis. The diagnostic work-up of patients with IBD is relatively complicated, and endoscopic exam and biopsy are currently crucial components of the diagnosis. Less invasive, accurate diagnostic tools to distinguish between UC, CD, and cases of indeterminate colitis are needed.

It has been proposed that serological markers for IBD can be utilized, both to differentiate UC from CD, and to define patient subgroups (e.g., location of the disease, such as proximal versus distal bowel involvement). Other potential uses include determination of disease severity, prediction of response to anti-tumor necrosis factor (TNF) therapy, and identification of the susceptibility to IBD among family members of an affected individual. Anti-neutrophil cytoplasmic antibodies (ANCA) and anti-Saccharomyces cerevisiae antibodies (ASCA) have been the most extensively studied serological markers for use in the diagnosis of IBD. ANCA are a group of antibodies, which are specific for granulocyte antigens. Anti-neutrophil cytoplasmic antibodies with perinuclear staining (pANCA) have been most commonly described in IBD and have been linked with UC. Other antibodies that have recently been associated with CD include anti-OmpC, anti-cBir1, Anti-I2, ACCA, ALCA, and AMCA. Increased amounts and levels of an antibody's response have been suggested to predict a more complicated course of disease. Large prospective studies are needed, to validate these findings.

Recent data suggest that the presence of serological biomarkers might represent a genetic susceptibility, because patients who have positive antibodies may carry mutations in the NOD2/CARD15 gene or in toll-like receptor genes. However, future studies of larger cohorts with well-defined clinical characteristics and patient populations are needed, to determine the validity of this relationship.

The PROMETHEUS IBD sgi Diagnostic aims to help identify IBD and differentiates between UC and CD. It may also assess a patient's risk for more aggressive disease. The test includes the proprietary and patented serologic markers anti-CBir1, Anti-OmpC and DNAse-sensitive pANCA process as well as, the markers ASCA IgA (ACCA) and IgG (ALCA and AMCA). The sgi Diagnostic test also includes the ATG16L, ECM1, mkX2-3, and STAT3 genetics and inflammation markers such as VEGF, ICAM-1, VACAM-1, CRP, and SAA. The Smart Diagnostic Algorithm technology produces an IBD score; results are reported as consistent with IBD (consistent with ulcerative colitis, consistent with CD, or inconclusive for ulcerative colitis vs. CD) or not consistent with IBD. The test is intended for use in patients with clinical suspicion of IBD.

SUPPORTIVE LITERATURE

A published study compared the predictive values of the Prometheus Inflammatory Bowel Disease (IBD) Serology 7 (IBD7) panel (Prometheus Laboratories, San Diego, CA) with the predictive values of routine blood tests in a population of children referred for initial evaluation of suspected IBD (Benor 2010). Medical records of pediatric patients referred for evaluation of IBD for whom IBD7 testing was performed at Prometheus Laboratories between January 2006 and November 2008 were reviewed. Patients underwent diagnosis by pediatric gastroenterologists on the basis of clinical, radiologic, endoscopic, and pathologic evaluations. A total of 394 records were identified and 90 records were excluded on the basis of age of > 21 years, previous diagnosis of IBD, or unclear diagnosis. The prevalence of IBD in this cohort was 38%. The sensitivity, specificity, positive predictive value, negative predictive value, and kappa value for the serological panel were 67%, 76%, 63%, 79%, and 42%, respectively, compared with values for a combination of three (3) abnormal routine laboratory test results of 72%, 94%, 85%, 79%, and 47%. The antiflagellin antibody assay, the newest assay added to the panel, had sensitivity of 50% and specificity of 53%. Repeat serological testing failed to produce consistent results for four (4) of 10 patients. The authors

concluded this study showed, the IBD7 panel has lower predictive values than routine laboratory tests in pediatric screening for IBD.

The use of serological markers for patients with IBD has not been shown to improve health outcomes by reducing the need for other tests nor has it been proven to increase the accuracy of diagnosis for these patients. Large-scale prospective studies are required, to ascertain the predictive value and cost-effectiveness of the use of these serology markers in the screening and monitoring of IBD patients.

PROFESSIONAL GUIDELINE(S)

The American College of Gastroenterology (ACG) published clinical guidelines for the management of Crohn's disease in adults (Lichtenstein 2025). They do not support serologic testing and state the following:

- "Routine use of serologic markers of IBD to establish the diagnosis of Crohn's disease is not indicated."
- "Because of the heterogeneous nature of IBD there has been extensive research directed toward finding immunologic markers that would assist in disease diagnosis. These studies have focused on antibodies to microbial antigens and autoantibodies. Antiglycan antibodies are more prevalent in CD than in UC but have a low sensitivity, making their use in diagnosis less helpful. Tests have been developed that use a combination of serologic, genetic, and inflammatory markers to try to improve diagnostic efficacy; however, this combination of markers has not improved serology measurements usefulness as a screening tool."

ACG published clinical guidelines for the management of ulcerative colitis in adults (Rubin 2025). They do not support serologic testing and state the following:

- "We recommend against serologic antibody testing to establish or rule out a diagnosis of UC (strong recommendation, very low quality of evidence)"
- "We recommend against serologic antibody testing to determine the prognosis of UC (strong recommendation, very low quality of evidence)."
- "Serologic markers such as perinuclear anti-neutrophil cytoplasmic antibodies (pANCA) may be found in up to 70% of patients with UC, and combination of negative anti-Saccharomyces cerevisiae (ASCA) antibodies with elevated pANCA levels have been proposed to facilitate establishing a diagnosis of UC. However, the pooled sensitivity of antibody testing for diagnosis of UC is low, and such markers are not used for establishing or ruling out a diagnosis of UC. While pANCA positivity has also been associated with treatment refractory UC, the evidence supporting this is limited and there is currently no role for such testing to determine the likelihood of disease evolution and prognosis."

REGULATORY STATUS

Clinical laboratories may develop and validate tests in-house and market them as a laboratory service. Laboratory-developed tests must meet the general regulatory standards of the Clinical Laboratory Improvement Amendments (CLIA).

Laboratories that offer laboratory-developed tests must be licensed by CLIA for high-complexity testing. More information is available at: Clinical Laboratory Improvement Amendments (CLIA) | FDA [accessed 2025 Sep 23]

CODE(S)

- Codes may not be covered under all circumstances.
- Code list may not be all inclusive (AMA and CMS code updates may occur more frequently than policy updates).
- (E/I)=Experimental/Investigational
- (NMN)=Not medically necessary/appropriate

CPT Codes

Code	Description
There are no specific CPT codes.	Codes 81479, 82397, 83516 83520, 86140, 88346 or 88350 may be used for billing PROMETHEUS IBD sgi Diagnostic; however, these codes are not specific to PROMETHEUS IBD.

CENTERS FOR MEDICARE AND MEDICAID SERVICES (CMS)

Based on our review, Serological Diagnosis of Inflammatory Bowel Disease or Prometheus IBD is not addressed in National or Regional Medicare coverage determinations or policies.

PRODUCT DISCLAIMER

- Services are contract dependent; if a product does not cover a service, medical policy criteria do not apply.
- If a commercial product (including an Essential Plan or Child Health Plus product) covers a specific service, medical policy criteria apply to the benefit.
- If a Medicaid product covers a specific service, and there are no New York State Medicaid guidelines (eMedNY) criteria, medical policy criteria apply to the benefit.
- If a Medicare product covers a specific service, and there is no national or local Medicare coverage decision for the service, medical policy criteria apply to the benefit.

MEDICAL POLICY

Medical Policy Title	**Shoulder Joint Procedures for Managed Medicaid (MMC), Health and Recovery Plan (HARP), Child Health Plus (CHP), and Essential Plan (EP) Members**
Policy Number	**7.01.125**
Current Effective Date	**January 1, 2027**
Next Review Date	**September 2027**

Our medical policies are guides to evaluate technologies or services for medical necessity. Criteria are established through the assessment of evidence based, peer-reviewed scientific literature, and national professional guidelines. Federal and state law(s), regulatory mandates and the member's subscriber contract language are considered first in the determination of a covered service.

Shoulder Reconstruction and Corrective Procedures

POLICY STATEMENT(S)

Total Shoulder Arthroplasty

I. Shoulder arthroplasty is **not medically necessary** for **ANY** of the following contraindications:
   A. Material allergy incompatible with implantation;
   B. Clinical instability or inadequately managed comorbid conditions;
   C. Poor dentition requiring major dental intervention prior to arthroplasty;
   D. Diabetes with HbA1c greater than 8%;
   E. Nicotine or tobacco use, including cigars, cigarette, e-cigarette, nicotine pouch, smokeless tobacco, or vape pen, within 6 weeks of surgery;
   F. Intra-articular corticosteroid injection within 12 weeks of surgery;
   G. Untreated or unmanaged substance use disorder;
   H. Uncontrolled hypertension;
   I. Active local or systemic infection, including infection that is undergoing treatment or remains unresolved;

J. Neurologic conditions resulting in **one (1) or more** of the following:
   1. Charcot arthropathy;
   2. Complex regional pain syndrome (CRPS) or related CRPS variant; **or**
   3. Loss of deltoid or rotator cuff function;

K. Shoulder arthroscopy of the affected shoulder within the preceding 12 weeks.

Total Shoulder Arthroplasty (TSA) or Resurfacing

II. Total shoulder arthroplasty or resurfacing is **medically necessary** when **ALL** of the following are met:
   A. Shoulder pain and dysfunction result in limitations of activities of daily living (ADLs);
   B. Documentation supports **one (1)** of the following:
      1. Advanced glenohumeral joint disease confirmed by imaging studies (e.g., radiographs, CT, and/or MRI) demonstrating severe joint degeneration and joint space loss associated with **one (1)** of the following:
         a. Degenerative arthritis or post-traumatic arthritis, including findings such as asymmetric joint space loss, glenoid wear, glenoid flattening, subchondral sclerosis, or cuff tear arthropathy; **or**
         b. Inflammatory arthropathy, including rheumatoid arthritis, characterized by uniform joint space narrowing, erosive changes, synovitis, pannus formation, or cartilage loss;
      2. Prior osteotomy associated with persistent loss of shoulder function and range of motion;
      3. **All** the following conditions are present:
         a. Adequate bone stock to support fixation of the prosthesis;
         b. Intact deltoid function; **and**
         c. A reparable rotator cuff;
      4. Conservative management meets **either** of the following:
         a. Conservative management is not required when **any** of the following is documented:
            i. Acute proximal humerus fracture not amenable to internal fixation, including displaced three- or four-part fractures, head-splitting fractures, or complex fracture-dislocations;
            ii. Osteonecrosis (avascular necrosis) of the humeral head with collapse;
            iii. End-stage glenohumeral arthritis with bone-on-bone articulation identified on

radiographs; **or**

iv. Primary or metastatic malignancy involving the shoulder joint or adjacent soft tissues;

OR

b. For all other indications, conservative management must include **both** of the following:

i. Physical therapy (PT) meets **all** the following:

a) Supervised by a licensed PT, chiropractor, or through tele-rehab PT;

b) Participation for a minimum of 6 weeks during the previous 6 months;

c) Failure to improve symptoms or functional impairments; **and**

ii. Pain management includes **either** of the following:

a) Intra-articular, subacromial or bicipital groove corticosteroid injection; **or**

b) Medication management (e.g., non-steroidal anti-inflammatory drugs [NSAIDs] or oral analgesics);

Reverse Total Shoulder Arthroplasty (RTSA)

III. Reverse total shoulder arthroplasty is **medically necessary** when **ALL** the following are met:

A. Shoulder dysfunction results in limitations of activities of daily living (ADLs);

B. Documentation supports **one (1)** of the following:

1. Advanced glenohumeral joint degeneration demonstrated by imaging studies (e.g., radiographs, CT, and/or MRI) with severe joint space loss associated with:

a. Degenerative or post-traumatic arthritis; **or**

b. Inflammatory arthropathy, including rheumatoid arthritis;

2. Massive irreparable rotator cuff pathology, including substantial partial-thickness or full-thickness tearing associated with significant loss of shoulder function;

3. Persistent severe pain following prior rotator cuff repair failure;

4. Failure of a prior total shoulder arthroplasty in the setting of an irreparable rotator cuff deficiency;

5. Conservative management meets **either** of the following:

a. Conservative management is not required when **any** of the following is documented:

i. Acute proximal humerus fracture, including two-part, three-part, or four-part fracture patterns, with or without associated tuberosity involvement;

ii. Symptomatic malunion of a proximal humerus fracture associated with rotator cuff dysfunction;

iii. Primary or metastatic malignancy involving the glenohumeral joint or adjacent soft tissues;

iv. Bone-on-bone glenohumeral degeneration identified on radiographs, CT, or MRI; **or**

v. End-stage glenohumeral arthritis (Kellgren-Lawrence Grade IV); **or**

b. For all other indications, conservative management must include **both** of the following:

i. Physical therapy (PT) meets **all** the following:

a) Supervised by a licensed PT, chiropractor, or through tele-rehab PT;

b) Participation for a minimum of 6 weeks during the previous 6 months;

c) Failure to improve symptoms or functional impairments; **and**

ii. Pain management includes **either** of the following:

a) Intra-articular, subacromial or bicipital groove corticosteroid injection; **or**

b) Medication management (e.g., NSAIDS or analgesics);

C. Glenoid bone loss, bone deficiency, or structural compromise that limits the ability to support a conventional glenoid component;

D. Preserved deltoid muscle function;

E. Painful loss of shoulder motion resulting in pseudoparalysis, demonstrated by inability to actively elevate the arm to 90 degrees without assistance;

F. Imaging demonstrates advanced structural shoulder disease, including **one (1) or more** of the following:

1. Bone-on-bone glenohumeral articulation;
2. Complete or near-complete joint space loss; **or**
3. Significant osseous deformity involving the glenohumeral joint.

IV. Revision of a prior shoulder arthroplasty is **medically necessary** when **ALL** the following are met:

A. Functional impairment of the affected shoulder that interferes with ADLs and/or IADLs;

B. No active or inadequately treated joint infection; **and**

C. **One (1) or more** of the following prosthesis-related complications:

1. Recurrent instability, dislocation, or subluxation;

2. Periprosthetic infection requiring revision;
3. Periprosthetic fracture;
4. Aseptic component loosening;
5. Osteolysis;
6. Implant failure, component dysfunction, instability, or device recall; **or**
7. Symptomatic synovitis or adverse local tissue reaction, including metallosis;

Hemiarthroplasty

V. Shoulder hemiarthroplasty is **medically necessary** when **ALL** the following are met:
   A. Shoulder dysfunction results in limitations of activities of daily living (ADLs);
   B. Documentation supports **one (1)** of the following:
      1. Advanced glenohumeral joint disease demonstrated by imaging studies (e.g., radiographs, CT, and/or MRI) with severe joint space loss associated with:
         a. Degenerative arthritis;
         b. Post-traumatic arthritis;
         c. Inflammatory arthropathy, including rheumatoid arthritis
         d. Massive irreparable partial-thickness rotator cuff pathology;
         e. Full-thickness rotator cuff tear associated with significant functional deficit, including weakness and/or impingement symptoms; **or**
         f. Structural joint destruction demonstrated by bone-on-bone articulation or osseous deformity;
      2. When **all** the following criteria are met:
         a. Humeral bone quality or bone stock is inadequate to support stable internal fixation;
         b. Preserved deltoid;
         c. Rotator cuff function sufficient to support the planned procedure; **and**
      3. Conservative management meets **either** of the following:
         a. Conservative management is not required when **any** of the following is documented:
            i. Osteonecrosis (avascular necrosis) of the humeral head with collapse;
            ii. Acute proximal humerus fracture that is not amenable to internal fixation, including displaced three-part or four-part fractures, head-splitting fractures, or complex fracture-dislocations; **or**
            iii. Primary or metastatic malignancy involving the glenohumeral joint or adjacent

soft tissues; **or**

b. For all other indications, conservative management must include **both** of the following:

i. Physical therapy (PT) meets **all** the following:

a) Supervised by a licensed PT, chiropractor, or through tele-rehab PT;

b) Participation for a minimum of 6 weeks during the previous 6 months;

c) Failure to improve symptoms or functional impairments; **and**

ii. Pain management includes **either** of the following:

a) Intra-articular, subacromial or bicipital groove corticosteroid injection; **or**

b) Medication management (e.g., NSAIDS or analgesics).

Shoulder Arthroscopy

Diagnostic Shoulder Arthroscopy

VI. Diagnostic shoulder arthroscopy is **medically necessary** when **ALL** the following criteria are met:

A. Alternative conditions that could reasonably account for the individual's symptoms have been excluded, including:

1. Glenohumeral arthritis;
2. Brachial plexus pathology;
3. Fracture;
4. Referred cervical pain; **or**
5. Thoracic outlet syndrome;

B. Persistent functional impairment as evidenced by **both** the following:

1. Shoulder pain and functional limitations have been present for at least 6 months; **and**
2. Symptoms interfere with activities of daily living (ADLs) or instrumental activities of daily living (IADLs);

C. Clinical examination demonstrates abnormalities when compared with the unaffected shoulder, including **one (1) or more** of the following:

1. Findings consistent with impingement syndrome;
2. Restricted active or passive range of motion; **or**
3. Measurable loss of strength;

D. Conservative management must include **both** of the following:

1. Physical therapy (PT) meets **all** the following:
    a. Supervised by a licensed PT, chiropractor, or through tele-rehab PT;
    b. Participation for a minimum of 3 months during the previous 6 months;
    c. Failure to improve symptoms or functional impairments; **and**
2. Pain management includes **either** of the following:
    a. Intra-articular, subacromial or bicipital groove corticosteroid injection; **or**
    b. Medication management (e.g., NSAIDS or analgesics);

E. Both radiographs and MRI have been performed and have not established a definitive diagnosis or explanation for the individual's symptoms.

VII. Rotator cuff repair is **not medically necessary** when **ANY** of the following contraindications are present:

A. Advanced glenohumeral degenerative joint disease, including severe joint-space loss, bone-on-bone articulation, large osteophytes, subchondral sclerosis, or subchondral cyst formation (Kellgren-Lawrence grade II or greater);
B. Full-thickness rotator cuff tear without associated symptoms;
C. Medical or behavioral health conditions that are not adequately controlled or optimized for surgery;
D. Corticosteroid injection into the operative shoulder within the preceding twelve (12) weeks;
E. Deltoid paralysis or rotator cuff paralysis;
F. Poorly controlled diabetes mellitus (HbA1c greater than 8%);
G. Uncontrolled hypertension;
H. Active local or systemic infection; **or**
I. Nicotine or tobacco use within 6 weeks of the planned procedure, including cigarettes, cigars, smokeless tobacco, nicotine pouches, electronic cigarettes, or vaping devices.

VIII. Arthroscopic rotator cuff repair is **medically necessary** when **ALL** the following are met:

A. Shoulder symptoms result in functional impairment affecting activities of daily living (ADLs) and/or instrumental activities of daily living (IADLs);
B. Imaging confirms a rotator cuff tear, including partial-thickness tear; or full-thickness tear;
C. Clinical findings are consistent with rotator cuff pathology, including **both** the following:
    1. Reproducible pain patterns characteristic of rotator cuff disease; **and**
    2. Examination findings demonstrating rotator cuff dysfunction;
D. Symptoms are consistent with shoulder impingement, including pain reproduced with

overhead activity and improvement with lowering of the arm;

E. Conservative management meets **either** of the following:
   1. Conservative management is <u>not</u> required when **either** of the following is documented:
      a. Progressive enlargement of a full-thickness rotator cuff tear by 50% or more on serial imaging obtained at least 3 months apart; **or**
      b. Symptomatic traumatic rotator cuff tear with imaging demonstrating absence of glenohumeral arthritis; **or**
   2. For all other indications, conservative management must include **both** of the following:
      a. Physical therapy (PT) meets **all** the following:
         i. Supervised by a licensed PT, chiropractor, or through tele-rehab PT;
         ii. Participation for a minimum of 6 weeks during the previous 6 months;
         iii. Failure to improve symptoms or functional impairments; **and**
      b. Pain management includes **either** of the following:
         i. Intra-articular, subacromial or bicipital groove corticosteroid injection; **or**
         ii. Medication management (e.g., NSAIDS or oral analgesics).

<u>Revision Rotator Cuff Repair</u>

IX. Revision rotator cuff repair is **medically necessary** when **ALL** the following are met:
   A. For revision procedures performed more than 1 year after the index repair, the request must satisfy the current rotator cuff repair medical necessity criteria;
   B. MRI or CT arthrography demonstrates **one (1)** of the following:
      1. Failure of tendon healing following prior repair (e.g., Sugaya Type IV or Type V); **or**
      2. Recurrent rotator cuff tear occurring more than 3 months after the original surgical procedure.

<u>Anterior-Inferior Labral Tear Repair (Bankart Repair)</u>

X. Anterior-inferior labral tear repair is **medically necessary** when **ALL** the following are met:
   A. No evidence of moderate-to-severe glenohumeral arthritis (Kellgren-Lawrence grade II or greater);
   B. No nicotine or tobacco use, including cigar, cigarette, e-cigarette, nicotine pouch, smokeless tobacco or vape pen use within 6 weeks of surgery;
   C. Comorbid conditions are appropriately managed and there is no active infection;
   D. For individuals with diabetes mellitus, HbA1c is 8% or less;
   E. Presence of **one (1) or more** of the following:

1. Combined labral pathology;
2. Recurrent glenohumeral instability, including **two (2) or more** subluxation or dislocation episodes; **or**
3. Acute shoulder pain associated with activity or exertion;

F. MRI or CT arthrogram confirms an anterior-inferior labral tear or bony Bankart lesion;

G. Conservative management must include **both** of the following:

1. Physical therapy (PT) meets **all** the following:
   a. Supervised by a licensed PT, chiropractor, or through tele-rehab PT;
   b. Participation for a minimum of 6 weeks during the previous 6 months; **and**
   c. Failure to improve symptoms or functional impairments; **and**
2. Pain management includes **either** of the following:
   a. Intra-articular, subacromial or bicipital groove corticosteroid injection; **or**
   b. Medication management (e.g., NSAIDS or analgesics);

H. Physical examination reveals **all** the following:

1. Absence of significant shoulder stiffness;
2. Clinical evidence of instability;
3. Restricted or abnormal range of motion; **and**
   a. At least **one(1)** of the following:
      i. Positive apprehension test;
      ii. Positive relocation test;
      iii. Positive labral grind test; **or**
      iv. Objective painful laxity on examination.

<u>Shoulder Capsulorrhaphy</u>

XI. Shoulder capsulorrhaphy is **medically necessary** when **ALL** the following are met:

A. No evidence of moderate-to-severe glenohumeral arthritis (Kellgren-Lawrence grade II or greater);

B. No nicotine or tobacco, including cigar, cigarette, e-cigarette, nicotine pouch, smokeless tobacco or vape pen use within 6 weeks of surgery;

C. Comorbid conditions are appropriately managed and there is no active local or systemic infection;

D. For individuals with diabetes mellitus, HbA1c is 8% or less;

E. Chronic shoulder stiffness resulting from **one (1)** of the following:
   1. Adhesive capsulitis; **or**
   2. Arthrofibrosis related to disease, injury, or prior surgery;
   3. Conservative management must include **both** of the following:
      a. Physical therapy (PT) meets **all** the following:
         i. Supervised by a licensed PT, chiropractor, or through tele-rehab PT;
         ii. Participation for a minimum of 3 months during the previous 6 months;
         iii. Failure to improve symptoms or functional impairments; **and**
      b. Pain management includes **either** of the following:
         i. Intra-articular, subacromial or bicipital groove corticosteroid injection; **or**
         ii. Medication management (e.g., NSAIDS or analgesics);

F. Physical examination demonstrates excessive glenohumeral joint translation, including **all** the following:
   1. Sulcus sign greater than 1 cm;
   2. Hyperabduction (Gagey) testing demonstrating greater than 105 degrees of abduction; **and**
   3. Beighton hypermobility score greater than 4;

G. Shoulder dysfunction has been present for at least 3 months;

H. Symptoms interfere with ADLs;

I. Documentation supports **one (1)** of the following:
   1. History of shoulder trauma; **or**
   2. Postoperative shoulder contracture.

<u>Shoulder Loose Body or Foreign Body Removal</u>

XII. Removal of an intra-articular loose body or foreign body from the shoulder is **medically necessary** when **ALL** the following are met:

A. No evidence of moderate-to-severe glenohumeral arthritis (Kellgren-Lawrence grade II or greater);

B. No nicotine or tobacco, including cigar, cigarette, e-cigarette, nicotine pouch, smokeless tobacco or vape pen use within 6 weeks of surgery;

C. Comorbid conditions are appropriately managed and there is no active infection;

D. For individuals with diabetes mellitus, HbA1c is 8% or less;

E. Documentation does not support another condition that adequately explains the individual's symptoms, including **any** of the following:
   1. Glenohumeral arthritis;
   2. Brachial plexus pathology;
   3. Fracture;
   4. Referred cervical pain; **or**
   5. Thoracic outlet syndrome;

F. CT or MRI demonstrates an intra-articular loose body or foreign body;

G. Documentation demonstrates **both** of the following:
   1. Shoulder pain or mechanical symptoms, including clicking, catching, or popping; and
   2. Functional limitation affecting ADLs;

H. A minimum of 3 months of conservative management failed, or was not tolerated, or the loose or foreign body results in **any** of the following:
   1. Acute mechanical restriction of shoulder motion;
   2. Locking; **or**
   3. Other severe mechanical symptoms requiring surgical intervention.

<u>Shoulder Lysis of Adhesions, Capsulotomy, and Capsular Release</u>

XIII. Shoulder lysis of adhesions, capsulotomy, or capsular release is **medically necessary** when **ALL** the following are met:

A. No evidence of moderate-to-severe glenohumeral arthritis (Kellgren-Lawrence grade II or greater);

B. Imaging studies do not demonstrate fracture or other significant soft tissue injury as the primary cause of the individual's symptoms;

C. No nicotine or tobacco use, including cigar, cigarette, e-cigarette, nicotine pouch, smokeless tobacco or vape pen use within 6 weeks of surgery;

D. Medical comorbidities are appropriately managed and there is no active infection;

E. For individuals with diabetes mellitus, HbA1c is 8% or less;

F. A minimum of 3 months of conservative management during the previous 6 months failed, or was not tolerated, and includes non-pharmacologic management with **either**:
   a. Chiropractic care; **or**
   b. Supervised physical therapy (PT);

G. Shoulder pain and loss of function interfere with ADLs;

H. Physical examination demonstrates loss of shoulder motion of at least 50% in **two (2)** planes when compared with the contralateral shoulder.

Shoulder Manipulation Under Anesthesia (MUA)

Requests for manipulation under anesthesia of the shoulder will be reviewed on an individual case basis using the clinical information submitted for review.

Shoulder Osteotomy

XIV. Shoulder osteotomy is **medically necessary** when documentation supports **one (1)** of the following indications:

A. Achondroplasia;

B. Degenerative or inflammatory shoulder arthritis;

C. Symptomatic osseous impingement or bone spur formation;

D. Hill-Sachs deformity;

E. Limb-length discrepancy resulting from trauma, infection, hypoplasia, or skeletal dysplasia;

F. Malunited fracture resulting in functional impairment;

G. Symptomatic shoulder instability; **or**

H. Residual shoulder deformity or dysfunction associated with obstetric brachial plexus palsy.

Partial Claviculectomy, Acromioplasty, or Distal Clavicle Excision (DCE)

XV. Partial claviculectomy, acromioplasty, and/or distal clavicle excision is **medically necessary** when **ALL** the following are met:

A. Conservative management must include **BOTH** of the following:

1. Physical therapy (PT) meets **all** the following:
    a. Supervised by a licensed PT, chiropractor, or through tele-rehab PT;
    b. Participation for a minimum of 6 weeks during the previous 6 months;
    c. Failure to improve symptoms or functional impairments; **and**
2. Pain management includes **either** of the following:
    a. Intra-articular, subacromial or bicipital groove corticosteroid injection; **or**
    b. Medication management (e.g., NSAIDS or analgesics);

B. Localized acromioclavicular joint tenderness;

C. Positive cross-body adduction testing;

D. Shoulder pain and dysfunction have been present for at least 3 months;

E. Symptoms interfere with ADLs;

F. Radiographs or MRI demonstrate pathology involving the acromioclavicular joint, including **one (1) or more** of the following:
   1. Joint-space narrowing;
   2. Moderate-to-severe acromioclavicular degenerative disease;
   3. Distal clavicular edema; **or**
   4. Distal clavicular osteolysis.

Posterior Labral Repair

XVI. Posterior labral repair is **medically necessary** when **ALL** the following are met:

A. Imaging does not demonstrate **any** of the following advanced degenerative diseases:
   1. Posterior glenoid cartilage loss;
   2. Subchondral cyst formation;
   3. Significant joint-space narrowing; **or**
   4. Posterior humeral head subluxation associated with arthropathy;

B. No nicotine or tobacco use, including cigar, cigarette, e-cigarette, nicotine pouch, smokeless tobacco or vape pen use within 6 weeks of surgery;

C. Medical comorbidities are appropriately managed and there is no active infection;

D. For individuals with diabetes mellitus, HbA1c is 8% or less;

E. Conservative management must include **both** of the following:
   1. Physical therapy (PT) meets **all** the following:
      a. Supervised by a licensed PT, chiropractor, or through tele-rehab PT;
      b. Participation for a minimum of 6 weeks during the previous 6 months;
      c. Failure to improve symptoms or functional impairments; **and**
   2. Pain management includes **either** of the following:
      a. Intra-articular, subacromial or bicipital groove corticosteroid injection; or
      b. Medication management (e.g., NSAIDS or analgesics);

F. MRI confirms a posterior labral tear;

G. Physical examination demonstrates **any** of the following findings:
   1. Positive load-and-shift test;
   2. Positive drawer test;
   3. Positive jerk test; **or**

4. Positive Kim test;

H. Documentation demonstrates **one (1) or more** of the following:
   1. Instability;
   2. Painful mechanical symptoms, including catching or popping; or
   3. Shoulder pain is attributable to the labral pathology.

Superior Labral Anterior-Posterior (SLAP) Repair

Debridement, biceps tenotomy, and biceps tenodesis are distinct procedures and are not considered SLAP repair.

XVII. Superior labral anterior-posterior (SLAP) repair is **medically necessary** when **ALL** the following are met:
   A. No evidence of moderate-to-severe glenohumeral arthritis (Kellgren-Lawrence grade II or greater);
   B. No nicotine or tobacco use, including cigar, cigarette, e-cigarette, nicotine pouch, smokeless tobacco or vape pen use within 6 weeks of surgery;
   C. Medical comorbidities are appropriately managed and there is no active infection;
   D. For individuals with diabetes mellitus, HbA1c is 8% or less;
   E. Documentation supports a shoulder injury associated with development of a SLAP tear, including:
      1. Overhead athletic activity;
      2. Fall;
      3. Traction injury;
      4. Lifting injury; **or**
      5. Motor vehicle accident;
   F. Conservative management must include **both** of the following:
      1. Physical therapy (PT) meets **all** the following:
         a. Supervised by a licensed PT, chiropractor, or through tele-rehab PT;
         b. Participation for a minimum of 6 weeks during the previous 6 months;
         c. Failure to improve symptoms or functional impairments; **and**
      2. Pain management includes **either** of the following:
         a. Intra-articular, subacromial or bicipital groove corticosteroid injection; **or**
         b. Medication management (e.g., NSAIDS or analgesics);

G. MRI confirms a superior labral tear;

H. The lesion is classified as a Type II or Type IV SLAP tear;

I. At least **one (1)** of the following provocative tests is positive:

1. Anterior slide test;
2. Biceps load test I or II;
3. Forced shoulder abduction and elbow flexion test;
4. Jobe relocation test;
5. O'Brien (active compression) test;
6. Pain provocation test; **or**
7. Resisted supination external rotation test;

J. Shoulder symptoms have persisted for at least three 3 months; and

K. Pain and loss of function interfere with ADLs.

Shoulder Synovectomy

XVIII. Partial or complete shoulder synovectomy is **medically necessary** when **ALL** the following are met:

A. No evidence of moderate-to-severe glenohumeral arthritis (Kellgren-Lawrence grade II or greater);

B. No nicotine or tobacco use, including cigar, cigarette, e-cigarette, nicotine pouch, smokeless tobacco or vape pen use within 6 weeks of surgery;

C. Medical comorbidities are appropriately managed and there is no active infection;

D. For individuals with diabetes mellitus, HbA1c is 8% or less;

E. No uncontrolled hypertension;

F. Documentation demonstrates **one (1)** of the following:

1. Hemochromatosis;
2. Hemophilia;
3. Inflammatory arthropathy, including rheumatoid arthritis, gout, pseudogout, or psoriatic arthritis;
4. Lyme-related or nonspecific synovitis;
5. Pigmented villonodular synovitis (PVNS);
6. Recurrent hemarthrosis; **or**
7. Synovial chondromatosis;

G. Conservative management must include **both** of the following:
   1. Physical therapy (PT) meets **all** the following:
      a. Supervised by a licensed PT, chiropractor, or through tele-rehab PT;
      b. Participation for a minimum of 6 weeks during the previous 6 months;
      c. Failure to improve symptoms or functional impairments; **and**
   2. Pain management includes **either** of the following:
      a. Intra-articular, subacromial or bicipital groove corticosteroid injection; **or**
      b. Medication management (e.g., NSAIDS or analgesics);

H. MRI or CT findings consistent with primary synovial disease or joint effusion, or prior arthroscopic findings demonstrating secondary hypertrophic synovitis;

I. Shoulder symptoms result in impairment of ADLs.

Long Head of Biceps (LHB) Tenotomy or Tenodesis

Tenodesis may be more appropriate in highly active individuals with greater functional demands, while tenotomy may be preferred when tendon healing capacity is a concern.

XIX. Long head biceps tenotomy or tenodesis is **medically necessary** when **ALL** the following are met:

A. No evidence of moderate-to-severe glenohumeral arthritis (Kellgren-Lawrence grade II or greater);

B. No nicotine or tobacco use, including cigar, cigarette, e-cigarette, nicotine pouch, smokeless tobacco or vape pen use within 6 weeks of surgery;

C. Medical comorbidities are appropriately managed and there is no active infection;

D. For individuals with diabetes mellitus, HbA1c is 8% or less;

E. No uncontrolled hypertension;

F. Documentation demonstrates **one (1) or more** of the following:
   1. Long head biceps hypertrophy, subluxation, or tear confirmed by MRI or CT;
   2. Superior labral anterior-posterior (SLAP) tear demonstrated on MRI;
   3. Full-thickness rotator cuff tear that independently meets medical necessity criteria for repair;
   4. Failure of a prior SLAP repair; **or**
   5. Chronic biceps tenosynovitis associated with localized pain in the bicipital groove;

G. Conservative management must include **both** of the following:
   1. Physical therapy (PT) meets **all** the following:

a. Supervised by a licensed PT, chiropractor, or through tele-rehab PT;
b. Participation for a minimum of 6 weeks during the previous 6 months;
c. Failure to improve symptoms or functional impairments; **and**

2. Pain management includes **either** of the following:
a. Intra-articular, subacromial or bicipital groove corticosteroid injection; **or**
b. Medication management (e.g., NSAIDS or analgesics);

H. Physical examination demonstrates at least **two (2)** of the following:
1. Anterior shoulder pain;
2. Positive Yergason test;
3. Positive Speed test;
4. Bicipital groove tenderness; **or**
5. Weakness attributable to long head biceps pathology;

I. Shoulder pain and dysfunction have been present for at least 3 months; **and**

J. Symptoms interfere with ADLs.

<u>Subacromial Decompression (SAD)</u>

XX. Subacromial decompression is **medically necessary** when **ALL** the following are met:

A. Radiographs obtained within the previous 12 months do not demonstrate moderate-to-severe glenohumeral degenerative joint disease, including advanced joint-space loss, large osteophyte formation, or bone-on-bone articulation;

B. No nicotine or tobacco use, including cigar, cigarette, e-cigarette, nicotine pouch, smokeless tobacco or vape pen use within 6 weeks of surgery;

C. Medical comorbidities are appropriately managed and there is no active infection;

D. For individuals with diabetes mellitus, HbA1c is 8% or less;

E. No uncontrolled hypertension;

F. Subacromial decompression is being performed in conjunction with at least **one (1)** of the following medically necessary procedures:
1. Capsulorrhaphy;
2. Debridement;
3. Distal clavicle excision;
4. Labral repair;
5. Removal of an intra-articular loose body or foreign body;

6. Lysis of adhesions or capsular release;
7. Rotator cuff repair;
8. Synovectomy; **or**
9. Long head biceps tenotomy or tenodesis.

DESCRIPTION

Total shoulder arthroplasty (replacement) is a surgical technique that involves replacing the humeral head and the glenoid. A total shoulder arthroplasty is typically the best option if the glenoid is damaged, but sufficient bone and rotator cuff remain to ensure that the glenoid component will last. The primary goal of shoulder replacement surgery is pain relief, with the secondary benefits of restoring motion, strength, and function, and helping individuals return to an activity level as near to normal as possible.

Partial shoulder replacement, also known as hemiarthroplasty, is a surgical technique that involves replacing the humeral head and not replacing the glenoid (socket), which is typically the best option if the glenoid does not have any arthritis or if there is some concern that the glenoid component might fail if it is replaced. Hemiarthroplasty is a highly technical procedure. There are two types of hemiarthroplasties: stemmed hemiarthroplasty and resurfacing hemiarthroplasty. The surgeon determines the type of procedure to perform, based on the nature of the injury and the condition of the shoulder.

Reverse shoulder arthroplasty (replacement) involves replacing both the humeral head and the glenoid, but the ball and socket are reversed to improve muscle function. This allows the deltoid muscle, which has a longer movement arm, to generate greater force, allowing it to act in place of an inadequately functioning or torn rotator cuff.

Revision of shoulder arthroplasty (replacement) is a surgical technique that involves surgical reconstruction or replacement due to failure or complication of previous shoulder arthroplasty.

Shoulder pseudoparesis is a shoulder dysfunction, particularly in the setting of a massive unrepairable or irreparable rotator cuff tear, in which there is the presence of less than 90 degrees of active elevation.

Shoulder pseudoparalysis is a shoulder dysfunction, particularly in the setting of a massive unrepairable or irreparable rotator cuff tear, with all of the following: the presence of true anterosuperior escape; no true active shoulder elevation; and the individual is only able to demonstrate a shrug.

Shoulder resurfacing is a surgical technique that involves replacing the diseased part of the shoulder joint without replacing the humeral head. Resurfacing of the humeral head involves a prosthetic metal covering or cap to provide complete or partial coverage. It can be performed alone (hemi-re surfacing) or in combination with glenoid resurfacing (total or partial shoulder resurfacing.

The Walch classification of glenoid morphology is used to stratify the outcomes of shoulder arthroplasty for varying pathologic glenoid types. It also is used in preoperative planning to recognize morphologies that may pose intraoperative problems.

Type A: Centered humeral head, concentric wear, no subluxation of the humeral head

- A1: minor central erosion
- A2: major central erosion, humeral head protruding into the glenoid cavity

Type B: Humeral head subluxated posteriorly, biconcave glenoid with asymmetric wear

- B1: narrowing of the posterior joint space, subchondral sclerosis, osteophytes
- B2: biconcave aspect of the glenoid with posterior rim erosion and retroverted glenoid
- B3: monoconcave and posterior wear with >15° retroversion or >70% posterior humeral head subluxation, or both

Type C:

- C1: dysplastic glenoid with >25° retroversion regardless of the erosion
- C2: biconcave, posterior bone loss, posterior translation of the humeral head

Type D: Glenoid anteversion or anterior humeral head subluxation <40°

SUPPORTIVE LITERATURE

In a systematic review and meta-analysis, Carter and colleagues (2012) characterized the change in generic and shoulder-specific health-related quality-of-life (QOL) measures resulting from TSA. These investigators identified published studies reporting pre-operative and post-operative health related QOL outcomes for patients receiving TSA. Health-related QOL measures were identified, and meta-analysis was used to calculate standardized mean differences (SMD)s1 reflective of the effect size, and 95% confidence interval (CI) for each scale. A total of 20 studies (1,576 TSAs) met the inclusion criteria. Outcome measures were analyzed after an average post-operative follow-up duration of 3.7 +/- 2.2 years. The Short Form-36 demonstrated significant improvement in physical component summary scores (SMD = 0.7, $p < 0.001$), but not in mental component summary scores (SMD = 0.2, $p = 0.37$). Significant improvements were observed in the visual analog scale score for pain (SMD = -2.5, $p < 0.001$) and scores on three shoulder-specific measures: the Constant score (SMD = 2.7, $p < 0.001$), the American Shoulder and Elbow Surgeons score (SMD = 2.9, $p < 0.001$), and the Simple Shoulder Test (SMD = 2.3, $p < 0.001$). The authors concluded that TSA leads to significant improvement in scores for function and pain. Shoulder-specific measures of function consistently showed the greatest degree of improvement, with large effect sizes. They noted that TSA also leads to significant improvements in overall physical well-being, with a moderate-to-large effect size.

In a multi-centered retrospective study, Favard and colleagues (2012) evaluated the rate of complications and the functional improvement with different types of shoulder arthroplasties after a minimum follow-up of eight years. A total of 198 shoulders, including 85 with primary osteoarthritis (OA) of the shoulder, 76 with rotator cuff tears, 19 with avascular necrosis, and 18 with rheumatoid arthritis (RA), were included in this study. Arthroplasties included 104 anatomic TSAs, 77 reverse arthroplasties, and 17 hemiarthroplasties. Ten patients had their arthroplasty revised, and 134 patients with TSA were able to be present at the final follow-up or provide information on their case. Function was evaluated by the Constant-Murley score, and loosening was evaluated by standard radiographs. In the group with primary OA of the shoulder, there were eight complications (11 %), including six (8.3 %) requiring implant revision. In the group of rotator cuff arthropathies, there were nine (14.7 %) with complications, including four (6.5 %) requiring implant revision. In the group with RA, there was one complication, but no surgical revision was necessary. There were no complications in the group with avascular necrosis. Glenoid migration occurred in 28.5 % of anatomic TSAs, and 3.4 % of reverse arthroplasties. This difference was significant ($p < 0.001$). The Constant-Murley score was significantly improved in all etiologies. The authors concluded that glenohumeral arthropathies can be successfully treated by arthroplasty. Anatomic TSA was shown to be associated with a high risk of glenoid loosening at radiographic follow-up, which made them hesitate to use the cemented polyethylene implant, especially in young patients.

In a Cochrane review, Singh et al (2011) determined the benefits and potential harm associated with surgery for shoulder OA. These investigators performed a systematic review of clinical trials of adults with shoulder OA, comparing surgical techniques (TSA, hemiarthroplasty, implant type and fixation) to placebo, sham surgery, non-surgical modalities, and no treatment. They also reviewed trials that compared various surgical techniques, identifying patient-reported outcomes (pain, function, quality of life, etc.) or revision rates. They calculated the risk ratio for categorical outcomes and mean differences for continuous outcomes with 95% CI. There were no controlled trials of surgery versus placebo or non-surgical interventions. A total of seven studies with 238 patients were included. Two studies compared TSA to hemiarthroplasty (n = 88). Researchers noted significantly worse scores on the 0 to 100 American Shoulder and Elbow Surgeons scale (mean difference, -10.05 at 24 to 34 months; 95 % CI: -18.97 to -1.13; $p = 0.03$) and a non-significant trend toward higher revision rate in hemiarthroplasty compared to TSA (relative risk 6.18; 95 % CI: 0.77 to 49.52; $p = 0.09$). With one study providing data (n = 41), no differences were noted between groups for pain scores (mean difference 7.8; 95 % CI: -5.33 to 20.93), quality of life on Medical Outcomes Study Short-Form 36 physical component summary (mean difference 0.80; 95 % CI: -6.63 to -8.23), or adverse events (relative risk 1.2; 95 % CI: 0.4 to 3.8). The authors concluded that TSA was associated with better shoulder function, with no other demonstrable clinical benefits compared to hemiarthroplasty. They stated that more studies are needed, to compare clinical outcomes between them and comparing shoulder surgery to sham, placebo, and other non-surgical treatment options.

Vancolen et al (2020) conducted a systematic review to evaluate the outcome of six studies totaling 245 participants aged less than 65 years who underwent reverse total shoulder arthroplasty (RTSA), with the most common indications being failed rotator cuff repair and rotator cuff tear arthropathy. The overall concern regarding RTSA is implant longevity and risk of failure necessitating need for

revision surgery which may be a dissatisfier in younger individuals due to their higher postoperative expectations of function and pain relief. A significant level of postoperative functional improvement outcome was reported at a mean follow-up of 49 months (range, 19-140 months) (P < .05) as measured by the American Shoulder and Elbow Surgeons (ASES) and Subjective Shoulder Value (SSV), as well as pain scores as measured by Visual Analogue Scale (VAS) postoperatively. The pooled complication rate was considered high at 18% (n=44/245) with the most common complication reported as postoperative dislocation followed by glenoid loosening. The reoperation (revision) rate was 6% (n=15, range, 2-5) at a mean follow-up of 34 months (range, 19-140 months). The authors concluded that this small group study identified favorable short- to midterm functional outcomes of RTSA in the younger individual (<65 years) for indications including rotator cuff arthropathy and osteoarthritis. Due to the complication and revision rates identified in this systematic review, the authors stated that additional long-term studies are needed to report definitive clinical results regarding prosthesis longevity, complications, and need for revision surgery in this patient population.

Mowers and colleagues (2025) performed a systematic review and meta-analysis which included six (6) studies totaling 4525 individuals (males, n=2288 and females, n=2237) to compare patient-reported outcomes, range of motion, and rates of revision surgery between male and female individuals who had undergone a primary anatomic total shoulder arthroplasty (aTSA). The systematic review identified that males experienced significantly greater improvement in postoperative ASES shoulder pain and functional scores (mean difference 2.18, P<.001) and VAS pain scores (mean difference 0.40, P<.001) compared to females. The study also found that female individuals compared to male individuals had a significantly higher risk of revision surgery (10.1% versus 7.3%, risk ratio 1.43, P<.001) and revision surgeries (6.2% versus 3.7%, risk ratio 1.87, P= .03). It has been well established that female individuals are associated with a higher risk of periprosthetic fracture due to a higher prevalence of osteoporosis in females. The authors concluded that there is a need for further investigation to determine the clinical significance of the identified aTSA comparative outcomes and to identify modifiable biological and social risk factors to improve results in female patients.

Bi and colleagues (2024) conducted a systematic review and meta-analysis which included 23 studies totaling 1178 individuals to analyze comparative studies of surgical treatment options for massive irreparable rotator cuff tears (MIRCTs) in individuals less than 70 years of age for several patient-reported outcomes, range of motion (ROM), and acromiohumeral distance (AHD). The mean age of study participants was 62.8 years of age, male (n=48.2%) to female (n=51.8%) participant numbers with a mean follow-up timeframe of 28.9 months. For the Constant-Murley score, debridement (MD, 21.03; 95% CI, 8.98 to 33.08; P<.001) and arthroscopic bridging graft (aBG) (mean difference [MD], 6.97; 95% CI, 1.88 to 12.05; P= .007) resulted in the highest P-scores. For the ASES score, InSpace balloon arthroplasty (MD, 12.34; 95% CI, 2.18 to 22.50; P= .017), aBG (MD, 7.07; 95% CI, 0.28 to 13.85; P = .041), and long head of biceps augmented superior capsular reconstruction (BSCR) (MD, 5.16; 95% CI, 1.10 to 9.22; P = .013) resulted in the highest P-scores. For AHD, BSCR resulted in the highest P-score (MD, 1.46; 95% CI, 0.45 to 2.48; P= .005). For forward flexion range of motion (ROM), debridement (MD, 45.77; 95% CI, 25.41 to 66.13; P<.001) resulted in the highest P-score,

while reverse shoulder arthroplasty (RSA) resulted in the lowest P-score (MD, -16.70; 95% CI, -31.20 to -2.20; P = .024). The authors concluded that graft interposition repair techniques, superior capsular reconstruction using the long head of the bicep tendon, arthroscopic debridement, and balloon arthroplasty provided superiority in various study outcomes for individuals less than 70 years of age with MIRCTs without significant arthritis or pseudoparalysis and RSA provides the least benefit in forward flexion.

There is a lack of long-term, randomized controlled studies for shoulder resurfacing using metal, polyethylene and biological materials for the treatment of glenohumeral arthritis, humeral head fractures, and osteochondral lesions. Biological glenoid resurfacing with or without prosthetic humeral head replacement has been suggested as a means to avoid the potential complications of polyethylene use in younger patients with glenohumeral arthritis. A variety of biologic surfaces, including anterior capsule, autogenous fascia lata, and Achilles tendon allograft have been used; however, there is minimal evidence in the peer-reviewed literature that these biological grafts can provide a durable bearing surface over time and there is documentation of post-operative infections. Further studies to assess the long-term outcomes and to evaluate alternative surface bearing materials (especially on the glenoid side) are required.

PROFESSIONAL GUIDELINE(S)

According to the 2020 Management of Glenohumeral Joint Osteoarthritis Evidence-based Clinical Practice Guidelines of the American Academy of Orthopaedic Surgeons (AAOS), there is strong evidence that anatomic TSA produces more favorable function and pain relief in the short-to mid-term follow-up, when comparted to hemiarthroplasty, for the treatment of glenohumeral osteoarthritis. These guidelines also recommend, in the absence of reliable evidence, that clinicians use either anatomic TSA or reverse TSA for the treatment of glenohumeral joint osteoarthritis in selected patients with excessive glenoid bone loss and/or rotator cuff dysfunction.

Within the 2020 guidelines, AAOS also advised of limited evidence to support that clinicians may utilize stemmed, stemless or resurfacing prosthesis for patients with glenohumeral joint osteoarthritis undergoing total or hemi-arthroplasty. However, the low-quality studies provided early information that any of these implants are reasonable and safe options but should be used with caution as there are no long-term outcome studies.

According to the 2010 Management of Rotator Cuff Injuries of the AAOS which were updated in 2019, there is strong evidence supporting both physical therapy and surgical management resulted in a notable improvement in PROs for patients with symptomatic small to medium full-thickness rotator cuff tears. AAOS also recommended that there is also strong evidence that supports that PROs improve with physical therapy in symptomatic patients with full-thickness rotator cuff tears. However, the rotator cuff tear size, muscle atrophy, and fatty infiltration may progress over five (5) to 10 years with nonsurgical management.

REGULATORY STATUS

The U.S. Food and Drug Administration (FDA) regulates a variety of shoulder arthroplasty systems,

including reverse total shoulder arthroplasty (rTSA) and stemless implants as medical devices. All shoulder implants including related components require FDA approval before marketing and use in the United States to ensure they are safe and effective for human use. Refer to the FDA Medical Device website. Available from: https://www.fda.gov/medical-devices [accessed 2026 Sept 09]

The FDA lists the most serious type of medical device recalls as well as early alert communications about corrective actions being taken by companies that the FDA believes are likely to be the most serious type of recalls. Available from: Medical Device Recalls and Early Alerts | FDA [accessed 2026 Sept 09]

CODE(S)

CPT Codes

Code	Description
23334	Removal of prosthesis, includes debridement and synovectomy when performed; humeral or glenoid component
23335	Removal of prosthesis, includes debridement and synovectomy when performed; humeral and glenoid components (e.g., total shoulder)
23450	Capsulorrhaphy, anterior; Putti-Platt procedure or Magnuson type operation
23455	Capsulorrhaphy, anterior; with labral repair (e.g., Bankart procedure)
23460	Capsulorrhaphy, anterior, any type; with bone block
23462	Capsulorrhaphy, anterior, any type; with coracoid process transfer
23465	Capsulorrhaphy, glenohumeral joint, posterior, with or without bone block
23466	Capsulorrhaphy, glenohumeral joint, any type multi-directional instability
23470	Arthroplasty, glenohumeral joint; hemiarthroplasty
23472	Arthroplasty, glenohumeral joint; total shoulder (glenoid and proximal humeral replacement (e.g., total shoulder).
23473	Revision of total shoulder arthroplasty, including allograft when performed; humeral or glenoid component
23474	Revision of total shoulder arthroplasty, including allograft when performed; humeral and glenoid component
23480	Osteotomy, clavicle, with or without internal fixation;
23485	Osteotomy, clavicle, with or without internal fixation; with bone graft for nonunion or malunion (includes obtaining graft and/or necessary fixation)
23700	Manipulation under anesthesia, shoulder joint, including application of fixation apparatus

Code	Description
	(dislocation excluded)
29805	Arthroscopy, shoulder, diagnostic, with or without synovial biopsy (separate procedure)
29806	Arthroscopy, shoulder, surgical; capsulorrhaphy
29807	Arthroscopy, shoulder, surgical; repair of SLAP lesion
29819	Arthroscopy, shoulder, surgical; with removal of loose body or foreign body
29820	Arthroscopy, shoulder, surgical; synovectomy, partial
29821	Arthroscopy, shoulder, surgical; synovectomy, complete
29822	Arthroscopy, shoulder, surgical; debridement, limited, 1 or 2 discrete structures (e.g., humeral bone, humeral articular cartilage, glenoid bone, glenoid articular cartilage, biceps tendon, biceps anchor complex, labrum, articular capsule, articular side of the rotator cuff, bursal side of the rotator cuff, subacromial bursa, foreign body[ies]
29823	Arthroscopy, shoulder, surgical; debridement, extensive, 3 or more discrete structures (e.g., humeral bone, hum-eral articular cartilage, glenoid bone, glenoid articular cartilage, biceps tendon, biceps anchor complex, labrum, articular capsule, articular side of the rotator cuff, bursal side of the rotator cuff, subacromial bursa, foreign body[ies]
29824	Arthroscopy, shoulder, surgical; distal claviculectomy including distal articular surface (Mumford procedure)
29825	Arthroscopy, shoulder, surgical; with lysis and resection of adhesions, with or without manipulation
29826	Arthroscopy, shoulder, surgical; decompression of subacromial space with partial acromioplasty, with coracoacromial ligament (i.e., arch) release, when performed (List separately in addition to code for primary procedure)
29827	Arthroscopy, shoulder, surgical; with rotator cuff repair
29828	Arthroscopy, shoulder, surgical; biceps tenodesis

Code	Description
Not Applicable	

ICD10 Codes

Code	Description
M05.00 - M05.9	Rheumatoid arthritis (code range Felty's syndrome)
M12.511 - M12.519	Traumatic arthropathy, shoulder (code range)

Code	Description
M19.011 - M19.019	Osteoarthrosis, localized, primary, shoulder region (code range)
M19.111 - M19.119	Post-traumatic osteoarthritis, shoulder (code range)
M19.211 - M19.219	Osteoarthrosis, localized, secondary, shoulder region (code range)
M24.811 - M24.819	Other specific joint derangement of shoulder, not elsewhere classified [crepitus] (code range)
M87.021 - M87.029	Idiopathic aseptic necrosis of humerus [head] (code range)
S42.001K - S42.199P	Malunion or nonunion of fracture of shoulder (code range)
S42.201A - S42.496S	Fracture of humerus (code range)
T84.018A - T84.019A	Broken internal joint prosthesis [shoulder] (code range)
T84.028A- T84.029A	Dislocation of other and unspecified internal joint prosthesis (code range)
T84.038A - T84.039A	Mechanical loosening of other or unspecified prosthetic joint [shoulder] (code range)
T84.59XA	Infection and inflammatory reaction due to other internal joint prosthesis [shoulder]

Policy/Procedure Name: Sickle Cell Disease Drug Treatment **Control Number: 1350/20.000377**

Disclaimer Notice

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgment when deciding the most appropriate care for enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

Background

Sickle cell disease (SCD) results from a single amino acid substitution in the β-globin gene causing the sixth amino acid to be changed from glutamic acid to valine. The mutant hemoglobin S (HbS) has abnormal physiochemical properties that make it susceptible to continuous polymerization with other hemoglobin molecules in a hypoxic environment. As the HbS polymerizes, the red blood cell becomes deformed, assuming a characteristic sickle shape, impairing erythrocyte rheology, increasing adhesion-mediated vaso-occlusion, and ruining blood cell survival. Hence, the ordinarily free-flowing cytosol of red blood cells becomes very viscous and too rigid to transverse tight capillary beds. The resulting effects include cycles of microvascular vaso-occlusive events and intravascular hemolysis. These molecular, cellular, and biophysical processes synergize to promote acute and chronic pain, culminating in end-organ injury and failure. Several subtypes of SCD exist, depending on the exact mutation in each hemoglobin gene. However, available treatments so far are independent of these subtypes.

Hydroxyurea increases red blood cell (RBC) hemoglobin F levels and RBC water content, and reduces deformability of sickled cells, thereby altering adhesion of RBCs to endothelium. Hydroxyurea is usually first-line therapy in individuals with SCD who have frequent painful episodes, including infants. There is a strong recommendation to offer chronic hydroxyurea therapy to patients with ≥ 3 sickle-cell-associated moderate-to-severe crises in a 12-month period; sickle cell pain or severe symptomatic chronic anemia that interferes with daily activities and quality of life; and a history of severe and/or recurrent acute chest syndrome (ACS). In a landmark clinical trial in adult patients, hydroxyurea decreased median vascular occlusive crises requiring hospitalizations per year (2.5 vs 4.5, $p < 0.01$) and lengthened median time to first crisis (3.0 vs 1.5 months, p=0.01). Hydroxyurea is available as generic tablets, Droxia capsules, Siklos dissolvable and scored tablets, and Xromi oral solution.

Endari (L-glutamine) is an amino acid indicated to reduce the acute complications of SCD in adult and pediatric patients five years of age and older. In sickle cell disease, nicotinamide adenine dinucleotide (NAD) and its reduced form, NADH, have a role in regulating and preventing red blood cell oxidative damage, but the ratio of NADH to total NAD is lower, resulting in a decreased NAD redox potential. Glutamine may improve NAD redox potential in sickle red blood cells through increased availability of reduced glutathione. The FDA approval was supported by efficacy data from a 48-week Phase 3 clinical trial comparing L-glutamine to placebo (NCT01179217). Patients receiving Endari had a modest reduction in median sickle cell acute crises compared to placebo (3 vs. 4, p=0.05) and in hospitalizations for sickle cell pain (2 vs. 3, p=0.09). Approximately two-thirds of patients in both arms had been receiving a stable dose of hydroxyurea for at least three months and continued during the trial.

Adakveo (crizanlizumab) is a humanized IgG_2 kappa monoclonal antibody that binds to P-selectin and blocks its interaction with P-selectin glycoprotein ligand-1 on neutrophils and monocytes. As a result, Adakveo inhibits interactions between endothelial cells, platelets, red blood cells, and leukocytes, which may result in decreased platelet aggregation, maintenance of blood flow, and minimized sickle-cell-related pain crises. It is indicated to reduce the frequency of vaso-occlusive crises in adults and pediatric patients 16 years of age and older with SCD. Adakveo is administered intravenously based on weight and used mostly in the outpatient setting. Adakveo was studied in a randomized, double-blind, placebo-controlled trial. This phase II SUSTAIN trial demonstrated that patients receiving Adakveo (n=67) had a lower median annual rate of VOCs compared to patients receiving placebo (n=65) (1.63 vs. 2.98, p=0.01), indicating a 45.3% lower rate with Adakveo.

In September 2024, Oxbryta (voxelotor) was withdrawn from the market following recent data showing that there was a higher rate of vaso-occlusive crises in patients receiving Oxbryta compared to placebo, as well as more deaths in the Oxbryta group.

Summary

Effective date of policy:	2/12/2026
Indications	See specific agents listed below
Availability	Siklos (Hydroxyurea) is available as a 100-mg and 1,000-mg oral, scored tablets. Xromi (Hydroxyurea) is available as 100 mg/mL oral solution (148 mL bottle) Endari (L-glutamine) is available as a 5-g oral packet. Adakveo (crizanlizumab) [HCPCS Code: J0791] is available as a 100-mg/10-mL intravenous infusion.

Duration	Siklos - Initial: 12 months; continuation: 12 months Xromi - Initial: 12 months; continuation: 12 months Endari - Initial:12 months; continuation: 12 months Adakveo - Initial: Six months; continuation: 12 months

Required Criteria for Initial Approval

All of the following conditions for the requested drug and indication must be met in order to approve therapy.

Indication	Inclusion	Recommended Dosing
Siklos (hydroxyurea tablets) **Indication** (FDA approval) Reduce the frequency of painful crises and to reduce the need for blood transfusions in adult and pediatric patients, two years of age and older, with sickle cell anemia with recurrent moderate to severe painful crises. **AND** **Xromi (hydroxyurea oral solution)** **Indication** (FDA approval) Reduce the frequency of painful crises and reduce the need for blood transfusions in pediatric patients aged 6 months of age to less than 2 years with sickle cell anemia with recurrent moderate to severe painful crises **Rx Benefit**	1. Must have a diagnosis of Sickle cell disease (SCD) **AND** 2. Must meet the following age requirement based on product being requested: a. For Siklos, must be 2 years of age or older b. For Xromi, must be 6 months of age or older **AND** 3. Must meet one of the following (a, b, or c): a. Must have a valid medical reason why hydroxyurea capsules or Droxia cannot be used (i.e., unable to swallow whole capsules) **OR** b. If the requested dose is exactly divisible by available strengths of hydroxyurea capsules or Droxia, the patient will be required to use those unless there is a valid medical reason, they are unable. i. Hydroxyurea: 500 mg capsules ii. Droxia: 200 mg, 300 mg, 400 mg capsules [NOTE: Droxia does not require prior authorization but may not be on all formularies] iii. Siklos: 1000mg (can split into quarters for doses of 250, 500, 750, or 1000 mg; also available as 100 mg (can split in half for doses of 50 mg) iv. Xromi: 100 mg/mL (148 mL bottle) **OR** c. If the requested dose is not exactly divisible by available strengths of hydroxyurea capsules or Droxia, must meet both of the following (i and ii): i. Must have experienced a hematologic toxicity reaction with the next highest dose that can be made by using Droxia or generic hydroxyurea capsules **AND** a. Hematologic toxicity with hydroxyurea is defined by neutrophil, platelet, hemoglobin and/or reticulocyte count abnormalities concurrent with hydroxyurea use suggestive of hematologic toxicity. After the first hematologic toxicity, hydroxyurea therapy should be stopped and can be restarted with a dose reduction upon hematologic recovery. **AND** ii. Must have had drug failure (e.x., continued frequent and/or severe VOCs or ongoing, frequent transfusion requirements) with the next lowest dose that can be made by using Droxia or generic hydroxyurea capsules Quantity Limit for Xromi: 1 bottle (148 mL) per 30 days. Upon each review and dose escalation request the allowed quantity will be reviewed in accordance with FDA-approved weight-based dosing and as such will be limited to the number of full bottles necessary to obtain the appropriate daily dose. Example 1: Prescriber requests Xromi 700 mg per day (7 mL per day) or Siklos 700mg per day (1000 mg x1/2 + 100 mg x2), the patient would be required to use Droxia (300 mg x1 + 400 mg x1). Example 2: If a prescriber requests Xromi 750 mg per day (7.5 mL per day) or Siklos 750 mg per day (3/4 tab), the patient would be required to have a hematologic toxicity reaction with two Droxia 400 mg capsules taken together to make 800 mg per day **AND** drug failure with two Droxia 300 mg capsules taken together to make 600 mg per day.	Please see product specific prescribing information for FDA approved dosing

Endari (L-glutamine) **Indication** (FDA approval) Reduce the acute complications of sickle cell disease in adults and pediatric patients five years of age and older. **Rx Benefit**	1. Must have a diagnosis of Sickle Cell Disease type HbSS or HbS/β0 thalassemia as determined by hemoglobin electrophoresis **AND** 2. Member must be at least 5 years old **AND** 3. Must be experiencing symptomatic pain that is a result of Sickle Cell Disease **AND** 4. Must have had (See **Table 1** for additional hydroxyurea info) **(either a, b, or c)**: a. A therapeutic failure (ex. continued frequent and/or severe VOCs or ongoing, frequent transfusion requirements) to a ≥ 6 consecutive month trial of hydroxyurea at maximum tolerated dosing. Adherence will be based on: i. Pharmacy refill history. If the patient does not have pharmacy benefits through this health plan, a recent pharmacy profile will be requested. Progress notes documenting usage of sample medication may also be requested **OR** b. A contraindication to hydroxyurea defined as a hypersensitivity to hydroxyurea or any component of the formulation **OR** c. Must have experienced **two** hematologic toxicity reactions with hydroxyurea that resulted in discontinuation of therapy i. Hematologic toxicity with hydroxyurea is defined by neutrophil, platelet, hemoglobin and/or reticulocyte count abnormalities concurrent with hydroxyurea use suggestive of hematologic toxicity. After the first hematologic toxicity, hydroxyurea therapy should be stopped and can be restarted with a dose reduction upon hematologic recovery. If a second hematologic toxicity is experienced, treatment should be discontinued. 5. Endari and generic L-glutamine will not be approved in combination with Adakveo as there are currently no clinical studies evaluating the combinations Quantity limit exceptions will require a recent (within the past 6 months) weight and will be approved in accordance with the FDA-approved weight-based dosing as follows: a. < 30kg = 60 packets/30 days b. 30-65 kg = 120 packets/30 days c. > 65 kg = 180 packets/30 days	• < 30 kg: 5 g orally twice daily. • 30 to 65 kg: 10 g orally twice daily. • > 65 kg: 15 g orally twice daily.
Adakveo (crizanlizumab) **Indication** (FDA approval) Reduce the frequency of vaso-occlusive crises in adults and pediatric patients, age 16 years and older, with sickle cell disease. **Medical Benefit** **HCPCS:** J0791	1. The enrollee is at least 16 years of age 2. Must have a diagnosis of sickle cell disease (SCD) 3. Medication is prescribed by or in consultation with a hematologist or provider who specializes in management of SC 4. Enrollee had at least four or more vaso-occlusive crises (VOCs) within the previous 12 months that required a medical facility visit (ER, clinic, hospital, local physician visit). a. Examples of VOC events include but are not limited to: acute episode of pain caused by VOC, acute chest syndrome, hepatic sequestration, splenic sequestration, or priapism 5. Must have had (See Table 1 for additional hydroxyurea info) (either a, b, or c): a. A therapeutic failure (ex. continued frequent and/or severe VOCs or ongoing, frequent transfusion requirements) to a ≥ 6 consecutive month trial of hydroxyurea at maximum tolerated dosing. Adherence will be based on: i. Pharmacy refill history. If the patient does not have pharmacy benefits through this health plan, a recent pharmacy profile will be requested. Progress notes documenting usage of sample medication may also be requested OR	• 5 mg/kg IV infused over 30 minutes at week 0, week two, and every four weeks thereafter.

	b. A contraindication to hydroxyurea defined as a hypersensitivity to hydroxyurea or any component of the formulation OR c. Must have experienced two hematologic toxicity reactions with hydroxyurea that resulted in discontinuation of therapy. i. Hematologic toxicity with hydroxyurea is defined by neutrophil, platelet, hemoglobin and/or reticulocyte count abnormalities concurrent with hydroxyurea use suggestive of hematologic toxicity. After the first hematologic toxicity, hydroxyurea therapy should be stopped and can be restarted with a dose reduction upon hematologic recovery. If a second hematologic toxicity is experienced, treatment should be discontinued. 6. Adakveo will not be approved in combination with Endari/generic L-glutamine as there are currently no clinical studies evaluating the combinations 7. Initial approval will be for 6 months	

Exclusion Criteria

Coverage will not be administered for Siklos, Xromi, Adakveo, or Endari following gene therapy treatment for Sickle Cell Disease.

Continuation Criteria

- For Siklos, Endari, Xromi – documentation of positive clinical response to therapy (e.g., reduction in vaso-occlusive crises).
- For Adakveo - Recertifications will be for 1 year and require documentation of a decrease in the number and/or severity (ex. fewer/shorter hospitalizations) of VOCs compared to baseline.

Considerations

- Enrollee must have prescription drug coverage administered by CDPHP for hydroxyurea, Siklos, Xromi, or Endari.
- Adakveo will be covered under the medical benefit.
- Prior authorization is obtained through the CDPHP pharmacy department.

Table 1: NIH Consensus Treatment Protocol and Technical Remarks for the Implementation of Hydroxyurea Therapy

Initiation

- Starting dosage for adults (500 mg capsules): 15 mg/kg/day (round up to the nearest 500 mg); 5–10 mg/kg/day if patient has chronic kidney disease
- Starting dosage for infants and children: 20 mg/kg/day

Monitor

- Monitor CBC with WBC differential and reticulocyte count at least every 4 weeks when adjusting dosage.
- Aim for target ANC = 2,000/uL; however, younger patients with lower baseline counts may safely tolerate absolute neutrophil counts down to 1,250/uL.
- Maintain platelet count = 80,000/uL

Management of toxicities

- If neutropenia or thrombocytopenia occurs:
  - Hold hydroxyurea dosing
  - Monitor CBC with WBC differential weekly
  - When blood counts have recovered, reinstitute hydroxyurea at a dose 5 mg/kg/day lower than the dose given before onset of cytopenias

Response considerations

- A clinical response to treatment with hydroxyurea may take *3–6 months.* Therefore, a *6-month* trial on the maximum tolerated dose is required prior to considering discontinuation due to treatment failure, whether due to lack of adherence or failure to respond to therapy.
- A lack of increase in MCV and/or HbF is ***not*** an indication to discontinue therapy.

GOVERNMENT PROGRAMS

CHILD HEALTH PLUS: Subject to all terms and conditions noted in above application.

MEDICARE CHOICES: Medical Benefit – Subject to all terms and conditions noted in above application.

SELECT/HARP PLAN: Medical Benefit – Subject to all terms and conditions noted in above application.

Pharmacy Benefit - Effective April 1, 2023, the pharmacy benefit for Medicaid is administered by NYRx, the Medicaid Pharmacy Program.

CDPHP Pharmacy Services 2/12/2026

New: 2/2020

Revised	Reviewed
2/21, 2/22, 2/23, 2/24, 2/25, 6/25, 9/25, 2/26	

Revision Date	Changes Made
2/2022	Reduced Oxbryta age requirement from 12 years of age to four years of age; adjusted dosing to reflect pediatric reference. Added quantity limits based on available package sizes of 300mg tablets.
2/2023	Updated age range for Siklos from ages two to 18, to ages two and up to match updated indication Updated dosing for Siklos for adults.
2/2024	Added exclusion criteria that coverage will not be administered for Siklos, Adakveo, Oxbryta, or Endari following gene therapy treatment for Sickle Cell Disease.
2/2025	Oxbryta removed from policy following withdrawal from market.
6/2025	Added Xromi to the policy, modified inclusion criteria for Siklos to remove clinical requirements and shift to requiring dose optimization of formulary alternatives (generic hydroxyurea and Droxia), updated inclusion criteria for Endari to require therapeutic failure of 6 months of hydroxyurea instead of 12 months **or** contraindication to hydroxyurea **or** Hematologic toxicity to hydroxurea for Endari coverage, added NIH table regarding hydroxyurea treatment protocol and implementation into considerations, added quantity limits for Siklos, Xromi, Endari.
9/2025	Dosing update for Endari for individuals under 30kg
2/2026	Adakveo: Updated enrollee has had at least two or more vaso-occlusive crises (VOCs) within the previous 12 months to four or more and added examples of VOCs Updated hydroxyurea trial language for Adakveo

MEDICAL POLICY

Medical Policy Title	**Sinus Excision/Destruction, Implants, and Repair**
Policy Number	**7.01.99**
Current Effective Date	**January 1, 2027**
Next Review Date	**December 2026**

Our medical policies are based on the assessment of evidence based, peer-reviewed literature, and professional guidelines. Eligibility for reimbursement is based upon the benefits set forth in the member's subscriber contract. (Link to Product Disclaimer)

POLICY STATEMENT(S)

I. Drug- Eluting Implants (Mometasone Furoate)

A. The SINUVA implant is considered **medically necessary** when **ALL** of the following criteria are met:

1. 18 years of age or older;
2. Diagnosis of recurrent nasal polyps secondary to chronic rhinosinusitis;
3. History of ethmoid sinus surgery and would be candidates for revision sinus surgery;
4. Have nasal obstruction/congestion syndromes despite use of intranasal steroid irrigations or sprays;
5. Previous treatment, contraindication, intolerance to conventional nasal polyp therapy such as leukotriene receptor antagonist, steroid taper, or intranasal steroids.

B. The use of the PROPEL drug-eluting sinus stent is considered **investigational**.

C. Repeat use of drug-eluting sinus stents has not been medically proven to be effective and, therefore, is considered **investigational**.

II. Repair of Nasal Valve Collapse (NVC)/Nasal Obstruction

A. The use of an absorbable nasal implant (e.g., Latera) is **investigational** for the treatment of NVC in patients with nasal obstruction.

B. Radiofrequency ablation/neurolysis of the nasal valve (e.g., VivAer stylus) is considered **investigational** for **ALL** indications, including treatment of nasal airway obstruction.

III. Excision/Destruction of the Posterior Nasal Nerve (PNN)

A. Excision/Destruction of the PNN utilizing ANY of the following approaches is **investigational** for **ALL** indications, including the treatment of chronic rhinitis (allergic or nonallergic):

1. Cryoablation (e.g., ClariFix device);
2. RF ablation (e.g., RhinAer stylus, NEUROMARK);
3. Laser ablation.

POLICY GUIDELINE(S)

Not Applicable

DESCRIPTION

Rhinosinusitis is defined as inflammation of the sinuses and nasal cavity. Rhinosinusitis may be classified based on duration. Acute sinusitis is defined as having symptoms lasting for fewer than 12 weeks. Recurrent acute rhinosinusitis consists of three or more episodes of acute bacterial rhinosinusitis in a year, while chronic rhinosinusitis is characterized by symptoms lasting 12 weeks or more. Chronic rhinosinusitis (CRS) is characterized by four cardinal symptoms: nasal obstruction (congestion), mucopurulent drainage (anterior and/or posterior), facial pain/pressure/fullness, or decreased/loss of sense of smell. Non-specific symptoms can include fatigue, cough, ear pain/pressure, dental pain, or sleep disturbance) CRS may occur with or without nasal polyps. Symptoms persist for weeks to months. In some cases of CRS, surgical drainage may be necessary.

Rhinitis is defined as symptomatic inflammation of the paranasal sinuses and nasal cavity. Chronic rhinitis is defined as rhinorrhea with or without nasal congestion symptoms despite medical therapy lasting longer than three months. Allergic rhinitis is defined as an immunoglobulin E (IgE)–mediated inflammatory response of the nasal mucous membranes after exposure to inhaled allergens. Symptoms include rhinorrhea (anterior or postnasal drip), nasal congestion, nasal itching, and sneezing. Allergic rhinitis can be seasonal or perennial, with symptoms being intermittent or persistent.

Nasal obstruction is a symptom of difficulty moving air through the nose and can be cause by a variety of factors including anatomic narrowing (e.g., deviated nasal septum, neoplasm, scarring, nasal fracture), dynamic collapse (e.g., internal nasal valve collapse), inflammation (e.g., swelling, polyposis), turbulent airflow (e.g., septal perforation), and excessive secretions or crusting in the nasal cavity. Commonly, patients will feel that they have nasal congestion or stuffiness. Unilateral symptoms are more suggestive of structural causes of nasal obstruction. A history of trauma or previous nasal surgery, especially septoplasty or rhinoplasty, is also important.

Nasal valve collapse (NVC) is a readily identifiable cause of nasal obstruction. Specifically, the internal nasal valve represents the narrowest portion of the nasal airway with the upper lateral nasal cartilages present as supporting structures. The external nasal valve is an area of potential dynamic collapse that is supported by the lower lateral cartilages. Damaged or weakened cartilage will further decrease airway capacity and increase airflow resistance and may be associated with symptoms of obstruction (e.g., congestion, difficulty breathing with exertion or lying down, and mouth breathing). Patients with NVC may be treated with nonsurgical interventions to increase the airway capacity, but surgery may be necessary for severe symptoms and anatomic distortion.

Nasal and sinus conditions are a commonly diagnosed disease in the U.S. Symptoms are associated with significant negative impacts on quality of life, missed days from work and school, and high healthcare costs due to medical visits, prescriptions and over-the-counter medications, sinus surgeries. Treatments are based on the underlying etiology and experienced symptoms. Medical management (e.g., over-the-counter nasal strips, intranasal corticosteroids, short-term oral corticosteroid, saline nasal irrigation, nasal valve dilator) is the standard first-line treatment option; however, minimally invasive surgical interventions (e.g., post-operative stents, implants, ablation) may be necessary for patient who fail medical therapy.

Drug-Eluting Sinus Stents

Endoscopic sinus surgery (ESS), a fiberoptic nasal endoscope is used to visualize the sinus ostia, and any obstruction found is corrected. The procedure restores patency and allows air and mucous transport through the natural ostium. ESS for CRS may be compromised by post-operative inflammation, polyposis, and adhesions, often requiring subsequent medical and surgical intervention. Post-operative interventions employed to reduce these complications are often time-consuming and uncomfortable for the patient. Current medical therapies (e.g., oral corticosteroids, topical steroid spray, and nasal packing) all have limitations; therefore, sinus stents have been investigated as an option to maintain patency of the sinus openings in the post-operative period, and/or serve as a local drug delivery vehicle. Reducing post-operative inflammation and maintaining patency of the sinus may be important in achieving optimal sinus drainage and may impact recovery from surgery.

The PROPEL sinus implant manufacturer claims that the PROPEL stent "separates mucosal tissues, provides stabilization of the middle turbinate, prevents obstruction by adhesions, and reduces edema." The implant is manufactured from a synthetic bioabsorbable copolymer, poly (L-lactideco-glycolide), and contains 370µg mometasone furoate, a synthetic corticosteroid. The implant is designed to accommodate the size and variability of the post-surgical ethmoid sinus anatomy. The device is dissolvable over a period of several weeks, and, therefore, does not require removal.

The SINUVA sinus implant contains 1350 mcg of mometasone furoate and implantation can be performed in the physician's office. It is left in place for up to 90 days, or earlier, at the physician's discretion, to gradually release the corticosteroid, and then requires removal.

Treatment of Nasal Valve Collapse (NVC) with Obstruction

The placement of an absorbable implant to support the lateral nasal cartilage has been proposed as an alternative to more invasive grafting procedures in patients with severe nasal obstruction and can be implanted in the office-setting under local anesthesia. The concept is that the implant may provide support to the lateral nasal wall prior to its resorption and then stiffens the wall with scarring as it is resorbed. The Latera absorbable nasal implant consists of a PLLA-PDLA copolymer that is predominantly cylindrical in shape with an approximate diameter of one mm and length of 24mm as well as a disposable delivery device and is intended to support cartilage in the nasal lateral wall. Latera is designed to be absorbed by the body over the period of 18-24 months post-implant.

Temperature-controlled RF ablation has been proposed as a minimally invasive option to reduce nasal-valve obstruction by submucosal remodeling to improve nasal airflow (Jacobowitz et al 2022). The VivAer Stylus delivers bipolar temperature-controlled RF energy to targeted nasal tissue. Researchers theorize that as the tissue heals, the scarring and remodeling may increase the nasal valve opening, shrink submucosal tissue, and increases resistance to valve collapse.

Treatment of Chronic Rhinitis (Allergic or Nonallergic)

Excision/ destruction (cryoablation, RF, and laser) is a proposed alternative to medical management for patients with chronic rhinitis symptoms (allergic or nonallergic). Excision/destruction of the distal branches of the nasal parasympathetic system, the posterior nasal nerve (PNN), is a proposed treatment to improve symptoms of chronic rhinitis by reducing parasympathetic innervation to the nasal cavity. The procedure is thought to correct the imbalance of autonomic input to the nasal mucosa, reducing nasal antigen responses and vascular hyperreactivity.

Cryoablation freezes nerve fibers of the PNN to reduce the overactivity that causes excess mucus. The ClariFix device is a cryosurgical tool that uses nitrous oxide to freeze the PNN to correct the imbalance of autonomic input to the nasal mucosa to reduce nasal antigen responses and vascular hyperreactivity.

RF ablation uses low-temperature energy to disrupt the PNN to correct the imbalance of autonomic input to the nasal mucosa to reduce symptoms of chronic rhinitis. The RhinAer Stylus delivers temperature-controlled RF energy to target and calm overactive nerves in the PNN region to reduce symptoms of moderate to severe chronic rhinitis.

Laser surgery is a common minimally invasive treatment for a wide range of otolaryngological conditions including but not limited to hereditary hemorrhagic telangiectasia, turbinate hypertrophy, septoplasty, and choanal atresia. Its use has also been proposed for the treatment of rhinitis via destruction of the PNN. Lasers utilized for rhinology include argon, potassium titanyl phosphate, diode, neodymium-doped yttrium aluminum garnet, and carbon dioxide. Each laser type has different properties for whether it cuts, coagulates, or evaporates tissues, and many have differing delivery systems.

SUPPORTIVE LITERATURE

Drug-Eluting Stents

A 2025 systematic review and meta-analysis (Zamaili et al) aimed to assess the impact of steroid-eluting middle meatal implant after ESS for patients with CRS. The primary outcome was the rate of

adhesion following surgery, and secondary outcomes were mucosal inflammation, polyp reformation, the need for oral steroids and additional surgery, post-operative bleeding, sinus pain and discomfort, postoperative sinus infection and change in intraocular pressure. Randomized controlled trials were included and eligible if they involved adult patients receiving ESS for CRS with or without nasal polyps utilizing a steroid-eluting middle meatal implant within the four weeks postoperative period. A total of seven studies were included in the review, representative of 1122 participants (568 in implant and 554 in control groups). The implants utilized in the studies included PROPEL, PROPEL Mini or Contour, BISORB, and SinuBand FP. Results indicated that although beneficial effects were noted including fewer postoperative treatments, decreased rates of adhesions, inflammation and recurrent polyp development, these effects are based on measurements conducted 30 days post-surgery. Authors noted that only a few studies examined outcomes after this time frame. Additionally, the study design is open to potential bias impacting the overall conclusion of the analysis, therefore, trials looking into longer-term effects of the implants on the outcome of ESS are warranted.

There are four randomized controlled trials evaluating PROPEL implants. Murr et al (2011) and Marple et al (2012) compared unilateral PROPEL stent use in the ethmoid sinus with a non-drug eluting stent on the contralateral side. These studies, although they demonstrated some success in the reduction of inflammation rated by the treating physician, were also limited by a lack of knowledge on whether the comparator received optimal treatment (e.g., packing, intranasal steroids, and irrigation). Smith et al (2016) and Luong et al (2017) aimed to compare the use of PROPEL mini or PROPEL Contour sinus implant in the frontal sinus versus surgery alone on the contralateral side. These trials demonstrated a 22% reduction in the need for additional surgical intervention but also consisted of a high percentage of patients that were not included in the evaluation due to poor video quality. Further studies are needed with appropriately treated comparison subjects to provide high-quality evidence that steroid-eluting stents reduce adhesion, mucosal inflammation, polyp recurrence, the need for oral steroids post-surgery or additional surgical procedures.

Han et al (2014) reported on results from the RESOLVE trial, which was a sham-controlled, randomized trial evaluating the use of office-based placement of the RESOLVE mometasone-eluting nasal stent for patients with recurrent nasal polyposis after ESS. Eligible patients had CRS, had undergone prior bilateral total ethmoidectomy more than three months earlier, had endoscopically confirmed recurrent bilateral ethmoid sinus obstruction due to polyposis that was refractory to medical therapy, and were considered candidates for repeat surgery based on the judgment of the surgeon and patient. Patients and those who administered symptom questionnaires at follow-up visits were blinded to treatment group. The trial was powered to detect a between-group difference of at least a 0.6-point change in polyp grade from baseline, and at least a 1.0- point change in nasal obstruction/congestion score. One hundred subjects were randomized to treatment (n=53) or control (n=47). For endoscopically measured outcomes, at 90 days of follow-up, the treatment group had a greater reduction in polyp grade than the control group (-1.0 vs -0.1; p=0.016) and a greater reduction in percent ethmoid obstruction on a 100-mm VAS (-21.5 mm vs 1.3 mm; p=0.001), both, respectively. For patient-reported outcomes, there were no significant differences in change in nasal obstruction/congestion scores between groups. Compared with controls, fewer treatment-group patients required oral steroids for ethmoid obstruction (11% vs 26%), and fewer treatment group

patients were indicated for sinus surgery at three months based on established criteria (47% vs 77%), although statistical comparisons were not reported.

For individuals with recurrent or persistent nasal polyposis after ESS, the use of steroid-eluting nasal implants was investigated to determine improvements in polyp grade and ethmoid obstruction in two randomized controlled trials (RCTs) (RESOLVE I and RESOLVE II, Forwith et al (2016) and Kern et al (2018)). A total of 400 patients were represented between these two studies, and did demonstrate improvements utilizing a sham-controlled design, however both studies were at high risk for bias as the outcome assessment was unblinded to the treatment group.

In 2019, Ernst and colleagues aimed to evaluate the economic impact of insertion of a steroid-eluting sinus implant (SINUVA) after a previous endoscopic surgery compared to a repeat sinus surgery in adults with chronic sinusitis and nasal polyps. A budget impact analysis over a one-year period was conducted to determine annual total and per-member per-month (PMPM) direct health care costs for a commercial health plan with one-million members. Multiple data sources were utilized to inform the input model values, including a database of 86,052 patients with an ESS performed between 2012-2015. Results from the RESOLVE trial were used to calculate the rate of recurrent sinusitis and the proportion of patients still indicated for revision surgery at study completion. Several other assumptions were made including no preprocedural work up required for the drug implant procedure as well as likelihood of two implants obtained per encounter (bilateral nature of sinonasal polyps). Results of the analysis estimated that 1000 hypothetical members of a commercial health plan would be candidates to receive an implant or revision surgery. Estimated treatment costs for patients with chronic sinusitis with nasal polyps using only revision surgery was $11.03 million, or $0.92 PMPM. Authors used the assumption that the implant would replace surgery in 50% of cases, and if 63% of those individuals received a second treatment with implant during the year, the cost savings would be $2.56 million or $0.21 PMPM. An additional scenario analysis revealed that the cost savings would decrease to $1,278,336 ($0.11 PMPM) if uptake of the implant were 25% versus 50% or would conversely increase to $3,835,007 ($0.32 PMPM) if uptake of the implant was 75%. Authors concluded that use of the implant over revision surgery could result in considerable savings given much lower procedure-related costs and that more research is warranted to include real-world market adoption data for the implants.

Per the drug labeling, the repeat implantation of SINUVA has not been studied.

Absorbable Nasal Implant for Nasal Obstruction

Research evaluating the use of absorbable nasal implants (i.e., Latera) in individuals with symptomatic nasal obstruction due to internal NVC has included one small, short-term RCT and four non-randomized prospective cohort studies with follow-up of up to 24 months. Overall, improvements in nasal obstruction symptom scores have been demonstrated. Additionally, adverse effects have been mild and self-limiting. There have been no prospective studies evaluating device efficacy against a comparable procedure (e.g., inferior turbinate reduction and/or septoplasty), and the evidence is insufficient to determine patient selection criteria as well as net health outcomes.

A 2020 meta-analysis by Kim et al evaluated the effectiveness of Latera in the treatment of nasal obstruction caused by lateral wall insufficiency (LWI). Five studies, including 396 patients, which

scored endoscopic lateral wall movement and nasal obstruction related to quality of life (QOL) before and after bioabsorbable nasal implants were included in the analysis. One study included a comparison of the treatment to a sham group. Researchers found that bioabsorbable nasal implants significantly reduced endoscopic lateral wall motion as well as improved QOL up to 12 months postoperatively. Adverse effects were reported in five percent of implant patients, were mild and resolved without sequalae. Researchers acknowledged that, while bioabsorbable nasal implants may reduce nasal wall movement and subjective symptoms compared to preoperative status, more RCTs must be conducted to verify their effectiveness.

Stolovitzy et al (2019) conducted a prospective, multicenter, randomized sham-controlled single blinded trial evaluating the safety and efficacy of a bioabsorable implant treatment for NVC. A total of 137 patients with NAO due to dynamic bilateral wall insufficiency confirmed by a positive modified Cottle maneuver with Nasal Obstruction Symptom Evaluation (NOSE) scores of at least 55 (classified as severe) and failed medical management were randomized into the treatment (n=71) and sham control (n=66) groups. Following initial evaluation, patients underwent cannula-introduced bioabsorbable nasal implant (treatment group) or sham procedure involving the cannula without implant insertion. Patients were followed for three months. The primary endpoint was the responder rate at three months after the index procedure. Responders were defined as patients who had at least one NOSE class improvement or a NOSE score reduction of at least 20% from baseline. Secondary endpoints included the frequency of procedure-related adverse events at index procedure and all follow-up visits, and the change in NOSE and VAS scores from baseline to all follow-up visits. At three months after treatment, the treatment arm had a significantly greater reduction in NOSE and VAS scores compared to the sham group (-42.4 ± 23.4 vs -22.7 ± 27.9, $p < 0.0001$ and -39.0 ± 29.7 vs -13.3 ± 30.0, $p < 0.0001$, respectively). A total of 19 procedure-related or implant-related adverse events were reported in 17 patients, including six implant retrievals. This study's conclusions are limited by the short-term follow-up and the single blind design introduced risk of bias.

Bikhazi et al (2021) performed a follow-up to the Stolovityzy et al (2019) three-month trial in which sham participants still meeting inclusion criteria (i.e., NOSE score of 55 or greater) were invited to crossover to the treatment arm and were followed up to 24 months post-placement. A total of 111 participants (71 treatment as well as 40 out of 66 sham participants) enrolled in this follow-up, however 70 participants completed the 24-month follow-up visit. Participants underwent follow-up visits at three, six, 12-, 18-, and 24-months post implant. Visits included collection of patient-reported outcome measures of the NOSE, a nasal obstruction visual analog scale (VAS), and the Epworth Sleepiness Scale (ESS). Adverse event reporting was also evaluated at each visit. A NOSE responder was defined as a participant with at least one NOSE class improvement or a NOSE score reduction of at least 20% compared with baseline. Researchers found NOSE responder rates are greater than 80% at all follow-ups through 24 months. Mean reduction from baseline in NOSE scores is equal to or greater than 30 points and statistically significant ($p<0.001$) at all timepoints through 24 months. The mean VAS score reduction was at least 29.7 points and statistically significant ($p <0.001$) at all time points. A subgroup of participants with baseline ESS values greater than 10 experienced statistically significant ($p <0.001$) and clinically meaningful reductions at all postimplant periods, suggesting that the reduction in nasal symptoms may reduce daytime sleepiness for patients who have problems with sleep quality. No serious device-/procedure-related adverse events were reported. Implant

migration/retrieval rate was 4.5%. This study is limited by design as well as small and homogenous population, demonstrating the need for more robust, comparable, long-term clinical trials.

Cryoablation of the Posterior Nasal Nerve (PNN) (e.g., ClariFix device)

Chang et al (2020) conducted an industry-sponsored, prospective, multi-center, single-arm study of 98 adults diagnosed with chronic, medically intractable rhinitis (moderate to severe allergic or non-allergic) and treated with PNN cryoablation. Participants were over the age of 21 and had a minimum total score of four out of 12 on the Reflective Total Nasal Symptom Score (rTNSS). Excluded from the study, were participants with anatomy-limiting visualization and access to the posterior nasal cavity, ocular symptoms, sinus infection, recent history of epistaxis, bleeding disorder, anticoagulation medication, Raynaud's disease, or pregnancy. All 98 participants underwent PNN cryoablation in-office under local anesthesia. Patients discontinued use of intranasal ipratropium three days prior to treatment and throughout the study period. There were no comparators. Following treatment, the total rTNSS scores were significantly improved over baseline at all post-procedure evaluations: baseline (6.1 ± 1.9), at one month (2.9 ± 1.9, $p<0.001$), three months (3.0 ± 2.3, $p<0.001$), six months (3.0 ± 2.1, $p<0.001$), and nine months (3.0 ± 2.4, $p<0.001$). The authors defined the minimal clinically important difference (MCID) as a 30% reduction in baseline score. Following the procedure, 29 adverse events (AEs) related to the procedure or device were reported. AEs included two instances of epistaxis requiring office cautery or suction cautery in the operating room; two cases of new ostia (one uncinate process perforation and one maxillary sinus accessory os); and one case of nasal synechia. Other reported AEs were headache, eye dryness and sinus infections. The study was limited by a lack of control group, unblinded provider and patient, short term follow-up period, participant loss to follow up and exclusion only for use of intranasal corticosteroids (but not other medications that would affect rhinorrhea). The authors concluded cryoablation of the PNN for chronic rhinitis was safe, could decrease nasal symptoms of rhinitis, and could improve disease-specific quality of life. They acknowledged future RCTs, perhaps incorporating a sham treatment arm, would be helpful to further validate the efficacy of PNN cryoablation.

Ow et al (2021) published additional post-procedure results (12-24 months) of the prospective single arm study above (Chang 2020). Individuals were evaluated by office visit or phone for changes rTNSS scores from baseline at 12 and 24 months. Ninety-one participants completed the study through the initial 12-month study period. Fifty-seven participants completed the 24-month follow-up. Significant improvements in the total rTNSS were reflected in a median change from baseline of −3.0 or −4.0 at all-time points ($P < .001$). Greater than 80.0% of participants achieved the minimum clinically important difference (MCID) of improvement by greater than or equal to one (1) point on the rTNSS at all follow-ups. Total RQLQ scores indicated significant improvement ($P < .0001$) in quality of life. Over 77% of participants achieved the MCID (≥ 0.5 points) for the total RQLQ score. One participant experienced two treatment-related serious AEs (epistaxis and retained pledget). A total of 29 nonserious treatment related AEs were reported in 23 participants; most events were transient and resolved with little to no intervention. This follow-up study is limited by single arm design without a concurrent control arm and loss of 30% of the participants after the 12-months. The authors concluded cryotherapy significantly and clinically improves rhinitis symptoms and quality of life with outcomes that are durable through 24 months after treatment. Randomized trials with a

control or sham treatment arm evaluating outcomes are needed to evaluate the relative net health benefit of this treatment compared to standard treatment.

Yen et al (2020) evaluated cryoablation of the PNN at the inferior and middle meatus in 30 individuals with moderate to severe rhinorrhea and mild to severe nasal congestion for at least three months. Most previous studies were limited to applying cryoablation to the PNN at the middle meatus. While the participants reported significant symptom improvement at three months, the study was limited by the limited number of participants and follow-up and no control arm. This is representative of the body of evidence for this technology; larger studies with long-term follow-up are needed to better assess the safety and efficacy of this therapy.

Hwang et al (2017) reported on a series of 27 adults who were treated with the ClariFix cryoablation device for allergic and non-allergic rhinitis with or without nasal congestion symptoms despite medical therapy greater than or equal to three months. Individuals were evaluated using the TNSS and those with a minimum rhinorrhea and/or congestion subscore of two (moderate symptoms) were included. Treatment was completed in office under topical or injected local anesthesia. TNSS mean scores decreased significantly at seven days post procedure compared to baseline (6.2 ± 0.5 versus 4.3 ± 0.4; $p<0.005$). At 90 days, the 27 individuals continued to report a decline in the TNSS mean score at 2.7 ± 0.4; $p<0.001$. While the TNSS scores continued to decline at 180 days (2.3 ± 0.5) and 365 days (1.9 ± 0.3), six individuals (22%) were lost to follow-up at 180 days and 12 individuals (44%) were lost to follow-up at 365 days. Subjects reported mild pain/discomfort, severe ear blockage and severe nasal dryness, all of which had improved or resolved at the 30-day follow-up. A moderate nosebleed reported approximately one-month post-procedure, was managed by electrocautery. The findings of this study were limited by its small size and the high rate of subject attrition during follow-up. In addition, as medication use was not tracked during the study, other factors for improvement in symptoms may have confounded the results. The authors concluded cryotherapy of the PNN region is safe and well tolerated.

Radiofrequency (RF) Ablation of the Posterior Nasal Nerve (PNN) (e.g., RhinAer Stylus)

Stolovitzky et al (2021) evaluated the safety and efficacy of RF ablation (also known as neurolysis) of the PNN in the treatment of moderate to severe chronic rhinitis. Individuals were randomized to receive active treatment of the PNN area with a RF device (n=77) or with a sham device (n=39). The primary endpoint was the responder rate (at least a 30 improvement in rTNSS score from baseline) at 3 months. A significantly higher responder rate was reported in the active treatment arm compared to the sham arm: 67.5% (95% CI, 55.9%-77.8%) versus 41.0% (95% CI, 25.6%-57.9%) at 3 months. No serious AEs were reported. The study did not limit the use of prescribed medications but did track medication use. At three-month follow-up seven individuals (9.1%) in the active treatment arm and 5 individuals (12.8%) in the sham treatment group increased their use of medications during the follow-up. Individuals who increased their medication use were assigned to non-responder status, regardless of rTNSS scores.

Takashima et al (2023) reported the 12-month safety and efficacy of the Stolovitzky et al (2021) study. At 12 months, the responder rate was 80.6% (n = 67) and the mean change in rTNSS was −4.8 ($p < 0.001$), a 57.8% improvement. The improvement in rTNSS of the index active treatment arm, significantly greater than of the index sham-control arm at three months was also sustained

through 12 months. The mean baseline rTNSS for the index active treatment arm was 8.3, with an adjusted mean change in rTNSS of −3.6, −4.4, and −4.8 at 3-, 6-, and 12-months ($p < 0.001$), when comparing each follow up timepoint vs baseline. This represents improvement of 43.3%, 53.0%, and 57.8% over baseline at three, six and 12-months, respectively. Although nasal itching and sneezing did not exhibit a difference between the index active treatment and index sham-control arms at three months, the researchers reported a sustained reduction in the severity of these symptoms over baseline through 12 months. Postnasal drip and cough, which are common and troublesome symptoms of chronic rhinitis, showed a similar improvement compared with baseline over time, although there was no significant difference between the index active treatment and index sham-control arms at three months.

Ehmer et al (2022) reported on the results of a prospective, single-arm multicenter study of 50 individuals with chronic rhinitis who underwent RF treatment to the PNN area. Participants were evaluated at two, four, 12-, 26- and 52-weeks post-procedure, with 47 participants completing the study. The primary efficacy point was the change in rTNSS score from baseline through 12 weeks. The mean rTNSS score improved from 8.5 at baseline to 3.4 at 12 weeks. At 12 months, the mean rTNSS score was reported to be 3.6. There were no serious AEs reported. This early study was limited by the lack of blinding and lack of a control group.

Kim et al (2024) conducted a systematic review and meta-analysis to compare posterior nerve ablation with cryoablation versus RF neurolysis. The review included 10 studies representing 738 patients with 12 months of follow-up, by assessing the clinical response rates after both treatments using the TNSS score as well as quality of life scoring. Of the studies included, there were none that directly compared the two treatments, therefore, the results must be carefully interpreted. Score differences at the 12-month mark were less than those at 6 months, with quality-of-life scores not differing between the two treatments. Additionally, there were several limitations to the review, including a majority of the studies being of a single-arm design and small number of participants. The authors also state that medications, both pre- and post-surgery, were not carefully controlled and therefore, conclude that long term double blinded RCTs are needed.

Hwang and colleagues (2025) aimed to determine if the combination of RF ablation of the inferior turbinates and intraturbinate segments of the PNN with laser PNN would improve short-term response rates and enhance symptom control in chronic rhinitis patients. The retrospective study enrolled 54 patients aged 18-65 years with chronic rhinitis refractory to medical treatment for greater than six months with sinonasal symptoms. All patients were treated with both RF ablation and laser ablation. A total of 50 patients completed a 6-month follow-up. Outcomes measured were Reflective Total Nasal Symptom Score (rtNSSS) and Nasal Obstruction Symptom Evaluation (NOSE). Results demonstrated a significant post-surgical reduction in both rTNSS and NOSE (From baseline scores of 8.7 [95% CI, 8.2–9.2] and 61.6 [95% CI, 56.8–66.3], respectively, rTNSS decreased to 1.46 [95%CI, 1.9–1.1] and NOSE to 2.9 [95% CI, 4.4–1.4] at 6 months [both $p < 0.001$]). The study's retrospective design, lack of a comparator group, and short six-month follow-up period limit the interpretation of the findings. Authors conclude that future prospective studies with longer follow up and comparative analyses are needed.

Radiofrequency (RF) Ablation of Nasal Valves to Treat Nasal Airway Obstruction (NAO) (VivAer ARC Stylus)

Han et al (2022) and Yao et al (2023) reported the long-term (12-month and 2-year respectively) follow-up outcomes from the industry-sponsored trial conducted by Silvers et al in 2019, summarized below. Following the three-month primary end point, the trial was unblinded and all patient eligible to cross-over to the treatment arm (n=31) elected to undergo treatment. After two patients were excluded, 108 patients underwent treatment in the trial (77 as index active treatment, 31 after crossover). The crossover arm had a mean baseline NOSE Scale score comparable to the index arm.

The researchers acknowledge the study's limitations of lacking a control arm and the predominantly while study population. They indicated that although further studies that incorporate more liberal application of temperature-controlled radiofrequency (TCRF) to address multiple nasal airway obstruction (NAO) contributors are needed; the researchers concluded that this multi-institutional cohort study contributes substantial real-world evidence that minimally invasive TCRF device treatment of the internal nasal valve for NAO is well tolerated and effective in significantly and sustainably reducing NAO symptom severity through two years. Furthermore, TCRF treatment is effective in patients with either static or dynamic NVC, septal deviation, turbinate enlargement, and prior nasal surgery, all of which are common characteristics of patients who present at clinics seeking relief from their symptomatic NAO.

Silvers et al (2021) conducted an industry-sponsored prospective, multicenter, single-blinded, randomized controlled trial comparing a temperature-controlled RF device for treatment of the NVC in subjects with obstruction. Participants were randomized to either active treatment arm (n=77; RF device/VivAer Stylus) or a sham procedure arm (n=40; control group/where a stylus was applied in the same manner but without RF energy delivery). Patients were assessed with a physical and endoscopic exam, NOSE scale score, a 100-mm ease-of-breathing visual analog scale (VAS), and a 100-mm VAS for nasal pain. At baseline, patients had a mean NOSE-scale score of 76.7 (95% confidence interval [CI], 73.8 to 79.5) and 78.8 (95% CI, 74.2 to 83.3) ($p = 0.424$) in the active treatment and sham-control arms, respectively. At three months, the responder rate was significantly higher in the active treatment arm (88.3% [95% CI, 79.2%-93.7%] vs 42.5% [95% CI, 28.5%-57.8%]; $p < 0.001$). The active treatment arm had a significantly greater decrease in NOSE scale score (mean, -42.3 [95% CI, -47.6 to -37.1] vs -16.8 [95% CI, -26.3 to -7.2]; $p < 0.001$). Three AEs likely related to the device and/or procedure were reported, and all resolved. This study is limited by non-blinded physicians, medication use was not dictated by the protocol, and short-term follow-up.

Jacobowitz et al (2019) six-month results of an industry-sponsored study of minimally invasive office treatment for nasal airway obstruction. This nonrandomized, prospective, multicenter case series assessed the safety and effectiveness of in-office bipolar temperature-controlled RF treatment of nasal valve obstruction. The study included 50 patients with severe or extreme obstruction (NOSE score at baseline ≥ 60 who had a positive response to nasal mechanical dilators or lateralization maneuvers. Bilateral RF treatment was applied intranasally, using the Vivaer Stylus, under local anesthesia in one session. Efficacy was determined by using the NOSE score and patient-reported satisfaction survey at 26 weeks. The mean baseline NOSE score was 79.9 (SD 10.8, range 60-100), and all had severe or extreme obstruction. At 26 weeks, mean NOSE score was 69% lower at 24.7

(P<.0001) with 95% two-sided confidence intervals 48.5 to 61.1 for decrease. The decrease in NOSE score did not differ significantly between patients who did or did not have prior nasal surgery. Patient satisfaction mean by survey was 8.2 of 10. No device or procedure-related serious AEs occurred. The study is limited by the small sample size, lack of randomization, single-arm study with short-term follow-up.

Ephrat et al (2021) conducted an extended 24-month follow-up of subjects who participated in the above study conducted by Jacobowitz et al (2019). This study aimed to determine whether the results achieved at six (6) months would be sustained through 24-months and included 39 patients from the original cohort of 49 patients. Study participants completed self-administered evaluations of the NOSE and QoL measures at 12-, 18-, and 24-months post procedure. The researchers reported clinically significant improvement from baseline in NOSE Scale score change demonstrated at six months (mean, 55.9; standard deviation [SD], 23.6; $p < 0.0001$) was maintained through 24 months (mean, 53.5; SD, 24.6; $p < 0.0001$). Responders (≥ 15-point improvement) consisted of 92.3% of participants at six months and 97.2% at 24 months. Responses to the QOL questions also showed improvement in patients' QOL. Other than the short duration, this trial shares the limitations of the Jacobowitz study cited above. In addition, it is limited by loss of 22% of the original cohort, raising the possibility of retention bias. Ephrat and colleagues acknowledged that in order to distinguish the relative true treatment effect from placebo effects, "it will be necessary to confirm the results of this study in additional patients as part of a planned randomized, controlled trial."

Jacobowitz et al (2022) reported extended 48-month follow-up outcomes following the initial 26-week study by Jacobowitz et al (2019). Of the 49 patients in the initial study, 39 completed follow-ups through 24 months and 29 completed follow-ups through 48 months. Compared with baseline, mean total NOSE scores improved after treatment and were maintained throughout the 48 months. Mean NOSE scores decreased from 81.0 at baseline to 21.6 after 6 months (73.3% change), 25.6 after 12 months (68.3% change), 29.3 after 18 months (63.8% change), 22.5 (±20.9) after 24 months (72.2% change), 32.3 after 36 months (60.1% change), and 25.7 after 48 months (68.3% change) ($p < 0.001$ for all comparisons). Mean NOSE domain scores showed sustained improvement through 48 months, including patients with NOSE scores in the "extreme" (score of 80-100) or "severe" (score of 55-75) categories at baseline.

Brehmer et al (2019) conducted a nonrandomized prospective study to evaluate the safety and efficacy of low-dose RF energy, using the Vivaer system, for the treatment of narrowed nasal valves. The study included 31 participants presenting with symptoms of nasal obstruction and snoring. Researchers used the VivAer low energy RF system to remodel the nasal sidewall to improve airflow. Thirty days after the treatment patients completed two questionnaires measuring nasal obstruction and snoring (NOSE, Snore Outcomes Survey [SOS]). Patient satisfaction was then assessed 90-days after the intervention by means of a 10-point Likert scale (1 = completely dissatisfied; 10 = very satisfied). An improvement in nasal breathing was observed in all patients by NOSE score, sleep quality by SOS questionnaire and quality of life as measured by EQ-5D and SNOT-22. The study is limited by the small number of participants, the lack of randomization, control group and comparator, and by the short follow-up period.

PROFESSIONAL GUIDELINE(S)

The following information is included for reference purposes only. Its inclusion does not imply endorsement or alignment with the outcomes of the review of the evidence.

Drug-Eluting Sinus Stents

In 2023, the American Academy of Otolaryngology-Head and Neck Surgery (AAO-HNS) issued a position statement on the use of drug-eluting sinus implants for the management of mucosal inflammation of the paranasal sinuses. This statement was not based on a systematic review of the evidence.

"The AAO-HNS considers drug-eluting implants in the paranasal sinuses as a proven and effective therapeutic option for mucosal inflammation." The recommendation additionally states, "Multiple studies have demonstrated the efficacy and safety of drug-eluting implants in controlling sinonasal inflammation. Clinical evidence regarding the use of drug-eluting implants after sinus surgery has particularly shown enhanced wound healing through the reduction of both scar formation and anatomic obstruction."

In 2025, AAO-HNS updated a 2015 position statement on the use of biomaterials in sinonasal procedures, supporting the use of FDA-approved implants, stents, and packing material in sinonasal procedures to improve patient outcomes and reduce complications, stating that, "Updated studies continue to support the statistically significant efficacy of drug eluting implants in maintaining sinus outlet patency following surgery compared to other standard nasal dressings in nearly all clinical situations. It remains clear that the decision to place stents, either at surgery or in the office environment needs to be made expeditiously, based upon endoscopic findings and surgical judgement, before scarring or polyposis obstructs the region. This is not an intervention that should be delayed by requirements to try stepwise less invasive or less expensive therapies, as findings can be evident at 2 to 4 weeks in patients."

In 2021, the International Consensus Statement on Allergy and Rhinology (ICAR) (Orlandi et al) was updated and included the following recommendation regarding the management of CRS with nasal polyps, using non-surgical steroid-eluting implants: Sinuva was investigated in 2 RCTs and a pooled analysis. Outcomes reported were positive but there has been no long term follow up past 6 months, and given this, it is not known whether some patients may need the implant more or less frequently. Additionally, both RCTs had implants removed at 60 days despite their ability to release drug up to 90 days. They state, "Clinical experience with this device is still relatively limited and the evidence, though at a high level, is restricted to short-term outcomes." Regarding absorbable steroid-eluting stents (i.e., PROPEL), ICAR states, "While the authors recognize the high cost of these implants, given the level of evidence, absorbable steroid-eluting implants are recommended in carefully selected patients that are similar to those included in the underlying clinical trials."

ICAR additionally commented on the use of office-based versus operating room procedures stating, "While the data suggest that office-based sinus procedures can be performed safely, there remain significant gaps in evidence. Robust long-term outcomes data is necessary, especially for emerging in-office technologies."

The American Rhinologic Society (2023) position statement on criteria for drug eluting implants, endorses the use of drug-eluting implants into the sinus cavities to optimize sinonasal inflammation resulting in a decreased use of systemic steroid prescriptions and potentially delays the need for revision surgery. The society states that "drug-eluting implants should in no way be considered investigational and should be available to patients, when selected by the physician, in order to maximize outcomes." Further, the ARS states that they endorse the AAO-HNS position statement on drug eluting sinus Implants.

Excision/Destruction of the PNN

Published in 2023, ICAR's recommendations for the treatment of allergic rhinitis (Wise et al) addressed cryotherapy/ RF ablation of the PNN, stating it may be considered in allergic rhinitis patients that have failed medical management, particularly for rhinorrhea, adding that the aggregate grade of evidence is a C (observational studies). Further, "because the current evidence is primarily based on industry-sponsored studies with limited long-term data, these office-based interventions remain an option for properly selected patients".

In 2023, AAO-HNS published a position statement on PNN ablation for the treatment of chronic rhinitis, stating the following:

"Posterior nasal nerve neurolysis techniques such as RF ablation and cryotherapy thermal application methods have been used to disrupt the PNN in the posterior aspect of the middle meatus in the region of the sphenopalatine foramen. Multicenter, patient-blinded, sham-controlled RCTs have been performed for RF ablation and cryoablation and have demonstrated clinical benefit for nasal symptoms. For both methods, validated quality of life surveys have demonstrated statistically significant improvement with treatment, with therapeutic effect. Based on these safety and efficacy data, the AAO endorses the use of PNN ablation for the treatment of medically-refractory chronic rhinitis. We do not consider these treatments to be experimental."

The AAO-HNS does not reference the use of laser for destruction of the PNN.

Repair of Nasal Valve Collapse (NVC)

In 2023, AAO-HNS issued a position statement on nasal valve repair stating that treatment options of nasal valve dysfunction may include implants aimed at stabilizing the nasal valve. With regards to surgical repair of the nasal valve, the AAO-HNS states:

"The treatment of nasal valve dysfunction may involve techniques that include cartilage grafting and open surgical repair, suture suspension techniques, and implants or RF treatment aimed at stabilizing the nasal valve. Surgical repair of the nasal valve can be performed as a standalone surgical procedure or in conjunction with other procedures to improve nasal obstruction. These may include septoplasty, turbinate reduction, ESS, among others. These procedures, such as septoplasty, may be complementary to nasal valve repair, but are not effective substitutes as they do not address nasal valve dysfunction. When feasible, surgical treatment to address all contributing anatomic sites should be performed concomitantly, based on patient and physician shared decision making. Requiring septoplasty and/or turbinate surgery prior to nasal valve surgery is not recommended, as this may lead to unnecessary increases in surgical encounters. The nasal valve may be stabilized using office-based treatments, such as implants or RF treatment. For patients who require anatomic widening and

definitive stabilization of the nasal valve, surgical treatment of NVC, along with treatment of other possible causes of nasal airway obstruction, is required to optimize patient outcomes. Failure to perform nasal valve repair, when indicated, is a common cause of incomplete symptom resolution for patients with nasal obstruction and nasal valve dysfunction."

The ARS published a statement in 2022 endorsing the use of bioabsorbable nasal implants for the treatment of NVC as an option compared with cartilage grafts, stating that initial studies in humans support their use with studies demonstrating safety and tolerance through 18-months post procedure, with prospective studies demonstrating improvements in the NOSE survey scores through the six-month mark.

In the International Consensus Statement on Allergy and Rhinology: Allergic Rhinitis (Wise et al 2023), authors assess inferior turbinate surgery as a level of evidence grade B, that its benefits include an improvement in rhinitis symptoms including nasal breathing, congestion, sneezing, and itching, and is recommended in patients with medically refractory nasal obstruction. Authors conclude that inferior turbinate surgery is a safe and effective treatment to reduce symptoms and improve nasal function, however, more studies are warranted to directly compare surgery methods, including RF ablation, laser-assisted, and microdebrider assisted) for the most efficacious and long-lasting outcome.

REGULATORY STATUS

The United States Food and Drug Administration (FDA) regulates implants and devices for excision/destruction of the sinuses as medical devices. All devices including related components require FDA approval before marketing and use in the United States to ensure they are safe and effective for human use. Refer to the FDA Medical Device website. Available from: https://www.fda.gov/medical-devices [accessed 2025 Oct 8]

The FDA lists the most serious type of medical device recalls as well as early alert communications about corrective actions being taken by companies that the FDA believes are likely to be the most serious type of recalls. Available from: Medical Device Recalls | FDA [accessed 2025 Oct 8]

In 2011, the PROPEL system (Intersect ENT, Menlo Park, CA) was approved by the U.S. Food and Drug Administration (FDA) through the premarket approval process (P100044). In 2012, a smaller version of the PROPEL device, the PROPEL Mini Sinus Implant, was approved for use in patients older than age 18 years following ethmoid sinus surgery to maintain patency. In 2017, the PROPEL Contour was approved through a premarket approval supplement. The PROPEL Contour sinus implant is an adaptable implant that is designed to maximize drug delivery to the frontal and maxillary sinus.

In 1987, the SINUVA Sinus Implant (Intersect ENT, Inc., Menlo Park, CA) received its initial FDA approval. In 2017, the SINUVA Sinus Implant was approved with a new dose (1350 µg mometasone furoate) under a New Drug Application (NDA 209310). The SINUVA Sinus Implant is indicated for the treatment of nasal polyps in adult patients who have had ethmoid sinus surgery.

In May 2016, the Latera (Entellus Medical/Stryker ENT) was cleared for marketing by the FDA through the 510(k) process for the indication of supporting nasal upper and lower lateral cartilage.

In December 2017, the VivAer device (Aerin Medical) received its first 510(k) premarket notification FDA clearance (K172529). In April 2020, a second clearance (K200300) was issued for the VivAer Stylus, as substantially equivalent in function, design, and intended use as the predicate device for the intended use of coagulation of soft tissue in the nasal airway, to treat nasal airway obstruction by shrinking submucosal tissue, including cartilage in the internal nasal valve area.

In February 2019, the ClariFix device (Stryker) was cleared for use in adults with chronic rhinitis by the FDA through the 510(k) process (K190356). Clearance was based on substantial equivalence to the predicate device, ClariFix (K162608). The only modification to the subject device was an update to the indications for use to include adults with chronic rhinitis.

In December 2019, the RhinAer stylus (Aerin Medical) was cleared for use by the FDA through the 510(k) process as a tool to treat chronic rhinitis (K192471). Clearance was based on equivalence in design and intended use of a predicate device, the InSeca ARC Stylus (K162810). The RhinAer stylus includes modification of the InSeca ARC stylus shaft components and flexibility.

The NEUROMARK System (Neurent Medical) originally received 510(k) approval in October of 2021, indicated for use in otorhinolaryngology surgery for creation of RF lesions to disrupt PNNs in patients with chronic rhinitis.

There are currently no laser ablation devices with FDA clearance for treatment of chronic rhinitis.

CODE(S)

- Codes may not be covered under all circumstances.
- Code list may not be all inclusive (AMA and CMS code updates may occur more frequently than policy updates).
- (E/I)=Experimental/Investigational
- (NMN)=Not medically necessary/appropriate

CPT Codes

Code	Description
30117 *E/I	Excision or destruction (e.g., laser), intranasal lesion; internal approach (*E/I when treating the posterior nasal nerve [e.g., RhinAer, NEUROMARK or ClariFix procedures])
30468 E/I	Repair of nasal valve collapse with subcutaneous/submucosal lateral wall implant(s) (e.g., Latera)
30469 *E/I	Repair of nasal valve collapse with low energy, temperature-controlled (i.e., radiofrequency) subcutaneous/submucosal remodeling (*E/I when treatment is for radiofrequency ablation of the nasal valve [e.g., VivAer procedure])

Code	Description
30801 *E/I	Ablation, soft tissue of inferior turbinates, unilateral or bilateral, any method (e.g., electrocautery, radiofrequency ablation, or tissue volume reduction); superficial (*E/I when treatment is to be completed in combination with 30117, 30469, 30999 [ClariFix, RhinAer, NEUROMARK or VivAer procedure])
30802 *E/I	Ablation, soft tissue of inferior turbinates, unilateral or bilateral, any method (e.g., electrocautery, radiofrequency ablation, or tissue volume reduction); intramural (i.e., submucosal) (*E/I when treatment is to be completed in combination with 30117, 30469, 30999 [ClariFix, RhinAer, NEUROMARK or VivAer procedure])
30999 *E/I	Unlisted procedure, nose (*E/I when treatment is to be completed in combination with C1874, S1091, 30117, 30801, 30802, 30468, 30469)
31237	Nasal/sinus endoscopy, surgical; with biopsy, polypectomy, or debridement (separate procedure)
31242 E/I	Nasal/sinus endoscopy, surgical; with destruction by radiofrequency ablation, posterior nasal nerve (e.g., RhinAer, NEUROMARK)
31243 E/I	Nasal/sinus endoscopy, surgical; with destruction by cryoablation, posterior nasal nerve (e.g., ClariFix)
31299 *E/I	Unlisted procedure, accessory sinuses (*E/I when requested/billed with C1874, S1091, 30117, 30801, 30802, 30468, 30469)

CENTERS FOR MEDICARE AND MEDICAID SERVICES (CMS)

There is currently no National Coverage Determination (NCD) or Local Coverage Determination (LCD) for sinus stents for postoperative use following ESS, PNN ablation or intranasal RF ablation to treat NAO.

PRODUCT DISCLAIMER

- Services are contract dependent; if a product does not cover a service, medical policy criteria do not apply.
- If a commercial product (including an Essential Plan or Child Health Plus product) covers a specific service, medical policy criteria apply to the benefit.
- If a Medicaid product covers a specific service, and there are no New York State Medicaid guidelines (eMedNY) criteria, medical policy criteria apply to the benefit.
- If a Medicare product covers a specific service, and there is no national or local Medicare coverage decision for the service, medical policy criteria apply to the benefit.

Policy/Procedure Name: SIPULEUCEL-T IMMUNOTHERAPY (PROVENGE) **Control Number: 1350/20.0000272**

Disclaimer Notice

The purpose of this policy is to provide guidance for benefit and coverage determinations only. Benefit and coverage determinations are subject to the contractual limitations of an enrollee's individual benefit plan.

If there is a discrepancy between this policy and an enrollee's individual benefit plan, the benefit plan will control. It is not the intent of this policy to dictate to health care practitioners how to provide appropriate health care to their patients. Health care practitioners shall exercise their own medical judgment when deciding the most appropriate care for enrollees. The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

Background

Provenge (sipuleucel-T) is an autologous cellular immunotherapy treatment indicated for patients with asymptomatic or minimally symptomatic, metastatic, castration-resistant (hormone-refractory) prostate cancer. The precise mechanism of action is unknown, but Provenge is designed to induce an immune response targeted against prostatic acid phosphatase (PAP), an antigen expressed in most prostate cancers.

The therapy involves a multi-step process through which the patient's white blood cells (WBCs) are removed and exposed to PA2024, which is a molecule created by linking PAP with GM-CSF. GM-CSF is a protein that targets a receptor on the surface of WBCs. PAP serves to externally manipulate the immunological functioning of the patient's WBCs, while GM-CSF serves to stimulate the WBCs into action. Thus, the WBCs are "trained" to target and attack the prostate cancer cells. Clinically, this is expected to result in a decrease in the size and/or number of cancer cells, an increase in the time to cancer progression, and/or an increase in survival of the patient. Consistent with recognized evidence-based and peer-reviewed clinical criteria, the following policy is described.

The National Comprehensive Cancer Network Guidelines for Prostate Cancer recommend sipuleucel-T only for patients who are asymptomatic or minimally symptomatic, whose life expectancy is greater than six months, and who have no liver metastases and an Eastern Cooperative Oncology Group performance level of 0–1. Currently, sipuleucel-T has not been studied in patients with visceral metastases and is not recommended for patients with small cell/neuroendocrine prostate cancer.

Summary

Effective date of policy:	04/06/2022
Indications	Asymptomatic or minimally symptomatic metastatic castrate-resistant (hormone-refractory) prostate cancer
ICD10 diagnosis codes	Q2043
Availability	*Suspension for injection*
Duration	Six (6) months

Required Criteria for Initial Approval

All of the following conditions for the requested indication must be met in order to approve Provenge therapy:

Indication	Inclusion	Recommended Dosing Regimen
Indication: Asymptomatic or minimally symptomatic metastatic castrate-resistant (hormone-refractory) prostate cancer (FDA approval) ICD10: C61	• The enrollee is an adult male 18 years of age or older. • Presence of metastatic castration-resistant prostate resistance as evidenced by: o The enrollee has a histologically confirmed adenocarcinoma of the prostate with radiologic evidence of metastases to soft tissue, lymph nodes, or bone. o The enrollee has undergone treatment with surgical castration (bilateral orchiectomy) or ≥ 3 months of chemical castration (luteinizing hormone-releasing hormone [LHRH] agonists or antagonists*). ▪ Evidence of sufficient castration by a serum testosterone concentration < 50 ng/dL (current or at initiation of chemical castration). o Evidence of progressive disease after surgical or chemical castration (known as castrate-resistant, hormone-refractory, or androgen-	• Each dose of sipuleucel-T contains a minimum of 50 million autologous CD54+ cells activated with PAP-GM-CSF suspended in 250ml of Lactated Ringer's Injection, USP in a sealed, patient-specific infusion bag. Administer the entire contents of the bag via IV infusion over 60 minutes; give approximately every two weeks for three doses

	independent prostate cancer), showing one or more of the following: ▪ Progressive measurable disease: defined by response evaluation criteria in solid tumors (RECIST) as an increase of at least 20% in the sum of tumor diameters AND an absolute increase of at least 5 mm. One or more new lesions is additionally considered progression. ▪ Worsening disease on bone scan: appearance of two or more new lesions (Progression identified in the first follow-up scan must be confirmed by a second scan, which must show additional new lesions from the first follow-up scan). ▪ PSA progression: After decline from baseline, an increase in PSA 25% above the nadir AND an absolute increase in PSA of at least 2 ng/mL. Confirmed by a second value three or more weeks later. • The enrollee is asymptomatic or minimally symptomatic, without cancer-related bone pain or use of opioid analgesics for cancer pain. • The enrollee has an Eastern Cooperative Oncology Group (ECOG) performance status of 0 or 1. • The enrollee has a life expectancy of ≥ 6 months. • The ordering physician is an oncologist, or there is documented collaboration with an oncologist in the decision to prescribe Provenge. • The administration of Provenge must be done in an infusion site equipped to handle infusion-related adverse events. *LHRH agonists include leuprolide (Lupron, Viadur, Eligard), goserelin (Zoladex), triptorelin (Trelstar), and histrelin (Vantas). Degarelix (Firmagon) and relugolix (Orgovyx) is an LHRH antagonist that is thought to work like LHRH agonists.	

Exclusion Criteria

CDPHP will <u>not</u> provide coverage for Provenge in the following situations:

- Presence of liver or brain metastases.
- The enrollee has a life expectancy of < 6 months.
- Provenge is not recommended for small cell/NEPC.

Continuation Criteria

- Requests will be reviewed per criteria every six months.

Considerations

- Prior authorization is obtained through the CDPHP pharmacy department.
- If prior authorization is approved, coverage for Provenge will be administered as a medical benefit (a prescription drug benefit is not required) when obtained and administered by a participating practitioner.
- Requests for off-label uses of Provenge will be reviewed on a case-by-case basis. Please refer to pharmacy policy, Off-Label Uses of FDA Approved Drugs, control # 1350/20.000048.

- The concomitant use of immunosuppressive drugs, such as systemic corticosteroids, may interfere with the safety and/or efficacy of Provenge. Therefore, an evaluation of whether such therapy can be safely reduced or discontinued must be conducted prior to Provenge use.
- Provenge has a maximum duration of 3 doses for prostate cancer.

The CDPHP® coverage determinations are benefit decisions only and are not to be interpreted as providing health care services. CDPHP reserves the right to review this policy at any time and change it without notice.

Background

Adrenoleukodystrophy (ALD) is a rare genetic condition characterized by progressive loss of white matter in the nervous system and degradation of adrenal glands. It is caused by a mutation in the ABCD1 gene on the X-chromosome. Because it is an X-linked disorder males develop more serious complications than females, while some females will have no symptoms. Diagnosis can be established given clinical findings and elevated very long-chain fatty acids (VLCFA) and confirmed via genetic testing. Prevalence of ALD is approximately 1 in 10,000 to 1 in 17,000 individuals in the general population. New York State does include Adrenoleukodystrophy (ALD) in their newborn screening panel.

ALD is highly heterogeneous with a wide variety of symptomatology. There are four main types described:
Childhood Cerebral type (ccALD)
Adult Cerebral type (acALD)
Adrenomyeloneuropathy (AMN)
Addison's-only type

The most severe form of ALD is cerebral adrenoleukodystrophy (CALD) which affects 35-40% of those with ALD. Male children develop symptoms between three and ten years of age (almost never occurring before 2.5 -3 years of age). Affected males will develop normally and then start to show a regression of previously acquired skills. Before the loss of skills, affected males may exhibit behavioral problems including attention deficit and hyperactivity disorder (ADHD) and learning disabilities. Affected individuals usually develop cognitive deficits which means that they may have impairment of their mental processes and have difficulty acquiring information and knowledge. Children may "space out" in school or at various times, have difficulty understanding speech, difficulty reading or understanding written words, difficulty with spatial references, and show a deterioration in handwriting skills. As the condition progresses additional symptoms include diminished visual acuity, hearing loss, gait difficulty, weakness and stiffness of limbs, convulsions, and seizures. Within two to three years of neurologic symptom onset the disease progresses to a vegetative state and death.

Diagnosis for CALD is centered around identifying the characteristic symptoms as well as diagnostic tests. Initially one would assess the levels of VLCFAs in the blood and, if elevated, would follow up with genetic testing to confirm the diagnosis. The ACTH stimulation test is also available which tests the function of the adrenal glands. Lastly, MRI imaging is utilized to assess how ALD has affected the brain including the loss of the myelin in the cerebral white matter.
