## **1 SCOPE AND INTRODUCTION**

This document is part of a series of reference documents defining the framework of the Land Use / Cover Area frame statistical Survey (LUCAS). The LUCAS reference documents are periodically improved and adapted taking into account the experience from the implemented surveys and the requirements of the LUCAS data & information users.

LUCAS is co-ordinated by The Statistical Office of the European Commission (Eurostat).

The Commission uses the micro data collected in the LUCAS survey to produce land cover and land use aggregated statistical tables and to calculate Sustainable Development Indicators and Land take (these indicators are used in monitoring the implementation of the Europe 2020 strategy). Landscape indicators are also derived from the data collected in the survey.

LUCAS micro data is also used for Agro Environmental Indicators (AEI), LULUCF (land use, land use change and forestry) indicators, for Europe Resource Efficiency indicators.

Moreover in the context of the Copernicus programme CORINE Land Cover (CLC) and other Pan-EU land cover mapping initiatives, such as the Copernicus HRL (High Resolution Layers), LUCAS micro data and photos<sup>1</sup> are used for production, verification and validation processes.

More information on land cover/use statistics and on LUCAS in general can be found on the Eurostat website: <http://epp.eurostat.ec.europa.eu/portal/page/portal/lucas/introduction>.

The LUCAS sampling is based on two-phase sampling with stratification of the master sample of points.

i) First Phase (Master grid): The LUCAS master is obtained using a 4 Km<sup>2</sup> grid (2x2 km) which includes around 1.100.000 points covering the EU-28 territory. Each of these points is classified into k land cover categories (the strata) on the basis of photointerpretation of aerial photos or satellite images. In 2005 these points in the master were stratified into 7 aggregated strata.

ii) Second Phase (Sample): The final field sample is a sub-selection of the master. Samples of n points, out of N, is selected by strata and by NUTS2 and the n points are visited in order to determine the land cover and land use at a more detailed level. The final aim of this strategy is to estimate the coverage of the full list of categories included in the LUCAS land cover and land use classification over the whole study area. In this way, it is possible to combine the information resulting from the photointerpretation with the information collected during the ground inspection of a portion of the N points selected in the first phase.

The final statistical estimates are based on the weights derived both from the master and the field observations collected on the field.

This document provides record descriptor of the LUCAS CSV files on web page <http://ec.europa.eu/eurostat/web/lucas/data/primary-data>.
