

PeerStory: Veracode

This PeerStory is a collection of quotes from a real user sharing their experience using Veracode on PeerSpot.

Everton Y.
VP of Engineering at Resola Inc

Use Case

Veracode is a DAST solution that we use for automated security scans of our APIs and front end. We perform daily scans of our applications so we can act on the results quickly instead of routine security audits that we might do yearly or quarterly. It's a complement to the standard penetration test suite.

Valuable Features

I like Veracode's **ease of integration and onboarding**. You can quickly and easily get started with a new project or application. That's one area where Veracode shines relative to other tools we've evaluated. Other tools need more work or an engineer to do the setup. With Veracode, you can do the onboarding in a few steps quickly. Another beneficial feature is Veracode's reporting. The report not only **outlines the security issues in detail but also offers some solutions**. Even if one of our backend engineers isn't specialized in security, they can still fix the issue solely based on the suggestions in the report.

"Deploying Veracode was straightforward."

"It saves time equivalent to one full-time security engineer."

Results

Veracode helps us **improve our overall security and build trust with our customers**. For example, some of our customers have strict security requirements, and they need us to use more products. It helps our business by building confidence in our products' security. Veracode improves our sales and helps us secure contracts because we can demonstrate what we are doing to the clients.

ROI

We can use it in our dev environment to **detect issues early before they get into production**. We have around 60 people on the team, but we don't need a security engineer. Our regular engineers can fix the issues themselves based on Veracode's report.
